Our understanding of the physical and chemical nature of protoplasm has also been greatly enhanced by recent discoveries concerning the properties of colloidal solutions. Colloids are substances that do not diffuse through animal or vegetable membranes. The molecules carry charges of electricity which can be changed in certain ways, such as through the action of certain dilute salt solutions. The living protoplasm behaves in so many ways as do these colloidal solutions, that an insight into the physical nature of these substances promises to solve some of the most difficult problems connected with the "physical basis of life." Lastly, the theory of dissociation, especially as applied to dilute salt solutions, promises to give another means of elucidating certain reactions of the protoplasmic materials. From these and from other results it appears that the lines are slowly but surely closing in on the ultimate biological problem of the constitution of living matter. When analysis and synthesis meet, we shall be in a position to determine whether inorganic matter, transformed into organic matter, will show the properties of living things. Until that time arrives it is pointless to discuss the problem of the origin of life, but to have found means by which we may hope at least to reach ultimately a solution of the problem is one of the triumphs of modern chemistry.

The dictum that all life comes from preceding life has been extended to smaller units of the organism. The formulation of the cell theory in 1838-39, by Schleiden and Schwann, has been followed by a minute study of these units of which all the higher organisms are composed. It was discovered that each cell arises from a preceding cell by a process of division. *Omnis cellula e cellula* was proclaimed. Within each cell there is a central vesicle or sphere known as the nucleus, when the cell divides the nucleus divides also, and each daughter cell gets half of the original nucleus. Other bodies have also been found within the cell and within the nucleus, such as chlorophyll grains and plastids of different sorts, the centrosome and the chromosomes, etc., that also divide. Carried further, we can imagine the cell peopled with innumerable units, so that all the properties of the cell can be ascribed to these minute bodies or granules. *Omnis granulum e granulo* has also been claimed to be true.

Based on views of this nature, several biologi-

cal systems have been promulgated in recent times by noted biologists, that of Weismann being perhaps the most elaborated, the most famous, and the most contested. On this theory each character of the individual is supposed to be represented in the germ by one or more units called biophors. These biophors are imagined to be combined into larger groups called determinants, which in turn form groups called *ids*, and these collectively make the threads of visible chromosomes found in the nucleus. To the biophor is ascribed the property of growth and division. After a certain size is reached the biophor divides in the same way as the cell. At each cell division, or preceding it, these smaller units of the cell are supposed to divide so that each daughter cell contains half of all of the units of the original cell. In this way each cell inherits the peculiarities of the original cell, and heredity means only the passing on from one generation to the next of each kind of biophor. The "continuity of the germ plasma" is brought about by this means.

When the cell develops it produces by division an immense number of cells, all essentially alike. Most of these form the body of the individual, i.e., the soma, the rest remain as germ cells to continue the propagation of the race. The individual, or *soma*, has been compared to a nurse that protects and nourishes the germ cells. The individual is, from this standpoint, of secondary importance. It represents the interest spent in each generation to keep in existence the immortal property of the individual, represented by the germ plasma.

The argument that the elements of the individual are contained in separable units that lead an independent life of growth and division is not, however, essential to the view of the continuity of the germ plasma, for it is equally conceivable that any part of the protoplasm may contain within itself the potentiality of producing all the characters with which the race or species is endowed. It is true that we find within the egg-cell different kinds of substances, and we can imagine that the differentiation of the cell may be connected with the presence of certain of these substances, but the visible elements or substances in the egg appear to be vastly less than the characters of the individual that develop from the egg, and it seems more in accord with our present knowledge to assume that the polymorphic nature of the protoplasm is the basis for character formation, than to assume a different substance for each character. From this point of view the continuity of the germ plasma means the separation at each cell division of a reasonably small number of substances, each having the potentialities of forming different combinations. In other words, the variable substances of the germ are products of the common protoplasmic basis.

The theory of the continuity of the protoplasm accounts sufficiently for heredity, and will suffice to explain the continuity of existing species, but it leaves unaccounted for the possibility of the formation of new species. A discussion of the origin of species belongs more especially to the field of evolution, but in so far as certain fundamental biological questions are involved the problem must be briefly referred to.

Biologists are divided into two schools regarding the causes of variability in the germ plasma. One school, the older, assumes that external influences that affect the body may also affect the

germ cells in the same way, so that changes in the environment may cause the evolution of a new form. Closely associated with this idea is the view that any changes in the body, either brought about directly by external influences or indirectly through its own activities, are carried to the germ plasma, which is sensitive to all such changes and becomes modified accordingly. In this way each and every change, by means of which the organism adapts itself to the outer world, is supposed to be transmitted to the germ, so that the next generation starts where the former one left off. Some of the individuals of a species, adapting themselves to certain conditions, become modified to suit those conditions, others become modified to suit other conditions. In this way a species becomes separated into several species.

Another school denies that adaptation has arisen in these ways, although the followers of this school separate into several groups according to the methods invoked to account for the formation of new types, and for the origin of adaptation. Darwin and his followers appeal to fluctuating variations as the chief source of species formation and of adaptation. Observation shows that no two individuals are exactly alike. A statistical examination of these differences shows that they conform to Quetelet's (sometimes spoken of as Galton's) law of probability. According to this law, the individuals of such a group will form, if arranged according to their measurements, a curve known as the curve of probability. The resulting form of such a curve is something like an inverted Ω . There are more mediocre individuals in the middle, and fewer that depart from mediocrity in each direction. The Darwinian school assumes that if the individuals belonging to the one or the other sides of the middle possess any advantage in "the battle for existence" they will survive, and the next generation will be modified in the direction of this selective process. In time the change may be so great that a new variety or a new species will be formed. Thus adaptation and species formation go hand in hand.

Other biologists refer the modification of the species to other kinds of variations. In recent years discontinuous or definite variations—also called mutations—have been claimed to furnish the materials for evolution. A mutation is a spontaneous variation that appears in the germ-plasm and expresses itself in the next generation. A mutation differs from a fluctuation in two essential aspects: first, it appears suddenly and is completely formed from its first appearance; second, if a mutant is bred to another mutant of the same sort (or, if a hemaphroditic mutant be self-fertilized), all the offspring are, as a rule, like the new form. Mutations have been recorded for a number of animals and plants, and it seems not improbable that the formation of domesticated breeds of animals or plants owes its origin in part to the picking out of such new forms. The change from the old form to the new may be small, and even not transgress the limits of fluctuation, but the difference between the two kinds of variation seems apparent when it is found that the mutant transmits to all its offspring its new characters, and there is no return to the original type. Failure of practical breeders to distinguish between these two kinds of variation may have led to the erroneous opinion that their results have been obtained through the selection of

fluctuating variations. One of the peculiarities of some of these mutants is that when crossed to the parent type they transmit to some or to all the offspring their new character in full force. Thus the original type, whenever crossed with the new type, will have grafted to it, as it were, the new character. Instead of the new type becoming swamped, by back crossing, the parent type is the one that is lost or changed whenever it meets the new form. The chance of an individual mutation surviving is small compared with the chance of its crossing with the parent type, but if the mutation is of the sort described—and such are known—it may be perpetuated despite back crossing.

If mutation has been one of the means by which evolution has taken place, the question of greatest biological interest is the cause of the appearance of such types. That the germ plasma has suddenly changed its character seems clear, but the cause of this change, whether internal or external, is unknown. Theoretically it seems necessary to assume that external causes must give the stimulus, but the effect is indirect, and the change in the germ plasma must be held to be the chief factor in the result. It is recognized that external conditions are largely responsible for fluctuating variations, and it seems plausible that they may indirectly bring about also mutational changes. Galton's simile of a polyhedron enables us to form a picture of the difference between the two kinds of change. A disturbance may cause the polyhedron to rock back and forth on the face on which it stands. This is comparable to fluctuation. A greater disturbance may cause the polyhedron to roll over on to a new face. This would correspond to a mutational change in a species.

The most general characteristics of living things, as contrasted with non-living matter, may be included under the categories of reproduction, rejuvenescence, waste and repair, growth, regulation, irritability, and memory.

Reproduction. No inorganic substance, and not even a machine, has the power to throw off spontaneously small portions of itself that will increase in size and undergo changes in form until the original size and arrangement of parts is attained. All organisms have this power, and it is largely through its possession that they are able to maintain themselves and meet the accidents to which all living things are continually subjected. Not only do organisms perish through external agencies, i. e., accidentally, but in all the higher forms, and in most of the lower forms also, the length of life of the individual is limited, and its place is taken by its offsprings. Many methods of reproduction exist. They fall, however, into two groups, the sexual and the non-sexual. Animals and plants reproduce non-sexually most simply by dividing into two parts or by producing buds, but chiefly, especially in plants, by setting free single cells called spores, generally protected by a tough surrounding membrane. In animals, the formation of parthenogenetic eggs leads to the same result, but while a spore does not in most instances represent an egg, in animals the parthenogenetic egg appears to have been at one time an ordinary egg requiring fertilization, which has later acquired the power to develop without fertilization. In recent years it has been found possible, by artificial means of many kinds, to induce almost all kinds of ordinary eggs to develop without fertilization, i. e., parthenogenetically.

The other method of reproduction, the sexual, consists in the union of two cells, derived in most cases each from different individuals. These two kinds of cells are known as eggs (or ova) and spermatozoa. Each cell has become specialized in a different way—the egg, as a storehouse of material to be used in development, the spermatozoon, as a motile form capable of finding and entering the egg. A biological problem of great importance in relation to sexual reproduction is whether there is any advantage of this method over the other, or non-sexual method, for it is manifest that the sexual process involves also disadvantage, since it requires twice as many individuals as does the non-sexual method. In other words, if all the individuals were females, twice the number of eggs could be produced and there would be double the chance of survival of some of them. Many attempts to answer this question have been made, but none have proven satisfactory. It has been claimed, for instance, that by the union of cells derived from two individuals the chance of producing new variations is given through the combination of their individual differences (Weismann), but it seems more probable, on the contrary, that continual crossing of this sort would tend only to reduce all individuals to the same standard and obliterate any individual difference that might arise. The older zoologists were so convinced that sexual reproduction must take place that they believed no species could continue to reproduce itself indefinitely by means of spores or by parthenogenetic eggs, yet a number of such species are now known, both in the animal and in the plant kingdom. Nevertheless, it is true that in nearly all forms reproducing by spores or by virgin eggs, sexual reproduction sooner or later occurs. Even in the lowest or unicellular forms, that may reproduce for hundreds of generations by simple division, it has been found that after a time division ceases and death follows unless conjugation takes place, after which the division cycle begins again with renewed activity. This renewal of vigor as the result of conjugation has led many biologists to assume that the function of fertilization is to make young again or rejuvenate the living individual.

Rejuvenescence The great vigor and immense vitality of youth are so familiar to us in our own species that it needs no further exposition, especially when we see abundant evidence of the same thing in other organisms. If rejuvenescence were always associated with sexual reproduction, it would seem a probable explanation of the advantage of the process, but it cannot be claimed that this is the only way in which rejuvenescence takes place. It is true that in a few cases parthenogenetic eggs may not develop as well as fertilized eggs, but in the great majority of cases they develop equally well, and the young, so far as known, show no lack of vigor. It would seem that an egg may become as well adapted to the one process as to the other. Nor can it be claimed in those cases where sexual and non-sexual forms alternate in the same cycle that the generations produced by budding or by spores show less vigor than those produced by fertilized eggs. On the other hand, close inbreeding of forms adapted to cross fertilization is generally supposed to be injurious, but here also there are exceptions, for some plants seem adapted to this process alone. The difficulties in the way of reaching even a probable conclusion are thus seen to be very great, but Darwin's de-

ductions from his own experiments and wide knowledge of the results of others seem to hold, namely, that some advantage results when an egg is fertilized by a spermatozoon of an individual that has lived in a different environment. How this result is reached we do not know, possibly in time physiological chemistry will throw light on the problem.

It must also be remembered, and even emphasized, that sexual reproduction is not the only way in which rejuvenescence through the germ cells may be accomplished. In some organisms other agencies may give rise to the same effect. In fact, the discovery of artificial parthenogenesis suggests many ways in which the same end may be attained.

Not only is rejuvenescence found in reproduction by means of sex cells, but an apparently identical process occurs in the formation of buds. The differentiated protoplasm has the power of returning under certain conditions to the embryonic condition, associated with which is found a renewal of vigor. In the regeneration of a new part from old tissues an analogous phenomenon occurs, if we may judge by the enormous increase in the powers of growth.

Waste and Repair, Growth Organisms conform to the laws of energy of lifeless matter, in that they have no power to create energy, but can only transform one kind of energy into another. Plants derive their energy in the first instance from the energy of light, more particularly sunlight. Once having changed this energy of light into the energy of chemical combination, the latter can be stored away for future use. The protoplasm itself is such a storehouse, it is a highly unstable compound capable of setting free a large amount of energy. Energy is also stored up by plants in the form of insoluble starch. The starch is changed by means of a ferment into sugar, which, being soluble, can diffuse into those regions where it is in excess to those regions deficient in sugar, where it may be used as food, i.e., as material for building up new protoplasm. Animals do not possess the power of transforming the energy of light into chemical energy, and all their energy is traceable ultimately to plants which they use as food. The chemical energy of the protoplasm and of the other organic constituents of plants supplies all the energy of animals, the food substance becoming incorporated in the animal tissues without first breaking down into their elements. While part of the energy of the plant may be lost in the transformation, the greater part of it is retained by the animal. The fact that animals and plants derive absolutely all their energy from external sources, and lack completely the power to make energy of any sort, goes far towards establishing the uniformity of the laws governing living and lifeless matter. In other words, these energies which taken together constitute what is called briefly *life* are all derived from the energies of the chemical compounds of which the organism is composed. The greatest generalization of physics, the law of the conservation of energy, applies as inexorably to living as to lifeless things. The question must still, however, be left open as to whether the transformation of energy that occurs in the brain, for example, may not involve forms of energy as yet undescribed by the chemist and physicist, but if such be found, it is safe to prophesy that they must conform to the law of the conservation of energy.

In order to do work of any kind, to move, to secrete, to think, energy must be liberated, and this is accomplished by the breaking down of the materials of the animals, such as the muscles, the glands, or the brain. The organism has a remarkable capacity to build up again its broken-down substances by means of the food stuffs that are made by plants and obtained from them by animals. This power to replace what is lost after work has been done, is one of the fundamental, but least understood, properties of living things. In consequence of this same or of some similar power, organisms grow when the waste is less than the construction that is taking place. Growth is not, however, so simple a problem as this, for there are distinctive powers of growth associated with each phase of the life cycle. Growth is a special feature of "young" or rejuvenated tissues. As the organism approaches a certain size, its power of growth slowly declines and then ceases entirely. Most remarkable is the fact that this cessation is not due to the loss of the power of growth, but to some inhibition of the process, as shown by the power of replacement or regeneration shown by most organisms. If the limb of a salamander that has ceased to grow is removed, a new limb is regenerated. It is reproduced out of the same tissues that had ceased to grow. The new limb will in time also cease to grow when it has reached a size characteristic of the stage of development which the animal has reached when the loss occurred. The factor that regulates the extent of growth of each species is entirely unknown. It appears to be connected with the differentiation of the tissues, but the differentiation is in turn intimately connected with the relation of cells to neighboring cells. Possibly the pressure relation of the cells may be the "formative factor" involved, and if so the formative force of the earlier biologists may turn out to be the response of the organism to pressure and tension relations. Reaction to contact or touch (called stereotropism) is one of the most general characteristics of adult organism, and there is much to indicate that the individual cells of the embryo respond to the same stimulus.

Regulation. Organisms show in many ways a power to adapt themselves directly to changes in their environment. Use of a part brings about an increase in its size, strength, and power to perform its functions more perfectly, as seen especially in the muscular and nervous system. Pressure on the skin may cause it to become thicker, exposure to sunlight "tans" the skin and protects it from burning. The rate of beat of the heart, and the respiratory process regulate themselves to the activity of the body, etc. The most wonderful regulations are seen in the development of the embryo, where the development of the parts depends on a subtle power of adjustment. The highest expression of this power is seen when a part of an egg or embryo produces an entire organism of reduced size.

The responses of animals regulated through the central nervous system fall also into this class, especially those that are not tropisms and instincts, but which have been acquired by experience. Fear, for instance, which is instinctive apparently in some animals, develops in others with extraordinary facility after the briefest experience. These regulations through the central nervous system separate more strongly than any other differences living from lifeless things. They may be analyzed into two

parts, first, the transmission of the stimulus, and second, the changes in the centres that determine how and where the outgoing nerve impulse, that follows, shall act. Sense organs are those parts of the surface layers that are specialized to receive certain impressions, and are connected by nerves with the central organs. There are some facts that seem to show that a chemical change is induced in the sense organ that transmits an impulse to the nerve. The character of the nerve impulse is unknown. It is carried into that ganglion cell of the central system connected with the nerve, and it is supposed that within the cell the regulation of the outgoing impulse takes place. The character of this regulation is hardly surmised. It is true that there seem to be certain prearranged paths of least resistance through the central nervous system that determine the direction of the outflow of impulse received, but experience also seems in part to determine the paths of least resistance which come to be those most often used to accomplish an end.

Associated Memory. The reactions of the higher animals are determined in part by their individual experiences. This means that the consequences that have followed from a given reaction may determine whether the same reaction is repeated as at first or is inhibited. The lower animals have been supposed to learn very little from experience, but to react always in the same way to the same external stimulus. More careful observations have shown, however, that their reactions are not so stereotyped as had been previously supposed, and there is evidence that the character of a reaction may be affected by the last reaction, and possibly also by the experience that has followed. If the difference between the first and the second reaction involves only a difference in the physiological state of the organism, and is not influenced by the experience that has followed the reaction, the change may be due to something like memory, but memory not connected with the results of experience, and only with the difference in the physiological state induced by the stimulus. It is, however, only a step further to imagine that the resulting experience may also induce a physiological state that becomes associated with the physiological state that follows the reaction, just as the reaction is associated with the stimulus. Whether this change in reaction, involving something like memory, is accompanied by consciousness, we do not know and have no means of discovering. If we judge by the similarity of the results to those that follow in ourselves, we might be inclined to impute consciousness to these organisms, but we should not forget that in ourselves certain kinds of changes may take place in our reactions as a result of experience that do not rise to a conscious state. In its simplest form memory is an alteration in a reaction in conformity with past experience, in its highest forms memory is a recalling of the entire chain of events without either the original stimulus being present or any action following. Self-consciousness has been cleverly, but perhaps superficially, defined as associated memory. It is probable that nothing is remembered unless something recalls the peculiar state of the brain that stands for a particular memory, but the important point is that other subsequent associations than the original sequence may equally serve to awaken the memory. There are analogies in inorganic nature, as when, for instance, the after effect of

a reaction persists so that a second reaction is different from the first, or as when a piece of wire is once bent it is more easily bent in the same place a second time, but in these inorganic changes nothing has been found comparable to the substitution of one stimulus by an associated stimulus, which is one of the chief characteristics of memory,—a change, moreover, that takes place with great ease and rapidity in most animals

The higher functions of the central nervous system of man are so little understood in their biological significance that any comparison between them and the phenomena of the inorganic world would be extremely unprofitable at the present time. Consult Thomson, *Science of Life* (London, 1910), Huxley, *Discourses Biological and Geological* (New York, 1897), Sedgwick and Wilson, *Introduction to General Biology* (New York, 1895), Haeckel, *Wonders of Life* (New York, 1904). See BACTERIA, CYTOLOGY, CELL, REPRODUCTION, WEISMANN, MENDELISM, DARWIN, LAMARCK, HERPITY

BIOLOGY This term has often been used of plants, especially in Germany, instead of ecology (qv), though biology in this sense usually includes the more sensational topics of ecology, such as pollination, carnivorousness, etc., rather than the broad field which is now known as ecology. The term in this sense should be discarded.

BI'ON (Gk *blōn*) OF SMYRNA. A Greek bucolic poet, of the latter part of the second century B.C., a younger contemporary and imitator of Theocritus (qv). Of his works there are extant 17 short poems and his longer "Lament for Adonis" (*Ἐπιτάφιος Ἀδωνιδος*), in 98 hexameters, a hymn of great beauty and tenderness, which shows many reminiscences of Theocritus' first idyl. It became itself the model for Shelley's *Adonais*. Bion was inferior to Theocritus in directness and dramatic power, he is more rhetorical and more sentimental. The "Lament for Adonis" dealt with that day of the festival of Adonis (qv) on which his death was lamented. The poems are edited with Theocritus and Moschus, by Ahrens (1855), Meineke (1856), Ziegler (1868), the *Ἐπιτάφιος* was edited, with translation and explanatory introduction, by Wilamowitz-Moellendorf, *Adonis* (1900). Wilamowitz edited the text in the *Oxford Classical Text Series*, in 1905, in a volume called "Bucolic Græci." Consult Smyth, *Greek Melic Poets* (New York, 1900). Andrew Lang translated Bion, together with Theocritus and Moschus, in 1889. Consult Susemihl, *Geschichte der griechischen Literatur in der Alexandrinischen Zeit* (Leipzig, 1891), and, for text and translation, Edmonds, *The Greek Bucolic Poets* (London, 1912).

BIONDO, byōn'dō, FLAVIO. See FLAVIO BIONDO.

BI'ONOMIC'S (Gk *bios*, *bios*, life + *nomos*, law), or **ETHOLOGIC**. The science which deals with the relations of animals or plants to their surroundings, called also ecology, a term formerly especially used by botanists, but now equally used by zoologists in the widest sense. The science is a new one and has as yet too few adherents. Charles Darwin, Fritz Müller, and Karl Semper are the best examples of workers in this field. Some of the topics with which bionomics deal are: The relation of animals to their inorganic environment, the relation of aquatic organisms to the chemical nature of the

water, to its density, to its volume, to its temperature and currents, to light, and to gravity, the relations of land animals to the humidity and temperature of the air, to the other chemical and physical properties of the medium, to light, to gravity, and to air currents, the relation of organisms to alternate submergence and desiccation, their relation to shelter and homes, the relation of animals to their organic environment, their relation to food, to mates, to the nutrition and care of young, or to enemies, animal communities, and the interdependence of organic species, as in parasitism and commensalism or symbiosis. Most of these topics are separately treated elsewhere. Consult Waether, *Einführung in die Geologie*, parts 1, 11, *Bionomie der Meerestiere und Lebensweise der Meerestiere*. See ECOLOGY.

BION'OMY. See PALEONTOLOGY, ECOLOGY, DISTRIBUTION OF ANIMALS, DISTRIBUTION OF PLANTS.

BIOPHOR. See BIOLOGY.

BIORNEBORG. See BJORNEBORG.

BIOT, be'd' or byo, EDOUARD CONSTANTIN (1803-50). A French writer on China. He was born in Paris, July 2, 1803, and was a son of the astronomer J. B. Biot. After a short service in railway enterprises he devoted himself to the study of Chinese and contributed many valuable papers to the *Journal Asiatique*. He prepared a *Dictionnaire des villes et arrondissements de l'empire chinois* (1842), *Essai sur l'histoire de l'instruction publique en Chine et de la corporation des lettrés* (1847), *Mémoire sur les colonies malaises et agricoles des chinois* (1850), *Le Tchou-ly, ou rites des Tchou-ly*, a translation, with notes, of an ancient work on the government institutions of the Chou dynasty (1851), and he wrote *De l'abolition de l'esclavage ancien en occident* (1840), for which he received a gold medal from the Institute. He became a member of the Academy in 1847.

BIOT, JEAN BAPTISTE (1774-1862). A distinguished French physicist and astronomer. He was born in Paris and early entered the artillery, but forsook the army for science. He was appointed a professor of mathematics at the Ecole Centrale of the department of Oise and in 1800 became professor of physics in the Collège de France. He was made a member of the Institute in 1803, and in 1804, at a meeting of that body, called to vote in favor of establishing an empire, Biot refused to vote. With Aiago he was made a member of the bureau of longitude, and (1806) sent to Spain to supervise the triangulation involved in the measuring of an arc of meridian, preparatory to the introduction of the metric system of weights and measures. Together with Aiago he also made an exact determination of the force of gravity in Paris, and they were associated in a number of scientific investigations. Biot was able to demonstrate by direct experiment that the velocity of sound in solids was greater than in air, and he was the founder of saccharimetry by the use of the polariscope. In company with Gay Lussac, he made in 1804 the first balloon ascent for the purpose of making scientific observations. His most valuable contributions to science deal with the polarization of light, and his researches connected with ancient astronomy are also very valuable. Among his writings are *Traité élémentaire d'astronomie physique* (3 vols., Paris, 1805), 3d ed., considerably augmented (1850), 6 vols., with vol. of plates—

translated into English, *Traité de physique* (4 vols, 1816), *Précis de physique*, an abridgment of the former in 2 vols (1818), often republished, *Recueil d'observations géodésiques*, etc (1821). Among the most important of his later works are *Recherches sur plusieurs points de l'astronomie égyptienne* (1823), *Recherches sur l'ancienne astronomie chinoise* (1840), *Mémoire sur la constitution de l'atmosphère terrestre*, in the *Connaissance des temps* (1841), *Mélanges scientifiques et littéraires* (1858), *Études sur l'astronomie indienne et sur l'astronomie chinoise* (1862).

BIOTITE, or **BLACK MICA**. A mineral of the mica group consisting of an orthosilicate of potassium, magnesium, aluminum, ferrous and ferric iron. It occurs in monoclinic tabular crystals similar to those of muscovite (qv) and characterized by the basal cleavage common to the micas. It is possible, by reason of this easy cleavage, to split crystals of biotite into extremely thin plates. It is also found in disseminated scales and massive aggregates. Biotite is commonly dark green to black in color with a vitreous or pearly lustre, often submetallic in the dark colored varieties. It is an important constituent of many igneous rocks and is common in most granites and in many syenites and diorites. Large crystals and plates of biotite are especially characteristic of pegmatitic granites.

BIPENNIS (Lat bis, twice + *penna*, wing, edge). A double-headed axe.

BIPLANE. See **AERONAUTICS**.

BY-PONT EDITIONS (*Bypontum* is Latin of Ger *Zweibrücken*, from *bis*, double + *pons*, bridge). A name given to a classical series of 50 volumes, begun at Zweibrücken (1779) and finished at Strasbourg.

BIQUADRATIC EQUATIONS (from Lat. *bis*, twice + *quadratus*, squared). Equations of the fourth degree in one or more unknowns or variables. They are often also called quartic equations. The solution of the biquadratic equation in one unknown was first given by FERRARI (1522-62). Other solutions were given by DESCARTES and EULER. The quadratic, cubic, and biquadratic equations are all solvable by radicals. But this is the end of the series in this direction. The equations of higher degrees are not solvable algebraically, but require the use of transcendental functions for their solution. See **ALGEBRA, EQUATION**.

The biquadratic equation in two variables defines a quartic plane curve. For its theory, consult SALMON, *Treatise on the Higher Plane Curves* (Dublin, 1852, 3d ed, 1879).

BIR. See **BIREK**.

BIRAGO, bé-ra'gò, KARL, BARON VON (1792-1845). An Austrian military engineer, born at Casenna d'Olmo, near Milan. In 1825 he invented the military bridge named after him, consisting of detachable blocks and pontoons—an invention adopted by the Austrian army in 1828. He erected the military bridge across the Po, at Brescello (1839), which was followed, a few years later, by a similar bridge across the Danube. His system of constructing military bridges was adopted by nearly all the armies of Europe. He wrote *Untersuchungen über die europäischen Militärbrückentranss*, etc (1839) and *Anleitung zur Ausführung der im Felde am meisten vorkommenden Pontonbrücken*.

BIRCH *Betula*, a genus of plants of the family *Betulaceæ*. The subfamily *Betuleæ* con-

tains two important genera, *Betula* and *Alnus*, birch and alder, the plants of which are all trees or shrubs, natives of temperate and cold regions.

Birches are found from the Arctic Circle to Texas, southern Europe, Himalayas, China, and Japan, about 30 species being known, a dozen of which are found in North America. The common birch (*Betula alba*) has small, triangular, doubly serrated leaves. In the south of Europe it is found only upon mountains of considerable elevation. It is a tree of rapid growth. In favorable situations it attains the height of 60 or even 70 feet, with a diameter of $1\frac{1}{2}$ or 2 feet. In the northern or utmost alpine limits of vegetation it appears only as a stunted bush. The bark is smooth and silvery white, and its outermost layers are thrown off as the tree advances in age. The smaller branches are very slender and flexible, and in a particularly graceful variety called the weeping birch (*Betula pendula* of some botanists) they are still more slender, elongated, and pendulous.

The bark and leaves of the birch are, in some northern countries, used medicinally in cases of fever and eruptions. The bark is also used for yellow dye. It is in some countries made into shoes, hats, drinking cups, etc. In many parts of the north of Europe it is used instead of slates or shingles by the peasantry, and in Russia—the outer or white layers being subjected to distillation—there is obtained a reddish empyreumatic oil called birch oil, it yields also the birch tar, or *degutt*, which is employed in the preparation of Russia leather. The wood is in universal use in northern countries for a great variety of purposes. It is white, firm, and tough and is employed by wheelwrights, coopers, turners, etc. It is much employed for smoking hams, herrings, etc., because of the flavor which it imparts. Much of it is made into charcoal for forges. In the highlands of Scotland and in many other countries the sap is used, either in a fresh or in a fermented state, as a beverage. The white birch of North America (*Betula populifolia*) very nearly resembles the common birch, but is of much less value. It is found as far south as Pennsylvania. The wood is scarcely used. The black birch, or river birch, of North America (*Betula nigra*), also sometimes called red birch, is similar to the common birch and produces very hard and valuable timber. It attains the height of 70 feet. The bark is of a dark color, the epidermis in the younger trees reddish. The name "black birch" is also given to a species that is found in the more northern parts of North America and is sometimes called the sweet birch, or cherry birch (*Betula lenta*), this also is a tree 70 feet or more in height, of which the timber is fine-grained, and valuable for making furniture and for other purposes. The bark of this species yields an essential oil identical with oil of wintergreen. Its leaves, when bruised, diffuse a sweet odor and, when carefully dried, make an agreeable tea. The yellow birch of North America (*Betula lutea*) is a tree 70 to 80 feet high, destitute of branches for 30 to 40 feet, and remarkable for its large leaves, which are 3 to 5 inches long, as well as for the brilliant golden yellow color of the epidermis. It is found in Nova Scotia, New Brunswick, Maine, etc. Its timber is used for furniture and occasionally in shipbuilding. The young saplings of all these American species are much employed for making hoops for casks. The paper birch (*Betula papyrifera*) is found in the

northern parts of North America. It attains a height of 70 feet. The bark of the young trees is of a brilliant whiteness, and capable of division into very thin sheets, which have been used as a substitute for paper. It is used by the Indians for canoes, boxes, buckets, baskets, etc. The wood is used for the same purposes as that of the common birch. The mountainous districts of India produce several species of *Betula*. Thin, delicate strips of the bark of the *Betula utilis* are used for lining the tubes of hookahs. They were formerly used as writing paper. *Betula alnoides*, a native of the mountains of Nepal, is a tree 50 to 60 feet high, covered with branches from the base, and of an oval form. Its wood is strong and durable. The dwarf birch (*Betula nana*) is a mere bushy shrub, seldom more than 2 or 3 feet high and generally much less. It has orbicular crenate leaves. It is a native of the northern regions of the globe and is found in some parts of the highlands of Scotland. It is interesting because of its uses to the Laplanders and other inhabitants of very northern regions, to whom it supplies their chief fuel and the material with which they stuff their beds. Its seeds furnish food for the ptarmigan.

Fossil forms of birch are found in the Cretaceous rocks of Greenland and in the Tertiaries of Europe and North America. See Plate of BAMBOO, ETC.

BIRCH, HARVEY A character in *The Spy*, a novel of the American Revolution, by Cooper.

BIRCH, SAMUEL (1813-85). An English antiquarian, Keeper of the Oriental Antiquities in the British Museum. He was born in London, Nov. 3, 1813, the grandson of Samuel Birch, Lord Mayor of London in 1814, and the son of the Rev. Samuel Birch, rector of St. Mary Woolnoth, London. He received his education at the Merchant Tailors' School and in 1832 entered the service of the Commissioners of Public Records. In 1836 he accepted an appointment as an assistant at the British Museum and in 1844 became Assistant Keeper of Antiquities in that institution. In 1861 he was advanced to the position of Keeper of Oriental, British, and Medieval Antiquities. When, in 1866, these departments were divided, Birch was made Keeper of the Oriental Department. He died Dec. 27, 1885.

Birch was a man of varied attainments. During his connection with the British Museum he devoted much attention to classical and British antiquities and to numismatics. Among his works on these subjects are his *Catalogue of Greek and Etruscan Vases in the British Museum*, published in 1851 with the collaboration of Mr. Newton, and his *History of Ancient Pottery* (2 vols.), published in 1858. He also wrote a number of papers for the *Numismatic Chronicle* and for *Archæologia*. In early life he was a zealous student of Chinese, and in later years he wrote some translations from that language. Among these, his *Chinese Widow*, published in 1862, is well known. He was also proficient in other Oriental languages, but it is upon his work as an Egyptologist that Birch's reputation chiefly rests. As early as 1838 he published his *Explanation of the Hieroglyphics on the Coffin of Mycerinus*, and some of the most important Egyptological publications of the British Museum were issued under his editorial supervision. Among these are *Select Papyri in the Hieratic Character* (1841-60), *Inscriptions in the Hieratic and*

Demotic Character (1868), *The Rhind Papyrus* (1866), and *Facsimile of an Egyptian Hieratic Papyrus* (1876). In 1867 Birch enriched Bunsen's work, *Egypt's Place in Universal History*, by the addition of a valuable volume (vol. v) containing the first Egyptian dictionary since that of Champollion, and the first translation of the Book of the Dead, and in 1878 he edited the revised edition of Wilkinson's *Manners and Customs of the Ancient Egyptians*. Birch was a most prolific writer, especially upon Egyptological subjects, and his articles in the *Proceedings of the Society of Literature*, *Revue archéologique*, *Zeitschrift für ägyptische Sprache*, and other periodicals, are very numerous. He was one of the founders of *Records of the Past* (1873 ff.), and many of his translations of Egyptian texts appeared in this series. He was also one of the founders of the Society of Biblical Archaeology and was a frequent contributor to the *Transactions* and to the *Proceedings* of the Society. For his untiring industry, and his boldness in exploring untried fields of research, Birch's reputation as an Egyptologist stands deservedly high. The best sketch of his life and work is to be found in *Transactions of the Society of Biblical Archaeology*, vol. ix (London, 1893).

BIRCH, THOMAS (1705-66). An English historian, born at Clerkenwell. He took orders in the Church of England in 1731, held a benefice in Essex in 1732, and in 1734 became chaplain to the Earl of Kilmarnock, who was beheaded in 1746. He was then (1746) appointed rector of St. Margaret Pattens, London, and in 1752 was one of the secretaries of the Royal Society, a history of which he published (4 vols., 1756-57). His first literary undertaking was *The General Dictionary, Historical and Critical* (10 vols., 1734-41), founded on Bayle's celebrated work. He next edited the State papers of Thurloe, secretary to Oliver Cromwell (7 vols., 1742). Among his other works are *Life of the Hon. Robert Boyle* (1744), *Inquiry into the Share which King Charles I. Had in the Transactions of the Earl of Glamorgan* (1747), *Historical View of the Negotiation Between the Courts of England, France, and Brussels, 1592 to 1617* (1749), *Life of Tilloston* (1752), *Memoirs of the Reign of Queen Elizabeth* (2 vols., 1754), and he edited the works of Sir Walter Raleigh and of Bacon.

BIRCH-PFEIFFER, BIRCH-PFIFTER, CHARLOTTE (1800-68). A German actress and playwright, born in Stuttgart. She made her debut in Munich at the age of 13 and played with great success in Berlin, Vienna, Hamburg, St. Petersburg, Pesth, Amsterdam, and other places. In 1825 she married Dr. Christian Birch of Copenhagen. She managed the theatre in Zurich from 1837 to 1843, and then, after visiting professionally most of the cities in Germany, made an engagement with the Royal Theatre in Berlin, which continued until her death. Her plays, although of no high artistic merit, showed true dramatic talent and a thorough knowledge of stage effects and met with popular success throughout Germany. Most of her plays were dramatizations of popular novels. The following were especially successful: *Pfefferkorn*, *Ilanko*; *Die Günstlinge*, probably her best; *Der Glöckner von Notre Dame*, after Victor Hugo; *Die Frau in Weiss*, after W. Collins, and *Die Waise von Lowood*, after Charlotte Brontë's *Jane Eyre*. Her *Gesammelte Novellen und Erzählungen* (3 vols.) were published in 1863-65.

BIRD (origin obscure) Birds are warm-blooded vertebrate animals clothed with feathers and normally capable of flight. They comprise the class *Aves*. They have existed since early Mesozoic times, exhibit an interesting evolution within very compact and well-defined limits, dwell in every part of the globe, are exceedingly diverse in size, form, ability, and appearance, adapted to every sort of climate and food, show mental qualities of a high order, are of great importance in their economic relations with man, and in most cases are beautiful in outline and color and possessed of melodious voices.

The Bird's Place in Nature. Birds are classified between the reptiles, regarded as inferior to them, and the mammals, regarded as superior in general organization. Birds differ from mammals, broadly, in being clothed with feathers instead of hair, and in the absence of milk glands, and by sundry differences in anatomy and methods of existence, such as the hatching externally of eggs, and the devotion of the fore limbs to flight. They differ from reptiles in having a covering of feathers instead of scales, a complete double circulation of warm blood, no more than three digits in the manus, long legs, etc.

Affinity with Reptiles.—The differences last noted are, however, of much less importance than those which separate them from mammals, and the structural resemblance is so close that some anatomists, notably Huxley, have included reptiles and birds in a single group, the *Sauropsida*, comparable to *Fishes* or *Mammals*, and completing, with them, the three divisions of the *Vertebrata*. This grouping was founded upon the fact that birds and reptiles were alike in being oviparous or ovoviviparous, in having a cloaca, in the incompleteness of the diaphragm, and of a corpus callosum in the brain, in having only one occipital condyle, in the presence of a movable quadrate bone and other peculiarities of the skull, and in the fact that the ankle joint is between two sets of tarsal bones. The close relationship thus implied has been confirmed by the disclosures of paleontology, which show that birds have a reptilian ancestry and are an offshoot of the same stock as modern reptiles.

Development of the Class.—For details of the geological evidence of the origin and evolution of birds, the reader is referred to the articles **BIRD**, **FOSSIL**, **EVOLUTION**. It will suffice here to sum up the matter as Prof. A. Newton, following Furbinger, does in his *Dictionary of Birds* (London, 1893-96). Birds, since they spring from reptiles, must have begun with toothed forms of small or moderate size, with long tails and four lizard-like feet, having well-formed claws, while their bodies were clothed with a very primitive sort of down. To them succeeded forms wherein down developed into feathers, and the fore and hind limbs differed in build—the former becoming organs of prehension (as is still the case in some young birds), and the latter the chief instruments of progression. Then followed a dinosaur-like transformation of the pelvis and legs, and a gradual coalescence of the ankle bones, enabling birds more and more to walk erect. These early reptilian birds were flightless and terrestrial, or at most climbed trees. "Among those which possessed this habit, the bef Feathering (which as yet had, like the hair of mammals, served only for warmth) presumably entered upon a higher step, the feathers becoming larger on certain parts of

the body, particularly on the fore limbs and tail, so as to begin to act as a parachute and allow of a safe gliding descent from a height. By successive increase in the stiffness and size of the feathers, and corresponding modification and strengthening of the skeleton and muscles, the possibility of incipient but real flight was afforded." Thus far this explanation of primitive bird formation is theoretical, but at this point comes confirmatory evidence in the fossil remains of *Archæopteryx* (*q.v.*)—an actual bird with real feathers and apparently considerable power of flight, that lived at the beginning of Secondary or Mesozoic time. "The faculty of flight, thus acquired, went on improving. The remiges grew stronger and stronger and in proportion as the fore limbs specialized into highly developed wings the tail shortened and was consolidated, the posterior vertebrae becoming united as a pygostyle. Thus originated the higher or better 'Birds of Flight'. This type was established in the Cretaceous *Ichthyornis*, and includes the vast majority of existing birds commonly grouped as *Carniatae* (i.e., with a keeled breastbone—not *Ratitæ*), but these only in later times developed their various higher modifications, which were rendered possible by the saving of material and weight." It is important, however, to bear in mind that all birds did not reach the highest degree of faculty in flight. "Many stopped, as it were, halfway," to continue Newton's summary of Furbinger's conclusions, "when a retrogression of the power already attained took place, or, if the power were reached, it could not be maintained—an easy life and absence of rivalry inducing an increased bulk of the body, until the utmost exertion of muscular strength could no longer sustain it in the air. Thus when this retrograde movement began, occasion was afforded for the dwindling away of the volant power, and hence arose the different types which are commonly grouped as *Ratitæ* (*ostriches*, etc.)."

From recent discoveries it seems probable that the primitive group of reptiles known as *Pseudosuchians* is ancestral to the birds. These show close affinities with the dinosaurs or at least with the *Theiopoda*. For a long time one or the other of the dinosaurs was regarded as close to the avian ancestor, and the resemblance of the pelvis and hind limb in the two groups lent weight to this. Huxley, Marsh, and Cope all favored this view. Others were more strongly impressed by the apparent avian characters to be seen in the skeleton of *Pterodactyls*, and especially in the very close resemblance of the brain. Osborn, while recognizing the affinities to both groups, and especially to the dinosaurs, believed that the birds and the dinosaurs had a common ancestor in the Permian. The *Pseudosuchians* are a group immediately ancestral to the theropodous dinosaurs, antedating the characters which are too specialized in the dinosaurs to be directly in a line with avian descent. The bird pelvis may well have evolved from a type like that of *Ornithosuchus* by the pelvis turning farther back.

Following out this line of theory it would seem that the birds' ancestor was a hopping animal before it flew, and that the metatarsus became early strengthened to support the weight of the body entirely on the hind feet. Such a creature could easily have become arboreal and developed a wing from a four-toed hand.

External Features Though a strictly scientific arrangement might call for the more basal internal structure to be first considered, it suits present purposes better to give first an account of the exterior—the plumage and epidermal appendages so characteristic of birds.

Plumage—Feathers are horny products of the epidermal cells of the skin, but very different from mammalian hairs or reptilian scales. Scales, in the herpetological sense, are pieces of the skin itself, originating as folds of the cuticle, and hairs arise from involution pockets in the skin, whereas feathers are produced from papillae of the cuticle. They grow so as to form a coat over the whole body, called plumage. (For the structure and characteristics of a feather considered alone, see FEATHER, for the peculiarities of their growth in "tracts," see PTERYLOSIS, and for the periodical loss and renewal of plumage, see MOLTING.) The origin of plumage can only be surmised. It may well have been that chance variation which marked the earliest divergence from a reptilian stock toward the bird type. It has been conjectured that the primitive plumage was in the form of down, and the probability of this is shown in the fact that at present infant birds are first clothed with down alone. In a large class of birds mostly of low organization, this down is assumed before the embryo leaves the egg, such are called *Dasypteres*, and as most of them are sufficiently advanced to begin at once to run about and pick up a living without parental help, they are said to be *pre-cocial*, and their parents classed as *Procees*. Among the higher birds, as a rule, however, the young are quite naked when hatched, and are termed *Gymnopes* (or *Psilopes*), and these birds are spoken of as *al-tricial* (*Altrices*), because they must feed and care for the young.

Origin and Service of Plumage—The first and essential service of the feathers is as a coat, protecting the body against cold and atmospheric changes. In the view of Prof. O. C. Marsh, who did more than any one else to collect and reason upon the facts of the origin and development of birds, the acquirement and gradual increase of the feather coat was accompanied by a steadily augmented warmth of blood, and a proportional increase in its activity. The greater activity would result in a more perfect circulation, and this in a steady improvement of general bodily ability and power. If this view be correct, to the acquirement of plumage may be attributed the high degree of development attained in modern birds as a class. The second great service of plumage is its development, on wings and tail, into an instrument of flight. (For the phenomena of flying, see FLIGHT.)

Wings and their Functions—Wings, externally viewed, are formed of large quill or flight feathers (*remiges*), which grow from the posterior margin of the arms and hands in a plane (when outstretched) horizontal with the long axis of the body, they overlap one another at the outer edge so as to slide much beneath one another when the wing is closed, form an aeroplane when distended and quiet, and a series of oars when the bird moves. It is believed that in the development of the wings (Gadow, *Proceedings Zoological Society of London*, 1888, p. 665) and powers of flight in birds, those feathers nearest the body were the first to become serviceable; but now the most important *remiges* are those near the outer margin of the wing. These

form a set (usually 10, but in some groups 9, and in a few cases 11), which spring from the bones of the hand and are called *primaries*, they are long and comparatively narrow, and the shaft is near to the anterior margin. Inside these, springing from the ulna, is a set of lesser and more equally proportioned quills called *secondaries*, or better, *cubitals*, these are variable in number, the humming bird having only 6, while the albatross has 40. The fleshy parts of the wing are covered with rows of feathers called *coverts*, which gradually diminish into the general "scapular" plumage upon and overlying the shoulder. Wing feathers vary in length, strength, and shape, according to the mode of life and power of flight in different birds, and there is consequently great variety among birds in respect to the relative size, shape, and power of the wings themselves. The extreme of length, both absolutely and relatively, is found among the oceanic birds, whose lives may be said to be spent upon the wing. The albatross and the condor have wings two and one-half times the total length of the body, reaching an alar expanse of between 11 and 12 feet in large specimens, and nearly the same proportions hold for other pelagic wanderers, as the tropic birds, while in such birds as swifts and hummers the wing may largely exceed the body length. Such wings belong to birds which range over vast spaces of ocean, or remain poised for long periods in the upper air, as do the vultures and diurnal hawks, or that feed upon flying insects, and so have need of extraordinary sustaining power, endurance, and ability for occasional extreme speed and agility. Such wings are always slender, and sabre-like in outline, when extended, the primaries being usually much longer than the secondaries, narrow and curved, but very strong and far overlapped, those of the diurnal birds of prey are peculiarly narrowed, or "whittled away" on the inner vane toward the tip. From this extreme, wings grade down in shape to the "round" or "shot" type characterizing the terrestrial and arboreal birds generally, or those which seek their food in limited areas of quiet water. Here the wing may be considerably shorter than the body, and its feathers broad, the primaries little, if at all, exceeding the secondaries in length—all broadly and evenly vaned, so that the breadth of the wing approaches its length. Such are adapted to quick starting and short, agile "flitting" flights, rather than to prolonged sustentation or swift darting, yet they do not lack power, for many short-winged birds make journeys of hundreds of miles without resting (see MIGRATION), and others are capable of extremely swift motion, but none of them can soar, as do sea birds and birds of prey, nor equal these in volant grace. All these, moreover, trust for safety rather to hiding than to fleeing from danger.

Degeneration of Wings and Flight Power—There is, then, a close relation between the form of wings and the habits of their owner, so far as these involve flight. Hence it might be expected that birds which for any reason diminished or were prevented the use of their wings would find these gradually reduced in utility. Thus, as a matter of fact, has happened. As has already been intimated, there is every probability that the ratite birds (ostriches, cassowaries, and various forms recently extinct) began to be affected in this feature early in the history of the class, and that their present flightless and

almost wingless condition, now most extreme in the apteryx (qv), is due to degeneration of these organs, following the acquirement of cursorial habits in treeless regions. The same result came about differently in another direction, where the penguins, developing by untoward circumstances of competition in the Antarctic region, and forced to get their food wholly from the sea, have had their wings utterly metamorphosed from flight organs into swimming organs. The related auks of the Arctic regions have continued to find use for their wings and have retained them in fair condition, but these include an example of how this kind of degeneration of an organ may come about in a species whose home is so restricted and peculiar (perhaps in freedom from natural enemies) that little or no call is made for exercise of the wings—such circumstances as might surround a bird or breed of birds on any of many small and nearly barren islands. The great auk or gareful (*Plautus impennis*), although somewhat more free than in the case supposed, seems to have degenerated to its wingless condition in such a way, and another, more pertinent example is the weka (qv) of Tistan d'Acunha, which, otherwise little different from a gallinule, is entirely flightless. Several other instances might be adduced, and the fact that the dodo, dinornis, and other extinct flightless birds were inhabitants of islands strengthens the thesis. See FLIGHTLESS BIRDS.

Secondary Uses of Wings—Wings have other uses than for flight. They seem to have been organs for climbing before they were organs for flying, and immature birds of several sorts (see HOATZIN) still use them in scrambling about branches or through the reeds or over rough ground. They enable many water birds to dive and swim, by motions under water analogous to flying. They form hiding places and shelters for the young. "As a hen gathereth her chickens under her wings" was an expression chosen in Holy Writ to enforce the idea of supreme protection. Spread above the nest, they shield the eggs or tender fledglings from rain and hot sunshine. They serve as weapons also, for many birds strike with them very effectively, as our barnyard turkeys show, and in certain forms, as the jacana, chahua (see SCREAMER), and the spui-winged goose, the outer edge of the wing is furnished with one or more spurs which are highly effective as weapons. As a means of expression of the emotions, especially in the nuptial season, wings are utilized in many ways by these highly emotional animals. They are curiously developed, and are fluttered, elevated or spread, or beaten against the body or upon the air, or clapped together over the back, to make drumming or crackling sounds indicative of excitement, and serving as signals or challenges. In some cases certain parts of the wings are modified, as is the case in the snipe (qv), where some of the outermost primaries are shaped so as to make a distinctively audible noise in flight (when desired) known as bleating, and still more strangely in the case of certain manakins. In color, wings are likely to be plain—at least so far as the quill feathers are concerned. The proudly displayed wing colors of the sun bittorn (see Plate of BUSTARDS) is one of a few exceptions. Ordinarily there are bars of white, and in the case of the ducks a brilliant metallic "speculum," and the linings of wings are often more beautiful than the outside. Fre-

quently, however, there are present other sexual characters, more or less transitory, in the form of elongated plumes, as in the aiguis pheasant, the standard-wing (see Plate of NIGHTJARS), and some of the birds of paradise (qv). These belong to the male alone and may or may not be permanent. Their explanation and history come under the domain of "sexual selection" (see NATURAL SELECTION). Lastly, wings seem to offer the privacy and darkness grateful to tired nature, for a bird desiring to sleep usually "tucks its head under its wing."

The Tail—The tail, like the wings, presents great variety as to form and serves sundry purposes. It may be invisible, as in the apteryx, a downy tuft, as in the dodo, very short, broad and stiff, or very long, flexible and narrow, plain and simple or highly ornate. Like the wings, it is composed of large quill feathers called rectrices, the insertion of which is concealed by under and upper coverts, either of which may sometimes be transformed into highly ornamental plumes. The tail feathers grow in pairs, the reason for which arrangement is shown by Archaeopteryx, where each vertebra of the lizard-like tail supported one on each side. The reduction of this long caudal skeleton to a pygostyle, and the consequent crowding of the feathers upon a short base, seems to have produced the modern fan-shaped tail. "The normal number of rectrices is 6 pairs, but a few birds possess 10 or 11, several 9, 8, or 7, many only 5, and Crotaphaga (ams) only 4—the diminution being brought about by the suppression of the outer pair or pairs." The main purpose of the tail, which is capable of much movement, is to assist the bird to balance, check, and guide itself. There seems, however, to be no relation between the size and shape of the tail and the character of the wings, though its shape is pretty constant within each order. Thus most of the sea birds, waterfowl, waders, and game birds have short, compact, inconspicuous tails, until we come to the pheasants, where they are likely to be exceedingly long and showy. The pigeons and their allies have broad tails, and those of the birds of prey are stout and square. The picarian families are mostly possessed of tails which are long or strikingly colored, as notably in the trogons and some cuckoos, or marked with peculiarities of form, as in the motmots, or are the subject of special ornamentation, as among the humming birds. In the great tribe of Passeres the utmost variety exists, the magnificent lyre bird (see Plate of LYRE BIRD, etc.) coming next to the bob-tailed pittas, and here, among the short-tailed finches, warblers, and thrushes, are found birds capable of such caudal displays as those of the paradise birds, sunbirds, some jays, etc. This shows that the essential service of the tail in flight may be performed by an appendage of almost any shape, and that the conspicuous, flexible, and somewhat unimportant nature of the organ has caused it to be influenced by natural (and especially by sexual) selection in an unusual degree as a means of displaying sexual ornamentation and emotion. This is the explanation of the possession by male pheasants of their magnificent trains, of the gorgeous array spread by the peacock (though here it is really the tail coverts), of the symmetrical beauty of the lyre bird's tail, and of the amazing caudal ornaments of birds of paradise (See Plates of PEACOCKS, LYRE BIRDS, BIRDS OF PARADISE). "The motmot," remarks F. M.

Chapman (see MORRIS, for interesting details), "gesticulates with its tail in a remarkable manner, swinging it from side to side, so that it suggests the pendulum of a clock, or sweeping it about in circles with a movement which reminds one of a bandmaster flourishing his baton. We shall find in other species, also, that the tail, more than any other organ, is used to express emotion. Recall its twitching and wagging how it is nervously spread or 'jetted,' showing the white outer feathers, as in the meadow lark. The tail may be also expressive of disposition. Compare the drooped tail of a pensive flycatcher with the uplifted member of an inquisitive wren."

Crests, Combs, etc.—Crests in very great variety, usually able to be elevated or depressed at the will of the bird, and ornamental plumes or tufts of feathers, such as the aigrettes (see AIGRETTE) of herons, and the "tassels" hanging from the turkey's breast, are developments of the plumage that might properly be discussed here, but the limitations of space compel a reference instead to the biographies of the various birds that exhibit them. The beak and head appendages, such as combs, wattles, carunculated ceres, "helmets," etc., are, however, dermal growths, which require mention, as also will the coverings of the feet.

The Beak.—The beak or bill of a bird is formed of two horny sheaths, overlying bony supports, and forming the mouth and food-getting organ of a bird. It consists of two mandibles, an upper and a lower, into which the foremost bones of the skull are produced, all appearance of lips being lost. It is not furnished with proper teeth, although rudiments of them have been observed in the embryos of some parrots, and the marginal laminae with which the bills of many waterfowl are furnished partake of the same character, being secreted by distinct pulps. The resemblance of these marginal laminae to teeth is particularly marked in the merganser (qv). The bills of birds differ much according to their different habits, and particularly according to the kind of food on which they are destined to live, and the manner in which they are to seek it. In birds of prey the beak is strong, the upper mandible arched or hooked, and very sharp, the edges sharp, often notched, and the whole beak adapted for seizing animals, and tearing and cutting to pieces their flesh. A powerful, short, hooked beak, sharp-edged and notched, indicates the greatest courage and adaptation to preying on living animals. The beak of the vulture is longer and weaker than that of the eagle or falcon. In birds which feed on insects and vegetable substances the hooked form of the beak is less common, though well marked in parrots, those birds which catch insects on the wing, such as the nightjars, swifts, etc., are remarkable for the deep division of the beak, and their consequently wide gape, and an analogous provision to facilitate the taking of prey is to be observed in herons, kingfishers, and other fishing birds, but the object is attained in their case by the elongation of the beak, whereas birds which catch insects on the wing have the beak very short. Birds which feed chiefly on seeds have the beak short and strong, for bruising them, while the beak of insectivorous birds is comparatively slender.

Many aquatic birds have broad, comparatively soft and sensitive bills, with laminae on the inner margin for straining the mud from which

much of their food is to be extracted, other birds, as snipes, avocets, etc., seeking their food also in mud, have slender bills of remarkable sensibility. As the varieties of form roughly distinguished the larger and more obvious of the groups of birds, the bill was made the standard for the early classifications, giving such group names as Dentirosities, Conirostices, etc., no longer of scientific value. The modifications of form are very numerous, and the peculiarities of the bills of toucans, hornbills, spoonbills, crossbills, parrots, humming birds, etc., are very interesting, and intimately connected with habits. Some of the modifications, however, are sexual and transitory, such as the knob on the beak of the white pelican, and the deciduous parts of that of the puffin. At the base of the upper mandible a portion of the beak is covered with a membrane, called the *cere* (Lat. *cera*, wax, from the waxy appearance which it presents in some falcons, etc.), which in many birds is naked, in others is feathered, and frequently is covered with hairs or bristles. The nostrils are situated in the upper mandible, usually in the cere, but in some birds they are comparatively far forward, and in some, as puffins, they are very small and placed so near the edge of the mandible as not to be easily detected. They are more or less open, or covered with membrane, or protected by hairs or feathers. Besides their principal use for seizing and dividing or triturating food, the bills of birds are employed in a variety of functions, as dressing or preening the feathers, constructing nests, etc. They are also the principal instruments used by birds in their combats.

The Feet.—The feet of birds vary considerably, according to their mode of life. In some the claws are strong and hooked, in others short, straight, and weak, in some the toes are all separate, in others more or less connected, in birds especially adapted for swimming they are generally *scabbled* or united by a membrane, in other swimming birds, however, a membrane extends only along the sides of each toe. A large group of birds, including woodpeckers, parrots, etc., have two toes before, opposed by two behind, the foot being thus particularly adapted to grasping irregular surfaces and facilitating climbing. These distinctions were seized upon by the early ornithologists as a means of classification, which gave us such obsolete group names as Scansores, Rasores, etc., which only partly coincide with the more scientific groupings now accepted. In most birds the tibia is feathered to the heel joint, in some, however, and particularly in *waders*, the lower part of it is bare, the shank and toes are generally destitute of feathers, and are covered with scaly skin, and the arrangement of these scales has been much studied. "The most primitive form of the horny covering of the feet," according to Stejneger, "seems to be its division into uniform hexagonal scales, and is called reticulate, the next stage is when some of these scales fuse together, forming what are termed scuta, or scutella, still further specialization is indicated by the tarsal scuta fusing into a continuous covering, which, in its extreme development, embraces both the front and the back of the tarsus, as in some of the higher groups of passerine birds, such a tarsus is said to be 'booted.'" Feet, like beaks, have certain accessory or changeable parts, thus in the grouse family there is a seasonal molting of the sheaths of the claws. The most important appendage, however, is the spur or series of

spurs, which arm the "heels" of certain gallinaceous cock birds, and form serviceable weapons among this class, whose beaks are ill adapted to use as weapons, so that they strike with feet and wings in their combats. The extraordinary development of the legs and feet in ratite birds will be found described under *MOA*, *OSTRICH*, and similar titles.

Oil Gland—The skin of birds has no sudoriferous or sebaceous glands, but on the rump at the base of the tail (on the "pope's nose") is a bilobed gland containing oily matter, which is present in all birds except the Ratitæ, bustards, and a few others. This secretion seems useful only for cleaning the plumage, and the bird squeezes a little out upon its beak before preening its feathers. In the oilbird the secretion is excessive, and that of the hoopoe has a very disagreeable odor.

Internal Structure *Skeleton*—The theory and facts of ancestry related above are enforced by comparative anatomy, which finds in the structure of birds a close resemblance to the internal structure of reptiles. Birds, nevertheless, possess distinctive anatomical features fully entitling them to rank as a separate class. In general form the body is spindle-shaped, tapering forward from the shoulders to the head, with the feathers sloping backward, and again diminishing toward the tail, this is adaptive to progress through the thin media of air and water inhabited by birds, and the weight is thrown forward, securing proper balance for the normally horizontal position. In order to secure this there is a concentration of muscles and other organs in the region below the point of suspension of the wings. Not only are the fleshy portions of the legs mainly confined to the upper portions of these limbs, but the muscles which elevate the wings are actually placed on the under instead of the upper surface of the body.

Though the neck is sometimes much prolonged, the body is very compact and rigid. The backbone consists of vertebrae having (typically) saddle-shaped, articular facets, and many processes and ligaments which lock them firmly together, moreover, the vertebrae of the back generally become ankylosed or firmly united together by cementing bone, the solidity thus acquired being for the support of the ribs, and these also are proportionately stronger than is usual in mammals, each of them is provided in the middle with a flattened bony process, directed obliquely backward to the next rib, so that they support one another, and they often become ossified with the sternum, giving unusual rigidity and strength to the thoracic framework. The hinder part of the spine is consolidated with the pelvis, and the tail, primitively long, has become shortened into a few small movable vertebrae terminating in a short and generally much elevated bone, consisting of ankylosed vertebrae, called the pygostyle, or plowshare bone.

In contrast to the general stiffness of the vertebral column in the trunk, it is remarkable for great flexibility in the neck, enabling a bird to make ready use of its bill, or to bring its head into such positions as suit the adjustment of the centre of gravity in flying, standing, etc., there are also certain peculiar ligamentous bands, by which birds can retain the neck in the customary S-curve without muscular exertion. The first (atlas) and second (axis) vertebrae are modified to form an articulation with the head, which is completed by a single globular condyle

(as in reptiles), forming a sort of pivot, and enabling the head to be turned around with a freedom and to an extent impossible to the mammalia, and the fact that it is formed almost wholly by the basioccipital bone constitutes a fundamental distinction between birds and the reptiles on one side and the mammals on the other.

The Skull—The skull is formed of bones corresponding with those of man, but they can be distinguished only when the bird is very young, soon becoming consolidated together. The brain case "is more arched and spacious, and is larger in proportion to the face, than in any reptalia" except pterodactyls. The jaws are much elongated, so as to form the bill, the outward shape of which, however, formed by the

horny sheath, may be very different from that of its bony supports, in adaptation to habits of use. The upper mandible is formed anteriorly and mainly of the premaxilla, and posteriorly by the paired maxillaries and other bones, varying greatly in relative position and importance, and in many birds movable, so that the upper jaw is capable of a certain amount of up and down motion as on a hinge. These and other elements form a palate, the varying bony arrangement of which has been used with disputed success as a basis for general classification in or-

mythology The lower jaw is formed of several elements now fused solidly together, and it is connected with the skull by the quadriates and other lesser bones and by a series of elastic cartilages permitting extreme movability and large expansion of the gape

Legs—The limbs of birds conform to the vertebrate type, with certain modifications, which are least in the hinder pair They are attached to the "pelvic arch," which in birds consists of some solidified sacral and coxycal vertebrae and the paired pelvic bones (ilium, ischium, and os pubis), which latter meet to form a cup in which rests the head of the femur When one con-

TARSAL ENVELOPES

4 Reticulate-scutellate

siders how far behind the centre of gravity of a bird's body the hip joint is placed, and how it must sustain the whole weight of the body under unfavorable circumstances, as well as provide for the leverage of the muscles of the thigh, the necessity for this consolidation, breadth, and massiveness will be perceived The thigh is short, and concealed within the body, the next division, often mistaken for the thigh, is the leg, strictly so called, or *tibia* and *fibula*, which ends at what is really the ankle joint, although popularly regarded as the knee, and beneath this is the shank, commonly called the *tarsus*, which in some birds is very long, serving as a part not of the foot, but of the leg, and formed by a compound bone, composed of the united metatarsal bones, with the upper end of which four tarsal bones are fused Thus the ankle joint is not between the tarsus and metatarsus, but between two series of tarsal bones The tibia is therefore properly a tibiotarsus, and the so-called tarsus is really a tarsometatarsus The feet are divided into toes, which are four in number, three before and one behind, differing from each other in length and in the number of joints or phalanges of which they are composed, the hallux, which is directed backward, being in general comparatively short, and consisting of two joints only No fifth toe is known, and the hallux (first toe) is absent in the Stuthiones, which have lost also the second, while the fourth is diminished, throwing the work almost alone upon the third, or middle toe

Wings and Shoulder Girdle—The anterior limbs or wings of a bird are the fore limbs of other vertebrates modified for the purposes of flight They are attached to the shoulder girdle or pectoral arch of the skeleton, which in this class is of extraordinary strength and importance It consists of the thoracic case formed by the dorsal vertebrae, the true ribs and the breastbones (sternum), which are connected by ligaments and ossifications All the bones of birds are dense and hard The sternum is remarkably large and strong, serving for the at-

tachment of the muscles which depress the wings It generally exhibits a projecting ridge, or keel, along the middle, which is proportionately largest in birds of most powerful flight or swimming ability, and is wanting only in the flightless birds (see above) This plate ossifies only as the bird matures, being in early life a cartilage, the flexibility of which may easily be felt in young fowls, affording housekeepers a test for alleged "spring" chickens The variations in form of the sternum are of considerable taxonomic significance Outside and attached to this case on each side, at a point as high and forward of the centre of gravity as feasible, is the framework of the shoulder joint, biased against the tremendous leverage of the wings It consists of the scapula, or shoulder blade, a coracoid, and a clavicle, the junction of which forms a cup in which rests the head of the humerus The scapula is a more or less sabre-shaped bone placed above the ribs, and lying parallel to the spine, imbedded in muscles and firmly attached (sometimes fused) at the forward extremity to the head of the coracoid The coracoid is a pillar-like bone which serves as the main support of the shoulder, "for while at one extremity it sustains the wing, at the opposite end it is firmly united to the front of the sternum A third brace is afforded by the combined clavicles, which curve downward and backward from the shoulder joint, imbedded in muscles, and unite under the neck, and just in advance of the sternum, to form the furculum (fork), which we know as the "wishbone," and the English call "merrythought." See FOLKLORE

The wing bones are homologous with those of the arm in other vertebrates, but have become modified in both form and relative position to adapt them to the requirements of flight "The fore limb of a bird, when in a state of rest," says Huxley, "exhibits a great change of position if it be compared with that of an ordinary reptile, and the change is of a character similar to, but in some respects greater than, that which the arm of a man presents, when compared with the fore limb of a quadruped mammal The humerus lies parallel with the axis of the body, its proper ventral surface looking outward The forearm is in a position midway between pronation and supination, and the manus is bent back upon the ulnar side of the forearm, in a position not of flexion, but of adduction"

The humerus is usually short as compared with the radius and ulna (the latter is more curved and stouter than the former) which together form the forearm and main stretch of the visible wing, these remain separate, and at their outer extremities articulate with the two small bones of the wrist (carpus) which alone remain free The other, distal, carpal bones, "fuse in the embryo with the proximal end of the three first metacarpals, and all trace of their originally separate existence disappears" The metacarpus consists of three bones (I, II, III), which are more or less flattened and fused The first bears the pollex or "thumb" (whence springs, in some birds, the bastard wing or alula), and the second the index finger, which is long, straight, and has two, or sometimes three, phalanges These bones complete the wing, except that a few species have a rudimentary third finger Archaeopteryx, however, had three well-developed fingers, all armed with claws, and in embryo ostriches a claw sometimes appears on the third

finger. Such is the bony framework of the wings, operated by muscles of immense power (the pectoral muscles are said to make about one-fourteenth of the weight of the whole body in birds of prey, and one-eleventh in a wild goose), but their usefulness depends upon the external furniture of feathers, heretofore described, which forms the expanse necessary for buoyancy and flight (see following paragraph).

Muscular System. The muscles of birds conform, in general, with the vertebrate type, though the homologies, especially about the fore limbs, are sometimes obscure. For these homologies Newton's review in Bronn's *Thier-Reich* (Vogel, pp. 9-325) is complete, and is epitomized in the former's *Dictionary of Birds*, pp. 602-620. Specified arrangements of muscles and tendons, especially the plantar tendons, have been much experimented with as a basis of classification, but the results have not proved of great value when taken alone. Only a few general considerations need be presented here. The muscular system of birds is characterized by an extraordinary strength in those parts concerned with activity and endurance and has certain interesting automatic functions. Thus the vast pectoral muscles attached by a broad fleshy base to the sternum and narrowing to a complicated tendinous attachment to the wing bones, are mainly two, forming the thick whitish "breast" of edible fowls, they depress the wing—the effective movement in flight. An elastic band in front of the wing passes from the head of the humerus to the carpal joint, when the wing is extended, it is stretched about three times its ordinary length, and its natural contraction enables the bird to keep the wing closed without effort. As it lies just beneath the skin, it is easily cut, and as such a severance prevents the wing from being firmly extended, it offers the best method of rendering captive birds incapable of flight, to disable one wing is quite enough. See **MUSCULAR SYSTEM, EVOLUTION OF**.

"In the hind limb of most birds there is a singular extensor muscle, which arises from the pubis, ends in a tendon which passes to the outer side of the knee joint, and terminates in the leg by uniting with the flexor digitorum perforatus. The result of this arrangement is, that the toes are flexed whenever the leg is bent upon the thigh, and, consequently, the roosting bird is held fast upon his perch by the weight of his own body" (Huxley, *Anatomy of Vertebrated Animals*, New York, 1878).

Visceral System. The digestive apparatus of birds resembles that of mammals, exhibiting, however, various modifications, according to the different kinds of food—some birds feeding on flesh, others on fish, others exclusively on insects, others on seeds, others more indiscriminately on a variety of animal and vegetable substances. Few birds masticate their food in any degree, upon being swallowed, it enters the crop or *gizzard*, an enlargement of the oesophagus situated just before the breastbone, where it is moistened by saliva and partly digested, so that its contents, easily regurgitated, form a suitable food for nestlings in some families, as, notably, the pigeons. The crop is wanting in the ostrich, and also generally in birds that feed on fish, and is of greatest size in those of which the food consists of seeds or grain. It is generally single, and on one side of the gullet, sometimes, as in pigeons, it is double. A second dilatation of the oesophagus, called the *proventriculus*, is gen-

erally largest in those birds in which the crop is wanting or small, and in this the food is further softened and chemically treated. The third and principal stomach is the *gizzard* (*gizzard*), which in birds of prey, fish-eating birds, etc., is a mere membranous sac, but in birds which feed on grain or seeds is very thick and muscular, so that it acts as a sort of mill and with extraordinary power. In these birds, also, the grinding down of the contents of the gizzard is assisted by the small rough pebbles or grains of sand constantly swallowed, as is well exemplified in domestic fowls. The liver and pancreas are usually large, as also are the kidneys, but there is no urinary bladder, and the urine, which contains very little water, is at once poured into the cloaca, an enlargement of the terminal portion of the intestine. The intestine varies greatly in capacity and length, being "short" in all purely frugivorous and insectivorous birds, and "long" in those which live upon fishes, carrion, grain, and grass, its walls differ in structure from the mammalian and agree with the reptilian type. The diaphragm is incomplete and differently arranged from that of mammals. See **ALIMENTARY SYSTEM, EVOLUTION OF**.

Food.—The amount of food required to sustain the high temperature and great bodily activity of birds is excessive, when compared with that required by other animals of proportionate size, and young, growing birds tax the food-getting abilities of their parents to the utmost. Many facts might be quoted in support of this, such as that of Aughey's confined plovers, which ate an average of 200 locusts and similar large insects each day, fledglings habitually consume more than their own weight of food between sunrise and sunset—sometimes twice as much. Adult birds eat almost continuously, and digestion is extremely rapid, the process being completed in from one to two hours in small birds. This ability for enormous consumption makes the birds of vast value to man in the reduction of insect pests, it also limits the time birds may fast, so that, unless they can fly with very great rapidity, long journeys cannot be undertaken, and the fact that most birds are able to make great speed is probably an achievement of natural selection related to this very characteristic. On the other hand, birds show considerable ability to adopt a new diet and adapt themselves to it healthfully. The writings of Dr. F. E. L. Beal, Prof. S. A. Forbes, and others, published in the documents of the United States Department of Agriculture, and by the governments of Illinois and other States, contain much information on this subject.

Respiration in Birds is rapid and copious, and the pulmonary system includes not only a pair of rather large lungs, but a system of "air sacs" by which air is distributed throughout the body. These air sacs are of two kinds. One consists of membranous expansions of the lungs, which lie among the tissues in the form of inflatable bags controlled by muscles, so that they can be emptied and filled at the will of the bird, they occur in all parts of the body and penetrate beneath the skin and inside many bones, but in varying amount. It is popularly believed that all bird bones are hollow, but this is far from true. "Generally, the skeleton is most pneumatic in large birds that fly well, like vultures, storks, swans, and pelicans, less so in small birds, and least in heavy or little-flying water birds. However, there are many excep-

tions While, for instance, most of the bones of many Passeres, of swifts, divers, rails, the kiwi, and of terns, are solid, and air cells are restricted chiefly to the cranium, many parts of the skeleton of the large *Ratites* are very pneumatic. The greatest development of pneumatic cells exists in the screamers and hornbills, in which even the fingers and toes, in fact, any part of the skeleton, are hollow. It is well known that a bird which has its humerus shattered by shot can for some time breathe, although its beak and nostrils be tightly closed, and thus be submitted to unnecessary, excruciating pain. Compression of the thorax and abdomen suffocates a wounded bird better than strangulation." See **RESPIRATORY SYSTEM, EVOLUTION OF, ANIMAL HEAT**

The functions of these air sacs are not very evident. They serve to ventilate the rather incontractile lungs, and from them issues the air which inflates the "drums" in the neck of the prairie chicken, the gular pouches of the adjutant stork, the "horn" of the bellbird (*qv*), and that extraordinary swelling of the throat which marks excitement in the pectoral sandpiper (see Colored Plate of **SOUND BIRDS**). These inflations are characteristics of male birds only and appear only in the spring. The air sacs also assist in furnishing a continuous current of air enabling some singing birds to maintain a long strain of melody, such as the nightingales.

Arterial Circulation.—Conformably with this copious aeration, and the habits of activity, the circulation of the blood in birds is rapid, the heart beating 120 times a minute at rest, and nearly doubling this rate at the first stroke of the wings, and its temperature (from 100° to 112° F.) is considerably higher than in mammals. The heart resembles that of the mammalia in its form and structure, but the right ventricle, instead of a mere membranous valve, is furnished with a strong muscle to impel the blood with greater force into the lungs, and the carotid arteries are peculiar. During incubation there is a congestion of blood in the enormously dilated vessels of the abdominal wall, forming the

"brood organ." The red corpuscles are, on the average, twice as large as those of man, and elongated, as in reptiles, rather than round, as in most mammals. See **CIRCULATORY SYSTEM, EVOLUTION OF**

Reproductive System.—Birds are distinctly male and female, cock and hen. The females possess a pair of ovaries (of which only the left one is functional as a rule) situated in the "small of the back" at the front end of the kidney. The ovary consists of a grape-like cluster of germinal eggs, which during the breeding season exhibit all stages of size and ripeness, but in winter are reabsorbed, so that the determination of sex by dissection at that season is difficult. The ripe egg passes down tubular passages (oviducts) in which it receives, in certain "uterine" expansions, its coverings of albumen and shell, to the right side of the rectum, and thence is voided in a more or less advanced state of development, which is completed by incubation or its equivalent. The testes of the male are a pair of glands, situated as are the ovaries, from which the spermatic ducts lead to the cloaca. (See **Egg and EMBRYOLOGY**). All birds lay eggs, some only one, others as many as 20, the number seeming to depend upon the average chances of reaching sexual maturity possessed by each species. With rare exceptions, these eggs are cared for by the parents, and all birds of higher organization prepare receptacles (nests) for them, and furnish by brooding the continuous warmth necessary to their hatching—a process which requires from two to six weeks according to size and other factors. This necessity has developed a body of instincts, habits, and mental and structural characteristics, which include the most striking, significant, and interesting facts of bird life and history. See **NIDIFICATION**

Nervous System. The nervous system of birds is highly developed, but presents few salient differences from the vertebrate type. There is a perceptible improvement of the brain over that of reptiles, more especially in the increased proportional development of the cerebral hemispheres, but the surface convolutions and other

ANATOMY OF BIRDS

- 1 Limbs, as related to the general skeleton. *Scap*, scapula, *hu*, humerus, *cor*, coracoid, *r*, radius, *ca*, carpus, *di*, distals, *met*, metacarpus, *st*, sternum, *kl*, keel of sternum, *ul*, ulna, *py*, pyrostyle, *fa*, femur, *fi*, fibula, *t*, tibiotarsus, *tm*, tarsometatarsus.

- 7 Viscera (of a duck). *T*, trachea, ending below in syrinx (see Fig. 14). *H*, heart, *p*, portion of anterior wall of the body cavity, *Co*, *thg*, coraco-thoracic ligament, *P*, axillary sac (lying between the coracoid, scapula, and the anterior ribs, and communicating with the sub-bronchial air sacs), *S*, sub-clavicular muscle, *Lg*, lung, *Cor*, coracoid, *Pa*, pectoral artery, *Pa*, pectoral vein, *Pul*, pulmonary artery, ***, point of entrance of bronchi into lungs, *S*, *S*, partition walls between the anterior intermediate air sacs, *St*, *St*, partition walls between anterior and posterior intermediate air sacs, *Ant*, anterior intermediate air sacs, *Post*, posterior intermediate air sacs, *Fos*, fibrous oblique septum, *P*, pectoralis major, *F*, furcula, *Stg*, suspensory

- falciform ligament, *rcl*, right coronary ligament of the liver, *lcl*, left coronary ligament of the liver, *rAdd*, right abdominal posterior air sac, *lAdd*, left ditto, *Co*, oesophagus, *Aa*, innominate artery, and *Va*, innominate vein, with their branches.
- 8 Convoluted windpipe (of an ibis). *W*, windpipe (trachea), *Fu*, furculum, *Cor*, coracoid, *rb*, right bronchus, *lb*, left bronchus, *St*, sternum.
- 9 Alimentary canal (of a fowl). *a*, oesophagus, *sm*, crop, *pr*, proventriculus, *gt*, gizzard, *d*, duodenum, *sm*, lower part of small intestine, *in*, intestinal caeca, *r*, rectum, *cl*, cloaca, *l*, liver, *bl*, gall bladder, *p*, pancreas, *u*, ureters, *ov*, left ovary (the right ovary is rudimentary).
- 10 Muscles of the wing (of a goose). *B*, biceps, *Elast*, *Sec*, vinculum elasticum, *Exp*, *sec*, expander secundarium, *Lig*, ligament, *Mpt*, metapatagium, *Peet*, pectoral muscle ("breast"), *Prop*, propatagium, *Pl*, *lp*, and *Pl* *br*, long and short propatagials, *Tr*, troiceps.
- 11 Muscles of the leg. *Glut* 2, glutens maximus, *Glut* 3, glutens medius, *Glut* 4, glutens minimus, *Glut* *ant*, glutens anterior, *Vast*, vastus externus and vastus internus, *Obt*, obturator internus, *Crureus*, *crureus*, *Semim*, *semimembranosus*, *Femo*, *caud*, femorocaudal, *Biceps*, biceps femoris, *Ambiens*, ambiens, *Long* *halls*, longus hallucis.
- 12 Structure of the inner ear. *Q*, quadrate bone, *Pter*, right pterygoid, *F*, *for*, foramen magnum, *Ca*, occipital condyle, *L*, lagena, *Co*, columella auris, *H*, horizontal semicircular canal, *S*, sagittal semicircular canal.
- 13 Section across the nasal channel of a bird's beak.
- 14 Typical form of a bronchial syrinx in *Passerina* *irrus*, *a*, front view, *b*, side view, showing position of external tympanic membranes, *cl*, tracheo-clavicular muscles.
- 15 Plantar tendons (*Passerina* type). *fp*, flexor peronaeus, dividing to 2d, 3d, and 4th toes, *fh*, flexor hallucis.

[illegible]

features that play so important a part in the brains of the higher mammals are absent or merely indicated. In this, and in the way the cerebral nerves originate, the brain remains nearly reptilian. The sympathetic system is

them, apart from the guidance of touch and smell. Odors affect birds also, but to a less degree probably than is frequent among even reptiles, not to say mammals, and it is probable that even the carrion-eating species depend little upon their sense of smell in guiding them even to odoriferous food. Birds owe less to the sense of touch than many other creatures, for they have few tactile organs, the bristles about their beaks having other purposes, mainly. The bills of some mud-hunting species, however, are specialized in this direction (see DUCK and SNIFE). In respect to hearing, birds are well endowed, having the internal apparatus of the ear (see EAR) highly perfected, and exposed to the vibrations of the air through a cartilaginous meatus with a fairly wide opening. One function of the ears of birds, as well as of other creatures, seems to be to inform the animal as to its relations with space, balance, direction, etc. Whether or not this is to be regarded as a sense, is undecided. There is no external ear, the nearest approach being in the nocturnal owls (where the organ presents other peculiarities, see OWL), though the so-called "ears" of some of those birds are merely tufts of feathers which have nothing to do with audition. Moreover, this faculty in birds extends beyond mere quick perception of sounds to "the power of distinguishing or understanding" pitch, notes, and melodies, or music, and it has been an important factor in the development of bird singing.

The vocal performances of birds are one of

BRAIN OF A PIGEON

highly developed, as would be expected in creatures of such activity and sensitiveness. See NERVOUS SYSTEM, EVOLUTION OF.

The Senses of Birds, as a whole, equal those of most mammals and in some directions are superior to those of other animals. Taste is, perhaps, feeblest, the horny nature of the jaws and the character of the food not favoring the development of this sense in birds, yet a certain amount of discrimination is undoubtedly exercised by

TOPOGRAPHY OF A BIRD

A General plumage 1, forehead (frons) 2, lore, 3, crest, 4, crown (vertex), 5, eye, 6, hind head (occiput), 7, nape (nucha), 8, hind neck (cervix), 9, interscapular region, 10, back proper (dorsum), including 11, 11, rump (uropygium), 12, lesser tail coverts, 13, tail, 14, under tail coverts (crissum), 15, leg (see C), 16, abdomen, 17, side of body, 18, breast (pectus), 19, primaries, 20, secondaries or cubitals, 21, tertaries or greater coverts, 22, coverts, 23, alula, or bastard wing, 24, throat, the lower half of which is called "jugulum", 25, ear coverts (auriculars), 26, cheek,

or malar region, 27, chin (mentum), 28, beak (see B), 29, nostril.

B Parts of the beak and face 1, culmen (ridge of upper mandible), 2, apex, tip, or hook, 3, tooth on cutting edge of upper mandible, 4, junction (gonys) of ramus of lower mandible, 5, cere, 6, nostril, 7, left lore, 8, corner of mouth (commissure), 9, chin (mentum).

C Parts of the leg 1, thigh (femotarsus), 2, tarsus (metatarsus), 3, first or hind toe (hallux), 4, second or inner toe, 5, third or middle toe, 6, fourth or outer toe.

their foremost and most pleasing characteristics, yet of only a few, in the most highly organized classes, can it be said that they sing. Even in the order called "singers" (Oscines) many make little melody, though, like the crow, they may utter a long list of significant notes—a real language, which is developed among birds generally to a degree realized by few. The vocal mechanism of this class is not in the larynx, but at the lower or pectoral end of the windpipe, in an organ called the syrinx, which consists of several stretched and vibratory membranes, tracheal rings, and controlling muscles. This complicated organ, peculiar to birds, presents almost unlimited modifications, and is quite unlike the arrangement of laryngeal vocal cords in mammals, for the tongue has nothing to do with a bird's speech or music. (See Plate, Figs 7, 8, 14.) Further consideration of the singing of birds leads into the domain of their evolution.

The Eyes of Birds are large, clear, highly perfected in structure, and in many species en-

ocean straight towards small islands or restricted areas of coasts as some birds habitually do in their migrations. See MIGRATION OF ANIMALS.

General Considerations Many aspects of bird life properly belonging to a treatise more extended than this need only be indicated here, because they are elsewhere discussed with reasonable fullness. Thus their classification is outlined under ORNITHOLOGY. The distribution of birds on the globe, where, in spite of their powers of flight, most groups and species are strictly bounded in their range, is sketched under DISTRIBUTION OF ANIMALS. The seasonal movements that characterize most birds outside the tropics, leading them to make more or less extended journeys, along the customary routes, northward in the spring and southward again in the fall, will be found explained under MIGRATION OF ANIMALS. The singing of birds, which forms so conspicuous and enjoyable a feature of their life, is treated elsewhere in this article, and their nest architecture, eggs, care of young, and domestic traits are treated under NIDIFICATION, Egg, etc., while their peculiar colors, ornaments, weapons, economic value, and habits in general, are portrayed in the biographies to be looked for under the names of various species and groups, and in such articles as AGRICULTURE, EVOLUTION, FALCONRY, FOWL, and the like. Birds have also taken a part in the history of mankind's mental and religious development, as appears in the articles AUGURIES AND AUSPICES, FOLKLORE. Finally, many species have been exterminated, directly or indirectly, since mankind came upon the earth, an account of which will be found under EXTINCT ANIMALS.

Bibliography *General Works*—Newton, *A Dictionary of Birds* (London, 1896), Knowlton and Ridgway, *Birds of the World* (New York, 1909), Beebe, *The Bird* (New York, 1906), Pycraft, *A History of Birds* (London, 1910), Beddard, *Structure and Classification of Birds* (London, 1898), Sharpe, *Review of Recent Attempts to Classify Birds* (Budapest, 1891), Evans, *Cambridge Natural History*, vol. ix, "Birds" (Cambridge, 1900), Stejneger, *Standard Natural History*, vol. iv, "Birds" (Boston, 1885), Sharpe, *Royal Natural History*, vols. iii, iv, "Birds" (London, 1898), Huxley, "On the Classification of Birds," in *Proc Zool Soc of London* (London, 1867, and ib, 1868, pp 294-319), Nitsch and Burmeister, *System der Pterylographie* (Halle, 1840), translated into English by Dallas, and published by the Royal Society (London, 1867), as *Pterylography*, Furbringer, *Untersuchungen zur Morphologie und Systematik der Vogel* (Amsterdam, 1888). *Extinct Birds*—Dixon, *Lost and Vanishing Birds* (London, 1898), Hornaday, *Our Vanishing Wild Life* (New York, 1913).

Faunal Works, North America—Wilson, *American Ornithology* (Philadelphia, 1810-14), several more recent editions, of which a good one is Brewer's (Boston, 1853, reprinted, New York, 1853), and the finest is that issued by Porter & Coates (Philadelphia, 1871), Audubon, *Birds of America* (London, 1827-38), Swanson and Richardson, *Fauna Boréal Americana*, part ii, "Birds" (London, 1831), Audubon, *Ornithological Biography* (Edinburgh, 1831-39), Nuttall, *Manual of the Ornithology of the United States and Canada* (Boston, 1832-34), DeKay, *Zoology of New York*, part ii, "Birds" (Albany, 1844), Baird, *Pacific Railroad Reports*, vol. ix (Washington, 1858), reprinted with an

STRUCTURE OF THE EYE

Horizontal section. A ch, anterior chamber, Pch, posterior chamber, C, cornea, Ch, choroid, Co, conjunctiva, Cm, Crampton's muscle, L, lens, P, pupil, No, optic nerve, R, retina, Sc, sclerotic coat, with imbedded osseous ring.

dowed with a power of vision which is beyond anything known elsewhere. The way in which vultures descend upon carrion from a height where they are invisible to us, or sea birds swoop down upon fishes, or flycatchers dart long distances upon insects so small we can barely perceive them at close range, are examples of their sharp-sightedness, with which is combined remarkable ability in rapidly changing the focus, as must be necessary to a bird darting swiftly upon prey it must keep constantly in view. Both eyelids are movable, but the lower is much more so than the upper, and in addition to these a third, called the nictitating membrane, is frequently drawn over the eyeball to clean and lubricate it, or shield it from a glare. The owls and other nocturnal birds have great power of contractility not only of the pupil, but of the whole eye. See EYE.

A "Sense" of Direction—The so-called "sixth sense" of orientation or direction, i.e., the power of instinctively knowing and maintaining a course of flight through the air independent of guidance of landmarks, is manifested by birds in a most surprising way, for no other explanation (little as we understand it) seems to account for their ability to cross vast spaces of

atlas of 100 plates by Baird and Cassin as *Birds of North America* (Philadelphia, 1860), Baird, Brewer and Ridgway, *History of North American Birds*, "Land Birds" (Boston, 1875), *Water Birds* (Cambridge, 1878), Chapman, *Bird Life* (New York, 1898, ed in colors), Coues, *Key to North American Birds* (Boston, 3d ed, 1887), Ridgway, *Manual of North American Birds* (Philadelphia, 1887), Chapman, *Handbook of Birds of Eastern North America* (New York, 1895) (the three last named are technically descriptive only), Coues, *Birds of the Northwest* (Washington, 1874), Coues, *Birds of the Colorado Valley* (Washington, 1878, contains an extensive bibliography from 1612 to 1878), Cooper, *Ornithology of California* (San Francisco, 1870), Nelson, *Natural History Collections in Alaska* (Washington, 1887), Turner, *Contributions to the Natural History of Alaska* (Washington, 1886), Warren, *Birds of Pennsylvania* (Harrisburg, 1890), Dawson, *Birds of Washington* (Seattle, 1909), and many popular illustrated works. The most complete list is *Check-List of North American Birds* (New York, 1910), published by the American Ornithologists' Union. Its official organ is *The Auk*, a quarterly. The most recent and monumental descriptive work is Ridgway's *Birds of North and Middle America*.

Europe—Temminck, *Manuel d'ornithologie* (Paris, 1815 and 1820), Brehm, *Naturgeschichte der Vogel Deutschlands, etc* (Ilmenau, 1831), Gould, *Birds of Europe* (London, 1832-37), Naumann, *Naturgeschichte der Vogel Deutschlands*, new ed by Blasius (Leipzig, 1890), Fritsch, *Die Vogel der Palaearktischen Fauna* (Berlin, 1871), Dresser, *Birds of Europe* (8 vols quarto, London, 1879), "unquestionably the most complete work of its kind, both for fullness of information and beauty of illustration", Hartert, *Die Vogel der Palaarktischen Fauna* (Berlin, 1903-14). For British birds in elaborately illustrated works, see Zarell, *History of British Birds* (London, 1858), Howard, *The British Birds* (last ed by Saunders, London, 1885), McGillivray, *History of British Birds* (London, 1837-40), Bree, *History of Birds of Europe* (London, 1875-76), Morris, *History of British Birds* (London, 1858), Howard, *The British Warblers* (London, 1907-12), Seebohm, *History of British Birds and their Eggs* (London, 1853-85); for a more condensed history, see Montagu, *Ornithological Dictionary*, Newman's ed (London, 1883). The leading ornithological journals are *The Ibis* (London) and *Journal für Ornithologie* (Berlin).

Asia, Japan, and Oceania—Pallas, *Zoographica Russo-Asiatica* (St Petersburg, 1811), Gould, *Birds of Asia*, completed by Sharpe (London, 1883), David and Oustalet, *Les oiseaux de la Chine* (Paris, 1877), Taczanowsky, "Faune Ornithologique de la Sibirie Orientale," in *Mémoires Acad. de Sciences* (St Petersburg, 1891), Blanford, *Zoology of Persia* (London, 1876), Seebohm, *Birds of Asia* (London, 1901), Jerdon, *Birds of India* (Calcutta, 1862), Blanford, *Fauna of British India Birds* (London, 1893), Blythe, *Mammals and Birds of Burma* (London, 1875), Oates, *Birds of British Burmah* (London, 1883), Stewart-Baker, *Indian Ducks* (1908) and *Indian Pigeons and Doves* (London and Bombay, 1913), Dewar, *Glances of Indian Birds* (London, 1913), Legge, *Birds of Ceylon* (London, 1880), Hume, *Nests and Eggs of Indian Birds* (Oates's ed, London, 1890), Blakiston

and Preyer, *Birds of Japan* (London, 1882), Seebohm, *Birds of the Japanese Empire* (London, 1890), Gould, *Birds of Australia* (London, 1848, supplements, 1869)—magnificent folios of colored plates, Gould, *Handbook to the Birds of Australia* (London, 1865)—reprint, with additions, of the text of the foregoing, Campbell, *Nests and Eggs of Australian Birds* (Sheffield, 1900), Matthew, *The Birds of Australia* (London, first volume published 1911), *The Emu* is the ornithological journal of Australia, Buller, *Birds of New Zealand* (London, 1888), Wallace, *Malay Archipelago* (New York, 1860), Gould, *Birds of New Guinea*, completed by Sharpe (London, 1881), Hartlaub and Finsch, *Beitrag zur Fauna Centralpolynesiens* (Halle, 1867), Salvadori, *Ornatologia della Papuasia e delle Molucche* (Turin, 1882, enlarged, 1891), Wilson and Evans, *Birds of the Sandwich Islands* (London, 1884). The most important journal, partly ornithological, is *Journal of the Bombay Natural History Society*.

For the Philippines, see Von Martens, *Journal für Ornithologie* (Leipzig, 1866), Lord de Walden, *Trans Zool Soc London* (London, 1844), *Proc Zool Soc London* (London, 1878 and 1879, many articles), Wardlaw-Ramsay, *Ibis* (London, 1884 and 1886), Blasius, *Trans Linnæan Soc of London*, and *Ibis* (London, 1884-88), and *Proc Zool Soc London*, 1888, and subsequently).

Africa—Layard, *Birds of South Africa* (2d ed, London, 1884), Anderson, *Notes on the Birds of Damara-land* (London, 1872), Henglin, *Ornithologie Nordostafrikas* (Cassel, 1875), Finsch and Hartlaub, *Vogel Ostafrikas* (Leipzig, 1870), Hartlaub, *System der Ornithologie West Africae* (Bremen, 1857), Shelley, *Handbook to the Birds of Egypt* (London, 1872), Tristram, *Fauna and Flora of Palestine* (London, 1884), Milne-Edwards and Granddier, *Hist nat des oiseaux de Madagascar* (Paris, 1884), Stark and Selater, *Fauna of South Africa, Birds, v-v* (London, 1900-06), Shelley, *Birds of Africa* (London, 1896-1913), Horsburgh, *Game-Birds and Water-Fowl of South Africa* (London, 1912).

South and Central America—Azara, *Hist nat de los pájaros del Paraguay y Río de la Plata* (Madrid, 1805), Belt, *A Naturalist in Nicaragua* (London, 1888), Bates, *The Naturalist on the Amazon* (London, 1863), Selater and Salvin, *Biologia Centrali Americana, "Birds"* (London, 1880), Cory, *Birds of the West Indies* (Boston, 1889), Darwin, *A Naturalist's Voyage* (London, 1860), Selater and Hudson, *Argentine Ornithology* (London, 1889), Brabourne and Chubb, *The Birds of South America* (London, first volume published 1912). Consult also *Proceedings of the United States National Museum*, and those of the Zoological Society of London, since 1870.

BIRD, FOSSIL Fossil remains that could be referred to birds were among the later acquisitions of paleontologists. The first were mistakenly so considered and consisted of the famous "bird tracks" discovered in the "brown-stone" rocks of the Connecticut River by Hitchcock, about 1835, and extensively studied by him. These footprints may possibly, in a few instances, be traces of primitive animals properly called birds, but so far as known all are impressions made upon mud by dinosaurs and similar amphibians or reptiles of the Triassic Age (See DINOSAURIA, STEGOCERATIA, etc.) More recently true birds have been found fossil from the Jurassic Age onward, but their remains are everywhere comparatively scarce, due mainly to the

easy destructibility of their bodies. The earliest to be identified proved to be also the earliest in time, and consisted of the remains in the Jurassic slates of Bavaria of archæopteryx, whose characteristics are fully described under ARCHÆOPTERYX. This seems to have been a true feather-clothed bird, with well-formed wings, but a long lizard-like tail, beset on each side with a row of horizontal quill feathers, and a heron-like beak studded with teeth. These characteristics are so radically different from those of all other birds that the archæopteryx is classified in a subclass of itself termed Archæornithes, all other birds, fossil and recent, forming another subclass, Neornithes or Euornithes. A long gap in geological time separates the period of the archæopteryx from the next earliest fossil birds known, which belong to the upper, or more recent, part of the Cretaceous Age. These formations in Europe and India, but especially in the western United States, have yielded varied remains of large birds, which, because all have teeth in the beak, have been called Odontornithes or Odontoptes. All are still of a low type of organization, showing many points of genetic affinity with reptiles, but far advanced beyond archæopteryx, and all were aquatic and fish-eating. They approximate, indeed, so closely to the ordinary carinate birds of the present time that they are included with them in a single subclass, as above noted, of which, say Parker and Haswell, "they will constitute a separate series characterized by the possession of teeth and that the two halves of the lower jaw remain completely separate in front, instead of having a solid bony union. Of these toothed birds the one type is known as *Ichthyornis*, and comprises somewhat gull-like birds characterized by having a numerous series of teeth implanted in distinct sockets, and also by the vertebrae or joints of the back articulating with one another by means of cup-like surfaces (instead of saddle-shaped)."

It is quite within the bounds of possibility that these birds may be ancestral types of the modern gulls. With *Hesperornis* (q v) we are confronted with a totally different type, in which the teeth were implanted in an open groove, while the wings were rudimentary and the keel of the breastbone was wanting, although the vertebrae resembled those of existing birds. In general organization, *Hesperornis*, indeed, approximated very closely to the modern divers.

That it was thoroughly aquatic in its habits is self-evident, while it may be regarded as a specialized and flightless offshoot from the ancestral stock of the modern divers. The discovery and elucidation of these Cretaceous toothed birds was made chiefly by Prof. O. C. Marsh, of Yale University, between 1870 and 1880, and his novelties included a large number of skeletons or fragments which have been referred to various genera and are preserved in the Yale Museum at New Haven. "They afford a most valuable contribution in favor of the doctrine of evolution, approximating more and more, as we descend in the geological scale, to reptiles, from which it may be confidently stated the avian class has originated."

With the closing of the Cretaceous Period toothed birds seem to have disappeared, for bird fossils from the early formation of Tertiary Age lack them, and in general approach closely to modern types. Few of these fossils have been found in North America, but Europe and South America have supplied many genera and species

of various groups, increasing in numbers as we rise in the geologic scale. Among the oldest (Eocene) were certain gigantic forms, characterized by long, powerful legs and small and apparently useless wings, but especially by "the enormous and ponderous structure of the skull, which is quite unlike that of any recent bird, and seems out of all proportion to the limbs, gigantic as are some of the leg bones." These have been combined into a group (*Stecorornithes*) including many species, chiefly of the genera *Brontornis* and *Phororhacos*, from the Miocene of Patagonia. "*Brontornis*, for example," according to Lucas, "had leg bones larger than those of an ox, while the great *Phororhacos*, one of his contemporaries, was not only nearly as large, but quite unique in build. Imagine a bird seven or eight feet in height, from the sole of his big, sharp-clawed feet to the top of his huge head, poise this head on a neck as thick as that of a horse, arm it with a beak as sharp as an ice pick and almost as formidable, and you have a fair idea of this feathered giant of the ancient pampas." The skull equaled in size that of a large horse, but whether this great equipment was used for carnivorous purposes can only be conjectured. The general affinity of these huge birds seems to be with the herons, and with them have been classed *Gastornis* and certain other large forms of contemporary time in Europe and North America, whose habits are supposed to be those of cursorial birds of prey. Other birds of the early Tertiary Age represented the *Steganopodes* (q v), or were similar to gulls, penguins, cranes, kingfishers, game birds, and many other modern types. The rocks and caves of the Paris basin and of central France and the Eocene beds of Wyoming have been particularly fruitful in ornitholites. The Miocene and Pliocene eras furnish still more fossil forms, among which a large number of genera still exist, showing how early birds arrived at the perfection of their form and adaptation. Lydekker tells us that by far the greater portion of the remains of birds from the still higher Pleistocene rocks seem to be generically if not specifically identical with those now inhabiting the district in which they occur, though their range at that time may have been different from its present extent. To this period, immediately precedent to that in which we live, belong such recently existing races as the moa, epornis, dinornis, etc., but they are treated elsewhere.

Consult Newton, *Dictionary of Birds* (London, 1893-96), *Ossesania fossiles de la Franco* (Paris, 1867-71), Marsh, *Odontornithes* as *Monograph of the Extinct Toothed Birds of North America* (Washington, 1880), Lucas, *Animals of the Past* (New York, 1901), Case, "The Development and Zoological Relations of the Vertebrates Aves-Mammalia," in *The Journal of Geology* (Chicago, 1898), *Journal of Geology*, vol. xxi (Chicago, 1913), Shufeldt, "Review of Fossil Fauna of the Desert Region," *Bulletin of the American Museum of Natural History*, vol. xxxv (New York, 1913). See also, for further references and particulars, BIRD, EXTINCT ANIMALS, ARCHÆOPTERYX, HESPERORNIS, MOA.

BIRD, ARTHUR (1856-) An American musician, born in Cambridge, Mass. After studying in Berlin he went to Canada, but in 1886 he became a resident of Berlin. His compositions comprise a symphony, three suites for orchestra, a serenade for wind instruments,

Puppetance, and various other compositions for the piano, the comic opera *Daphne* (New York, 1897), the ballet *Rubecah!*, and a decimet (for wind instruments), which won the Paderewski prize in 1902.

BIRD, FREDERIC MATYER (1838-1908) An American clergyman, educator, and hymnologist, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1857 and the Union Theological Seminary in 1860, and from 1860 to 1867 was a Lutheran minister. In 1868 he took orders in the Protestant Episcopal church, and from 1870 to 1874 was rector at Spottwood, N. J. From 1881 to 1886 he was professor of psychology, Christian evidences, and rhetoric at Lehigh University, and from 1893 to 1898 was editor of *Lippincott's Magazine*. He edited *Charles Wesley Seen in his Finer and Less Familiar Poems* (1867), *The Lutheran Ministerium* (1st ed., 1868, with Dr. B. M. Smucker), and *Songs of the Spirit* (1871, with Bishop Odenheimer), and has written much on hymnology, in which he is considered one of the foremost American authorities. He also published *The Story of our Christianity* (1893).

BIRD, ISABELLA See BISHOP, ISABELLA BIRD.

BIRD, ROBERT MONTGOMERY (1805-54) An American novelist. He was educated as a physician, but practiced little. Turning his attention to literature, he composed three tragedies, *The Gladiator*, *Oralosa*, and *The Broker of Bogotá*. The first suited the dramatic talent of Edwin Forrest and was one of his favorite impersonations. It still yields declamations for schoolboys. Bird's first novel, *Calavar*, appeared in 1834, and was followed by *The Infidel* (1835). Both of these were historical romances with Mexico as their scene and the Spanish Conquest as their background. Then followed *The Hawks of Hawk Hollow*, *Sheppard Lee*, and *Nick of the Woods* (1837). The last is Bird's most popular and important work, the scene being laid in Kentucky near the close of the Revolutionary War, and its motive being the fear and hatred inspired in the backwoodsman by the red man. In other words, Bird sought to counteract the effects of Cooper's idealization of Indian character. Less important books followed, then Bird practically retired from literary work. His literary life was passed mainly in Philadelphia. Consult Trent, *American Literature*, pp. 386, 463, 590 (New York, 1903).

BIRD-CAGE WALK A walk in St. James's Park, London.

BIRDCATCHING See TRAPPING.

BIRD CHERRY A term applied in Great Britain and Europe to *Prunus padus*, a tree bearing its fruits in racemes, and in other respects being a close counterpart of the American chokecherry (*Prunus virginiana*). In America the term "bird cherry" is reserved for *Prunus pennsylvanica*, the wild red cherry, also known as pigeon or pin cherry. *Prunus pennsylvanica*, a tree 30 to 40 feet high, is of little economic importance, being sparingly cultivated for ornamental purposes, it is occasionally used as a stock for the orchard cherry, and its bark and fruit are used in making cough mixtures.

BIRDE, **berd**, or **BYRD**, **WILLIAM** (1543-1623) An English ecclesiastical composer. He was educated at Edward VI's Chapel, was appointed organist in Lincoln Cathedral in 1563, and 12 years afterward organist to Queen Elizabeth. He is undoubtedly the greatest of the older English masters not only in the field of

sacred music, but also in that of instrumental music. Fétis calls him the English Palestrina. His works include *Psalmes, Sonets, and Songs of Sadness and Piete* (1588), *Songs of Sundrie Natures*, etc. (2d ed., 1610), two books of *Gradualia* (1607), three masses, and numerous compositions for organ and virginal.

BIRD ISLAND One of the smaller of the Hawaiian Islands.

BIRD ISLANDS See AVES, LOS.

BIRD LICE AND OTHER BIRD PARASITES. See FLEA, LOUSE, MITT, TICK, MALLOPHAGA, ETC.

BIRD LIME See TRAPPING.

BIRD OF PARADISE A member of an Australasian family of Passerine birds, remarkable for ornamental plumes, and so called in free translation of their native name in the Moluccas, meaning 'birds of the gods,' which Buffon transformed into *manucode*. They first became known to Europe by specimens brought by the returning ship of Magellan's expedition in 1522, but their skins had previously circulated in trade in India, Persia, and among the Arabs, being worn in the headdresses of the Janizaries early in the sixteenth century, and they soon began to be imported into Spain and Portugal. In preparing for market the skins (mainly or altogether those of the great bird of paradise) the islanders cut off the legs and sometimes the wings, leaving in place of the latter simply the tufts of orange plumes that spring from beneath them. Thus, although Antonio Pigafetta, in his account of the Magellan voyages, had described them pretty accurately as living birds of ordinary structure, many fables were woven around these mutilated skins and burdened literature for many years, as may be seen by a reference to Aldrovandus and his followers, and a monument remains in the present specific name of the most prominent form, *Paradisea apoda*, the 'footless.' It is a curious circumstance that although first, and for a long time, only known from the Moluccas (where the species sent by the ruler as a present to the King of Portugal was not rediscovered until lately), the paradise birds are most numerous and varied elsewhere, especially in New Guinea and the neighboring islands (particularly Aru) and along the northern margin of Australia, many, however, are confined to limited areas, as a single small island. There are about 50 species forming a part of a family (*Paradisidae*), which is closely related to the crows, and which also contains the Australian riflebirds (qv). The bower birds (qv) were formerly included in this family, but now are generally thought to merit a family of their own, Ptilonorhynchidae.

Birds of paradise vary in size from that of a crow to that of a sparrow, and spend their lives and make their nests—which, as a rule, are of very simple construction—in the forest tree tops. All of them are lively and active, running and hanging about the branches with the clinging agility of woodpeckers, as well as in graceful perching attitudes, and all are more or less gregarious and migratory, moving around, or passing back and forth between certain islands, with changing seasons, in search of food. Their food consists largely of various fruits, but insects, snails, and other things are eaten, this group sharing the omnivorous appetites of the crows and jays. Females and young form little flocks which act together, but the males are less often seen, though betraying their presence by loud,

harsh cries. The plumage of all is remarkably soft and velvety, and pleasing tints everywhere prevail, but there is a constant and great dissimilarity between the sexes, the females and young being dressed in quiet colors and having none of the eccentric and gorgeous plumage which renders the males so conspicuous, and which, if worn by the hens, would betray their presence on the nest and lead to the extermination of the species by its natural enemies, such as monkeys, arboreal birds, and beasts of prey. The marvelous ornamentation of the males seems to have been developed wholly by rivalry in attracting the admiration of the females, and in the courting season assemblages of these magnificent beaus take place upon certain trees, where they display their beauties in a sort of matrimonial mart which the Papuans call dancing parties. "A dozen or twenty full-plumaged male birds," says Wallace, "assemble together, raise up their wings, stretch out their necks, and elevate their exquisite plumes, keeping them in a continual vibration. Between whiles they fly across from branch to branch in a state of great excitement, so that the whole tree is filled with waving plumes in every variety of attitude and motion."

This family, therefore, naturally plays a very important part in the evidence adduced by Darwin, Wallace, and other evolutionists, in support of the theory of sexual selection as a means of developing certain specific and group characteristics. It is at the time of these assemblages at dawn, when the birds are too much engrossed with their "dancing" to be cautious, that the natives secrete themselves in the tree tops and silently shoot them down with blunt-headed arrows, and this and other means have been practiced so assiduously to supply the demand for the plumes by milliners that several species are now actually exterminated, and others are on the point of disappearing. The skins are roughly prepared and cured by smoke, so that they lose a good deal of their brilliancy and delicacy of texture. Few species have been caught alive, or, at any rate, have lived to be carried to Europe, but those which complete their journey in good health live for years and thrive, and some females have even laid eggs in captivity. Only two have reached the United States alive, and are now on exhibition in the New York Zoological Park. Some endure confinement well enough in the tropics and exhibit in their cages an amusing solicitude to keep their trailing finery in perfect order.

It is impossible, in a brief article, to describe the bewildering variety and splendor of these astonishing birds, three of which are shown in the accompanying Colored Plate. The plumage of the males is characterized not only by great brightness, but by a glossy, velvety appearance, a metallic lustre, and a singularly beautiful play of colors. Tufts of feathers generally grow from the shoulders, and these, in some of the kinds, are prolonged so as to cover the wings, in the great emerald bird of paradise (*Paradisea apoda*) the prolongation of these shoulder tufts is so great that they extend far beyond the body and even far beyond the tail. They constitute the magnificent part of the well-known bird-of-paradise plumes, many of which, however, are derived from other related species, as *Paradisea minor*, illustrated in the Plate, they can be erected so as to seem to fall in a shower over the whole bird. A peculiarity of many species

is the presence of very long feathers, which consist almost wholly of the central shaft, with little or no vanes, and which curl and glisten like plant wires. The 12-wired *Seleucidus nigricans* or *ignotus* of New Guinea is a remarkable example of this, here they spring from the flanks, but they may be produced from the tail, wings, or head. The figure of the six-shafted bird of paradise (*Parotia seflata*) in the Plate is another example. Its plumes may be raised and lowered as the bird wills, and D'Alberty gives a long account of how one magnificently burnished male of this kind displayed all his glittering armature, one day, in a forest glade, for the delectation of admiring companions. In recent classifications this species has been placed among the bower birds. Among the smallest of all is the third species illustrated, the king bird of paradise (*Cinnamurus regius*). It measures only about 6½ inches in length, and the prevailing colors are velvety red, with the erectile, fan-like plumes on the sides purplish, tipped with green, and the under parts white, separated from the red throat by a green gorget. Those who wish to acquaint themselves further with these splendid birds, of which Thoreau said, "Nature made them pure feathers to show what she could do in that line," should examine the colored life-size plates in Elliott's *Monograph* of the family, and in Lesson's earlier monograph, entitled *Histoire naturelle des Oiseaux de Paradis et des Epimaques* (Paris, 1835), also the plates of the *Voyage de la Marchese, A. R. Wallace, Malay Archipelago* (New York, 1869), Rothschild's *Paradisæida* in *Tierreich* (Berlin, 1898), Sharpe, *Monograph of the Paradisæida* (London, 1892-98), and the writings of Dr. Guillemard, D'Alberty, Salvadori, Hunstein, and other European explorers of the Papuan Archipelago. For descriptions of new species, eggs, and notes on the various plumages, see the volumes of *Novitates Biologica*, published at Tring, England. A somewhat extended popular account will be found in *Royal Natural History*, vol. III, pp. 329-40 and in Knowlton's *Birds of the World*, pp. 750-770.

BIRD OF PASSAGE See **MIGRATION OF ANIMALS**

BIRD OF PREY Any of the predaceous, flesh eating birds, called in the older classifications Rapaces, Raptores, Accipitres, etc., considered as a group from the point of view of habits rather than of structure. In the past they have been regarded usually as an order divisible into two uncertain groups—Nocturnal and Diurnal—the former including the owls, and the latter the eagles, falcons, buzzard hawks, vultures, etc. Ornithologically they are held by most modern systemists to include the three orders, Strigiformes (owls), Cathartidiformes, or New World vultures, and Accipitriformes, the last embracing all the diurnal falconine and Old World vulturine families, together with the aberrant forms, *Serpentarius* or *Gypogaeus*, the secretary bird (*q v*), and *Pandion*, the ospreys (*q v*).

Characteristics—Agreeing in subsisting by the chase and seizure of living animals, or upon dead flesh which must be torn apart, all of this large group present an organization which combines great power with special tools adapted to their habits. Most of them are masters of the power of flight, the great vultures soaring out of human sight, and the falcons having astonishing dash and quickness. Their wits are alert,

BIRDS OF PARADISE

and their senses are keen, their eyesight being the most highly developed, perhaps, in the whole animal kingdom. In size they vary from the condor, one of the greatest of all birds, to the finch falcon or pigmy owl, scarcely larger than a sparrow. They are widespread, but far more numerous in warm climates than in cold, few dwelling near the Arctic zone, and while many are migratory, the most of them are permanent residents of the districts they inhabit. Their plumage, as a rule, is plain, black, white, reddish browns, and yellowish tints predominating, nor are crests or ornamental feathers common among them. The female is usually somewhat larger than the male—a fact due, no doubt, to the circumstance that she labors more continuously than her partner in providing food for her young and in defending her home. All the birds of prey are monogamous, and the larger ones are believed to pair for life. Certain nesting sites are resorted to for many generations in succession by eagles, vultures, fishhawks, etc., the nest being annually refitted for occupancy. The nesting sites are very various, ranging from the ledge of a lofty crag, or a tall tree top, to bushes, the ground, or even holes in the ground. The eggs of the owls are always white, but those of other families are usually blotched with color, and they are commonly few in number. "The period of incubation is longer than in most other aerial birds, and the young at first are covered with down, are quite helpless, and for an unusually long time are entirely dependent on the parents." In all species the many indigestible substances, as hair, scales, bones, etc., swallowed, are later ejected from the stomach in pellets called "castings."

Predaceous Equipment.—The birds of prey have acquired an equipment of beak and claws entirely suitable for their work. The beak is large, strong, terminates in a sharp hook, and the edges of the mandible are sharp and more or less serrated, forming an excellent piercing, tearing, and cutting instrument. The base of the upper mandible is sheathed in a membrane, bare of feathers, and often bright yellow in color, through which the nostrils open, and which is called the cere, no other birds have a similar beak except the parrots, which otherwise are very different from this group. In the vultures not only the base of the beak, but the whole head is naked, in adaptation to their carrion-eating habits, involving the constant smearing of the head with filth prejudicial to feather growth. (See **VULTURE**). Instruments for seizing their prey (which includes fish), holding it or carrying it away, are provided in the feet, which are flexible, very strong, and armed with long, sharply pointed and powerful claws, giving a lacerating, catlike grasp, which ordinarily no force available to the victim is able to break. In carrion feeders, however, the feet exhibit little of this power, and the talons are comparatively short and blunt, for they are not called upon to seize and hold a struggling victim. Most of these birds live many years. They are nowhere very numerous in any one district.

Bibliography. Consult books mentioned under **BIRD**, *Fisher, Hawks and Owls of the United States* (Department of Agriculture, Washington, 1893). See **BUZZARD**, **EAGLE**, **FALCON**, **HAWK**, **OWL**, **VULTURE**, with the accompanying plates, and the names of particular birds of prey.

BIRDS, THE. A comedy by Aristophanes (q v).
BIRD'S ELL, WILLIAM WILFRED (1854-1900). An American educator, born at Richmond, Ind. He graduated at Earlham College (Richmond, Ind.) in 1873, and from 1885 to 1893 was instructor in mathematics at the Friends' Central School, Philadelphia, Pa. He was president of Swarthmore College (Swarthmore, Pa.) in 1898-1902, and then became principal of the Girls' High School in Philadelphia. With Rufus M. Jones he edited *Shepp's Literary World* in 1897, and the *Library of American Literature* in 1901.

BIRDSBORO. A borough in Berks Co., Pa., 8 miles (direct) southeast of Reading, on the Philadelphia and Reading and the Pennsylvania railroads (Map Pennsylvania, K 7). It has large foundries and machine shops. Pop., 1890, 2261, 1900, 2264, 1910, 2930.

BIRDS-EYE LIMESTONE. A limestone at the base of the Trenton series in New York State, so called from the white "eyes," cross sections of crystallized corals of the genus *Tetradium*, that appear on the surface of the stone. The rock is usually dove-colored, fine-grained limestone which has, when free from the "eyes," been used for a secondary grade of lithographic stone. The maximum thickness of the formation is 30 feet, and it is exposed on the flanks of the Adirondack Mountains of New York and has been doubtfully recognized in Kentucky. Its characteristic fossil in New York is *Bathyrurus extans*, a trilobite. The name "Birdseye Limestone" has been replaced by the geographic term "Lowville Limestone," which refers to the town of Lowville, N. Y., in the vicinity of which the formation is well developed. See **ORDOVICIAN**.

BIRD'S-FOOT CLOVER (*Ornithopus*). A genus of plants of the family Leguminosae, subfamily Papilionaceae, deriving both its popular and its botanical name from the resemblance of the curved pods to birds' claws. The leaves are pinnate, with a terminal leaflet. One species, *Ornithopus perpusillus*, is a native of Great Britain and central Europe, growing on dry, sandy, or gravelly soils—a small plant of little importance, the flowers of which are white or yellow, striated with red. *Ornithopus sativus* is an important forage plant. See **SERRADELLA**.

BIRD'S-FOOT CLOVER. See **LOTUS**.

BIRDS' NESTS. See **NIDIFICATION**.

BIRDS' NESTS, EIDILE. See **SWIFT**.

BIRDS OF AMERICA, THE. A monumental work by John James Audubon (1827-38), published at a cost of \$100,000 and sold at \$1000 a copy.

BIRDS OF PASSAGE. Five collections of poems, or "Flights," by II. W. Longfellow (q v) (1863-78).

BIRD SPIDER, or BIRDCATCHING SPIDER. A name given to some of the largest spiders, belonging to the family Theraphosidae. Most of them are natives of tropical and subtropical America. The best known is *Mygale* or *Avicularia avicularia* of Brazil, known there as *Aranha caranqueyna*, or 'crab spider'. It is nearly 2 inches long, very hairy, and almost entirely black, its feet, when stretched out, occupy a surface of nearly a foot in diameter. The hooks of its mandibles are strong, conical, and very black. This great spider forms a tube-shaped burrow in sandy soil, widening towards the mouth, sometimes 18 inches deep, and lined with a fine white semitransparent silken tissue, like muslin, at the bottom of which the silken nidus

of eggs is loosely placed. Here the females sit peering out of the trumpet-shaped entrance most of the time, day and night. They are timid, gentle in disposition, and do not bite their captors. No debris is ever found about their burrows to indicate their food. In fact, their prey is not known, nor their manner of taking it, which apparently is never by searching for it or chasing. "We must confess," says the eminent specialist, the Rev F O P Cambridge (*Proc Zool Soc of London*, 1896, p 717), "that we do not know the staple diet. Though I was out night after night, and though I watched, on several occasions, the whole night through, the tunnels of 20 and upward of the sand burrowing 'mygale,' yet not once could I detect a spider in the act of seizing her prey or even venturing beyond the entrance of her burrow."

BIRD TICK See FOREST FLY

BIRD WOOD, SIR GEORGE CHRISTOPHER MOLESWORTH (1832-) An English physician and botanist, born in Belgium, Bombay. He studied at the University of Edinburgh and was in 1854 appointed to the medical staff of the Bombay Establishment of the East India Company. From 1857 to 1869 he was connected with the Grant Medical College of Bombay as professor successively of anatomy and physiology and botany and materia medica. He was also chiefly instrumental in establishing in Bombay the Victoria and Albert Museum and the Victoria Gardens. From 1871 to 1902 he was special assistant in the revenue, statistics, and commerce department of the India Office. He was a learned student of Indian botany. He published in 1862 a *Catalogue of the Economic Vegetable Products of the Bombay Presidency* (1868) and identified the frankincense tree (*Transactions of the Linnean Society*, vol xxvii). His other works include *The Industrial Arts of India* (1888), *The Aryan Flora and Fauna* (in Max Müller's *Biography of Words*, 1888), *Report on the Cultivation of Spanish Chestnuts* (1892), *The First Letter-Book of the (English) East India Company* (1895), *Relics of the East India Company*, with a series of 50 plates, by William Griggs (1909, with William Foster).

BIREJIK, be'ra-jék', or **BIR**, bër (anciently, *Butha*, fortress, stronghold). A town of Asiatic Turkey, in the vilayet of Aleppo, on the east bank of the Euphrates, at the head of navigation (Map Turkey in Asia, H 4). The town, built on a limestone cliff 400 feet high, is surrounded by a strong wall flanked with towers. Its streets are narrow and clean, and it has several mosques with tall minarets, a caravansary, a bazar, and a ruined citadel and castle. Travelers and caravans from Aleppo to Diarbekr, Bagdad, Persia, etc., cross the Euphrates at this point. Pop (est.), 8000. Bir, which signifies 'well,' is a prefix to the names of several smaller towns in Arabia.

BIRET'IA See COSTUME, ECCLESIASTICAL

BIRGE, birj, EDWARD ASAHEL (1851-) An American naturalist. He was born in Troy, N Y, and was educated at Williams College and at Harvard University. He was appointed professor of natural history and zoology at the University of Wisconsin in 1879, dean of the College of Letters and Sciences in 1891, and was acting president of the university from 1900 to 1903. In 1897 he became director of the Geological and Natural History Survey of Wisconsin. He wrote various papers on zoology and

edited the revision of Prof James Orton's *Comparative Zoology* (1882). He became a member of the Board of Forestry Commissioners in Wisconsin in 1905, and a member of the Conservation Commission in 1908.

BIRGE, HENRY WARNER (1825-88). An American soldier, born in Hartford, Conn. At the opening of the Civil War he organized the first State regiment of three-year troops—the Fourth Connecticut Volunteers—in which he was appointed major. After service in Maryland and Virginia he was commissioned colonel of the Thirtieth Connecticut infantry regiment in 1861 and in 1862 was placed in command of the defenses of New Orleans. In December of the latter year he was appointed to the command of a brigade, which he retained through the first Red River campaign and at the siege of Port Hudson. He was raised to the rank of brigadier general in September, 1863, served in the second Red River expedition, and subsequently commanded at Baton Rouge. In 1864 he was assigned to the command of the second division of the Nineteenth Corps. He participated in the battles of General Sheridan's campaign in the Shenandoah valley, and in February and March, 1865, was appointed to the command of the defenses of Savannah. In the same year he resigned, with rank of brevet major general of volunteers.

BIRGER OF BJALBO, bër'gër da byél'bò (?-1266). Regent of Sweden (1250-66), during the minority of his son, Waldemar, the successor of Eric XI. During his regency he passed many beneficent laws, brought over to Christianity the inhabitants of Tavastehus, Finland, whose incursions had frequently desolated Sweden, increased the Swedish possessions in Finland, founded the city of Stockholm, and established important commercial relations with Lübeck and Hamburg.

BIRGIT, BIRGITTA See BRIDGET

BIRGIT'TINES See BRIGITTINES

BIRKBECK, bër'bek, GEORGE (1776-1841). An English physician and educational reformer, born at Settle, Yorkshire. He studied medicine at the universities of Edinburgh and London. At the age of 23 he was appointed professor of philosophy at Anderson's College, Glasgow (now merged in the Glasgow and West of Scotland Technical College), where in 1800 he introduced a course of lectures to workmen. This "mechanics' class" evolved, in 1823, into the Glasgow Mechanics' Institution, which is believed to have been the first institution of its kind. In 1804 he moved to London, where he attained considerable reputation as a physician. In 1824 the London Mechanics' Institution was organized by Dr Birkbeck and was subsequently named in his honor. The success of his educational establishments paved the way for the present system of popular scientific education in England.

BIRKDALE, bër'kdäl. A manufacturing town and railway junction in Lancashire, England, 1½ miles southwest of Southport (Map England, C 3), of which it is a residential section. Pop, 1891, 12,400; 1901, 15,511; 1911, 18,000.

BIRKENFELD, bir'ken-felt (Ger. *Birke*, birch + *Feld*, field, referring to its rich forests). A German principality belonging politically to the Duchy of Oldenburg, but forming an enclave in the Prussian Rheinland adjoining the districts of Coblenz and Treves (Map Germany, B 4). Its area is about 192 square miles. The prin-

pality belongs to the region of the Hochwald and Idar Wald, and its surface is hilly and covered for a large part with forests. The area devoted to agriculture is very limited, and the domestic supply of agricultural products generally falls short of the demand. The chief industry is the polishing of agates, which gives work to about 8000 men. The administration of the principality is vested in a board, consisting of a president and two assistants, responsible to the ministry of Oldenburg, and a council of 15 members. Pop., 1900, 43,406, 1910, 54,465. About 80 per cent of the population is Protestant. In the capital, Birkenfeld, the industries are brewing and tanning, and the manufacture of tobacco and cheese. It contains two churches, a grand-ducal high school, and a hospital. Pop., 1900, 2229.

BIRKENHEAD, bĕrk'en-hĕd. A seaport town and municipal, county, and parliamentary borough in Cheshire, England, situated opposite Liverpool, on the left bank of the Mersey (Map England, C 3). It includes the townships of Cloughton, Oxtan, Tranmere, and part of Higher Bebington. The growth of the town has been very rapid since the opening of its first great dock in 1847, its floating and dry docks now cover an area of over 165 acres. They are, with those of Liverpool, under the management of the Mersey Docks and Harbor Board (See LIVERPOOL). The streets of the town are regularly laid out, and the buildings, as a rule, are substantial. Among the notable buildings are the handsome townhall, the merchants' hall, and the market hall. The educational institutions include St Aidan's Theological College, a school of science and art, and a public library. Birkenhead has for some years been celebrated for its extensive shipbuilding yards, some of the largest iron ships afloat having been built there. The celebrated Confederate cruiser *Alabama* was built here in 1862 by the Messrs Laird, to whose enterprise, more than to that of any other firm, the town owes its present importance. In the neighborhood of the docks are the Canada Works for the construction of gigantic bridges, the Britannia machinery works, and others. Birkenhead has a number of street railway lines, which are owned by the corporation, but leased to private companies. It is connected with Liverpool by three ferries owned by the municipality and netting annually (1909-10) about \$54,000, and by the Mersey Tunnel, opened in 1886. Birkenhead was incorporated in 1577 and received a municipal charter in 1877; it sends one member to Parliament. The town's affairs are administered by a mayor, a municipal council of 40 and a board of aldermen of 14 members (See GREAT BRITAIN, *Local Government*). The town owns its water works, which net an annual profit of about \$26,000. It also owns its gas works and an electric light and power plant, the former netting annually about \$100,000, the latter about \$60,000 (in 1909-10). Refuse is for the most part burned in destructors, the sewage is discharged into the sea. The town maintains public baths, markets (a covered market was erected in 1909 at a cost of about \$50,000), a slaughterhouse, and a cemetery. There are three fine municipal parks. Pop., 1901, 110,926, 1911, 130,832.

BIRKMITRE, bĕrk'mĭr, WILLIAM HARVEY (1860-) An American architectural engineer, born at Philadelphia. After studying architecture for four years with Samuel Sloan

he moved to New York to take charge (1885) of the construction work of the Jackson Architectural Iron Works, and (1892) of the J. F. and J. M. Cornell Iron Works. His plans for steel details include those for such buildings as the Astor hotels, Central Bank Building, Silk Exchange Building, and Lords Court Building (all in New York). He is author of *Architectural Iron and Steel* (1891), *Compound Riveted Girders* (1893), *Skeleton Construction in Buildings* (1893), *The Planning and Construction of American Theatres* (1896), *Construction of High Office Buildings* (1898).

BIRMAH, bĕr'mā. See BURMA.
BIRMINGHAM, bĕr'mĭng am (either AS *Birmingham*, *Becorning*, a proper name + *hām* home, or 'home on the hill by the heath,' from AS *brōm*, broom + *ahh*, descent + *hām* home). A city and a county and parliamentary borough of England, the chief seat of metal manufactures in Great Britain and the leading hardware centre of the world (Map England E 4). It stands near the centre of England, the northwest of Warwickshire, with extension in Staffordshire and Worcestershire, 113 miles by rail northwest of London. It is built on the eastern slopes of three hills at the confluence of the Rea and the Tame, with a gravelly foundation overlying clay and new red sandstone and is one of the best-drained towns in England. The older part of the city is crowded with workshops and warehouses, but the modern portion is well built and possessed of architectural beauty. For the most part the streets are crooked and somewhat narrow, but there are several fine thoroughfares, as New Street, Colmore Row, and Corporation Street, which contain the more important buildings. Among the finer buildings are the council house and art gallery, in Renaissance style, completed in 1881; the townhall, in Greek style, completed in 1850 and the post office—these are at the western end of New Street, the Midland Institute (with fine lecture room) and the Central Library, near the townhall, a school of art, in Colmore Row the enormous New Street Station of the London and Northwestern and Midland railways, the handsome Victoria assize courts (completed 1891) in Corporation Street, and, in New Street, the building of the Royal Society of Artists, the exchange, and the grammar school of King Edward VI. Among ecclesiastical edifices, of which Birmingham is not conspicuous, may be mentioned the Anglican churches of St Martin St Philip, and St Alban, the Unitarian church of the Messiah, a Wesleyan church, and the Roman Catholic cathedral of St Chad.

The central part of Birmingham, the worst overcrowded section before 1876, has been vastly improved since then and has become the best part of the city. This was accomplished by the municipality condemning the district and purchasing it for some \$8,000,000. A considerable income is derived from the leases, and in 1912 the city will come into possession of all the buildings erected on its land. Besides nine parks, of which the chief are Aston Park (to the northeast, Cannon Hill Park on the south and the Botanical Gardens, seven gardens or recreation grounds are distributed over the city.

Birmingham has been at the head of the large progressive cities of England in the work of modernizing its institutions. In 1875 it reorganized its health department, which set itself to work eradicating unsanitary conditions. One

the first tasks was the providing of a pure water supply. Some 3000 polluted wells were closed, to prevent the spreading of zymotic diseases. That, combined with the condemnation of unsanitary houses, the increase of disinfecting facilities, and a rigorous inspection of food supplies, helped to reduce the average death rate from 26 per 1000 to less than 20. In the unsanitary districts the reduction was from 60 and more per 1000 to 25.

With the same purpose in view the city improved its sewage system by providing a modern system of sewage and garbage collection combined with a sewage farm, it erected baths and washhouses, hospitals, asylums, special artisans' dwellings, etc. Most of Birmingham's municipal undertakings date back to 1874-75, when Joseph Chamberlain, as mayor of the town, inaugurated the new era. At that time, also, Birmingham bought out the water company at a cost of more than \$6,000,000. Since then great extensions and improvements have been carried out, and a new supply obtained from the watershed of the rivers Elan and Clearwen, in Wales, some 73 miles from the city, for which more than \$30,000,000 was appropriated. The supply was formally opened by King Edward in 1904. The gathering ground covers 45,562 acres, and the great Caban Coch Dam forms a reservoir of 1,500,000,000 gallons. The gas works were acquired by the city in 1875 for \$10,000,000. Though the price of gas was reduced about 33 per cent, the business yielded a profit to the city. In 1899 the supply of electricity was also municipalized. Free libraries in Birmingham date back to 1860. They consist of a reference library, central circulating library, and nine branch libraries. The city owns the markets and slaughterhouses, which yield a considerable net income, in addition to facilitating the inspection of the food supply of the city. It also owns its street railways, which are operated by private companies, paying a high rental.

As an industrial centre, Birmingham provides many facilities for technical education. In 1895 the Municipal Technical School, in Suffolk Street, was completed, and to it was transferred the scientific department of the Midland Institute. The University of Birmingham, with site at Edgbaston, was chartered in 1899. Into it was merged Mason College (founded 1870), which had already practically absorbed Queen's College (chiefly medical). The city maintains also a school of art, with branches in several of the board schools. The art gallery and museum form an integral part of the art school. The elementary schools are under the control of the school board. The charitable institutions, maintained by endowments, legacies, and donations, comprise the General, Queen's, and Children's hospitals, general dispensary, asylums for lunatics, for the blind, deaf and dumb, sanatorium, and almshouses.

Birmingham is the largest manufacturing town in England after Manchester. It became very early the seat of iron manufactures on account of its proximity to a forest and extensive iron mines. Its principal industry at present is the manufacture of brass and iron and steel products. Its manufactures comprise steam and gas engines, electric motors, hydraulic presses, railway cars, guns, machinery, etc. In addition there are glass works, chemical works, breweries, etc. Women are generally employed in the lighter trades.

Birmingham returns seven members to Parliament. It was created a city in 1889, and the title of lord mayor was conferred on the chief magistrate in 1897. It covers 13,478 acres, divided into 18 wards. The council consists of 18 aldermen and 54 councillors. The corporation is a large landowner and the largest employer of labor in the borough. (See GREAT BRITAIN *Local Government*.) Birmingham is the seat of an American consulate. Like most of the great industrial cities, Birmingham increased rapidly in population during the nineteenth century. In 1501 it had 60,000 inhabitants, in 1901, 523,179, an increase of 770 per cent in a century, and of nearly 22 per cent from 1891 to 1901 (1891 430,000), in 1911, 525,833, the increase over 1901 being only 0.5 per cent. It is the fourth English city in population, being exceeded by Manchester, Liverpool, and London.

History. Birmingham was an old town of the Anglo-Saxons (Beornings Ham). After the Conquest it was ruled by the De Birmingham family till 1527. In mediæval times it was a thriving commercial and industrial place. During the Civil War it was staunchly Puritan and supplied the armies of Parliament with arms. It was plundered and in part burned by Prince Rupert in 1643. Its great commercial importance dates from the seventeenth century, when the restoration of Charles II brought from France a fashionable demand for metal ornaments, which Birmingham supplied with unexampled vigor. In the latter part of the seventeenth century the Birmingham smiths began to manufacture swords and guns. Its hardware manufactures as early as 1727 are said to have supported 50,000 persons. The earliest attempts at cotton spinning by rollers were made in 1736. The opening of the coal and iron fields of Lancashire added greatly to its prosperity, so that in 1745 it was one of the principal inland towns of England. By 1761 its manufactures were known throughout the world. Towards the end of the eighteenth century it was a centre of Liberal agitation, being the home of Priestley. The Reform and Chartist movements had powerful support in the town.

Bibliography. Bunce, *History of the Corporation of Birmingham, with a Sketch of the Earlier Government of the Town* (Birmingham, 1885); Griffith, *History of the Free Schools, Colleges, Hospitals, and Asylums of Birmingham* (London, 1861); Timmins, *The Resources, Products, and Industrial History of Birmingham and the Midland Industrial District* (London, 1866); Shaw, *Municipal Government in Great Britain* (New York, 1895); Jones, *A Short History of Birmingham* (Birmingham, 1911).

BIRMINGHAM. The county seat of Jefferson County and the largest city in Alabama. It is 97 miles north of Montgomery, the capital, and is served by nine railroad systems, several of which have two or more lines entering the city. They are the Southern, Louisville and Nashville, Seaboard Air Line, Illinois Central, Queen and Crescent, Atlanta, Birmingham and Atlantic, Central of Georgia, Birmingham Mineral and Birmingham Southern. Interurban electric lines give extensive connection with near-by cities. Following the discovery of the great deposits of coal, iron ore, and limestone in Jefferson County, Birmingham was laid off by the Elyton Land Company early in 1871 and was named after the iron and steel manufac-

turing city of England. In December of the same year, with a population of about 1000, the town was incorporated. Growth was rapid from the beginning, but in 1873 a terrible cholera epidemic caused the death of scores and drove thousands away. Following 1880 growth again became very rapid, but the panic of the late eighties prostrated business and again caused thousands to leave. Recovery soon began, however, and the maximum growth was from 1900 to 1910, when the population gain was 245 per cent over the figure for the previous decade. While coal mining and iron and steel manufacture of all kinds are the most important industries, the city has great cotton and lumber interests. Birmingham also has cotton factories, automobile factories, cottonseed-oil mills, flour and grain mills, furniture, box, and mattress factories, and numerous smaller industries. It has become a very important point in the South for manufacturer's agents. Because of its mineral products Birmingham's annual railroad tonnage is greater than the total tonnage of the other gulf States. The city has beautiful parks, many miles of well-paved streets, handsome public buildings, and exceptional school facilities. Its Central High School is regarded as a model of its kind. Howard College (Baptist and coeducational) is at East Lake, while Birmingham College (Methodist) is on Owen-Town Heights. Office buildings ranging from 6 to 27 stories in height include the Woodward, First National Bank, Brown-Marx, Empire, Y M C A, Title Guarantee, Chamber of Commerce, Farley, Jefferson County Bank and American Trust. Two hotels, the Tutwiler and Roden, each costing more than \$1,000,000, were erected in 1913. There are two handsome railroad stations—the Louisville and Nashville, and the Terminal, the latter being used by all roads except the Louisville and Nashville and the Atlanta, Birmingham, and Atlantic. The two largest hospitals are St. Vincent's and Hillman, the latter being a charity institution operated by Jefferson County. Since March 31, 1911, Birmingham has been governed by a commission of three, one of whom is elected each year. They are paid \$7500 each per annum. Each has charge of certain features of city administration, and it is claimed the system has been more economical than the aldermanic form of government. The Greater Birmingham law became effective Jan. 1, 1910, under which the following incorporated suburbs became a part of the greater city: Wylam, Eusley, Pratt City, West End, Elyton, North Birmingham, East Birmingham, Avondale, Woodlawn, and East Lake. The city's area is now 50.08 square miles. Birmingham's annual expenditures for administration are well over a million dollars. The city's outstanding bonds amount to \$5,887,000. Pop., 1880, 3086; 1890, 26,178; 1900, 38,415; 1910, 132,685.

BIRMINGHAM, GEORGE A. The pen name of the Rev. J. Owen Hannay (qv).

BIRMINGHAM FESTIVAL. The A periodical musical festival begun in Birmingham, England, in 1768, and given every three years. At one time the programme was made up largely from Handel, and at all times the character of the music has been of the highest order. The custom is in a measure a commemoration of the founding of Dr. Ash's hospital in the town in 1766, and the proceeds are given to the perpetuation of this institution.

BIRNAM, bër'nom. A hill 1324 feet high, in the east of Perthshire, Scotland, near Dunkeld, 12 miles northwest of Perth, commanding a fine view of the valley of the Tay (Map Scotland, E 3). It was formerly covered by part of an ancient royal forest, which Shakespeare has immortalized in his tragedy of *Macbeth*. A village of the same name is situated at less than one mile's distance southeast of Dunkeld.

BIRNBAUMER WALD, bîrn'bôu-mër wald (Ger. *Birnbaum*, pear tree + *Wald*, wood, forest, a translation of the Latin *ad prum*, at the pear tree). A highland of Carniola, near the river Frigidus, northeast of Trieste. Theodosius I (qv) won a victory over Arbogast and Eugenius there in 394. In this highland lay the Roman station *Ad Prum*, on a main road across the Alps to Italy.

BIRNEY, bîr'nî, **DAVID BELL** (1825-64). An American soldier, the son of James G. Birney. He was born in Huntsville, Ala., graduated at Andover, studied law in Cincinnati, and practiced for several years in Philadelphia. He entered the Federal army as lieutenant colonel in the Twenty-third Pennsylvania Infantry, in April, 1861, was raised to the rank of brigadier general of volunteers in February, 1862, served with great gallantry in the Peninsular campaign, distinguishing himself particularly at Yorktown and Williamsburg, and afterward took a conspicuous part in the second battle of Bull Run, and in the battles of Fredericksburg and Chancellorsville. In May, 1863, he became a major general of volunteers and during part of the battle of Gettysburg commanded the Third Army Corps. From May to June, 1864, he commanded a division under Hancock, and rendered efficient services in the battles of the Wilderness and Spotsylvania, and after July of this year he was in command of the Tenth Corps of the Army of the James. He died on Oct. 18, 1864, in Philadelphia, of a fever contracted during this last campaign. Consult vol. iv of the *United Service Magazine* (New York, 1865).

BIRNEY, JAMES GILLESPIE (1792-1857). An American reformer, leader of the conservative Abolitionists during the antislavery struggle. He was born in Danville, Ky., studied at Transylvania University, and graduated at Princeton in 1810. He then studied law under Alexander J. Dallas in Philadelphia, began practice in Danville in 1814, and was elected to the State Legislature two years later. In 1818 he removed to a plantation in the vicinity of Huntsville, Ala., and in the following year served in the Alabama Legislature. He resumed his law practice in Huntsville in 1823, was elected prosecuting attorney there, and soon became the most successful practitioner in northern Alabama, but turned his attention more and more to the study of the slavery question, and in 1832-33 acted as agent of the Colonization Society (qv) for the district embracing Tennessee, Alabama, Mississippi, Louisiana, and Arkansas. In November, 1833, he returned to Danville, Ky., where he freed his own slaves and devoted himself with zeal and energy to the cause of gradual emancipation, though he soon became a convert to immediatism. He organized the Kentucky Antislavery Society in 1835 and in the same year planned an antislavery paper, but, as he was unable to find a publisher in Kentucky, he removed to Cincinnati, Ohio, where, on Jan. 1, 1836, he issued the first number of *The Philanthropist*. During the

next few years his press was several times destroyed by mobs, and he himself was repeatedly threatened with personal violence and death, but in spite of opposition his paper rapidly attained a wide circulation and exerted a powerful influence among those who, like himself, believed in abolition, but opposed the radicalism of Garrison and his followers (See GARRISON, WILLIAM LLOYD) Both as an editor and as a speaker, though firm and unflinching in his advocacy of what he believed to be right, he upheld the Constitution, opposed all violence and fanaticism, and was uniformly courteous, tolerant, and fair. He spent much of his time in making speeches throughout the North, especially before the legislatures of the various States, and in 1837 was elected secretary of the American Antislavery Society. In this capacity he conducted the correspondence of the society, employed its lecturers, and prepared its reports, and, in addition, he continued to make frequent addresses before legislatures and large public assemblies. He soon came to be regarded everywhere as the leader of the "Constitutional" Abolitionists, i. e., of the Abolitionists who opposed all revolutionary measures, fought against secession, and endeavored to effect their desired reforms through the ordinary machinery of government, and both in 1840 and in 1844 he was the unanimous candidate of the Liberty party (q v) for the presidency, receiving 7069 votes in the first election and 62,263 in the second. He was disabled by a fall from his horse in 1845 and passed the last 12 years of his life in retirement as an invalid, first in Bay City, Mich., and afterward in Eagleswood, N. J. Besides numerous brief articles for the press, his chief writings were his *Letter on Colonization* (1834), *American Churches the Bulwarks of American Slavery* (1840), *Speeches in England* (1840), *Examination of the Decision of the United States Supreme Court in the Case of Strader et al vs Graham* (1850). Consult the excellent biography by his son, William Birney, *James G Birney and his Times* (New York, 1890).

BIRNEY, WILLIAM (1819-1907) An American soldier and lawyer, the son of James G Birney. He was born near Huntsville, Ala., was educated at Yale College and in Europe, took an active part in the Revolution of 1848 in France, and for two years was professor of English literature in the college at Bourges. He entered the Federal army at the outbreak of the Civil War, was elected captain, attained the rank of brigadier general of volunteers in May, 1863, and from then until the close of the war was in command of a division. In 1863-64 he served as one of the three superintendents charged with the enlistment of colored troops and in this capacity organized seven regiments. He served with conspicuous gallantry in the battles of Second Bull Run, Chantilly, Fredericksburg, and Chancellorsville, received the brevet rank of major general of volunteers in March, 1865, "for gallant and meritorious services during the war," and resigned in August of the same year. After the war he lived for a time in Florida, but in 1874 removed to Washington and became a practicing attorney. Among his publications are the excellent *Life and Times of James G Birney* (1890) and *A Plea for Intellectual and Spiritual Liberty*.

BIRON, b'ron', ARMAND DE GONTAUT (1524-92) A French soldier. He became grand master of artillery in 1569 and was in command at

the siege of Rochelle and in Guienne. After the assassination of Henry III, who had appointed him marshal in 1576, he was among the first to declare for Henry IV. He brought a part of Normandy under subjection and dissuaded Henry from going into England, distinguished himself in the battles of Arques and Ivry against the League, and was killed by a cannon shot at the siege of Epernay.

BIRON, CHARLES DE GONTAUT, DUKE DE (1562-1602) A French soldier, son of Armand, under whose command he served with distinction in the campaigns against the League, acquiring renown and the surname of "Fulmen Galliae," or "Thunderbolt of France." He was made admiral of France by Henry IV in 1592, and marshal in 1594, became Governor of Burgundy in 1595, and was created duke and peer of France in 1598. He was a man of great intrepidity, but was fickle and treacherous. He was sent to England in 1601 to announce the marriage of Henry with Maria de Medici, but about the same time he was condemned by the Parliament for treasonable negotiations with Spain and Savoy, aiming at the overthrow of the Bourbon dynasty, the dismemberment of the kingdom into provincial states, and his own elevation to the sovereignty of Burgundy. Induced to come to Paris, he was apprehended and beheaded in the Bastille.

BIRON, b'ron, ERNEST JOHN, DUKE OF COURLAND (1690-1772) A Russian statesman. He was the son of a landed proprietor of the name of Buhren. Through Bestuzheff-Ryumin, who befriended him, he obtained the favor of Anna Ivanovna, who was called to the Russian throne in 1730, and he followed her to St. Petersburg, where he soon became chamberlain and practical ruler of the Russian Empire. Rambaud describes him "as a large, handsome man, uneducated, loving only his horses, a superb lackey, morally as evil and vindictive as his mistress." His enemies and rivals were swept out of his way, while the poor people were ground down by taxation. His revengeful severity is said to have exceeded that of his unscrupulous mistress. As an administrator, however, he showed considerable ability, and maintained order in the Empire. The Duchy of Courland, in which Biron was born, was then in dispute between Poland and Russia. Anna conferred the duchy upon Biron, and Russian armies were employed to place on the Polish throne Augustus III, Elector of Saxony, who had promised the investiture of Courland for Biron. The Emperor Charles VI readily countenanced these violent acts, and the King of Prussia was bought by certain territorial concessions. In 1737, therefore, the nobles of Courland were obliged to confirm Anna's appointment, and in 1739 the investiture took place at Warsaw by authority of the Polish King and Senate. The Empress died in October, 1740, and Biron, under her will, assumed the regency in the name of the infant Emperor Ivan VI. Field Marshal Munnich, who during the past reign had supported Biron, but who saw that he was to receive slight recognition now, set on foot a conspiracy, the result of which was the exile of Biron to Pelnin, in Siberia. A second palace revolution occurred soon after, and the new Empress, Elizabeth Petrovna, banished Munnich and permitted Biron to take up his residence at Yaroslavl. After Elizabeth's death his duchy was restored to him by Catharine II. He died Sept. 28, 1772.

Consult Rueli, *Geschichte E. J. von Birons* (1764) Rambaud, *Russia*, vol. 11, Lavisse et Rambaud, *Histoire générale* (Paris, 1893-1901), "Lettres d'Anna Ivanovna," in *L'Archiv Russe*, vols. 11 and 111 (Moscow, 1873-77), and *Les antiquités russes* (Moscow, 1884), Halem, *Lebensbeschreibung des russischen General-Feldmarschalls Münnich* (Oldenburg, 1803)

BIRE, béi See PARSONSTOWN

BIRRELL, Rr HON AUGUSTINE (1850-

) An English chancery barrister, best known as an essayist, born at Wavertree (near Liverpool). He graduated in 1872 at Trinity Hall, Cambridge, and in 1903 was admitted to the bar of the Inner Temple. From 1889 to 1900 he was returned to Parliament as a Liberal member for West Fife and in 1896-99 he was professor of law in University College, London. He became President of the Board of Education in the Campbell-Bannerman cabinet, formed in December, 1905. He was returned in the elections of 1906 as a member of Parliament for Bristol, and in 1907 he became Chief Secretary for Ireland. In 1912 he was installed as Lord Rector of Glasgow University. By his first volume, *Obiter Dicta* (1884), he achieved forthwith a unique place among modern English essayists. His power of analysis, his wit—often epigrammatic—his positive opinions, and his ubanity combine to form a style whose easy art has evoked the word "birrelling." His publications include, further *Obiter Dicta* (2d ser., 1887, a complete edition of *Obiter Dicta* was printed in 1910), "Life of Charlotte Brontë" (1887, in *Great Writers Series*, reissue, 1911), *Res Judicatae* (1892); *Men, Women, and Books* (1894, reissue, 1912), *Lectures on the Duties and Liabilities of Trustees* (1896), an edition (1897) of Boswell's *Life of Johnson*, *Sir Frank Lockwood* (1898), *Seven Lectures on the Law and History of Copyright in Books* (1899), *Collected Essays* (1900), *In the Name of the Bodleian* (1905), *Andrew Marvell* (1906), *A Rogue's Memoirs* (1912), *On a Dictum of M. Disraeli's and Other Matters* (1913)

BIRLT, bért, THODOR (1852-) A German philologist, born in Hamburg. He became professor at Marburg, and is author of numerous monographs, among which are *Das antike Buchwesen in seinem Verhältnis zur Literatur* (Berlin, 1882), *Der Haat bei Plautus* (1901), *Griechische Brünneren eines Reisenden* (1902), and *Die Buchrolle in der Kunst* (Leipzig, 1907). He also edited *Claudiamus* (qv) (Berlin, 1892) and wrote poems and dramas. Under the title *Jugendverse und Heimatpoesie Vergils* (Leipzig, 1910), he edited the "Catalepton," or Minor Poems, of Vergil.

BIRTH (AS *beof, gebýrd*, from *beran*, to bear, cf Ger *Geburt*, birth). At law birth does not take place until the complete separation of the child from its mother and the setting up of its independent system of circulation. The old doctrine of the common law that the child must be heard to cry in order to gain the status of a living person has long been obsolete, more exact and trustworthy methods of establishing the fact having been adopted. Even before birth a child is for many purposes regarded as a living person and may accordingly inherit real property or acquire a *vested* interest under a will or grant of lands. The latter result has been secured by statute in England and generally in the United States (See POSTHUMOUS CHILD). At common law the killing of an un-

born child was not murder, but it has been made so, generally of the grade of manslaughter, by modern statutes. See ABORTION.

In England and many of our States there are elaborate provisions by statute for the compulsory public registration of births. These provisions apply to all children born alive, whether legitimate or illegitimate, but not to such as are stillborn.

Concealment of Birth is a statutory offense, created in England by 21 Jac I, c 27 (1624). That statute provided that if any woman who was delivered of a child which would be a bastard if born alive endeavored to conceal the birth by burying, drowning, or the like, she should suffer death, unless she could prove by at least one witness that the child was born dead. Even Blackstone was forced to admit that this law "savored pretty strongly of severity," and it has been modified from time to time. At present the English statute provides that any person who endeavors to conceal the birth of a child by any secret disposition of its dead body, whether it died before, at, or after its birth, is guilty of a misdemeanor. While the statutes of our States on this subject differ in some respects, most of them are characterized by the milder spirit of the modern English acts. Consult the authorities referred to under MEDICAL JURISPRUDENCE, CRIMINAL LAW.

BIRTH/MARK See NÆVUS

BIRTH/RIGHT A preference in inheritance accorded by law to an heir according to the order of his birth. Such preference may be exclusive, as in the English rule of primogeniture, which gives the entire real estate to the eldest male heir, and in the singular custom of borough English, under which it goes to the youngest son, or it may be proportional, only giving the eldest son, or the youngest, as the case may be, a larger share in the estate than is appropriated to the other heirs. In the latter sense it is used in early Hebrew history. The right, in one or another of these forms, prevailed in all stages of primitive society, though with advancing civilization it has gradually given place to the more equitable principle of an equal division of the property among all the heirs of a given class. Its survival in England is probably due quite as much to the conservative temper of the English people as to the existence of social conditions which tend to perpetuate it. Almost everywhere else, on the continent of Europe as well as in the United States and the colonies of Great Britain, it has completely disappeared. See HEIR, INHERITANCE.

BIRTHS, REGISTRATION OF In European countries the work of recording births was early undertaken by ecclesiastical authorities. As early as 1538 births were recorded by the clergy in England under the form of registration of baptisms. Registration of births was established in Sweden under ecclesiastical law in 1686. Complete statistics have been preserved since 1749. Systematization of birth registration was attained in England by a law of 1837 establishing a Registrar General's office. In 1876 registration of births was made compulsory. On the continent of Europe systems of registration became general by the middle of the nineteenth century.

In the United States the registration of births is required by law in a majority of the States, but adequate administration is confined to the

New England States, Pennsylvania, and Michigan. Even here it is estimated that not more than 90 per cent of the births are recorded. Various organizations, including the Bureau of the Census, the Public Health Service, the American Medical Association, the American Bar Association, and the American Statistical Association, have conducted a propaganda for the proper registration of births. In 1912 a model bill for the registration of births was prepared under the auspices of the Federal Census Bureau, by the Council on Health and Public Instruction of the American Medical Association. It is the purpose of the associations interested to urge upon the legislatures of the various States the enactment of this bill, at least in its essentials, in order to secure a high degree of uniformity in statistics of births.

Originally the chief object of the registration of births was to obviate disputes that might arise with respect to the inheritance of property. This is still an important object, but others of greater importance have arisen. Statistics of infant mortality, which are required as an indication of the need of improvements in sanitation, must obviously remain incomplete so long as the number of births is left to conjecture. It is on this ground that the Children's Bureau, established in 1912, devoted its first public monograph to the subject of *Birth Registration* (Washington, 1913). Almost every State has laws limiting the employment of children under a specified age. Such laws cannot be adequately enforced without an efficient system of recording births. From a social scientific point of view, it is of the greatest importance to ascertain the birth rates of the various classes in the general population. Under present conditions, except for New England, Pennsylvania, and Michigan, such rates can be found only through inferences from the census of population. See VITAL STATISTICS.

BIRTHWORT See ARISTOLOCHIA.

BIRUNI, bî-rû'nî, ABU RÂHMÂN MUHAMMAD IBN AHMED AL (973-1048). An Arabian scholar and author. He was born in Khwarizm and was of Iranian descent. Some time after he had finished his great work *Kitab al Athar al Bakuya*, in 1000 A.D., he moved to India, where he taught the Greek sciences and learned much concerning the civilization of India. Upon his return he took up his residence at Ghazni, Afghanistan, while that city was prominent as the capital of Mahmud and his son Mas'ud, to whom he dedicated his exposition of astronomy. He died at Ghazni. Among his works, translated by C. E. Sachaw, are *Chronology of Ancient Nations* (London, 1879) and *India: An Account of the Religion, Philosophy, Literature, Geography, Chronology, Astronomy, Customs, Laws, and Astrology of India about 1030 A.D.* (London, 1910), and a mathematical treatise translated into German by H. Suter, *Das Buch der Auffindung der Seiber in Bibliotheca Mathematica* (1910).

BIS (Lat twice). In music a term which denotes that the passage over which it is placed is to be played twice, or repeated. Such passages generally have a slur or bow over them, and the word "bis" written below it, thus *bis*.

BISAYA, bî-sî'yâ. See VISAYA.

BISBEE. A city in Cochise Co., Ariz., 82 miles southeast of Tucson, on the El Paso and Southwestern Railroad (Map Arizona, F 6). It contains a public library, two hospitals, and a

country club. Bisbee has important lead, silver, and gold mining interests and is one of the most productive copper regions in the southwest, having a daily output of 7000 tons. Pop., 1910, 9019.

BISBEE, WILLIAM HENRY (1840-) An American soldier, born in Rhode Island. He enlisted as a private in the Eighteenth Infantry at the outbreak of the Civil War and served until its close, especially distinguishing himself at the battles of Murrefreesboro and Jonesboro, Ga., and in the Atlanta campaign. Following the war he served for many years in the West, putting down numerous Indian uprisings and quelling riots. During the Spanish-American War he commanded a regiment and took part in the battles of El Caney and San Juan. From 1899 to 1902 he served in the Philippines, where for a time he commanded a subdistrict and later had command of all the troops north of Manila in the island of Luzon. He retired from active service in 1902, having attained the rank of brigadier general in the preceding year.

BISCACHA, bis-ka'chá. See VIZCACHA.

BISCAY (Sp. *Biscaya*, *Vizcaya*), a Spanish province named after the *Basques*, BAY OF (the Roman *Sinus Aquitanicus*, *Sinus Cantabricus*, *Cantaber Oceanus*, or *Gallicus Oceanus*, and the French *Golfe de Gascogne*, sometimes called also the Cantabrian Sea). A portion of the Atlantic Ocean sweeping in along the northern shores of the Spanish Peninsula in an almost straight line from Cape Ortegal to St Jean de Luz, at the western foot of the Pyrenees, and thence curving along the west shores of France northward to the Pertuis Breton and northward to the island of Ouessant. Its extreme width and length are about 400 miles each. The whole of the south coast is bold and rocky, in some places rising to a height of several hundred feet, and broken by inlets, some of which form safe and commodious harbors. From the mouth of the Adour to the Gironde the shore presents a totally different aspect, being low and sandy, with numerous lagoons, the embouchures of these two rivers forming the only harbors. For 800 miles north of the Gironde the coast is still low, but marshy instead of sandy, and from the peninsula of Quiberon westward it is moderately elevated and rocky in some places. The rivers falling into the bay on the Spanish shores are unimportant. On the coast of France it receives, through the rivers Vilaine, Loire, Charente, Dordogne, and Gironne (the common estuary of these two being the Gironde), and Adour, the waters of about one-half the surface of the whole country. Its chief ports are Gijón, Santander, Bilbao, San Sebastián, and Pasajes in Spain, and Bayonne, Bordeaux, Rochefort, La Rochelle, Nantes, and Lorient in France. Its chief islands, which are all situated north of the Gironde, are Belle-Île, Noirmoutier, Re and Oléron. Navigation is rendered difficult and dangerous by the prevalence of northwest winds and by the existence of the violent Renel's current. The depth of the bay ranges from 100 feet or less along the shore to more than 10,000 feet in the central part. The height to which the tides rise is hardly exceeded anywhere. Consult "Transactions," Linnæan Society of London, series 2, *Zoology* (London, 1904-11).

BISCEGLIE, bî-shâ'lyâ (anciently, Lat *Vesulisa*). A city in the province of Bari, south Italy, on the Adriatic, 21 miles northwest of Bari (Map Italy, L 6). The harbor admits

vessels of small burden only. The principal buildings are the cathedral, two churches, dating from the twelfth century, a dilapidated Norman castle, and the palaces of the old families. In the surrounding country, which produces excellent wine and currants, there are many magnificent villas. During the Crusades Bisceglie was famous for the hospital for pilgrims founded by Bohemond. Its ruins still exist. Pop, 1881, 24,000, 1901, 30,885, 1911, 34,425.

BISCHOF, bish'of, KARL-GUSTAV CHRISTOPH (1792-1870). A German chemist and geologist. He was born in Nuremberg and in 1822 became professor of chemistry and mineralogy at Bonn. He obtained the prize of the Scientific Society of Holland for his treatise on internal terrestrial heat, and published in England, in connection with it, *Researches on the Internal Heat of the Globe* (1841). His chief work, *Lehrbuch der chemischen und physikalischen Geologie* (3d ed, 1863-66), was an important contribution to the study of the physical and chemical problems of geology.

BISCHOF, MARIE. See BRANDT, MARIANNE.

BISCHOFF, JOSEPH EDUARD KONRAD, pen name, Konrad von Bolanden (1828-1910). A German novelist. He was born at Niedergailbach and after studying at the Catholic Theological Seminary at Munich was ordained a priest at Speyer in 1852. Afterward he retired from the ministry to devote his entire attention to literary work, in which he became noted through Catholic Europe. His publications consist of historical novels and romances attacking the Reformation, the political and literary movements of the eighteenth century, and the progress of contemporary science. His best-known works are *Eine Brautfahrt* (1857), *Franz von Sickingen* (1859), *Historische Novellen über Friedrich II von Preussen und seine Zeit* (4 vols, 1865-66), *Angela* (1866), *Gustav Adolf* (1867-70), *Die Bartholomäusnacht* (1879), *Die Sozialdemokraten und ihre Vater* (1894), *Deutsche Kulturbilder* (1893-94), *Otto der Grosse* (1898), *Die Sünde wider den heiligen Geist* (1901), *Megenfried* (1902), *Minnetreue* (1904), *Der neue Gott* (1909), *Satan bei der Arbeit* (1909). Consult article by Keiter, "Konrad von Bolanden," in *Unsere Zeit*, vol 1 (Leipzig, 1876).

BISCHOFF, THEODOR LUDWIG WILHELM (1807-82). A German anatomist and physiologist. He was born in Hanover and became professor of anatomy at Heidelberg in 1836. From Heidelberg he removed, in 1844, to the University of Gießen and in 1855 to that of Munich. He devoted himself especially to embryology, to which he made many contributions. His *Entwicklungsgeschichte des Kammcheneres* (1843) received the prize from the Berlin Academy. Of his numerous writings in Müller's *Archiv*, and published separately, may be singled out the *Beweis der von der Begattung unabhängigen periodischen Reifung und Loslösung der Eier der Säugetiere und des Menschen* (1844), in which he establishes the important doctrine of the periodic ripening and detachment of the ova in mammalia and man, independently of generation. Being called upon in 1850, together with Liebig, to give his opinion in the famous Gorlitz trial (q.v.), which involved the question of the possibility of spontaneous combustion, he took occasion to publish a dissertation on the subject, *Ueber die Selbstverbrennung* (demonstrating the impossibility of spontaneous combustion), which

appeared in Henke's *Zeitschrift für die Staats-ärztliche Kunde* (1850).

BISCUIT (for older *E biscuit*, Fr *biscuit*, twice-baked, from *bis*, twice + *cuire*, to bake, cf Ger *Zweiback*). A kind of hard, dry bread baked in small, thin cakes. In the United States this kind of bread is usually called crackers, the name "biscuits" being applied to small, round, soft cakes made from dough, raised with yeast or baking powder, or sour milk and soda, and usually shortened with lard, etc. Biscuits or crackers are usually made of flour, water, or milk, and salt, to which are added, for special varieties of biscuits, sugar, spices, butter, eggs, dried fruits, etc. There are many varieties of biscuits now made, but practically the same mode of procedure is adopted in making them all. The ingredients are first mixed by machine to form a dough, and this dough is mechanically kneaded, rolled out thin, and cut into squares or disks, which are carried through the ovens on traveling frames or belts, and baked in about 15 minutes. The baked biscuits are next dried for several days, and finally packed in one of a variety of forms for shipment. See BREAD.

BISCUIT. A term applied in pottery to porcelain and other earthenware after the first firing and before it has received the glaze and embellishments. (See PORCELAIN and POTTERY.) In this condition the ware is very porous and allows water very slowly to percolate through its pores.

BISCUIT ROOT. A bulbous plant belonging to the family Liliaceæ. See QUAMASH.

BISE. See BICE.

BISHARIN, bē'shā-rēn' (Ar pl of *Bishar*). The designation of a group of tribes living between the Red Sea, the Nile, and Abyssinia. Properly they form the northern division of the Beja, while the southern members of the group are called Hadendoa. The Bisharin are nomadic herdsmen and are nominally Mohammedans. Those living near the borders of Egypt have the reputation of being sturdy beggars. They present physically a fine Caucasian type, and they speak a highly developed Hamitic language, of which there are grammars by Almqvist (Upsala, 1881-85) and Reinisch (Vienna, 1893). For an account of the Bisharin, consult Munzinger, *Ostafrikanische Studien* (Schaffhausen, 1864).

BISH'OP. The title of the highest order of clergy in the Christian Church. The name is in the Saxon *biscop*, and comes from the Greek *ἐπίσκοπος*, *episkopos*, an overseer, from *ἐπί*, *epi*, upon + *σκοπεῖν*, *skopein*, to watch. The Athenians used to send officers called *ἐπίσκοποι*, *episkopoi*, to their subject states. The word was adopted by the Romans, and Cicero speaks of himself as an *episcopus* in Campania, it was also applied by them to the officers who inspected the provision markets. There are two theories as to the functions of a bishop in the primitive Church, which may be described as the Episcopalian and the Presbyterian theories. The question between them is whether the episcopate is necessary to the very existence of a church or only to its orderly regulation, in other words, to its *esse* or to its *bene esse*.

According to the former, the first bishops in the Church of Christ were his Apostles, "for the office wherunto Matthias was chosen is termed (Acts 1:20) *ἐπίσκοπος*, i.e., an episcopal office, which being spoken expressly of one, agreeth no less unto them all, and therefore St Cyprian, speaking generally of them all, calls them bish-

ops." The form of government at first established by the Apostles was that the laity or people should be subject to a college of ecclesiastical persons appointed for that purpose in every city. These, in their writings, they term sometimes "presbyters," sometimes "bishops." Thus St Paul to the elders at Ephesus says "Take heed to the flock over which the Holy Ghost hath made you overseers," i. e., bishops. But as the Apostles could not themselves be present in all churches, and as in a short time strifes and contentions arose, they appointed, after the order began at Jerusalem, some one president or governor over the rest, who had his authority established a long time before that settled difference of name took place whereby such alone were called bishops, and therefore, in the Book of Revelation, we find that they are entitled "angels." St Irenæus, martyred about the beginning of the third century, says "We are unable to number up them who by the Apostles were made bishops." In Rome, he tells us, they appointed Linus, and in Smyrna, Polycarp. St Ignatius witnesses that they made Evodius Bishop of Antioch. St Jerome says "All bishops are the Apostles' successors", and St Cyprian terms bishops "*prespositi qui apostolis vicaria ordinatione succedunt*" (presidents who succeed to the Apostles by vicarious ordination). Hooker says, in his usual judicious manner "Such as deny Apostles to have any successors at all in the office of their apostleship, may hold that opinion without contradiction to this of ours, if they will explain themselves in declaring what truly and properly apostleship is. In some things every presbyter, in some things only bishops, in some things neither the one nor the other, are the Apostles' successors." And he adds, what fairly states the episcopal theory on this subject "The Apostles have now their true successors, if not in the largeness, surely in the kind of that episcopal function whereby they had power to sit as spiritual ordinary judges, both over laity and over clergy, where churches Christian were established." We find, also, that throughout those cities where the Apostles did plant Christianity, history has noted a succession of pastors in the seat of one, not of many, and the first one in every rank we find to have been, if not some Apostle, yet some Apostle's disciple. By Epiphanius the bishops of Jerusalem are reckoned down from St James to his own time, and Tertullian, writing in the second century, has the following "Let them show the beginnings of their churches, let them recite their bishops one by one, each in such sort succeeding other that the first bishop of them have had for his author and predecessor some Apostle, or at least some apostolical person who persevered with the Apostles, for so apostolical churches are wont to bring forth the evidence of their estates." The judgment of the Church of England, as to the primitive existence of bishops, is to be found in the preface to the ordination service, drawn up in the reign of Edward VI, where it is said "It is evident unto all men diligently reading the Holy Scripture and ancient authors, that from the Apostles' time there have been these orders of ministers in Christ's Church—bishops, priests, and deacons." St Thomas Aquinas, however, distinguishes technically by saying that "the episcopate is not an order, but a dignity within an order." Accordingly, in the Roman Catholic church, while ordination

has always been performed by bishops, some other functions usually considered episcopal are at times delegated to priests, thus confirmation is occasionally administered by priests—with oil, however, blessed by a bishop.

According to the other, or Presbyterian theory of bishops, no traces of a hierarchy are to be found in the earliest churches. The superintendents or directors appointed over the first churches by the Apostles or chosen by the members of the congregations were unquestionably styled indifferently presbyters or bishops—the former title being borrowed from the Jewish synagogue, the superintendent or director of which was called the elder (Gr *presbyteros*), the latter (*episcopos*) being familiar to the heathen converts as the title of a civil office corresponding in function to that of a Christian pastor. But this original equality did not last long. As new churches multiplied, those formed round the original church remained in confederacy, though each having its own bishop or presbyter, and in the meetings of the pastors to regulate the common affairs one must of necessity preside, most likely determined by age, superior piety, or other qualification. From this simple circumstance as is indicated by Clemens Alexandrinus in the beginning of the third century, sprang the habit of looking upon one of the bishops as superior to the others, and this superiority, at first personal and accidental, soon came naturally to be regarded as attached to the bishop of a particular congregation. In his case the word "bishop" came to signify an overseer of pastors rather than an overseer of people. The monarchical form of state government favored this tendency and converted the president of a presbytery into the privileged superintendent of his brother pastors. The assumption was resisted by the presbyters at first, but from the middle of the fifth century episcopacy, or the domination of bishops, continued to gain the upper hand over presbyterianism, or equality of all pastors.

In the third century bishops appear still dependent on the advice of their presbyters and the consent of the people and shared with the former the office of teaching and the cure of souls. As yet their exclusive privileges or functions were limited to confirmation, ordination of ministers, consecration of sacred things, settlement of secular differences among Christians, and management of the revenues of the Church. But the tendency to subordination and unity did not rest here. Among the bishops, at first all equal, those of the larger and more important cities began gradually to acquire a superiority over those of inferior cities. When Christianity was made the religion of the Roman Empire, the bishops became more and more monarchical and put themselves on the footing of ecclesiastical princes. The chief cities of the larger civil provinces rose to be seats of extensive dioceses, the bishops of these assuming the distinctive titles of *patriarch*, *metropolitan*, *papa*—titles of courtesy that had long been applied to all bishops, while the less important provinces, with their capitals and bishops, became subordinate. Among these provincial bishops, again, three, from obvious causes, acquired a prominence that cast all the rest into the background, viz, Alexandria, Constantinople, and Rome. The beginnings of the ascendancy of the Roman Pontiff, whatever may be thought of its claim

to divine institution are indisputably discernible as early as the end of the second century.

In the Roman Catholic church the episcopal office is the foundation of the whole system. Christ's Apostles are held to have transferred their functions to the episcopacy as a body. Every bishop, therefore, exercises within his own diocese, first, the *ius magistratum*, i.e. the right of maintaining and propagating the orthodox faith, and second, the *ius ordinis*, or regulation of the sacred and mysterious rites of the priestly office, some of which are transferred to the inferior clergy, as *iura communia*, while others remain the privileges of the bishop (*iura propria*). Among episcopal prerogatives, in addition to those already mentioned as assigned to them in the third and fourth centuries, are anointing of kings, consecration of abbots, etc. They have also the management of the Church property in their respective dioceses and the oversight of all ecclesiastical institutions. They are appointed by the Pope. In the United States the clergy of the diocese who are entitled to share this function send to Rome a list of three names in order of preference, designating them as *dignissimus*, *dignior*, and *dignus*, a similar list is submitted by the other bishops of the province. The Pope may be guided by these recommendations and nominate one of these men, or he may set the lists aside altogether and make his own selection. In some European and South American countries, as a result of past compromises or concordats, the head of the state is allowed to nominate, subject, of course, to papal confirmation. The consecration takes place normally at the hands of three bishops, this number having been required from post-apostolic times, though a single consecrator would suffice for validity. After the elaborate ceremonies of consecration, the new bishop takes his place upon his throne and gives his blessing to the people committed to his oversight. (For the special vestments worn by Roman Catholic bishops, and their uses, see COSTUME, ECCLESIASTICAL.) In case of the incapacity through age or infirmity of a diocesan prelate, an assistant or coadjutor bishop is appointed, who bears the title of some extinct see *in partibus infidelium*, it being contrary to ancient usage to consecrate a bishop with a roving commission. See TITULAR BISHOPS.

In the Greek church the office of bishop is essentially the same, though the powers of the incumbent are somewhat more restricted. Greek bishops are practically always chosen from the monastic orders and generally from the archimandrites or abbots of those orders.

The episcopal office in its essentials has practically disappeared from the Protestant communities of the continent of Europe, although the title has been retained in Sweden, Norway, and Denmark. The bishops of the two former countries, while they are from the ecclesiastical standpoint no more than the superintendents of other Lutheran churches, have retained some of their ancient prerogatives, such as seats in Parliament, and still use the mitre, pallium, and crozier. In Germany the title has occasionally appeared in modern times among Protestant churches, having been conferred, for example, by Frederick I and Frederick William III.

In no other Protestant country have the prerogatives and revenues and functions of bishops remained so little impaired as in England, where the Reformation was guided by the King's own hands and, being propagated from above

downward, was effected in a very conservative spirit. Episcopacy was abolished by law under the Commonwealth, but at the Restoration the bishops were also restored, being connected closely in the thought of the time with monarchy, on James I's principle of "no bishop, no king," and have since retained their position in church and state. They are elected by the chapter of each cathedral church by virtue of a license from the crown, this is the theory, but actually the bishops of the Church of England are appointed by the crown on the advice of the prime minister, since no chapter ventures to disregard the nomination which accompanies the *congé d'élire*. The sovereign on the vacancy being notified, sends to the dean and chapter a letter missive, or *congé d'élire*, containing the name of the person to be elected, and if they do not elect in the manner appointed by the act, or if the archbishop or bishop appointed for the purpose refuse to confirm, invest, and consecrate the bishop-elect, the recusants incur the penalty of a *præsumptio* (q.v.). A bishop cannot be *deposed*, as it is supposed that the order itself cannot absolutely be taken from him: he may, however, be *deprived*, as was done to the Bishop of Clogher in 1822, he may also resign his see, and he may be removed from one see to another, which is called *translation*, but this practice is now less frequent than it used to be. The Dean and Chapter of Canterbury claim it as an ancient right of that church that every bishop of the province is to be consecrated in it, or the archbishop to receive from them a license to consecrate elsewhere, and it is said that a long succession of licenses to that purpose are regularly entered in the registry of that church. Bishops, upon their election, become peers of the realm and have seats in Parliament along with the other nobles, but the right under which they sit there, whether in respect of their baronies or by usage and custom, is a matter of uncertainty. It appears, however, that the bishops sat in the Witenagemote, under the Saxon monarchs, as spiritual persons, for they were not barons until William the Conqueror turned their possessions into baronies and subjected them to the tenure of knights' service. The bishops created by Henry VIII—viz. Bristol, Gloucester, Chester, Oxford, and Peterborough, as also some lately created bishops—sit in Parliament, though they do not hold their lands by baronial tenure. The bishops withdraw from the House (under protest, however) when any capital charge is to be decided. In respect of their persons bishops are not peers with the nobility, and in case of alleged crimes they are tried by a jury in the same manner as commoners, as was the case with Crammer and Fisher. When a see is vacant, the archbishop of the province is guardian of the spiritualities, but he cannot as such consecrate or ordain or present to vacant benefices. The sovereign has custody of the lay revenues during a vacancy. Queen Elizabeth kept the see of Ely vacant 19 years.

Including the two metropolitans, there are 35 diocesan bishops in England, most of them bearing the titles of pre-Reformation sees. They are Canterbury, York, London, Durham, Winchester, Bangor, Rochester, Exeter, Peterborough, St David's, Worcester, Chichester, Lichfield, Ely, Oxford, St Asaph, Manchester, Hereford, Chester, Llandaff, Lincoln, Salisbury, Bath and Wells, Carlisle, Gloucester, Bristol, Ripon,

Norwich, Sodor and Man, Truro, St Albans, Liverpool, Newcastle, Southwell, and Wakefield. There is also a constantly increasing number of suffragan or assistant bishops who bear territorial titles, but have no independent jurisdiction and no seats in Parliament. The Episcopal Church of Scotland has 7 bishops, and that of Ireland 2 archbishops and 11 bishops. The first colonial bishopric of the Anglican communion was that of Nova Scotia, founded in 1787, but the nineteenth century saw a prodigious increase in their numbers. There are now 21 bishoprics in British North America, 7 in the West Indies, 11 in India and Ceylon, 23 in Australia, 7 in New Zealand, 13 in South Africa, and 31 under the direct jurisdiction of the Archbishop of Canterbury, mostly in non-Christian lands.

In the Protestant Episcopal Church of the United States, the functions of the bishops, in religious matters, are similar to those of English prelates. In political affairs they have, of course, no official power. They are chosen to office by the convention of clerical and lay deputies of the diocese over which they are to preside, except in case of missionary bishops, who are nominated by the House of Bishops and elected by the House of Clerical and Lay Deputies. There are at present about 110 in the House of Bishops.

In England, under the Archbishop of Westminster as primate, there are 15 Roman Catholic bishops. The hierarchy here was restored in 1850, and in 1878 in Scotland, where there are 2 archbishops and 4 bishops. The assumption of territorial titles by Roman Catholic bishops in England and Scotland was made illegal by the Ecclesiastical Titles Act of 1851, but the law, passed in a moment of great popular excitement, has always been a dead letter. In Ireland there are 4 Catholic archbishops and 23 bishops. In the United States the Church has 14 archbishops, with the Archbishop of Baltimore as primate, and about 100 other diocesan bishops, besides an apostolic delegate.

In the Methodist Episcopal church the bishops are elected by the General Conference. Their duties are those included in a general superintendence of the whole church. Authority is vested in them all, and its administration distributed among them by mutual agreement. They preside over meetings of the annual conferences, ordain ministers, and appoint them to their fields of labor. There are 36 in the Northern branch and 14 in the Southern church. They have no dioceses and are all itinerant. The Reformed Episcopal church has 6 bishops, and the African Methodist Episcopal church 17. Other Protestant bodies in the United States have adopted the episcopal form of government, among them the United Brethren in Christ and the Evangelical Association. See ARCHBISHOP, APOSTOLIC SUCCESSION.

For the discussion of the theory, consult Lightfoot, *St Paul's Epistle to the Philippians* (London, 1888); Baur, *Das Christenthum und die christliche Kirche der ersten drei Jahrhunderte* (Tübingen, 1853); Hatch, *Organization of the Early Christian Churches* (London, 1881); Wordsworth, *Theophilus Anglicanus* (London, 1843); Dollinger, *The First Age of the Church* (Eng. trans. Oxenham, London, 1866); Moberly, *Ministerial Priesthood* (London, 1898); Réville, *Les origines de l'épiscopat* (Paris, 1894); Jungfer, *Die Unterschiede zwischen der Papstwahl*

und den Bischofswahlen nach dem gemeinen Kirchenrecht (Borna Leipzig, 1909).

BISHOP. A beverage best known in England, composed of red wine (claret, Burgundy, etc.) poured warm or cold upon ripe bitter oranges, sugared and spiced to taste, and drunk either hot or cold. The oranges should be carefully selected, and the white part between the peel and pulp thrown away. If white wine be used, the beverage is called *cardinal*, and with Tokay it becomes *pope*. "Bishop" was known under other names in Germany during the Middle Ages, having been imported into that country from France and Italy, its present name seems to have been bestowed during the seventeenth century.

BISHOP, ANNA RIVIÈRE (1814-84). An English operatic singer, born in London. She was the wife of the composer Sir Henry Rowley Bishop. Her first appearance was in 1837, and she soon became widely known in Europe and America. In 1839 she sang in the principal cities of the Continent. She returned to England in 1846 and in the following year came to America and became an exceedingly popular singer in the United States, Canada, and Mexico. She married Martin Schultz, a New York merchant, in 1858. In 1866 she sang in Manila and China. She lost her voice in 1868 and retired from the stage.

BISHOP, SIR HENRY ROWLEY (1786-1855). An eminent English composer of music. He was born in London. His principal musical instructor was Signor Francesco Bianchi, an opera composer settled in London. In 1806 Bishop was appointed composer of ballet music at the opera. The opera *Circassian Bride* (1809) won a triumph at Covent Garden, and a long list of works for the stage followed. From 1810 to 1824 he was director of the music at Covent Garden Theatre. He was not only one of the original founders of the London Philharmonic Society, but also one of its first directors. From 1840 to 1848 he conducted the *Concerts of Ancient Music*. He arranged several volumes of the *National Melodies* and succeeded Sir John Stevenson as arranger of the airs selected by Moore for his *Melodies*. Bishop composed the familiar music to John Howard Payne's *Home, Sweet Home*. In 1839 he received the degree of bachelor of music from the University of Oxford and in 1841 was elected Reid professor of music in the University of Edinburgh. In 1842 he was knighted. He resigned his Edinburgh chair in 1843 and in 1848 was elected professor of music in the University of Oxford.

BISHOP, ISABELLA BIRD (1832-1904). An English traveler and author. She was born in Yorkshire, England, Oct. 15, 1832, the daughter of Rev. Edward Bird. She began traveling in North America at an early age and later spent 13 years in Asia, showing skill, courage, and tact. Married to John Bishop, M.D., in 1881, and widowed in 1886, she continued her travels, lectures, and writing. In 1892 she was elected a fellow of the Royal Geographical Society as the first woman who joined the society. Her nine volumes of travel (many of which first appeared under her maiden name, Bird) on North America, Hawaii, Japan, the Malay Peninsula, Persia, Kurdistan, Tibet, Korea, Siberia, China, and Morocco, show great ability. In 1901 she went on a philanthropic mission to India. Among the best known of her books are *Korea and her Neighbors* (1898) and *The Yang-*

tse Talley and Beyond (1900) Consult Stoddart, *The Life of Isabella Bird* (New York, 1908)

BISHOP, JOSEPH BUCKLIN (1847-) An American journalist, author, and public official, born at Seekonk, Mass. He graduated from Brown University in 1870 and at once took up newspaper editorial work, writing first on the New York Tribune, later on the New York Evening Post, and then in 1900-05, as chief of the editorial staff on the New York Globe. In 1905 he was appointed secretary of the Isthmian Canal Commission, having general charge of all construction publicity plans and editing a weekly paper, the *Canal Record*. He remained in this office until the canal was completed. He wrote many articles for journals and magazines, and in 1913 published *The Panama Gateway*, and, with Robert E. Peary, *Uncle Sam's Panama Canal and World History*. He is also author of *Cheap Money Experiments* (1892), *Our Political Drama* (1904), and *Issues of a New Epoch* (1904)

BISHOP, SETH SCOTT (1852-) An American physician, born at Fond du Lac, Wis. He graduated in 1876 at Northwestern University and subsequently was appointed professor of otology at the Chicago Post-Graduate Medical School and Hospital and professor of diseases of the nose, throat, and ear at the Illinois Medical College. He published *Diseases of the Ear, Nose, and Throat, and their Accessory Cavities* (4th ed, 1908), and *The Ear and its Diseases* (1906)

BISHOP, WILLIAM HENRY (1847-) An American novelist, born at Hartford, Conn., and a graduate of Yale University in 1867. The best known of his novels and sketches are *Detmold* (1879), *The House of a Merchant Prince* (1882), *Choy Susan and Other Stories* (1884), *The Golden Justice* (1887), *The Brownstone Boy and Other Queer People* (1888, reprinted in 1902, with the title *Queer People*), *A House Hunter in Europe* (1893), *Writing to Rosina* (1894), *The Yellow Snake* (1902), reprinted as *A Pound of Treasure* (1904) *Old Mexico and her Lost Provinces* (1883) is a book of travel. Mr. Bishop was appointed United States Consul at Genoa in 1903, and was Consul at Palermo from 1905 to 1910

BISHOP AUCKLAND A town in the county of Durham, England, 10½ miles southwest of the city of Durham, on an eminence near the confluence of the Wear and Gauness (Map England, E 2) There is a fine town hall, built in 1863. The chief building of interest, however, is Auckland Castle, the palace of the bishops of Durham, a large pile covering about 5 acres in the midst of a park of 800 acres. The site was selected during the reign of Edward I (1272-1307). The principal industries of the town are iron manufactures, and in the neighborhood are several collieries. Pop, 1891, 10,500, 1901, 12,000, 1911, 13,834

BISHOP BLOU/GRAM'S APOLOGY. A fine dramatic monologue by Robert Browning

BISHOPS' BOOK A primer of doctrine and instruction, compiled by a commission of bishops and ministers of the English Church in 1537 and known also as *The Institution of a Christian Man*. It contains an exposition of the Apostles' Creed, the Seven Sacraments, the Ten Commandments, the Lord's Prayer, and the doctrines of justification and purgatory. It is contained in *Formularies of Faith Put Forth by Authority*

during the Reign of Henry VIII (Oxford, 1823) Consult Hardwick, *Reformation* (London, 1856)

BISH/OPSGATE/ A London street, so called from a gate, which once stood in the north wall of the city

BIS/KRA, or BIS/KARA (named after the tribe *Bishri*) A town and commune in the department of Constantine, Algeria, on the south side of the Aures Mountains, 117 miles southwest of Constantine by rail (Map Africa, E 1) It is the most important military post of the district and formerly had a large caravan trade between the Sahara and the Tell. Biskra is situated in a fertile oasis, rich in date palms and olives. Its pleasant climate and sulphur springs in the vicinity have made it a popular French winter resort. In summer it is very warm and a temperature of 120° F is not unusual, while winds in winter often cause intense cold. The town has broad streets, with substantial houses. Fort Saint-Germain contains the barracks, government offices, and hospital. Burnous and carpets are manufactured, and iron, limestone, and saltpetre are mined in the neighborhood. The Zaba of the Romans, it was an important town under the Moors, but declined after the plague of 1863, by which 71,000 inhabitants perished. It was taken by the French in 1844. Pop (commune), 1891, 7166, 1901, 7528, 1911, 10,606

BISLAND, ELIZABETH See WETMORE, ELIZABETH BISLAND

BISMARCK, biz/mark The capital of North Dakota, and the county seat of Burleigh County, on the Missouri River, and on the Northern Pacific and the Minneapolis, St. Paul, and Sault Sainte-Marie railroads (Map North Dakota, E 3) It is attractively situated on the east bank of the river, which is here crossed by a magnificent bridge of steel and iron, 50 feet above high water, and contains a fine courthouse, several Federal institutions, the State penitentiary, the State library, United States Indian School, Bismarck Hospital, and St. Alexis' Hospital. The capitol, completed in 1894 at a cost of \$500,000, is the most prominent building. The city controls a very extensive river trade, the principal commodities being coal, which abounds in that region, grain, hides, etc. The industrial establishments include grain elevators, a large twine plant, a large flouring mill, a creamery, and a foundry. Four miles distant is Fort Lincoln, a United States military post, from which General Custer started on the expedition which resulted in the annihilation of his entire troop. Lewis and Clark spent the winter of 1804-05 on or near the site of Bismarck, which was permanently settled in 1873 and incorporated shortly afterward. In 1883 it was made the capital of Dakota Territory and in 1889 became the capital of North Dakota. Bismarck adopted the commission form of government in 1913. It has a street-car line, owned and operated by the State. The North Dakota Industrial Exposition is held in Bismarck in October of each year. Pop, 1905, 4913, 1910, 5493

BISMARCK, biz/mark, Ger pron bis/mark, FRIEDRICH WILHELM, COUNT (1783-1860) A German soldier and military author. He was born at Windhelm, Westphalia, and was a member of the Rhenish branch of the Schönbach family of the Bismarck family. He served with Hanoverian, and afterward with Nassau regiments, and in 1804 became a member of

the English German Corps. Compelled to resign from the English service because of a duel, he entered the cavalry service of Wurttemberg, at that time in alliance with France. He greatly distinguished himself in the campaigns against Austria (1809) and Russia (1812). After the battle of Leipzig he was employed in various diplomatic missions in the service of Wurttemberg. He was a prolific writer, especially on cavalry tactics, and a great admirer of Napoleon, whose later campaigns he describes in the work entitled *Aufzeichnungen* (1846). Among his other publications are the following *Vorlesungen über die Taktik der Reiterei* (1818, 3d ed., 1826), *Reiterbibliothek* (6 vols., 1825-31); *Identität der Reiterei* (1829).

BISMARCK ARCHIPELAGO, ar'ki-pel'a-gō. A group of islands in the Pacific Ocean, situated about 56 miles east of New Guinea, and extending from lat 2° to 6° 30' S, and long 148° to 155° E (Map Australasia, G 3). Its area is estimated at 20,000 square miles, and it comprises the islands of New Pomerania (New Britain), New Mecklenburg (New Ireland), New Laurenburg (Duke of York Islands), New Hanover, Admiralty, Anchorite, Commerson, Hermit, and a few others. The chief products are copra, cotton, coffee, and rubber. The annual imports and exports are valued at about a quarter of a million dollars each. The population is estimated at 188,000 and consists chiefly of Papuans. In November, 1885, they were declared a German protectorate and placed under the control of the German New Guinea Company. Formerly called New Britain Archipelago, the group was renamed in honor of the great statesman. Consult Verbeek, "Die Entdeckung des Bismarck-archipels," in *Beiträge zur Kolonialpolitik und Kolonialwirtschaft* (Berlin, 1899-1900); Thilenius, "Geologische Notizen aus dem Bismarck-Archipel," in *Globus*, vol. lxxvii (Brunswick, 1900); Stephan and Graebner, *New Mecklenburg* (Berlin, 1907); Stephan, *Südsee- und Ostsee-Beiträge zur Kunst des Bismarck-Archipels* (Berlin, 1907).

BISMARCK - BOHLEN, bis'mark - bō'len, FRIEDRICH ALEXANDER, COUNT (1818-94). A Prussian soldier. He was born on the family estate at Karlsburg. From 1846 to 1848 he was the official military attaché and companion of Prince Frederick Charles at the University of Bonn. In 1864 he was raised to the rank of major general, in which capacity he served in the Austro-Prussian War. Upon the conclusion of that campaign he was appointed Governor of Hanover (1866). He was commandant of Berlin in 1868, and Governor-General of Alsace-Lorraine during the Franco-Prussian War, upon the conclusion of which he was appointed adjutant-general to Emperor William.

BISMARCK BROWN. See COAL-TAR COLORES.

BISMARCK-SCHONHAUSEN, bis'mark shōn'hou-zen, HERBERT NIKOLAUS VON, PRINCE (1849-1904). A German statesman, eldest son of Prince Otto von Bismarck. He was born in Berlin and studied at the universities of Bonn and Berlin. He fought in the Franco-Prussian War, and was appointed an officer Sept. 2, 1870. In 1873 he entered the Foreign Office and served at Bern and Vienna, acting subsequently as private secretary to his father from 1877 to 1881. In 1882 he was appointed Counselor of Legation at London and in 1884 he was sent in a similar capacity to St. Petersburg, whence he was in the same year transferred as Ambassador to The

Hague. He became Undersecretary of State in 1885, and Secretary of State in 1886. After the resignation of his father (March 20, 1890) retired from the diplomatic service and withdrew to his estate at Schonhausen. He was elected to the Reichstag in 1893 and 1898 as member of the Conservative party. The Treaty of 1885 between Germany and England, relating to the colonial boundary question, was negotiated by him. He also presided at the Samo Conference held in Berlin in 1889. His political speeches have been published by Penzler under the title *Politische Reden* (1890).

BISMARCK-SCHONHAUSEN, KARL OTTO EDUARD LEOPOLD VON, PRINCE (1815-98). First Chancellor of the German Empire. He was born April 1, 1815, at the family manor of Schonhausen, in the district of Magdeburg, Prussia. He was one of the six children of Karl Wilhelm Ferdinand von Bismarck, a captain in the Royal Bodyguard of Prussia. His mother was the daughter of Herr Menken, a high official in the Prussian civil service. The family traced its lineage back directly for five centuries, and many of its members had held high positions in the military service of Brandenburg and Prussia and at court. In 1832-33 Bismarck studied jurisprudence and political science at Göttinge where he made the acquaintance of John Lothrop Motley, the American historian, an acquaintanceship which ripened into the strong friendship of later years. He studied for three semesters in Berlin, was admitted to the bar in 1833 and was referendary in Aax-la-Chapelle at Potsdam in 1836-37. In the latter city and Griefswald he served his term in the army, lieutenant in the Life Guards. In Griefswald too, he familiarized himself with the science of agriculture. On July 28, 1847, he married Johanna von Putkammer, and in the same year entered the first General Diet of Prussia, where he became known as an able and aggressive champion of ultraconservative measures. In 1848 he was elected to the Second Chamber of the Prussian Diet, called into existence by the revolutionary outbreak of 1848, and as a member of that body and of the Erfurt Parliament (1850) he advocated an increase in the powers of the monarchy and the consolidation of the German people through the joint action of Prussia and Austria. At the same time he combated the Erfurt and Frankfurt plans of union. In the early part of his career Bismarck gave little indication, except in his strenuous advocacy of Prussia's leadership, of the aims towards which his later activity was to be directed.

After holding the position of Prussian Secretary of Legation at Frankfurt-on-the-Main, Bismarck was appointed, in 1851, Prussian Ambassador to the Germanic Diet at Frankfurt. He had now apparently become convinced of the need of constitutional concessions in order to unite the German people and of the inherent antagonism between the interests of Austria and the cause of German unity, for he adopted more liberal programmes and assumed that attitude of hostility to Austrian pretensions which he maintained so consistently and successfully. He was so outspoken in his opposition to Austria that it was deemed prudent, in 1859, on the eve of the Franco-Italian War against Austria, to transfer him to St. Petersburg. There he labored effectively to strengthen the friendly relations between Russia and Prussia and gained the highest esteem of Alexander II. When, c

OTTO VON BISMARCK
FROM A PAINTING BY FRANZ VON LENBACH

the death of Frederick William IV, Jan. 2, 1861, William I succeeded to the Prussian throne, Bismarck was transferred from St. Petersburg to Paris, and in September, 1862, was made head of the Prussian cabinet and Minister of Foreign Affairs. The King was then faced by a Diet which was in stubborn opposition to an army bill, but he found in Bismarck a minister daring enough to govern without a budget and without parliamentary majority. In this manner began the lifelong alliance between King William and his great minister. Bismarck now entered upon his life work, the unification of Germany under Prussian leadership, and the placing of the new Germany in the forefront of European nations. In pursuance of this object he developed a thoroughly consistent and often ruthless policy and carried it out without hesitation. Speaking to the Budget Commission of the Prussian Diet, Sept. 30, 1862, he said:

"Our blood is too hot, we are fond of bearing an armor too large for our small body. Germany does not look to Prussia for liberalism, but for power. Let Bavaria, Württemberg, Baden, indulge in liberal ideas; no one will assign them the rôle destined for Prussia. Prussia must consolidate its might and nurse it for the favorable moment. Prussia's boundaries as determined by the Congress of Vienna are not conducive to its welfare as a sovereign state. Not by speeches and resolutions of majorities are the mighty problems of the age to be solved—that was the mistake of 1848 and 1849—but by blood and iron."

This much-misunderstood statement, so characteristic of Bismarck, concisely summarizes the subsequent development of German history. Its full significance is elucidated by Bismarck in his *Autobiography*. Bismarck disliked war, but he saw no way of bringing the jealous German states together except through war. He regarded it as indispensable to drive Austria, as an essentially non-German and antinational state, out of the Confederation, and he utilized the Schleswig-Holstein affair (see SCHLESWIG-HOLSTEIN) to antagonize Austria and finally to force an issue between that power and Prussia. At the same time he made Prussia the champion of the demand for a national German Parliament based on popular suffrage. This seemed so at variance with his earlier political course that Germany found it difficult to believe in his sincerity. Nevertheless, it was entirely consistent with the development of his character and opinions. He gained Austria over to his views in the Schleswig-Holstein matter and with her cooperation entered upon the war against Denmark (1864). He won the confidence of Italy, formed an alliance between that state and Prussia, and when the Schleswig-Holstein controversy came to a crisis in the Germanic Diet, Prussia was ready for action. On June 1, 1866, Austria referred the settlement of the question to the Diet, and on June 10 Bismarck addressed to the German courts a letter setting forth Prussia's national policy. The following day Austria moved in the Diet for federal execution against Prussia, and the tie vote was decided in the affirmative, whereupon the representative of Prussia presented his government's plan for a new national organization, declared the Confederation dissolved by its own action, and withdrew. Prussia at once invaded the German states that adhered to Austria, while the main Prussian army was pushed into Austrian terri-

tory. The brief and brilliant campaign (see GERMANY and SEVEN WEEKS' WAR) secured the first object in Bismarck's programme. The Peace of Prague excluded Austria from the German Confederation, which was reorganized under a permanent Prussian presidency as the North German Confederation. It was still necessary to bring the South German states into the Union, to prick the bubble of Napoleon III's self-assumed leadership in European affairs, and to establish a more satisfactory western boundary for Germany by making the Rhine a truly German river. Bismarck forced an issue with France with the same relentlessness and the same certainty of result that had characterized the contest with Austria. The mistakes of the French diplomacy (see BENEDETTI) were utilized to the full, and France was goaded into a war to which she was wholly unequal. (See FRANCO-GERMAN WAR.) Throughout the war Bismarck was at the side of his sovereign, evincing in the course of the peace negotiations extraordinary determination and executive capacity. When on the 18th of January, 1871, King William of Prussia at Versailles accepted the title of Emperor of the new German Empire, Bismarck's policy had been vindicated. Before this his triumph had been won by constant contention against the centrifugal tendencies of the old Germany and in spite of the steadfast hostility of a large section of the German people. Now he became a popular idol. On April 16 the text of the Imperial Constitution was promulgated and Bismarck, now created a prince, became the first Chancellor of the new Empire. His next task was that of organizing the internal affairs of Germany upon the new basis, and of developing an Imperial policy worthy of a power of the first rank.

There is no ministerial responsibility under the Imperial Constitution of Germany, nor is the parliamentary opposition organized as it is in the United States and England. Bismarck never came to believe in the wisdom of popular majorities or control by a partisan parliament. He saw the necessity of a popular basis for a strong government, but he believed above all in a strong executive. And the necessity of German unity was always uppermost in his mind. The promulgation of the doctrine of papal infallibility by the Vatican Council of 1870 was odious to him as tending to weaken the loyalty of the German Catholics. In no sense intolerant of religions as such, he was opposed to any political religious organizations within the state which recognized any other leadership except that of the Prussian monarchy. In January, 1873, he caused the introduction into the Prussian Diet of certain laws to regulate the relations of church and state. This was brought on the six years' struggle with the Clericals, known as the *Kulturkampf* (q.v.), in which Bismarck made the great mistake of his career, carrying his measures so far that in the inevitable reaction he was forced to acknowledge a virtual defeat. Bismarck's position seems to have been simply that of defending the authority of the state against outside interference. In 1874, replying to a Catholic attack in the Prussian Diet, Bismarck stated his principles clearly, acknowledging his duty to respect the dogmas of the Catholic church merely as dogmas, and adding: "If the doctrine of infallibility be so interpreted as to lead to the establishment of an ecclesiastical *imperium in imperio*; if it lead

to the nullification of the laws of this country because unapproved by the Vatican, I am naturally driven to assert the legitimate supremacy of the state. We Protestants are under the conviction that the Kingdom of Prussia ought not to be ruled by the Pope, and we demand that you, the Ultramontane section of the Roman Catholics, respect our convictions as we do yours." The controversy led to an attempt upon Bismarck's life by a mechanic named Kullmann in 1874. Finally, however, Ultramontane resistance drove Bismarck into an attitude of intolerance which proved untenable. Personally he had passed through four stages in his religious views, having arrived through rationalism, skepticism, and conventional Christianity at a profound religious conviction with a firm faith in God and immortality. He was tolerant because he cared little for creeds and outward forms.

An equally difficult problem confronted Bismarck in the growing power of the Socialists. Two attempts on the life of the Emperor in 1878, by avowed Socialists, enabled the Chancellor to overcome the scruples of the Liberals in the Reichstag, and to secure the passage of special laws for the suppression of socialistic agitation. The *Kulturkampf* had brought Bismarck into alliance with the National Liberals, his conservative tendencies broke this alliance, and he came to an understanding with the Conservatives and Catholics. Now that he had suppressed the political activity of the Socialists for the time being, Bismarck very characteristically gave his attention to checking the movement by making many features of the Socialist programme his own, and he imitated a policy of paternalism, which has become the foundation of state socialism in Germany to-day. The Prussian common law, as promulgated in the eighteenth century, had long ago insisted in general terms that it was the bounden duty of the state to provide employment for the workman, and Bismarck believed thoroughly in this principle. "Give the workman work as long as he is healthy," he said, "assure him care when he is sick, insure him maintenance when he is old."

Is it not established in our social relationships that the man who comes before his fellow citizens and says, 'I am healthy, I desire to work, but can find no work,' is entitled to say also, 'Give me work,' and that the state is bound to give him work?" Germany, and particularly Prussia, now embarked extensively upon a policy of governmental ownership of industrial enterprises, while for the protection of the workman against accident, sickness, and old age an extensive series of compulsory insurance acts were adopted (1883-89).

With the industrial and commercial development of the Empire, the time seemed ripe for expansion beyond the seas, and in 1884 Bismarck entered upon his colonial policy, at first half-heartedly. In a speech before the Reichstag, June 26, 1884, he declared his opposition to forced colonization, and his willingness to support only such a colonial policy as grew out of the need of protecting German subjects in foreign lands. He favored leaving the management of affairs largely to chartered trading companies, and added "It is not our intention to found provinces, but to foster commercial enterprise." To stimulate industry and thereby to check the continuous emigration from Germany, Bismarck advocated a protective tariff.

To settle the African question, as raised by the work of the International African Association, he arranged a conference at Berlin in 1884-85, which secured the recognition of the Congo Free State and laid down the lines upon which the partition of Africa has been effected. Bismarck was the author of the policy of subsidizing steamship lines from Germany to Asia, Africa, and Australasia, and the constant advocate of the Baltic and North Sea Canal, which was not constructed until after his retirement.

The genius of Bismarck was always most conspicuous in international affairs. He deliberately brought on three wars—with Denmark, Austria, and France—in order to further the great consummation of German unity. The German Empire once established, the great Chancellor's policy became one of peace. He avoided entangling Germany in the Eastern Question, but when the rivals of Russia were aroused by the Treaty of San Stefano, in 1878, he asserted Germany's leadership in Europe by inviting an international congress to meet at Berlin (See BERLIN, CONGRESS OF). He formed the Triple Alliance to secure Germany against both France and Russia, but at the same time maintained the most friendly relations with Russia. France he did not regard as a serious competitor of Germany after 1871. His matured convictions in regard to Germany's position are set forth in his autobiography. In that work, after some observations on Russia's relations to the Eastern Question, he observed that if Russia failed to receive assurance of German neutrality, the old coalition of the Seven Years' War—the alliance, that is, of Austria, Russia, and France against Prussia—might be revived. "If Germany possesses the advantage," he said, "of having no direct interest at stake in the East, she labors, on the other hand, under the disadvantage of an exposed position in the heart of Europe, with an extended frontier, which has to be defended on every side, and surrounded by enemies ready to enter into alliance against her. At the same time Germany is, perhaps, the only great Power in Europe which is not tempted by objects unattainable except through war. It is our interest to maintain peace, while our continental neighbors, without exception, foster ambitions, either secret or officially avowed, which can be realized only by war. We must direct our policy in accordance with these facts—that is, we must do our best to prevent war, or at least, to restrict it." Bismarck's largeness of view and freedom from petty enmity is shown by his efforts, as soon as Austria had been beaten at Sadowa, to establish friendly relations between that Power and Germany. A man of strong passions, he allowed no prejudice to blind him to the requirements of sound national policy.

His attachment to Emperor William I was in every way creditable to him. After the death of the Emperor in 1888, Bismarck remained in office during the brief reign of his successor, the Emperor Frederick.

William II had learned his statecraft in the school of Bismarck, but it was inevitable that the autocratic young Emperor should come into collision with the strong-willed minister who had been so long accustomed to the personal direction of Prussian and German affairs. Numerous quarrels finally led to the resignation of Bismarck, which occurred on March 20, 1890. He retired to Friedrichsruh. On leaving office

the title of Duke of Lauenburg was bestowed upon him by the Emperor, together with one of the highest military ranks (Generaloberst of cavalry). The open estrangement between the two continued until after Bismarck's severe illness in 1893, when the Emperor made advances towards a reconciliation, which took place in form at least. Bismarck's eightieth birthday (April 1, 1895) was made the occasion of a great demonstration throughout Germany. He was visited by the Emperor and by thousands of military and political associates, and a Bismarck Museum was founded in Berlin.

So positive a force in the life of his day necessarily aroused both intense admiration and bitter hostility. He was, beyond question, the greatest European statesman of the century and one of the greatest statesmen of all time. His genius was of the rare constructive type, and he is justly included in the trio of creators of modern Germany, together with the Great Elector Frederick William and Frederick the Great. He had set himself a great end, the realization of a united Germany and the fullest development of the German nation; he pursued it relentlessly and he achieved it by methods at least as unimpeachable as those applied to any similar task in history. Against his critics he could set up the worldly but weighty defense of success. He found Germany a group of jealous kingdoms and principalities, the shuttlecock of Austria and France. He left it a united nation, one of the world's great Powers, and the dominant force on the continent of Europe. In his *Gedanken und Erinnerungen*, the work of his years of retirement, commonly though somewhat inaccurately called, in its English translation, "Bismarck's Autobiography," he has left a valuable epitome of his views on many points of European policy. In this and in his collected speeches, letters, and papers must be sought his *Apologia*. In private life Bismarck was a kind husband and father, a genial friend, and a considerate landlord. Physically and mentally he was a man of surpassing power and endurance, and his capacity for work, creative or absorptive, was tremendous. Though not a scholar in the strict sense of the word, he was a man of wide information, always accessible to his ready memory. While not a finished orator, the pungency of his speech and the aptness of his quotations from history and literature always held his audience in the Reichstag. He died July 30, 1898. For his own epitaph he wrote simply, "a faithful German servant of the Emperor William I." He had three children—Countess Marie, born Aug. 28, 1848; Prince Herbert, born in 1849, died in 1904; and Count Wilhelm, born in 1852, and died in 1901.

BISMARCK-SCHÖNHAUSEN, WILHELM ALBRECHT OTTO, COUNT VON (1852-1901). A German statesman, second son of Prince Otto von Bismarck, born at Frankfort-on-the-Main. He was educated at the University of Bonn and served in the Franco-Prussian War as an officer of ordnance. He was attached to the Imperial Chancellery from 1878 to the fall of 1879, when he was transferred to Alsace-Lorraine as assistant to the Governor. He again served in the Imperial Chancellery from 1881 to 1884, and was later successively appointed President of the province of Hanover (1889) and Governor of East Prussia (1895).

BISMUTH, biz'müth (Fr. *bismuth*, Ger. *Bismuth*, *Wismuth*, of unknown origin). A metallic element, possibly known to the ancients, but first clearly distinguished from tin by Basil Valentine in 1413. In the native state it is found widely distributed in small quantities, generally with ores of copper, lead, etc. It is further found in combination with oxygen as *bismite*, with sulphur as *bismuthinite*, with carbonic acid as *bismutite*, and as an alloy with tellurium, called *tetradymite*. These various minerals are widely distributed; but the principal commercial source is the metallic bismuth which is found in association with other ores, in the mines of Saxony and Bohemia, and at Monroe, Conn., in the United States. The commercial metal is obtained chiefly from the reduction works in Saxony, although a small quantity is smelted in England. The process by which the metal is obtained consists in first carefully hand-picking the ore, after which the selected pieces are roasted and the metal run off from the gangue into pots. By remelting at as low a temperature as possible, with one-tenth of its weight of nitre, a solid slag is formed by the nitre on the surface, with practically pure metal beneath. Bismuth (symbol, Bi; atomic weight, 208.0) is a brittle, grayish-white, crystalline metal of a distinctly red tinge. It melts at 268.3° C.; its boiling point is known to lie somewhere between 1450° and 1600° C. It is one of those substances that contract in melting, the specific gravity of molten bismuth being about 10.06, while that of the solidified metal is only about 9.82. Bismuth is a poor conductor of heat and electricity. The metal itself is used chiefly as a constituent of alloys and amalgams. With tin and cadmium it forms a fusible alloy known as Wood's metal, which melts at 60° C. (140° F.). This and similar bismuth alloys (see FUSIBLE METAL), besides having a remarkably low melting point, expand, like bismuth itself, in the act of solidification, thus giving a perfect cast. Small quantities have been used in the manufacture of bell metal. Bismuth combines with radicals to form diad, triad, and pentad salts, of which the trivalent compounds are the most stable. Its principal compound with oxygen is the trioxide, which is found native as the mineral bismite, and may be prepared artificially by igniting the bismuth

subnitrate until red fumes cease to come off. It is a pale-yellow, amorphous compound, used for glass and porcelain staining, as an addition to certain fluxes to prevent the production of color, and in gilding porcelain. The most important compound of bismuth is the nitrate, which may be made by dissolving metallic bismuth, or its oxide, or carbonate, in nitric acid, yielding a pearly white powder consisting of minute scales, which is used as a flux for certain enamels, owing to the fact that it increases their fusibility, as a colorless iridescent glaze on porcelain, and as a cosmetic for softening the skin, under the names of *blanc de fard* and *blanc d'Espagne*. It is an official medicine and was formerly termed *majesty of bismuth*, being largely used in chronic diarrhoea and cholera. Bismuth oxychloride, prepared by treating a solution of the normal nitrate with a dilute solution of common salt, yields a precipitate which is a white pearly powder that is used as a cosmetic under the name of *pearl-white* and also as a pigment. Bismuth citrate, bismuth carbonate, and bismuth and ammonium citrate are official medicines and are used chiefly as astringents. During the year 1911 172,093 pounds of bismuth, valued at \$311,771, were imported for consumption into the United States.

BISMUTHINITE A bismuth trisulphide that crystallizes in the orthorhombic system. It is of a lead-gray color and usually occurs massive with a foliated or fibrous structure, although sometimes it is found crystalline. The principal localities where this mineral occurs are various places in Cumberland, England, at Meymac, France, in Sweden, in Bolivia, South America, also in Beaver Co., Utah, and in Fresno and Mono counties, Cal. It has some value as an ore of bismuth.

BISON (Lat., Gk *βίον*, *bíon*, wild ox, cf. OHG *Wisunt*, *Wisant*, Ger *Wisent*, bison, AS *Wesend*, wild ox) A kind of wild cattle, characterized by massive and shaggy fore quarters. The name was applied by Pliny and subsequent Latin writers to a wild ox of Europe otherwise called *bonasus*, and probably the aurochs. More recently the term has been properly extended to the American "buffaloes," and erroneously to the East Indian gaurs. Zoologically the word is the name of a bovine genus, including the aurochs (*Bison bonasus*), the American bison (*Bison americanus*), and several extinct species of both continents.

Bisons differ from other oxen in the excessive development of their fore quarters, where the line of the back arches over the withers in a hump formed by the long dorsal spines that give attachment to the very thick and strong muscles needed to support the massive head, also in their more slender limb bones and ribs (which number 14 instead of 13), in the breadth and convexity of the front of the skull, where the horns spring from below the top line of the forehead, and in their six, instead of four, nasal bones. "Externally they differ in having the head heavily clothed with long, bushy hair, they also possess a heavy barb, and the fore legs are heavily fringed with coarse, long hair. The clothing hair of the body also differs from that of representatives of the restricted genus *Bos* and most of its allies in consisting mainly of short, curled, crisp wool in place of straight hairs. Their nearest ally is probably the yak" (Allen). The females are smaller, less

massive and shaggy in the fore quarters than the bulls, and with lighter horns. The two existing species will be treated of below. Three fossil species are recognized by J. A. Allen in his classic monograph, *The American Bisons* (Cambridge, 1876). One is *Bison priscus*, a very large, long-horned species, widely distributed in the Pleistocene formations of Europe. Another, named *Bison antiquus*, is found fossil in northern America and is so closely similar that Allen thinks the two might have been local races of a then circumpolar species. Both of these are regarded by some naturalists as direct ancestors of the modern forms. The third is *Bison latifrons*, a more ancient type (yet belonging to the era preceding the present), which was of gigantic size, with horns that must have spread 10 or 12 feet—three to four times that of any other species.

The Aurochs, *bonasus*, or zubr, has the general form of this type, and an old male stands about 6 feet high. The color is brown, much darker in the long hair of the fore parts than in the short wool of the sides and flanks. The horns are about 18 inches long, tapering, spreading, and a little curved inward at the point, and the tail is long and heavily tufted. Once widely distributed over continental Europe and Transcaucasia (avoiding the Russian steppes), it would long ago have become extinct were it not that guarded bands, numbering in 1898 about 700 individuals, have been protected in the imperial forest preserves of Bialowica in Lithuania, while a few hundred more roam semiwild in the fastnesses of the Caucasus. It has never been really domesticated, though several experimental crossings have been made between it and tame cattle, the results of which have not been important. It is said to exhibit aversion to association with other cattle and to retain its ancestral wildness and shyness with great tenacity. It moves about in small bands, which are easily provoked to anger, and become dangerous by the swiftness of their movements and the overpowering force of their weight in a charge. Its food consists of grass and brushwood and the leaves and bark of young trees. Its cry is peculiar, "resembling a groan or grunt more than the lowing of an ox." It does not attain its full stature till after its sixth year, and lives for about 30 or 40 years.

The AMERICAN BISON, more familiarly known as the "buffalo," is a slightly smaller, less massive animal than the aurochs, with more slender hind quarters, a shorter tail, and somewhat shorter and more robust horns, but with a higher hump and greater shagreenedness about the head and shoulders. The females are greatly inferior to the males in bulk, Audubon giving the weight of an old bull as nearly 2000 pounds, while full-grown, fat females will weigh only 1200 pounds. In habits it differs broadly from the aurochs in being highly gregarious, the nature of the country permitting it to gather into enormous herds, and in being almost exclusively a grazer.

"The habitat of the bison," according to Allen, "formerly extended from the Great Slave Lake on the north, in lat about 62°, to the north-eastern provinces of Mexico, as far south as lat 25°. Its range in British North America extended from the Rocky Mountains on the west to the wooded highlands about 600 miles west of Hudson Bay, or about to a line running southeastward from Great Slave Lake to the

BISONS

1. AMERICAN BISON or BUFFALO (*Bison americanus*). 2. EUROPEAN BISON or AUROCHS (*Bison bonasus*).

Lake of the Woods. Its range in the United States formerly embraced a considerable area west of the Rocky Mountains, its recent remains having been found in Oregon as far west as the Blue Mountains, and farther south it occupied the Great Salt Lake basin, extending westward even to the Sierra Nevada Mountains, while . . . until about 1830 it existed over the headwaters of the Green and Grand rivers and other sources of the Colorado. East of the Rocky Mountains its range extended southward far beyond the Rio Grande, and eastward throughout the region drained by the Ohio River and its tributaries. Its northern limit, east of the Mississippi, was the Great Lakes, along which it extended eastward to near the eastern end of Lake Erie. It appears not to have occurred south of the Tennessee River and only to a limited extent east of the Alleghenies, chiefly in the upper districts of North and South Carolina."

Restriction of range and decrease in numbers quickly followed the settlement of the interior. By 1800 it had disappeared east of the Mississippi; by 1850 it had been confined to the region of the dry plains; by 1875 it had been swept away from the central plains and limited to the region of northwestern Texas and western Kansas in the south, and in the north to Montana and northward, where isolated herds survived, with rapid diminution, until 1888, when the last remnant of the southern herd was nearly extinguished in the "Panhandle" of Texas, by the capture of the last specimens by C. J. Jones (consult Inman, *Buffalo Jones: Forty Years of Adventure*, Topeka, 1890). Small scattered bands remained a few years longer in isolated retreats, but the end of the century saw none in freedom south of the North Saskatchewan. There the extensive and lonely forests south of Great Slave Lake are still tenanted, sparingly, by the forest-ranging, larger, and darker variety known as the wood buffalo (subspecies *Athabasca*), which up to the recent establishment of preserves, was steadily being reduced by the Indians in spite of the efforts of Canadian officials. This is the result of a century of unexampled waste of one of the most numerous, interesting, and valuable animals in the world, and it is an irretrievable national disgrace. The last census, however, of this splendid animal is most encouraging. The species seems reasonably secure against immediate extermination, thanks to recent efforts on the part of the United States and Canadian governments, the New York Zoological and the American Bison societies. In 1889 the American bison reached its lowest ebb, when there were only 835 wild and 256 captive head. There are three centres of wild bison—the Yellowstone Park, the Montana Bison Range, and northern Athabasca. With the preserved herds in Yellowstone Park, the Montana, and Wichita ranges, the Canadian reserves, together with animals in captivity, there were 3453 full-blooded American bison in North America in January, 1913. For full particulars, consult Allen's *Monograph*, heretofore cited; W. T. Hornaday's "Extirmination of the American Bison," in the *Annual Report of the Smithsonian Institution for 1887*; *Our Vanishing Wild Life*, also by Dr. Hornaday (New York, 1913); and especially the *Annual Reports of the American Bison Society*.

The American bison was preëminently gregarious, and on the western prairies and plains

assembled in herds of thousands and even millions of individuals. So numerous were they that the early travelers on the plains might travel for days without losing sight of them; wagon trains, and even the first railroad trains, were sometimes compelled to stop and wait for their passage; and the present writer has seen steamboats halted by herds swimming the upper Missouri. These vast herds were made up of coherent bands, which had the habit of marching in files, and the paths thus made, called "buffalo trails," are still traceable on the arid plains; also the circular "wallows" where they rolled and spun in taking a dust bath. Each band was accompanied by bulls which, when alarmed, formed a defensive circle, with lowered heads, about the cows and calves, to protect them from the attacks of the bands of wolves that followed the herds, preying upon the weaklings, or from onslaughts by a puma or a bear; the grizzly alone was able sometimes to vanquish a buffalo in single combat. During the mid-summer rutting season the bulls were constantly fighting with one another also. The sexes remained together throughout the year, with the exception of an occasional solitary and morose bull. A single calf was the rule, born in spring, after a gestation of about nine months. The molting of the winter's woolly undercoat occurred early in summer, the hair coming off in great flakes; and the hide was in good condition for robes from October till May.

The buffaloes were nomadic, wandering in search of pasture, and certain annual migratory movements took place under the influence of regional or seasonal changes in forage or weather. In such movements they swam large rivers fearlessly and climbed mountains or made their way over rough ground with amazing agility. As a rule, however, they chose the easiest routes, and their trails were excellent guides to both travelers and engineers. One great defect in their character was their liability to panic, when the whole herd would rush headlong into a bog or over a precipice, taking no heed of the fate of those in front.

The Indians of the open interior region subsisted mainly upon the buffalo and were able to retain their independence as long as it was numerous. The flesh was excellent beef, and was sun-dried in vast quantities for transportation; and the hides served as material for lodges, winter clothing, harness, boats (in the form of coracles on the Missouri), shields, etc. Various uses were found for the sinews, bones, and horns, while the dung or "chips" formed the fuel of the plains. The Indians hunted it in companies, usually mounted, but sometimes on foot or on snowshoes, when various stratagems were employed to aid them. The simple chase on horseback was most exciting and perilous. When large amounts of meat were desired for winter stores, or for making pemmican, pounds were constructed, with guiding fences. At the entrance to the trap or inclosure a sudden pitch, natural or dug, would compel the animals to leap down, whence they could not return and could easily be slaughtered. This was feasible only in a somewhat wooded region. Another method was for a party of men to ride round and round a herd until they were crowded into a bewildered, stationary mass and then kill them at leisure. White men at first hunted the buffalo for food, and thousands were recklessly killed for the sake of a single slice from the

hump or a tongue. Their hides early became an article of commerce, and the Indians were encouraged to procure them for the traders. To this there was added, from about 1860 onward, an army of white hide hunters, who made a business of following and ruthlessly slaughtering the animals and succeeded so well that careful estimates show that on the average 2,000,000 hides a year were sent to market between the years 1865 and 1875. For these they received on the average no more than \$1, out of which sundry expenses must be paid. Subsequently, as the product diminished, prices rose, but never very greatly, and robes continued to sell up to 1890, in Eastern cities, for from \$15 to \$40, and the few remaining are not greatly advanced in price.

A great number of poor hides were tanned for leather, but it was porous and of no great value. The coarse fleece has been spun, and small quantities of it have been made into a soft cloth used for gloves, etc.—a service certain Indians found for it prehistorically. The early settlers in the Mississippi valley looked upon the buffalo as likely to prove domesticable and of great service, but although easily subjugated when taken young, it has not proved docile and of practical use, nor have the hybrids frequently produced between it and domestic cattle shown such qualities as make them desirable. See BUFFALO.

BISPHAM, bis'pam, DAVID (1857-) An American singer, born in Philadelphia, Pa., and educated at Haverford College. He studied in Florence under Vannucini and in London under William Shakespeare and in 1891 made his professional debut at the Royal English Opera, London, as the Duc de Longueville in *La Bascioche*. Following 1892 he sang in Italian, German, and English, as the principal barytone of the Royal Opera, Covent Garden, London. At the Metropolitan Opera House, in New York City, he appeared as the chief Wagnerian barytone. His remarkable success as a concert singer led him to abandon the operatic stage. He is known as one of the strongest advocates for the use of the English language and was the first of the great singers to employ English translations in his recitals of German songs.

BISSAGOS, bis-sa'gós, or **BIJU'GA ISLANDS** (from a negro tribe *Buyago*, or *Byyaga*, inhabiting several of the islands). A group of small volcanic islands, off the west coast of Africa, in lat 11° N and long 16° W, opposite the mouth of the Rio Grande. Sixteen of the islands are large and contain fine harbors. About half of the islands are inhabited by negroes under the dominion of native chiefs. The climate is unhealthy, but the vegetation is rich. Orango is the largest island. The chief town, Bulama, has a population of over 3700. The group is a dependency of Portuguese Guinea (Map Africa, C 3).

BISSÃO, bé-sour', or **BISSEO** The chief port of Portuguese Guinea (qv).

BISSEL, GEORGE EDWIN (1839-) A prominent American sculptor. He was born at New Preston, Conn., Feb. 16, 1839, the son of a successful quarryman, and was educated at the Northville Academy, and in Washington, Conn. He enlisted very young in the Civil War as a private in a Connecticut regiment and served during 1862-63. When his regiment was mustered out he was appointed assistant paymaster of the United States navy, serving from 1863 to

1865. At the end of the war he joined his father and brother in the marble business in Poughkeepsie, N. Y. Without artistic training, he furnished designs and models for public monuments, and at the age of 32 received his first order for a marble statue. His youthful experience thus gave him a facility in marble cutting often lacking in the modern sculptor. In 1875-76 he studied at Paris, Florence, and Rome, and on his return began as a portrait sculptor. Since that time he has steadily progressed, keeping in touch with the best work done abroad. From 1884 to 1896 he maintained an atelier in Paris, where he passed much of his time, he had another in Florence in 1903-05 and 1907-09. He has executed a great number of soldiers' monuments, of which the best is at his old home, Waterbury, Conn., where also is his statue of Col. John L. Chatfield. Among his other works are a bronze statue of Chancellor John Watts in Trinity churchyard, New York City, considered his masterpiece, Col. Abraham de Peyster (1896) at Bowling Green, New York City, a monument to Abraham Lincoln in Edinburgh, a marble statue of "Lycurgus" on the Appellate Courthouse, New York, Chancellor James Kent, in the Congressional Library, Washington, the remarkable Elton Memorial Vase at Waterbury, Conn., and a bronze statue of Abraham Lincoln, Clermont, Iowa. His art is characterized by a sturdy realism and remarkable adaptability to the material used.

BISSELL, EDWIN CONE (1832-94). An American biblical scholar. He was born at Schoharie, N. Y., March 2, 1832, and graduated at Amherst College (1855) and at Union Theological Seminary (1859). He served as a Congregational pastor at Westhampton, Mass., San Francisco, Cal., Winchester, Mass., and was a foreign missionary of the American Board of Commissioners for Foreign Missions at Innsbruck, Austria (1874-79). In 1881 he became professor of Hebrew in the Hartford Theological Seminary (Congregational), then in the McCormick Theological Seminary (Presbyterian) in 1892. He was captain of Company H, Fifty-second Massachusetts Volunteer Regiment (1862-63), while still pastor of Westhampton, and stated supply at Honolulu, Oahu, 1869-70. Among his works are *The Historic Origin of the Bible* (1873), *The Pentateuch: Its Origin and Structure, An Examination of Recent Theories* (1885), *Biblical Antiquities* (1888, 2d ed., 1892), *A Practical Introductory Hebrew Grammar* (1891), *Genesis, Printed in Colors, Showing the Original Sources from which it is supposed to have been compiled, with an Introduction* (1892). But his best work was his volume on *The Apocrypha of the Old Testament, with Historical Introductions, A Revised Translation, and Notes Critical and Explanatory* (1880), which Dr. Schaaf incorporated in his edition and translation of *Lange's Commentary*.

BISSELL, WILSON SHANNON (1847-1903). An American lawyer. He was born in New London, Oneida Co., N. Y., graduated at Yale, studied law in Buffalo, and in 1872 began practice with a law firm to which, in 1873, Grover Cleveland was admitted. On the election of Cleveland as Governor of New York, Bissell became the senior partner of a newly organized firm, confining his legal work to corporation practice. In 1890 he was appointed a commissioner to propose amendments to the judiciary articles of the New York constitution. From 1893 to

1895, during Cleveland's second administration as President, Bissell was Postmaster-General of the United States. In 1902 he became chancellor of the University of Buffalo.

BISSEN, HERMANN VILHELM (1798-1868). A Danish sculptor. He was born in Schleswig, Oct. 13, 1798, and studied first in Copenhagen, where in later years (1850) he was made director of the Academy of Arts. In 1823 he took the great gold medal and was sent to Rome to work under Thorvaldsen, with whom he studied 10 years. Among the works of his early period are a marble "Psyche" and similar subjects in the Glyptothek Ny Karlsberg. Commissioned by the will of Thorvaldsen to complete his work, he modeled the well-known Gutenberg monument at Mayence after the master's sketch. After his return to Copenhagen he carved in Kristiansborg Palace a frieze 134 feet long, destroyed by fire in 1884. About 1850 the character of his art changed, becoming more realistic. He designed many military monuments, among the best of which are the "Victorious Soldier" at Fredericia; the statue of Frederick VI (1856, Friedericksbergave); the equestrian statue of Frederick VII, facing Kristiansborg. Of a more ideal character are the "Maiden Bathing" (1859), "Shepherd's Boy" (1868), and "Moses," in front of the Fruekirch. His productivity was enormous. The royal collection in Copenhagen possesses 100 bronze busts, besides numerous marble statues, plaster casts, etc.

BISSEXTILE (Lat. *bissextilis*). The old name of leap year. In the Julian computation a day was added to February every fourth year; but instead of making it, as now, the 29th, the 24th day of the month was counted twice (*bis*), and as that day was the sixth (*sextus*) before the calends of March, it was called *bis-sextilis*. See CALENDAR.

BISTER, bis'tér (Fr. *bistre*, dark brown). A blackish-brown color, often made of moistened wood soot mixed with a little gum. It was often used by the old masters for tinted drawings and shaded sketches.

BISTINEAU, bis'té-nô'. A lake in the northwestern part of Louisiana, about 25 miles southeast of Shreveport; it is over 25 miles long and has an average width of about 2 miles. It receives a number of streams, mainly from the north, and discharges its water through the Red River, with which it is connected by a short river. It is navigable for river steamboats.

BISTORT (Lat. *bis*, twice + *tortus*, twisted; referring to its root)—*Polygonum bistorta*. A perennial plant, 1 to 1½ feet high, with a simple stem, ovate subcordate and wavy leaves, the radical leaves tapering into a long petiole, and one dense terminal cylindrical spiked raceme of flesh-colored flowers. The root is about the thickness of the little finger, blackish brown externally, reddish within, and tortuous (whence the name "bistort"). The whole plant is astringent, containing much tannin. Bistort is a native of Europe and Asia.

BISTRITZ (Slav. *bystřa*, swift). A river rising in the Carpathian Mountains in eastern Hungary, flowing southeast through Bukovina and Moldavia, and joining the Sereth just below Bakau, after a course of about 185 miles (Map: Austria-Hungary, K 3). It is called the Golden Bistritz on account of the auriferous character of its sands.

BISTRITZ (Hung. *Bessterce*). A royal free

town and the capital of the county of Beszterce-Naszdó, of Transylvania, in Saxonland, Kingdom of Hungary. It is beautifully situated on the Bistritz River, an affluent of the Szamos, in a fine valley about 50 miles northeast of Klausenburg (Map: Austria-Hungary, J 3). Lumbering and milling are the chief industries. Near the town are the ruins of a castle once the residence of the famous John Hunyady. Pop., 1900, 12,081; 1910, 11,966, mostly Germans. In 1848-49 Bistritz was the scene of fierce fighting between the Austrians and the Hungarians. The town was formerly called Nüsen, giving its name to Nüsen Land.

BITANGENT. A tangent which touches its curve in two distinct points. The general bi-quadratic plane curve has 28 such double tangents. For their theory, consult Salmon, *Treatise on the Higher Plane Curves* (Dublin, 1852; 3d ed., 1879).

BITHUR, bêt-hoor', or **BITHOOR**. A town of India, in the Cawnpore district, United Provinces of Agra and Oudh, on the right bank of the Ganges, 12 miles northwest of Cawnpore (Map: India, D 3). It is particularly devoted to the worship of Brahma, has numerous pagodas and elaborate ghats, and is a favorite pilgrim resort for purposes of ablution. During the mutiny of 1857 Bithur was the stronghold of Nana Sahib. Here Havelock more than once exacted retribution, defeating the Nana in the field and burning his fort. Pop., 1901, 7173; 1911, 4386.

BITHYNIA, bi-thin'i-á (Gk. *Bithynia*). An ancient division of Asia Minor, separated from Europe by the Propontis (Sea of Marmora) and the Thracian Bosphorus (Strait of Constantinople). It was bounded north by the Buxine, south by Galatia, Phrygia, and Mysia, and east by Paphlagonia. It contained the famous Greek colonies of Chalcedon and Heraclea, Pontica; at a later period, Nicomedia, Nicæa, and Prusa were the chief cities. The inhabitants of Bithynia were supposed to be of Thracian origin; from Thracæ two kindred tribes, the Thyni and the Bithyni, migrated to Asia Minor. Though for the most part mountainous, Bithynia has some fertile plains. The Olympus Range reaches a height of 7600 feet. The chief rivers were the Sangarius, the Rhyndacus, the Biliaeus, and the Partherius. The country is still well wooded, and has valuable natural resources, as yet undeveloped (see CHALCEDON; HERACLEA). It was subdued by Cæsar of Lydia and later fell under the Persian dominion, though the native princes seem to have been left in power. In the confusion which followed the death of Alexander the native dynasty secured an independent position, and in 297 B.C. Zipoites seems to have assumed the title of King. His son Nicomedes I founded in 264 B.C. the city of Nicomedia, which became the capital. Prusa was founded about 185 B.C. by King Prusias I, and was for a time the chief city. The last King, Nicomedes III, made the Romans his heirs, and, with a large addition from the Pontic Kingdom, Bithynia became a province of the Republic (74 B.C.). Under Trajan, Bithynia was governed by Pliny the Younger (103-105 A.D.), whose letters (x. 98-97) to the Emperor on the administration and condition of the province contain the well-known passage respecting the Christians. The Emperor Diocletian made Nicomedia his habitual residence. In 1298 Osman the Turk broke into the country, and in 1328 Prusa or Brusa, then

the chief town of Bithynia, became the capital of the Kingdom of the Osmanli, and in its mosque are the tombs of the earliest Sultans. Consult Ramsay, *Historical Geography of Asia Minor* (London, 1890). See BRUSA, NICÆA, NICOMEDIA.

BITING LICE, or **BIRD LICE**. See MALLOPHAGA.

BITLIS, bit-lès' A town of Asiatic Turkey, capital of the vilayet and sanjak of the same name. It is situated at an elevation of 5156 feet above the level of the sea, in a deep ravine traversed by the river Bitlis, a tributary of the Tigris, near Lake Van (Map Turkey in Asia, K 3). Bitlis is scattered and irregularly built, with a large number of mosques, convents, several well-stocked bazars, a palace, and ruins of an old fortress. It carries on an active trade in raw wool, tobacco, cotton fabrics, arms, and gold and silver articles. The population is approximately 39,000, about one third of whom are Armenians. The Persians defeated Solyman the Magnificent near Bitlis in 1554.

BITOLIA. Another name for the Macedonian city, Monastir (q v).

BITONTO, bë-tôn'tô (anciently Lat *Butuntum*). A city in south Italy, 5 miles from the Adriatic and 10 miles west of Bari (Map Italy, L 6). It has a Romanesque cathedral, a theological seminary, an orphan asylum, and a castle. The chief trade is in salad oil and in a wine called Zagarello. In its vicinity the Spardiars, under Count de Montemar, gained a victory over the Austrians in 1734, which gave Naples to Don Carlos. Pop. 1881, 23,812, 1901 (commune), 30,617, 1911, 33,003.

BITSCH, Fr **BITCHE** (anciently *Byths castuane*). A German town of Alsace-Lorraine, on the Horn, in a wild and wooded pass of the Vosges, 36 miles north-northeast of Strassburg (Map Germany, B 4). The citadel is built on a precipitous and isolated rock, 250 feet high, in the middle of the town. It has been made almost impregnable, is defended by 80 cannon, and has accommodations for a garrison of 1000 men. The Prussians, under the Duke of Brunswick, unsuccessfully attempted to surprise it in 1793, and in 1870 the Germans vainly besieged it after the battle of Worth. The town has manufactures of matches, watch glasses, and porcelain. Pop. 1900, 3600, 1910, 4290.

BITTENFELD, bit'ten-fêlt, HERWARTH VON. See HERWARTH VON BITTENFELD.

BITTER, KARL HERMANN (1813-85). A Prussian statesman and writer on music. He was born at Schwedt, province of Brandenburg, and studied law and cameralistics at Berlin and Bonn. He served as the plenipotentiary of Prussia on the Danube Commission from 1856 to 1860, was prefect of the department of Vosges during the Franco-Prussian War, and subsequently became Minister of Finance (1870), an office in which he displayed exceptional ability. He increased the indirect duties derived from the so-called tobacco monopoly and the tax on spirits and malt, introduced the "Borsensteuer" (tax on the bourse), and concluded the commercial treaty with the city of Hamburg by which that city entered the German Customs Union. He reestablished the stability of the Prussian finances and took a prominent part in bringing the railroads of Germany under government control. He resigned in 1882, in consequence of differences with Bismarck. His literary activity was confined almost exclusively

to works on music. His *Gesammelte Schriften* were published in 1884.

BITTER, KARL THEODORE FRANCIS (1867-) One of the foremost American sculptors. He was born at Rudolfsheim, near Vienna, Dec 6, 1867, and studied under August Kuehne and Edmund Heller in the Academy of Vienna. He came to the United States in 1889 and in the same year he was successful in a competition for the Astor Memorial bronze doors of Trinity church, New York City. Through the friendship of Richard Morris Hunt, architect, he received the commission for the decoration of the administration building of the Chicago Exposition, 1893, and a further commission for the manufacturers' building. By reason of the great success of these decorations he was appointed director of sculpture of the Buffalo Exposition of 1901, contributing himself the two colossal equestrian standard bearers. He was also chief of the department of sculpture at the St. Louis Exposition, to which he contributed the group "Louisiana Purchase." In the meanwhile, with marvelous facility, he contributed a mass of decorative sculpture for the great commercial buildings of New York and other cities, a good example being the series of colossal reliefs of the Pennsylvania Railway Station in Philadelphia. He also executed decorations for public buildings, such as the Chamber of Commerce and the Metropolitan Museum, New York, and for private houses, like the residences of George W. Vanderbilt in New York and in Baltimore, N. C., and those of C. P. Huntington and John Jacob Astor, New York. Most of this work was executed by a great number of assistants under his direction. Besides such decorative work he has during late years executed a series of bronze and marble statues of high technical ability and fine feeling, such as the memorial bust of Dr. Pepper in Philadelphia, and a series of monuments in New York—the beautiful nude Villard Memorial, the mysterious Hubbard Memorial called "Thanatos," the equestrian statue of Gen. Franz Sigel, and the memorial of Carl Schurz (1913), an admirably characterized statue of the great German-American, with very original granite reliefs. He is a member of the National Academy (1902), president of the National Sculpture Society, and of the National Academy of Arts and Letters. He received gold medals at Buffalo in 1901, Philadelphia in 1902, and St. Louis in 1904.

BITTER ALMONDS, OIL OF. See BENZALDEHYDE.

BITTER ASH. See QUASSIA.

BITTERFELD, bit'tër-fêlt. A town in the Prussian province of Saxony, about 20 miles north of Leipzig, on the Mulde (Map Prussia, E 3). There are manufactories of earthenware, piping, paper roofing, and machinery, also foundries, saw mills and coal mines in the vicinity. It is pleasantly situated on a junction of railways to Berlin, and is a popular residence of business men of Leipzig and Halle. Bitterfeld was founded in the twelfth century by the Flemings. Pop. 1890, 9047, 1905, 13,201, 1910, 14,617.

BITTERN (OE *bitoure*, bitter, from Fr *butor*, origin uncertain). Any heron of the genus *Botaurus* and related genera, once separated in the subfamily Botaurinae, but now considered to grade so completely into the other herons that no distinction can be recognized. Taking the extreme forms, bitterns are chiefly

distinguished from herons by the long, loose plumage of the sides of the neck, which they have the power of erecting at pleasure, along with the rest of their contour feathers, so as greatly to increase their apparent size. Bitterns also differ from most herons in the greater length of their toes, the middle toe being as long as the shank; in the presence of only two pairs of powder tracts, and in having only 10 tail feathers. They are almost all solitary birds, inhabiting reedy and marshy places, where they remain during the day, and will almost allow themselves to be trodden upon before taking wing; they feed during the night on frogs and partly, also, on fish, lizards, water insects, etc., and even small birds and quadrupeds. The claw of the middle toe is serrated on the inner edge, probably to aid in securing slippery prey. The common bittern of America (*Botaurus lentiginosus*) is a bird very widely diffused over the whole continent of North America. In size it varies greatly, from 2 to 3 feet in length, and it has an expanse of wing up to nearly 4 feet; the bill is about 3 inches long. The feathers on the crown of the head are dull brown, and the plumage in general of a dull, tawny color, beautifully and irregularly marked and mottled with black and white. The bittern makes a rude nest of sticks, reeds, etc., in its marshy haunts, and lays four or five eggs (illustrated in the Plate of EGGS OF WATER AND GAME BIRDS). It has a peculiar bellowing cry, which has obtained for it such name as "stake-driver," "bull of the bog," etc., and many of its appellations in other languages, perhaps even its name "bittern" (*bifour*, *butor*, *botaurus*). Some naturalists used to assert that the booming cry of the bittern was produced by the bird inserting its bill into a reed or into the mud, but that notion has long since been exploded.

This bird's spring notes are, however, very remarkable, making a booming which has been aptly compared to the noise made by an old wooden pump handle. When assailed, it fights desperately with bill and claws; and it is dangerous to approach when wounded, as it strikes with its long, sharp bill, if possible, at the eye. The bittern of Europe (*Botaurus stellaris*) is very similar to that of America, but differs in having the crown black and in some other details of color; the eggs also are different, being greenish brown. It is a common bird throughout Europe, Asia, and Africa. The Australian species (*Botaurus australis* or *pacioplilus*) is generally distributed throughout Australia, wherever marshes or sedgy rivers occur. In habits it closely resembles the bittern of Europe. The head and upper parts generally are purplish brown, except the wings, which are buff, conspicuously freckled with brown; the throat, breast, and belly mottled brown and buff. The so-called sun bittern (q.v.) is a South American bird allied to the cranes.

LEAST BITTERN.—Nearly allied to the bitterns are birds of the genus *Ardetta* or *Ixobrychus*, commonly known as "least bitterns." So similar are they to *Botaurus* that they are included in that genus by some ornithologists. They are more highly colored and are about a foot in length. The genus as represented by 10 species is very widely distributed over the world, but the birds are rarely seen because of their retiring habits, and the fact that they live in reedy swamps, where they are easily hidden. The

most common North American species is *Ardetta*, or *Ixobrychus*, *exilis*.

BITTERN, BITTER LIQUID, or OIL OF SALT. A term applied primarily to an oily liquid, obtained in salt manufacture, left when the mother liquor of the evaporating pans ceases to deposit crystals of common salt, but also applicable to some natural brines of high concentration. Examples of the latter are the water of the Dead Sea, of Elton Lake in southern Russia, and Red Lake in the Crimea. Bitterns consist principally of a strong solution of common salt, along with variable amounts of the chlorides of magnesium and calcium, as well as bromine and iodine. The bittern obtained from the salt works of Epsom was at one time the source of the sulphate of magnesium (hence called Epsom salts). They sometimes serve as commercial sources of calcium chloride, as in southeastern Ohio, and bromine, as in Michigan, West Virginia, and Germany. See SALT; BROMINE.

BITTERNUT. See HICORY.

BITTERS. A term applied in popular speech to beverages containing alcohol and either aloes for a cathartic effect, or Angostura bark, gentian, calisaya, etc., for stimulating the appetite and digestion. Drugs classed as "bitters" in the Pharmacopœia are mild or pungent tonics or digestants, as follows: The "simple bitters" include quassia, gentian, calumba, and eupatorium (boneset); the "aromatic bitters" include chamomile, cascarella, angostura, and cimicifuga (snakeroot). Wild cherry, cinchona, and picric acid are also classed as bitters, but have other special and distinctive qualities.

BITTER SPAR. See DOLOMITE.

BITTERSWEET, DULCAMARA, or WOODY NIGHTSHADE (*Solanum dulcamara*). A plant found in hedges and thickets in most parts of Europe and in Asia, and introduced in the United States. The root is perennial; the stem climbing and shrubby, many feet in length; the leaves ovate heart-shaped, the upper ones spear-shaped; the flowers, purple or blue, in drooping cymes, much resembling those of its congener the potato, but much smaller, followed by ovate red berries of tempting appearance, are not unfrequently the cause of serious accident, particularly to children. The twigs are collected in autumn after the leaves are fallen. The fluid extract prepared from the twigs possesses the power of blunting to some extent sensibility to pain and of considerably increasing the secretions of the skin, the kidneys, etc. The extract is employed in medicine chiefly as a remedy for scaly eruptions on the skin. Its principal chemical constituents are resin, gum, the alkaloid solanine, and the glucoside dulcamarin. *Oelasturus scandens*, a woody vine, is also called bittersweet in the United States. See SOLANUM; and Plate of POISONOUS PLANTS.

BITTER VETCH. See OROBUS.

BITTERWOOD. A name given to certain species of the genus *Xylopia*, trees and shrubs remarkable for the bitterness of their wood, particularly the West Indian *Xylopia glabra*. Furniture made of this wood is safe from the attacks of insects. The genus *Xylopia* belongs to the family Anonaceæ. The fruit of some of the species, particularly *Xylopia sericea*, is highly aromatic and pungent like pepper. *Xylopia sericea* is a large tree, a native of Brazil; its bark is used for making excellent cordage.

Bitterwood is also the name of *Picramnia ea-*

celso, formerly called *Quassia excelsa* and *Simaruba excelsa*, a tree of the family Simarubaceae, a native of Jamaica, the wood of which is used in medicine. It is nearly allied to the true quassia and possesses very similar properties, containing the crystallizable bitter principle called quassin. The wood, which is intensely bitter, is a very useful stomachic and tonic, if introduced into the rectum, it acts in certain cases as an excellent anthelmintic. An infusion of bitterwood is also a well-known and useful fly poison, and it appears to act as a powerful narcotic on many quadrupeds.

BITUMEN (Lat. a kind of mineral pitch). A name applied to a number of inflammable mineral substances varying in chemical composition and ranging in consistency from solid to gaseous. The bitumens consist mainly of compounds of carbon and hydrogen, but usually they contain also small amounts of sulphur, oxygen, and nitrogen. The most important substances, included under the name are natural gas, petroleum, maltha, asphalt, elaterite, wurtzite, albertite, grahamite, gilsonite, and ozocerite. Natural gas is composed mostly of marsh gas, with small quantities of other hydrocarbons. Petroleum and naphtha and the solid bitumens are essentially hydrocarbon compounds, containing also subordinate amounts of sulphur, oxygen, and nitrogen, and other elements which may be regarded as impurities. The bitumens are widely distributed over the earth's surface and occur endogenous in all the geological formations from the Ordovician to the present. Their origin in most cases can be traced to the decomposition of vegetable or perhaps also animal matter, but various other theories have been advanced to account for the deposits of petroleum and natural gas. The several bitumens are described in special articles. See **ASPHALTIC COAL**, **GAS** (NATURAL), **NAPHTHA**, **PETROLEUM**, **ASPHALT**, **BITUMINOUS LIMESTONE**, **BITUMINOUS SHALES**, **ELATERITE**, **ALBERTITE**, **GRAHAMITE**.

BITUMINOUS COAL (Lat. *bituminosus*, from *bitumen*, a kind of mineral pitch, bitumen). A term applied to the varieties of coal containing usually from 30 to 40 per cent of volatile matter. They yield by destructive distillation a considerable quantity of gas, easily purified and with good illuminating qualities, and are consequently largely used for that purpose. Some varieties also coke when heated out of contact with the air and yield a hard, porous product known as coke. See **BLACK COAL**, **CANNEL COAL**, **COAL**, **COKE**.

BITUMINOUS LIMESTONE. A limestone impregnated and sometimes deeply colored with bituminous matter (either petroleum or asphalt) derived from the decomposition of animal and plant remains entombed within the mass or in its vicinity. The amount of bituminous matter or asphalt in the pores of the rock is sometimes sufficient to permit the material being used for asphalt pavements after simply powdering and heating it. Still better results are obtained by mixing it with bituminous sandstone. In the United States bituminous limestone occurs in Oklahoma, Texas, and Utah. Much bituminous limestone is also mined in Germany, Switzerland, and France, whence it is sometimes brought to the United States. See **ASPHALT**, **PAVEMENT**, **ASPHALTIC COAL**.

BITUMINOUS SANDSTONE. A sedimentary rock of siliceous character, containing more

or less asphalt or other bituminous material in its pores. When rich in bitumen, it is a valuable economic product, sometimes it is used directly as a paving material, but more often it is previously subjected to a process of refining. In the United States it is known in California, Kentucky, and Oklahoma, but the deposits are not extensively worked. Consult the volumes of *The Mineral Industry*, especially vol. VIII (New York, 1900), and Ries, *Economic Geology* (New York, 1910). See **BITUMEN**, **ASPHALT**.

BITUMINOUS SHALES. The term properly applies to a shale containing considerable bituminous matter. It is of no value for fuel purposes, but may serve as a source of oil. See **OIL SHALE**.

BITURIGES, bi-tŭ'ri-jĕz. The Latin form of the name Bourges (q.v.).

BITZIUS, bit'si-us, ALBERT (1797-1854). A Swiss author, known also by his pseudonym, *Jeremas Gotthelf*. He was born at Muten (Freiburg), studied at Göttingen, and was pastor at Lutzelfuh in Emmental from 1832 until his death. His first work, *Bauernspiegel, oder Lebensgeschichte des Jeremas Gotthelf von ihm selbst berichtet* (1837), under his pseudonym, written with a strong ethical purpose, giving a picture of the village life of Emmental in the Canton of Bern, was very successful. It is written in the dialect of the region, as are his subsequent writings, which include *Leiden und Freuden eines Schulmeisters* (1838-39), *Uli der Knecht* (1841), English version, *Ulio the Farm Servant* (1888), by Julia Firth, with preface and notes by John Ruskin, *Uli der Pächter* (1849), *Erlebnisse eines Schuldenbauers* (1854). His complete works were published in 24 volumes (1856-61), and in 4 volumes (1894-96).

BIVALVES. A common name for the class of mollusks known scientifically as Pelecypoda (q.v.).

BIVOUEAC, bi-vŭ'āk (Fr. probably from *Gen. Bivouache*, *Bewacht*, from *ber*, by + *Wache*, watch, guard), MILITARY. An encampment of soldiers in the open air, generally of a temporary nature. In active service and in an enemy's country great care must be exercised in the choice of ground for a bivouac. It must offer few (if any) advantages to an enemy, be near water facilities for men and animals, be capable of hasty defense, and out of range of artillery fire. Bivouacs are generally for the night only and are so arranged that the troops may resume the formation in which they were halted with the least delay, and without confusion. See **ENCAMPMENT**, **CAMP**, **MILITARY**, **CANTONMENTS**.

BIWA, bi-wā. A beautiful lake in the southern part of the island of Nippon, Japan (Map Japan, E 6). It is about 36 miles long, 12 miles in width, and lies at an altitude of about 400 feet. The western shore is mountainous and the eastern is low. There are several small islets in the lake. Chikubu-shima is the most important. Fish is found in abundance. Biwa is connected by several canals with the inlet of Osaka and supplies water power to the mills and factories in Kyoto.

BIXBY, JAMES THOMPSON (1843-) An American Unitarian minister. He was born at Barre, Mass., July 30, 1843, graduated at Harvard College and at Harvard Divinity School, entered the ministry, and was settled in various

parishes, his last being at Yonkers, N. Y. He was professor of the philosophy of religion in Meadowville Theological School from 1879 to 1883, when he went abroad for study and travel, and in 1885 received the degree of Ph.D. at the University of Leipzig. He is the author of *Similarities of Physical and Religious Knowledge* (1876; 2d ed. under the title *Religion and Science as Allies*, 1895); *The Crisis in Morals; Examination of Rational Ethics in the Light of Modern Science* (1891; 2d ed. under the title *The Ethics of Evolution* (1900); *The New World and the New Thought* (1902).

BIXBY, WILLIAM HERBERT (1849-). An American army officer, born at Charlestown, Mass. He attended the Massachusetts Institute of Technology for one year, graduated from the United States Military Academy in 1873, and served as assistant professor of engineering at the Academy for four years. In 1881 he was sent to France to attend the French government school of bridges and highways. He rose through the various grades to be brigadier general in chief of the engineer corps (1910). He was president of the Mississippi River Commission in 1908-10, supervised the raising of the battleship *Maine* in Havana harbor, and in 1913, after 40 years of service, retired. He prepared *A Graphical Computing Table* (1879), various reports, and (1911) a *Discussion of River and Harbor Improvements*.

BIX'IN. See **ARNOTTO**.

BIXIO, bek'sé-ô, GIROLAMO (called *Nino*) (1821-73). An Italian patriot, born in Genoa. He was the brother of Jacques-Alexandre Bixio. He participated in the unsuccessful struggle of the Venetians against Austria and, after joining Garibaldi in Rome (1848), commanded the Roman troops that repulsed the first attack of the French General Oudinot (1849). He commanded one of Garibaldi's vessels during the expedition to Sicily in 1860, and after capturing Reggio and fighting in the battle of Volturmo (1860) was made lieutenant general. He served in the War of 1866, in 1870 forced the capitulation of Cività Vecchia, and took part in the capture of Rome. In 1866 he was elected to the Chamber of Deputies and in 1870 was called to the Senate. He died in the East Indies, where he had gone in charge of a commercial expedition. Consult: Guerzoni, *La vita di Nino Bixio* (Florence, 1875); Delveccio, *Cenni biografici di Nino Bixio* (Genoa, 1887); C. Martinengo, *Patrioti italiani* (Milan, 1890); C. C. Abba, *La Vita di N. Bixio* (Turin, 1905).

BIXIO, JACQUES-ALEXANDRE (1808-65). A French publicist and politician, born at Chiavari, then in the department of the Apennines. He was concerned in the Revolution of 1830 and in 1848 was influential as a leader of the Opposition. Under Louis Napoleon he received various political honors. His political career ended with the coup d'état of 1851, and from this time he devoted himself to agricultural affairs, and established the Library of Agriculture, to which he gave a part of his fortune. In 1831 Bixio, with Buloz, founded the *Revue des Deux Mondes*.

BIYSK, bĕsk. A district town in the government of Tomsk, Siberia, situated on the river Biy, 300 miles south of Tomsk, and 1900 miles east of Moscow (Map: Asia, H 3). A pass across the Altai Mountains favors a brisk trade with the Chinese and the Altai Kalmucks; hardware, printed cloth, leather, soap, tobacco, etc., are exchanged for cattle and hides. The

hides are dressed in the tanneries of Biysk and resold to the Mongols. Pop., 1897, 17,200.

BIZERTA, bi-zér'tà, or **BENZERTA**, ben-zér'tà (Lat. *Hippo Diarrhytus* or *Zarytus*, Gk. Ἰππὸν Ζάρρυτος, *Hippôn Zarrhytos*, from Phœnician *hippo*, a walled town + Gk. διάρρυτος, *diarrhytos*, intersected by streams). A fortified seaport of Tunis, 38 miles northwest of the capital, Tunis, at the mouth of a lagoon communicating with a deep gulf or bay of the Mediterranean (Map: Africa, E 1). In ancient times it was one of the best ports on the Mediterranean. The harbor later became obstructed, and when the French took possession, in 1881, they dredged the channel and built breakwaters. On account of its strategic position it is now an important naval base of France. The harbor contains a fully equipped navy yard and arsenal and has a 30-foot channel. Its trade is still in embryo, but is growing rapidly, and consists of produce, cereals, olive oil, and fish, the last being the most important. The town is surrounded by walls and defended by two castles and batteries placed on the neighboring hills. Hippo Diarrhytus, or Zarytus, was founded by the Tyrians. Agathocles, between the years 310 and 307 B.C., fortified the place and provided it with a new harbor, and under the Romans it was a free city. Pop. (est.), 17,300.

BIZERTA, or **BENZERTA**, LAKES OF, the ancient *Hyponitis Palus* and *Sisara Palus*. Two lagoons in Tunis, lying south of the town of Bizerta, whence they derive their name. They abound in fish, especially mullets, from the roes of which *botargo*, an important article of Levantine trade, is manufactured.

BIZET, bè-zé' (ALEXANDRE CÉSAR LÉOPOLD) GEORGES (1838-75). A French operatic composer. He was the son of a singing master in Paris and was generally regarded as a child prodigy. At nine he entered the Conservatoire, where his masters were Marmontel in piano, Zimmermann in harmony, Benoist in organ, and his future father-in-law, Halévy, in composition. For a decade he carried off nearly all the Conservatoire prizes, and in 1857 his comic opera, *Le docteur miracle*, was awarded the palm over 60 other compositions in a competition established by Offenbach. Several months later he won the Prix de Rome, and the dream of his life was realized. He plunged into the study of the great Italian masters of Church music, at the same time broadening and deepening his mental and artistic equipment by voracious reading and constant visits to the museums and galleries in Rome. His letters of this period mirror faithfully the striking growth of the artist, and more unusual still, the modest consciousness of this growth. While in Italy he composed the opera *Don Procopio*, discovered in 1895 among the papers of Auber; two movements of a symphony, and a comic opera, *La gusla de l'Emir*. He returned to Paris a finished composer, yet his opera *Les pêcheurs de perles*, a tale of Hindu love, was produced at the Théâtre Lyrique (1863) with no particular success. *La jolie fille de Perth*, based on Scott's novel, was more favorably received by the critics (1867). Bizet now accepted Wagner's contentions for dramatic verity in opera without accepting his methods of attaining it. These were the years of exoticism in music, which was inaugurated by Félicien David (q.v.), and at which Bizet had already tried his hand. *Djamileh* (1872), a one-act tragedy of unrequited love in the Orient, was

brushed away by the public as too Wagnerian and untheatrical, but the author was "absolutely sure that he had found his way, he knew what he was doing." Technical mastery, Gallic deftness and delicacy of touch, emotional depth and sincerity, were all concentrated in this tale of suppressed passion amid the languorous surroundings of a Cairo harem. Unlike David, with whom Orientalism was the aim and essence of the composition, Bizet employed it only as a background, an atmosphere for universal and eternal emotions. This little masterpiece was followed in the same year by the incidental music to Daudet's drama *L'Arlesienne*. The spirit of "fair Provence" was transmuted into tones with wonderful power. The public paid no attention to the *entr'acte* music, performed amid the chattering usual between the acts, and yet at present the music and the drama have grown to be considered as inseparable as is Mendelssohn's music from Shakespeare's *A Midsummer Night's Dream* or Beethoven's music from Goethe's *Egmont*. The discouraged composer tempted fortune for the last time with *Carmen* (1875), based on Mérimée's novel. Another failure, and in a few months the master died at Bougival, carrying to his grave the conviction that he had created a chef-d'œuvre—an opinion in which musicians of all schools and tastes concur at present, when *Carmen* is one of the half-dozen most popular operas of the lyric stage. "Dramatic and picturesque," *Carmen* delineates in masterly style the psychology of the wayward heroine from the whimsical coquetry of the first scene to the fatalistic bravado of the tragic denouement. The development of the choler in the weakening Don José, driven by Carmen's heartlessness to despair and murder, the purity and devotion of the lachrymose Micaëla, the pleasure-loving bullfighter—all these once seen and heard are never forgotten. Even the minor personages speak each an individual musical language.

Besides two overtures, Bizet wrote piano music and a number of songs, highly valued by connoisseurs.

Bizet was a remarkable reader of orchestral scores at sight, an erudite musician, a man of wide culture and strong artistic convictions. With all his admiration for the music drama, he did not overburden his *Carmen* with colossal orchestration, nor did he discard the time-honored set numbers and ensembles or make use of the *leit-motif*, except "remniscentially." The choice, too, of subjects for his last two works was in the direction of everyday realism, contrary to the theory that myth is the only subject for a music drama. France undoubtedly lost in Bizet one of her greatest musicians before he had achieved what was easily within his power to achieve. Consult C. Bellaigue, *Georges Bizet* (Paris, 1891), C. Pigot, *Bizet et son œuvre* (Paris, 1886), P. Voss, *Bizet* (Leipzig, 1899), A. Weissmann, *Georges Bizet* (Berlin, 1907), O. Séral, *Masters in Music: Bizet* (Boston, 1909).

BJERKNES, byærk'nés, VILHELM FRIMAN KOREN (1862-) A Norwegian physicist, born at Christiania, Norway. He was educated at the University of Christiania and also studied at Paris and Bonn. From 1893 to 1907 he was an instructor and professor at the University high school of Stockholm, and from 1907 to 1912 professor of mechanical and mathematical physics at the University of Christiania. In 1913 he became professor of physics at Leipzig.

His publications include "Fields of Force" in the *Columbia University Series* (1906) and *Dynamic Meteorology and Hydrography* (2 vols. 1910-11).

BJORCK, byërk, GUSTAV OSKAR (1860-) A Swedish genre and portrait painter. He was born at Stockholm and studied at the academy of that city under Perseus, and then for several years at Paris, Munich, Venice, and Rome, sketching during the summers at Skagen (Denmark). Among his early works are "A Timely Shot" (Museum of Copenhagen), "The Roman Smithy" (Cotcoran Gallery, Washington), "Vegetable Market in Venice" (1887, National Gallery, Stockholm). In 1889 he returned to Stockholm to become instructor in the academy, where he was appointed professor in 1893. His later works include "A Midday Meal in the Stable" (1890, National Gallery, Stockholm), a series of decorative paintings in the Opera, Stockholm (1895), and many portraits, including those of Oscar II and of Gustav V, in the palace at Stockholm, "Prince Eugene at his Basel" (National Museum, Stockholm), and Princess Ingeborg (1895). The chief characteristic of his paintings is a sturdy realism, his portraits are powerfully characterized and often cleverly solved intricate problems of color. Consult Nordensvan, *Svensk konst och svenska Konstnärer* (Stockholm, 1892), *Nordiskt Familjelok* (ib., 1903).

BJORNEBORG, byær'ne-bôrg, or **BIORNEBORG** (Finnish *Pori*). A seaport and the capital of a district in the government of Åbo Bjerneborg, Finland, on the east coast of the Gulf of Bothnia, at the mouth of Kumo, 76 miles north-northwest of Åbo, and 156 miles from Helsingfors (Map Russia, B 2). Ship-building is carried on, there is a large export of timber (to England principally) and forest products, and imports consist mostly of rye flour, salt, and iron. Large vessels cannot approach the city and must anchor off Refso. Pop., 1888, 10,100, 1900, 16,666.

BJORNSSON, byær'n'son, BJORNSTJERNE (1832-1910). A Norwegian poet, dramatist, and novelist. He was born at Kvikne, Dec. 8, 1832, the son of a Lutheran pastor. His childhood was passed in Kvikne, Romsdal, and Molde, in noble scenery rich in legendary association. He left the University of Christiania for journalism, having already, as a student, written sketches and reviews of plays, and in 1857 published his first drama, a one-act play, *Between the Battles*, and his first novel *Synnøve Solbakken*, a peasant story, translated by Mary Howitt as *Trust and Trial* (1858). He was made director of the theatre in Bergen and from 1860 to 1863 traveled on a government stipend, in Italy, France, and Germany. Thereafter he resided in Norway, with frequent visits to Paris, Rome, and Munich. In the winter of 1880-81 he lectured in the United States. Bjornsson was the greatest distinctively Norwegian writer, so intensely national that the Danish critic Brandes says that "the mention of his name in a gathering of his countrymen is like running up the national flag." He was the chief novelist, probably the chief poet, and, except possibly Ibsen, the chief dramatist of his country's history. For nearly 30 years he remained leader of the Republican party in Norway and was engaged actively in social and religious controversies. He was an advocate of Norwegian national rights as against

Sweden and as a talented orator and author lent his aid to the movement which brought about the dissolution of the union in 1905. The poet proved himself also a practical politician, and as a natural consequence he changed the character of his literary work, which was at first purely artistic, but in the stress of controversy tended to become didactic. The first period is distinctively lyric and of a romantic-religious character. His plays of this time are sagas, his narrative epics idyllic, and imbedded in them are gems of song, many widely popular and one "national." These were collected in *Poems and Songs* in 1870, and in the same year appeared his only epic, *Armljot Gelline*, founded on an episode in the *Heimskringla*. Thereafter Björnson wrote but little verse. He had already distinguished himself in peasant novels and tales, e.g., *Arne* (1858), *A Happy Boy* (1860), and *The Fisher Maiden* (1868), genuine pastorals, primitive yet modern. The dramas of these years are based on the native sagas, the best of them, *Sigurd Stenbe* and *Sigurd Jorsalfar* (1872), on the *Heimskringla*. *Mary Stuart in Scotland* (1864) is an exception, as is the problem play, *The Newly Wedded Pair* (1866). This realistic-critical style is characteristic of the whole drama of the second period, beginning with *The Editor* (1874) and counting *A Bankruptcy* (1875), *The King* (1877), *Leonarda* (1879), *The New System* (1879), *A Glove* (1883), *Beyond our Strength* (1883), *Geography and Love* (1885), *Paul Lange* and *Tora Persberg* (1898), *Laboremus* (1901), *At Storhove* (1903), and *Dagelcennet* (1904). The novels show the same evolution from *The Bridal March* (1873) through *Magnhild* (1877), *Captain Mansana* (1879), and *Dust* (1882), to the true problem novels *The Heritage of the Kurts* (*Det Flager*) (1884) and *In God's Way* (1889), the former dealing with redemption from heredity through education, the latter with bigotry and liberal thought. This brought on Björnson the imprecations of the orthodox, though its aim was to exalt and purify religion. In 1903 Björnson was awarded the Nobel prize in literature. There are translations of Björnson's novels by Anderson, and of *Sigurd Stenbe* by Payne (Boston). Edwin Björkman's translation of his plays was published in two series (at New York) in 1914. Consult: Brandes, *Moderne Geister* (Frankfort, 1897); Anderson, "Biographical Sketch," in *Symnive Solbakken*, translated by Anderson (Boston, 1882); Gosse, "An Essay on the Writings of Björnson," in *Björnson Novels* (London, 1895); Boyesen, *Essays on Scandinavian Literature* (New York, 1895); Collin, *Björnsterne Björnson*, 2 vols. (Christiania, 1903); Payne, *Björnsterne Björnson* (Chicago, 1910); Bæck, *Soldatene paa Aulestad* (Copenhagen, 1910); Björns-gaard, *Spredte minder fra 50 til 70-aarenes Norge* (Risor, 1911); Björkman, *Voices of Tomorrow* (New York, 1913).

BJÖRNSTJERNA, byörn'shär'nä, MAGNUS FREDRIK, COUNT (1779-1847). A Swedish soldier, statesman, and author. He was born in Dresden, where his father resided as Secretary to the Swedish Legation. He received his education in Germany and joined the Swedish army in 1793. He distinguished himself in the Finnish War and in 1813 was appointed colonel in the army that went to aid the Allies in Germany; took part in the conflicts at Grossbeeren and Dennewitz; was present at Leipzig, and concluded the formalities of capitulation with the

French at Lübeck and Maestricht. Subsequently he fought in Holstein and in Norway, where he signed the treaty which united that country with Sweden. In 1828 he was appointed Ambassador to the court of Great Britain, which office he held till 1846, when he returned to Stockholm, where he died. In addition to some political writings he published *The Theogony, Philosophy, and Cosmogony of the Hindus* (Stockholm, 1843).

BLAAS, bläs, VON. A family of distinguished Austrian painters. The eldest representative, KARL VON BLAAS (1815-94), was born at Nandern (Tyrol) and studied with great distinction at the Academy of Venice. In 1837 he received the Roman prize of the Academy of Vienna. At Rome he came under the influence of the Nazarenes (q.v.) and devoted himself to religious subjects, such as "Jacob's Journey through the Desert" (Museum of Vienna) and the "Visitation" (Innsbruck Museum). His rising fame secured his appointment to a professorship at the Academy of Vienna in 1850. Besides many portraits and religious canvases he painted 33 frescoes for the Altlerchenfeld Church of that city. In 1855 he received a prize at the Paris Exposition for the picture entitled "Charlemagne Visiting a Boys' School" (Venice Museum), and in the same year he accepted a professorship at the Venice Academy, but returned to Vienna in 1866. Among his most celebrated paintings are the following: "Tullia Driving over her Father's Body" (1832); "Rape of Venetian Brides in Sixth Century" (1858; Innsbruck Museum); 42 scenes in fresco (Vienna Arsenal); portraits of Francis Joseph and of the Queen of Spain; "Ekkehard Carrying the Duchess of Suabia across the Threshold of the Monastery."

JULIUS VON BLAAS (1845-), the second son of Karl, has devoted himself principally to equestrian subjects. He was born in Albano, Italy, and after studying with his father went to Rome, where he painted genre scenes from the Campagna. His "Race of Intoxicated Slavonic Peasants" (1869) is in the Imperial Museum of Vienna, which also possesses his "Antlassritt" (1899). Other pictures by him are the following: "Fox Hunt in the Campagna" (1877); "Market in Upper Hungary" (1885); "Horse Fair in Bischofshofen" (1888). He was much employed by the Austrian court as a portrait painter and became professor in the Academy of Vienna. Consult Karl von Blaas, *Autobiographie* (Vienna, 1876).

Karl's eldest son, EUGENE, a genre painter, was born in Albano, Italy, and studied with his father, and afterward at the Academy of Venice and in Rome. He settled in Venice, the life of which, past and present, he depicts in his pictures. The following are among his best works: "Conversion of the Rhätians by St. Valentine," "Cimabue and Giotto," "Scene from the Decameron," "Dogearse Going to Church," "Venetian Balcony," "Scene," "Bridal Procession in San Marco," "Venetian Masquerade," "A Journey to Murano" (Vienna Museum), besides many pictures of Venetian fisher folk. Until 1870 he imitated the Venetian color, but thereafter his tints lost their lustre. He became professor in the Academy of Venice.

BLAAUWBOK. See **BLAUWOK**.

BLACK. In art, black is the name of the darkest color—that which, according to physical scientists, is produced by the absence or by the

complete absorption of the rays of light See COLOR

BLACK, ADAM (1784-1874) A Scottish publisher With his nephew, Charles Black, he established a publishing house in Edinburgh, which began issuing the *Edinburgh Review* in 1826 and obtained the copyrights of the *Encyclopædia Britannica* in 1829 and of the *Waverley Novels* in 1851 Besides managing this immense business, he was Lord Provost of Edinburgh from 1843 to 1848 and was a member of Parliament, as the successor of Macaulay, from 1856 to 1865 Consult Nicolson, *Memoirs of Adam Black* (London, 1885)

BLACK, FRANK SWETT (1853-1913) An American lawyer, orator, and politician, born at Limington, Me He was educated at Dartmouth College and, after some experience in journalism, was admitted to the bar in 1879, practicing law in Troy until 1898 and later in New York City He served as a member of the Fifty-fourth Congress from 1895 until 1897 In the latter year he was inaugurated Governor of the State of New York, and during his two years' term of office showed much ability as an adroit and resourceful party leader On retiring from the governorship in 1899, he resumed the practice of law, but remained an influential member of the Republican party Mr Black was unusually gifted as a political speaker, and in 1904, at the Republican National Convention in Chicago, presented the name of Mr Roosevelt as the nominee of his party

BLACK, HUGH (1868-) A Scotch-American clergyman and author, born at Rotheray He studied at Glasgow University and was ordained to the Presbyterian ministry in 1891 From 1891 to 1896 he was pastor at Paisley and in the latter year was called to St George's Free Church, Edinburgh He became professor of practical theology in Union Theological Seminary (New York) in 1906, and was thereafter regarded as one of the finest preachers in America His publications comprise *Friendship* (1898), *Culture and Restraint* (4th ed., 1901), *The Practice of Self-Culture* (1904), *Edinburgh Sermons* (1906), *Christ's Service of Love* (1907), *University Sermons* (1908), *Comfort* (1910), *Happiness* (1911, 1913), *Three Discourses* (1912), *According to my Gospel* (1913)

BLACK, JEREMIAH SULLIVAN (1810-83) An American jurist and statesman He was born in Somerset Co., Pa., received a common school education, studied law, was admitted to the bar in 1831 and soon acquired a considerable practice He served for some time as deputy attorney-general for Somerset County, and from 1842 to 1851 was president judge of the Sixteenth Judicial District of Pennsylvania He became a judge of the Supreme Court of Pennsylvania in 1851 and filled the office with distinction until 1857, when he became Attorney-General of the United States in President Buchanan's cabinet In this capacity he protected the government against the frauds involved in the famous "California land claims," which grew out of alleged Mexican grants issued before the cession of California to the United States, and on the approach of the Civil War contended vigorously against any interpretation of the Constitution which would justify secession or would prohibit the President from suppressing insurrection or protecting Federal property against the attacks of State forces Black replaced Cass as Secretary of State in December, 1860, and soon after-

ward rendered an important service to the country by inducing Buchanan to take a firm attitude in his negotiations with the South Carolina commissioners with regard to the withdrawal of the United States troops from Fort Sumter At the close of Buchanan's administration, Black served for a time as United States Supreme Court reporter, but resigned to devote himself to his private practice and subsequently took part in many celebrated cases He was counsel for President Johnson in the famous impeachment trial of 1868, but withdrew from the case after the President's answer had been filed In 1877 he was conspicuous as one of Tilden's counsel before the Electoral Commission (qv) and afterward wrote an able argument against the decision of the commission in favor of Hayes Besides winning a foremost place at the bar, Judge Black was known as a thorough classical scholar and a brilliant conversationalist Soon after his death the bar of the Supreme Court of the United States spoke of him as having been "a lawyer profoundly versed in the science of the law and worthy to be ranked with the greatest and ablest of our age and country" His published addresses include *Observations on Territorial Sovereignty* (1860) and *Federal Jurisdiction in the Territories* (1883) Consult C F Black, *Essays and Speeches of Jeremiah S Black, with a Biographical Sketch* (New York, 1885)

BLACK, JOHN (1783-1855) A Scottish journalist He was born near Dunse, where he attended school, and was subsequently articled to a writer He afterward obtained employment as an accountant in Edinburgh, attending classes at the University and doing some literary work He became a reporter for the *London Morning Chronicle* in 1810 and editor in 1817 John Stuart Mill says that Black "played a really important part in the progress of English opinion for a number of years which was not properly recognized," and that he was the "first journalist who carried criticism and the spirit of reform into the details of English institutions" The institutions especially affected by this criticism were the courts and the Church, with the result that the press enjoyed a much larger measure of freedom in dealing with them Black was a friend of James Mill and Lord Palmerston, Melbourne, and Brougham, and was a patron of Charles Dickens, whose connection with the *Chronicle* began in 1835 He published translations of Humboldt's *Political Essay on New Spain* (1811-12), Von Buch's *Travels in Norway and Lapland* (1813), Bezelius' *System of Mineralogy* (1814), Schlegel's *Lectures on Dramatic Literature* (1811), and *Memoirs of Goldoni* (1814)

BLACK, JOSEPH (1728-99) A Scottish chemist He was born in Bordeaux, France, where his father was engaged in the wine trade Both his parents were of Scottish descent, but natives of Belfast, whither their son was sent for his education in 1740 In 1746 he entered the University of Glasgow, in 1751 he went to Edinburgh to complete his medical course, and in 1754 took his doctor's degree His thesis on the nature of the mild and caustic alkaline earths contained his first contribution to chemical science In those days the transformation by heat of a mild alkali (a metallic carbonate) into the corresponding caustic alkali (an oxide, or hydroxide) was interpreted on the hypothesis that the mild alkali combines with the fiery

inciple called phlogiston, and thus the caustic alkali is produced. Black showed, however, that the transformation was accompanied by a loss of weight, and that during the transformation an inferior substance escaped from the mild alkali. It is a ferri-form substance he found to be different from atmospheric air and gave it the name of *de air*. Thus the existence, both in the free state and in combination, of a gas different from—viz., carbonic acid—was first clearly established by Black. Black succeeded Cullen as professor of anatomy (which branch he afterward changed for medicine) and lecturer on chemistry in Glasgow. Between 1759 and 1763 he solved that theory of "latent heat" on which scientific fame chiefly rests, and also showed that different substances have different specific heats, the immediate preliminary to the next great stride in discovery by his pupil and assistant, James Watt. In 1766 Cullen was appointed to the chair of theoretical medicine in Edinburgh, and Black succeeded him in the air of chemistry. Thenceforth he devoted himself chiefly to the elaboration of his lectures, in which he aimed at the utmost degree of perspicuity. He published: *Experiments on Magnesia, Quicklime, and Other Alkaline Substances; Observations on the More ready Freezing of Water that has been Boiled; and Analysis of the Waters of Some Boiling Springs in Iceland*. His *Lectures on the Elements of Chemistry* was published after his death by Robison (2 vols., London, 1803). Cf. Brougham, *Lives of Philosophers of the Age of George III* (London and Glasgow, 1855).

BLACK, WILLIAM (1841-98). A British novelist. He was born in Glasgow, Nov. 9, 41. He studied art for a time in the government school there, with the intention of becoming an architect; but he soon abandoned art for journalism. After some experience on the *Glasgow Weekly Citizen*, he went to London, where first he wrote for the magazines. In 1865 he joined the staff of the *Morning Star*, becoming the next year its special war correspondent during the Prusso-Austrian War. Subsequently he was for a short period assistant editor of the *Daily News*. He died Dec. 10, 1898. He produced more than 30 novels, among which are: *Daughter of Heth* (1871), which gained him a reputation; *Kulmeny* (1870); *Strange Adventures of a Phaeton* (1872); *A Princess of Thule* (1873); *Madcap Violet* (1876); *Macleod of Dare* (1878); *Three Featherers* (1881); *Shandon Bells* (1883); *Judith Shakespeare* (1884). In *Far Chamber* (1888); and *Wild Eelin* (1898). As they are observed from these titles, Black laid his scenes mostly in northern Scotland, which he knew and loved well. It was, however, his pungent practice to contrast the simple manners of his country folk with the London Bohemia. His novels, some of which were extremely popular, show more than average workmanship. Some of them quite reach the high art of the best novelists, though *A Daughter of Heth* reveals talent which almost approaches genius. Cf. Sir Wemyss Reid, *William Black, Novelist: A Biography* (New York, 1902).

BLACK, WILLIAM MURRAY (1855-). An American army officer, born at Lancaster, Pa.; graduated from Franklin and Marshall College and later from West Point, engaged largely in government river and harbor improvement work, and passed through the grades of the Engineer Corps of the army to that of lieutenant

colonel and chief engineer of the United States Volunteers in 1898. He taught at West Point before the Spanish-American War and after it served at Havana, in the Philippines, and at the Panama Canal. In 1909 he was appointed chief engineer of the Eastern Division of the United States, and upon the retirement of Gen. William H. Bixby (q.v.) in 1913 he was advanced to chief of the Engineer Corps.

BLACK ACTS. Scottish parliamentary acts dating from 1424 to 1594; so called because they were all printed in the black, or Saxon, characters. The expression "Black Act" is also applied to an act of George I (1722), directed against poachers who, with their faces blackened or otherwise disguised, and associated, as we are told in the preamble of the act, under the name of Blacks, appeared in Epping Forest, near Waltham, in Essex, destroyed the deer there, and committed other enormities. This act, made perpetual in 1758, was subsequently repealed, together with numerous other statutes, in 1827 by 7 & 8 George IV, c. 27.

BLACK APPLE. A name applied in Queensland and New South Wales to *Sideroxylon australe*, formerly called *Achras australis*, a tree of the family Sapotaceae. The tree produces an edible fruit about the size of a plum. The timber of this and several other Australian species is close-grained, hard, and easily worked, and is valuable for cabinetwork and especially for carving.

BLACK ASSIZE. A popular name commemorative of an extraordinary epidemic of jail fever which broke out at Oxford at the close of the assizes, July 6, 1577. Contemporary accounts describe it as having originated in the courthouse immediately after a sentence to lose his ears was passed on Richard Jencks, a bookbinder accused of sedition. It was popularly interpreted as a divine judgment on the cruelty of the sentence; but the phenomenon is satisfactorily explained by the pestilential atmosphere of the adjoining jail, then, and long afterward, a seat of misery, filth, and disease. From the 6th of July to the 12th of August, 510 persons are said to have died in Oxford and the neighborhood of this terrible malady, among whom were the chief officials who sat at the assize, most of the jury, and many members of the university. Women, poor people, physicians, visitors, and children are said to have escaped the infection. A similar event is recorded as having taken place at Cambridge at the Lent Assizes in 1521. Consult: Holinshed, *Chronicles* (London, 1577; reprint, 6 vols., London, 1807-08); Stow, *Annales* (1st ed., London, 1580, ed. Howe, London, 1831); Wood, *Athenæ Oxonienses* (1st ed., London, 1691-92; 4th ed., ed. Bliss, Oxford, 1848).

BLACKBAND IRONSTONE. An ore of iron, found commonly in rocks of the Carboniferous system and to a lesser extent in the Jura-Trias system, of several countries. It occurs in bands or rounded masses and is often associated with coal and sometimes with limestone. It is mainly a carbonate of iron, accompanied by some coaly matter and clay impurities. In the United States blackband ores are obtained in Pennsylvania, Ohio, and Kentucky. In Europe Scotland yields some. This ore is low in iron, as shown by the percentage composition of an Ohio ore from Tuscarawas: silica, 26.22; phosphorus, 0.27; iron carbonate, 54.69; iron sesquioxide, 10.42; alumina, 0.70; manganese,

170, lime carbonate, 2 00, sulphur, 1 84 Before melting in the blast furnace, blackband ironstone has to be roasted. It is seldom used alone, and the United States' production is very small. See IRON, *Iron Ores*.

BLACK BASS, BLACK DUCK, etc. See the substantives.

BLACK BEETLE A common name in England for the Oriental cockroach (see COCK-ROACH), also, rarely, for beetles of the genus *Blaps*.

BLACK BERRY A term applied to various species of *Rubus* which bear a fruit consisting of an aggregation of small drupes or berries, arranged about the receptacle to which they adhere, and which, when ripe, separates from the plant with the drupes and forms a part of the so-called fruit. In America the blackberry and dewberry, or running blackberry (*Rubus canadensis*), are indiscriminately spoken of as blackberries, while the English bramble (*Rubus fruticosus*) is also called a blackberry. In America these fruits, with the exception of *Rubus fruticosus*, have attained a commercial status, and each year widens their range of cultivation. Although existing in a high state of development as wild plants, they attracted little attention as garden fruits until as late as 1850. Now, however, they are extensively cultivated over a wide area.

The blackberry is propagated almost exclusively from root sprouts, suckers, and root cuttings. New varieties are secured by planting the seed, but most of the named varieties now on the market are chance seedlings from wild or cultivated plants. The habit of growth of the blackberry renders it necessary to set the plants not closer than 3 by 8 feet for the smaller growing sorts, while 4 by 10 is not too wide for the larger kinds. The fruit is extensively used for canning, both in a commercial and domestic way, but it finds its chief market as a fresh fruit for dessert purposes. The bark of the root has tonic properties which are much prized by the country folk. A fluid extract made from blackberry root is sometimes prescribed in cases of diarrhoea. For illustration and a discussion of the genus, see RUBUS, also see DEWBERRY.

BLACKBERRY DISEASES See RASPBERRY DISEASES.

BLACK BESS The name of the English highwayman Turpin's mare.

BLACK BIRD Any of several different birds prevaillingly black in plumage, in America, a member of the family Icteridæ. About a

generally the contrast is very great. In most of the species the female is not black at all, and the young resemble her. The largest of the American blackbirds are those known as crow-blackbirds—*or*, more properly, grackles (*q v*)—one species of which reaches a length of 18 inches, but is not so heavy as a crow. The other blackbirds are much smaller—less than a foot in length—and are distinguished from each other chiefly by color. In the eastern United States we have only the cowbird (*q v*) and the red-winged blackbird (*Agelaius phœniceus*), the male of the former uniform lustrous black, with a brown head and the latter jet-black, with a scarlet patch on each "shoulder" (See RED-WING). In the Middle West, besides the eastern species, there occurs the handsome yellow-headed blackbird (*Xanthocephalus xanthocephalus*), in which the whole head and throat is yellow, or even orange. The Pacific coast has also the red-and-white-shouldered blackbird (*Agelaius tricolor*), which is bluish black, with a dark blood-red patch on the wing, bordered with pure white. All of these species, except the cowbirds, frequent marshy grounds or swamps to breed and often gather in large flocks, the more especially during the migrations. They feed on almost everything in the insect or vegetable line, but though they sometimes damage corn fields, they are beyond question beneficial. The nests are built on or near the ground in the swamps, among reeds or small bushes, and are composed chiefly of dried grass and reeds. The eggs are pale blue or grayish green, scrawled or spotted with brown.

In the Western States the lark bunting (*Calamospiza melanocorys*) is sometimes called the white-winged blackbird, while in the East the bobolink is frequently called the skunk blackbird, on account of its peculiar markings, and in Florida and the West Indies the ani is commonly termed savanna blackbird.

In Europe, the name "blackbird" is given to an entirely different bird, the merle, a thrush (*Turdus*, or *Merula merula*). It occurs throughout Europe, except Spain, where, as well as in northwest Africa and Asia, it is replaced by closely related forms. The male is deep black, while the female and young are rusty brown. Like the other thrushes, the merle is chiefly insectivorous, though it often eats fruit, and is a fine singer, although the notes are somewhat too loud to make it an acceptable cage bird. See PLATES OF BLACKBIRDS and of EGGS OF SONG BIRDS.

BLACK BOOK The designation of various historical and other works, so called from the character of their type or their binding or contents. Among the more popularly known are a university register, in which students' misdemeanors are recorded, any volume treating of necromancy or the "black art", and, in Great Britain, the list of habitual criminals published since 1877. The most important historical black books are the volume formerly attributed to Gervase of Tilbury, but now known to be the compilation of Nigel, Bishop of Ely (died 1169), giving a detailed description of the Court of Exchequer, its officers, their duties and privileges, etc., also of the revenues of the crown, a book of admiralty statutes and ordinances of the reign of Edward III, first edited by Sir Travers Twiss (4 vols, London, 1871-78), and a series of reports compiled by order of the visitors to the English monasteries in the reign of Henry

HEAD AND FOOT OF A TYPICAL BLACKBIRD

dozen species dwell in the United States. They agree in the possession of a rather long and slender beak, with cutting edges, and have only nine primaries in the wing, but are distinguished from each other by size and color. The males, when in full plumage, are always somewhat more strikingly colored than the females, and

1. BOBOLINK (*Dolichonyx oryzivorus*); male in summer plumage.
2. BOBOLINK; female.
3. YELLOW-HEADED BLACKBIRD (*Xanthocephalus xanthocephalus*).

4. COW-BIRD (*Molothrus ater*).
5. PURPLE GRAKLE (*Quiscalus quiscula*).
6. RED-WINGED BLACKBIRD (*Agelaius phoeniceus*).

VIII. Their presentation to Parham in 1536 was followed by the suppression of those institutions. These reports probably never formed a bound volume, although one is fabled to have been burned by order of Queen Mary. The reports still in existence are considered by recent historians to be extravagant and malicious in their statements. Consult Gardner, editor, *Letters and Papers of the Reign of Henry VIII* (London, 1880-86).

BLACK/BREAST. Either of two American bay birds. 1. The black-bellied plover (*Squatarola*, or *Charadrius squatarola*). 2. The dunlin (*Tringa*, or *Pelidna, alpina*); also called blackheart.

BLACK BRUNS/WICKERS, or THE DEATH'S-HEAD CORPS. A troop of 2000 hussars, organized in Germany by Frederick William, Duke of Brunswick, in May, 1800, during the Napoleonic wars. Their uniform was jet black and ornamented with lace in imitation of the ribs of a skeleton. Their helmets were adorned with silver skulls and crossbones and with black horsehair tresses instead of plumes.

BLACKBUCK (so named from its blackish brown color; AS. *bucca*, he-goat, *buc*, a male deer, OHG. *boch*, Ger. *Bock*, he-goat). The common antelope of India (*Antelope cervicapra*), which ranges over the whole of the peninsula and Assam, wherever there are open plains. A male blackbuck stands about 32 inches high at the shoulders and will weigh, alive, about 85 pounds. The horns usually run from 16 to 20 inches in length, but may reach 28 inches. They arise close together and are cylindrical and ringed, with an elegant spiral twist of from three to four turns. The does are hornless, as a rule.

Old males are among the handsomest of all antelopes, the contrast of the full blackish brown of the greater part of the head, body, and outer sides of the limbs with the white of the under parts and the ring around the eye being most striking. Young bucks, and the does of all ages, are rich yellowish brown, a color which renders them less conspicuous to their enemies. These pretty little antelopes are always found either in open ground, wild, grassy plains, or cultivated tracts, and go in herds, sometimes reaching hundreds, or even thousands, in number. Ordinarily, however, bands containing only from 10 to 40 individuals are met with, led by one shining, black-coated old buck. See PLATE of GAZELLES.

Sport.—They are a favorite object of sport, but in many parts of India are so protected by the prejudice of the natives as to suffer little from the gun. The literature of sport with the gun in India abounds in descriptions of blackbuck hunting. The usual method is to chase them with greyhounds. Where the plains are very sandy, this coursing is usually successful, and it affords the sportsmen who follow the dogs on horseback the exhilaration of a fine burst of speed before seeing the prey pulled down; but elsewhere, on open, hard deserts, or where plains of tough turf give the fleet little animals a good foothold and fair start, it is rare that the best of dogs can catch them. They are also chased with the cheeta and with falcons. The name is sometimes applied to the African sable antelope.

BLACK BUL/LY, BALLY-TREE WOOD, or SAPODILLA PLUM (*Achras sapota*). A tree peculiar to South America and the West Indies, having a durable wood that is used for shipbuilding, and a milky juice which is thickened

by evaporation and exported as gutta-percha. The tree is extensively cultivated throughout the tropics on account of its excellent fruit. The bark is febrifugal, and the seeds have diuretic and aperient properties.

BLACKBURN (named after the river Blackburn, from AS. *burna*, brook, stream, Ger. *Brunnen*, well, Eng. *burn*, rivulet, brook). A manufacturing town in Lancashire, England, on the Blackburn (generally called "the Brook"), and the Leeds and Liverpool Canal, 24 miles north-northwest of Manchester (Map England, D 3). Among its notable public buildings are a handsome townhall, a fine Gothic exchange, and a newly erected Drapers' Hall. There are two large parks—Corporation Park and Queen's Park, opened in 1887. Blackburn was incorporated in 1851 and since that date has rapidly advanced to the front rank of flourishing manufacturing towns. It has owned its water supply since 1875. The acquisition of the gas works followed in 1877, and in 1895 the corporation began the supplying of electricity. The street railways and suburban lines were taken over in 1898. The town also maintains public baths, markets, slaughterhouses, and cemeteries. Among its educational institutions are a grammar school, founded by Queen Elizabeth in 1567 (modern buildings, 1884); a technical school, maintained by the corporation; a public library, with which is connected a museum; and an art gallery. The town also maintains two hospitals. It has a modern and profitable sewage system, including extensive irrigation works, precipitation plant, and two farms. The great business of the town is the weaving of cotton stuffs. There are also large establishments for the manufacture of weaving machinery, and considerable manufacture of iron. Blackburn is the birthplace of John Morley (q.v.), and here James Hargreaves (q.v.), a native of the town, invented the spinning jenny about 1764. He was driven out of the town by a mob of workmen who feared that machinery would deprive them of their livelihood. Pop., 1891, 120,064; 1901, 127,527; 1911, 133,064.

BLACKBURN, JOSEPH CLAY STYLES (1838-). An American legislator, born in Woodford Co., Ky. He graduated from Centre College in 1857, entered on the practice of law in Chicago, and served in the Confederate army throughout the Civil War. For several years he was a member of the Kentucky House of Representatives and during the decade 1875-85 was in Congress. From then until 1897, and again in 1901-07, he was United States Senator from Kentucky. At the end of his second term he was appointed a member of the Isthmian Canal Commission and head of the department of civil administration of the Canal Zone. This office he resigned in 1909. One of the best-known Democratic campaigners and politicians of his day, Senator Blackburn was delegate to the Democratic National conventions in 1896, 1900, and 1904, and was chairman of the Democratic caucus in the Senate in 1906-07. He was noted as an orator of the florid type.

BLACKBURN, WILLIAM MAXWELL (1828-1898). An American clergyman and author. He was born in Carlisle, Ind., graduated in 1850 at Hanover College, and in 1854 at Princeton Theological Seminary, and held pastorates in Erie, Pa., and Trenton, N. J. In 1898 he was appointed professor of biblical and ecclesiastical history in the Presbyterian Theological Semi-

nary in Chicago, Ill. He was appointed president of the Territorial University of North Dakota in 1884 and in 1886 of Pierre University (now Huron College). He contributed to the *Princeton Review* and other periodicals, and published *Exiles of Madeira* (1862), *The Rebel Prince* (1864), *The College Days of Calvin* (1866), *Ulrich Zwingli, the Patriotic Reformer* (1868), *The Theban Legion* (1871), *History of the Christian Church from its Origin to the Present Time* (1879), *Historical Sketch of North and South Dakota* (1893).

BLACKBURNE, FRANCIS (1782-1867). An Irish Lord Chancellor. He was born at Great Footstown, county Meath, Nov. 11, 1782. He entered Trinity College, Dublin, in 1798. He studied law in Dublin and London and was admitted to the English bar in 1805 and to the Irish bar in 1822. In 1830 he was Attorney-General for Ireland under Earl Grey's government. When a renewal of the Insurrection Act was necessitated by the disturbed state of Ireland, Blackburne devoted himself to the vigorous application of that measure in Limerick and at the end of two years succeeded in restoring order. His activity against the riotous opponents of the collection of tithes, and a legal victory gained over O'Connell, antagonized that politician and his followers, and their bitter attacks led to his resignation. For a period of seven years following this incident he was consistently overlooked as place after place became vacant on the bench. Finally, in 1841, Sir Robert Peel again appointed him Attorney-General for Ireland. In the critical period of 1847-48 he presided with conspicuous ability in the prosecution of Smith O'Brien and others who were convicted of treason. In 1852 he was made Lord Chancellor, but resigned soon afterward. In the same year he was appointed a commissioner of education and in 1856 became Lord Justice of Appeals. He accepted the office of Chancellor for the second time in 1866, but his appointment being loudly condemned, he was induced to resign. He was for some years vice chancellor of Dublin University, and in 1867 declined Lord Derby's offer of a baronetcy. See O'CONNELL, DANIEL, and consult E. Blackburne, *Life of Lord Chancellor Francis Blackburne* (London, 1874).

BLACKBURNE, JOSEPH HENRY (1842-) An English chess player, born in Manchester. In his youth he became an expert at draughts (checkers), from which he soon turned to chess. Inspired by the performances of Paul Charles Morphy (qv), he became highly proficient in "blindfold" play, at which, in 1862, he defeated ten other players simultaneously, without seeing any of the boards. He began regular tournament play in 1868 and during the next 30 years competed in practically all of the important matches with remarkable success. Probably his greatest achievement was in 1881 at Berlin, where, after losing his first game, he played 15 more, of which he won 13, and drew two, defeating Zukertort, and taking the first prize. Consult MacDonnell, *Chess Life-Pictures* (London, 1883), and Chesshire, *The Hastings Chess Tournament* (New York, 1896).

BLACK'CAP A name in England and America of various small birds which have the top of the head black. In America it is properly applied to one of the fly-catching warblers, also called Wilson's warbler (*Sylvania*, or *Vilsonia pusilla*), a small olive and yellow bird, the male

of which has the top of the head rich, lustrous black. It frequents swamps and low woodlands, where it is very active in search of its insect prey and builds its nest near the ground. The black capped titmouse, or chickadee (*Parus atricapillus*), also frequently receives this name in the United States. See **TITMOUSE**.

In Europe the name is given to one of the warblers (*Sylvia*, or *Curruca*, *atricapilla*), closely allied to the nightingale, and one of the sweetest song birds of Great Britain. It is smaller than the nightingale and plain gray and ashy-brown. The male has the top of the head jet black, but in the female it is a dull rust color. This blackcap is very popular as a cage bird.

BLACK CAP See **RUBUS**.

BLACK CAP In England, the ceremonial head covering assumed by the judges of the higher courts on solemn occasions, as when pronouncing sentence of death, attending divine service in state, or at the official reception by the judges of the Lord Mayor of London. It is a square, limp cap of black cloth and is, like the academic "mortar board," a survival of the "pointed cap" worn by the judges and ecclesiastical dignitaries in the Tudor period. It was originally worn as a sign of judicial superiority. On certain ceremonial occasions it is replaced by a black cocked hat. It is not to be confounded with the *coif* (qv), which was the distinctive badge of the order of sergeants at law (qv).

BLACK'CAT A Canadian fur bearer. See **FISHER**.

BLACK CHALK A variety of clay containing a large amount of carbon. It is found in Carnarvonshire, Wales, and on the island of Islay off the coast of Scotland. It is used for drawing and, when ground, as a black pigment.

BLACK'COCK (fem *Gryehen*) A dark-colored grouse (*Lagopus*, or *Tetrao tetras*), with outward curling tail feathers, prevalent on moorlands throughout Europe. It is known in Great Britain as black grouse, or black game, and as heath cock and heath hen, while the young are called poult. See **GROUSE** and **PLATE OF GROUSE**.

BLACK CODE See **BLACK LAW**.

BLACK CO'HOSH See **CIMICIFUGA**.

BLACK DEATH (Lat. *pestis*, *pestis bubonica*, *pestis inguinalis*, bubonic plague) One of the names given to an Oriental plague. An acute infectious disease caused by the presence of a specific microbe (*Bacillus pestis*), and marked by suppuration and tumors, which in the fourteenth century desolated the world. It took this name from the black spots caused by subcutaneous hemorrhages which, in severe cases, appeared in the skin. The symptoms were swelling of glands and formation of buboes, headache, vertigo with tottering gait, pains, deafness, convulsions, cough, and expectoration of bloody mucus in some cases, enlargement of liver and spleen, etc. On the first appearance of the plague in Europe, fever, the evacuation of blood, and affection of the lungs brought death before the other symptoms could be developed, afterward boils and buboes characterized its fatal course in Europe, as in the East. In almost all cases its victims perished in two or three days after being attacked. Rufus of Ephesus wrote of its appearance in Libya, Egypt, and Syria during the third century B.C. The plague which broke out in the reign of Justinian originated in Egypt about 542 and passed

through Constantinople, Gaul, Spain, Marseilles, and thence over all Europe, lasting 50 years and resulting in enormous mortality. The precise date of the appearance of the plague in China is unknown, but from 1333 till 1348 that great country suffered a terrible mortality from droughts, famines, floods, earthquakes which swallowed mountains, and swarms of innumerable locusts, and, in the last few years of that period, from the plague. The pestilence had, in a milder form, appeared in Europe in 1342. The invasion of 1348 may be tracked from China in its advance by the various caravan routes toward the west. The northern coast of the Black Sea sent the plague by contagion to Constantinople. Thence it spread to the seaports of Italy and soon established itself over Europe. Its advance may be traced through Germany and France to England, from which it was transmitted to Sweden. It was three years from its appearance at Constantinople before it crept, by a great circle, to the Russian territories.

There are no proper materials for estimating the mortality which this plague produced, for it occurred before the value of statistics was appreciated. But in China 13,000,000 are said to have died and in the rest of the East nearly 24,000,000. Coming to Europe, the horror is increased by the greater exactness of the details. London alone lost over 100,000 souls; 15 European cities lost among them about 300,000; Germany is calculated to have lost 1,244,000; Italy, one-half its population. On a moderate calculation it may be assumed that in Europe 25,000,000 human beings perished. Africa suffered with the rest of the known world. All animal life was threatened. Rivers were consecrated to receive corpses, for which none dared to perform the rites of burial, and which in other places were cast in thousands into huge pits made for their reception. Death was on the sea, too, as well as on the land, and the imagination is quickened to the realization of the terrible mortality by accounts of ships without crews—the crews dead and putrefying on the decks of the aimless hulks—drifting through the Mediterranean, the Black, and the North seas, and cursing with contagion the shores on which winds or the tide chanced to cast them.

Many died of fear, which among the living disolved the ties of kindred; mothers forsook their plague-stricken children; the worldly became quickened to a maddening sense of sin; the religious fixed their eyes more steadily on futurity; all rushed to sacrifice their means to the Church, while the ecclesiastics drew back from the gold showered over their walls, as being tainted with death. In other cases people abandoned themselves to crime and debauchery. Superstition finally banded multitudes together by common means to work out the common safety. In Hungary, and afterward in Germany, rose the brotherhood of the Flagellants (q.v.), who undertook to expiate the sins of the people and avert the pestilence by self-imposed sufferings. Originally of the lower classes, they gathered to their order, as it extended, crowds of the highest, both men and women, and marched from city to city, robed in sombre garments, with red crosses on the breast, back, and cap, and with their heads covered as far as the eyes; they went chanting in solemn processions with banners, with downturned faces, and bearing triple scourges with points of iron, with which at

stated times they lacerated their bodies. They at last pervaded nearly all Europe; Germany, Hungary, Poland, Bohemia, Silesia, and Flanders did them homage. The order was not suppressed till the Pope, at the instigation of several crowned heads, prohibited throughout Christendom their pilgrimages on pain of excommunication. While the wanderings of the Flagellants threw society into confusion and helped to spread the plague, the horrors of the time were further heightened by the fearful persecutions to which the Jews were subjected, from a popular belief that the pestilence was owing to their poisoning the public wells. The people rose to exterminate the Hebrew race, of whom in Mainz alone 12,000 were cruelly murdered. They were killed by fire and by torture wherever they could be found, and to the terrors of the plague for them were added those of a populace everywhere infuriated against them. In some places the Jewish people immolated themselves in masses; in others, not a soul of them survived the assaults of their enemies. No adequate notion can be conveyed of these horrors. To aggravate the pestilence, the poison panic made the people shut up their wells. With terror of poison and of plague in a state of society rude at the best, but now disorganized, what means were available to mitigate or prevent the sufferings of the people were rendered altogether nugatory. The enormous decrease in the population of Europe occasioned by the Black Death necessarily brought about great and lasting changes in social conditions. Perhaps on no class of society were the effects of the plague so marked as on the laboring population, among whom the rate of mortality had been especially great. Immediately after the cessation of the pestilence, what would be called at present a very serious stringency in the labor market ensued. In England, where probably one-half of the population had been swept away (according to some chroniclers the survivors numbered only one-tenth), the agricultural laborers banded together for the purpose of securing higher wages. This led to a struggle between the laborers and the landlords, which took the form of violence on one side, and on the other of legislation fixing the scale of wages and prohibiting the migration of laborers from place to place, culminating in the peasant revolt of 1381 (see TYLER, WAT), and resulting in the gradual abolition of villenage and the reorganization of land-holding relations on the basis of rent, as between owner and tenant, and wages, as between farmer and laborer.

Bibliography. The following authors refer to or describe the Great Plague: Chaucer; Langland; Boccaccio in the *Decameron*; Bulwer, in *Rienzi* (Boston, 1890); Hecker, *Epidemics of the Middle Ages* (London, 1849); Creighton, *History of Epidemics in Britain* (New York, 1892); Hecker, *The Black Death* (London, 1890); F. A. Gasquet, *The Great Pestilence* (London, 1894); De Foe, *Journal of the Plague Year*. See PLAGUE.

BLACK DOSE, or DRAUGHT. See SENNA.
BLACK DROP, or BLACK LIGAMENT. An optical illusion noticed during the transit of Venus or Mercury across the sun's disc. At the first internal contact, when the disc of the planet separates from the edge of the sun, the former appears to become elongated toward the latter, remaining for some time connected with it by a narrow neck called the "black drop."

This breaks suddenly at last, but not until the planet has progressed to some distance from the sun's edge. The same phenomenon is observed as the planet is nearing egress. It has been variously ascribed to instrumental imperfections, atmospheric agitation, and irradiation (q.v.). With suitable precautions, however, its effect in preventing the accurate determination of the times of ingress and egress of the planet can be considerably diminished.

BLACK DUCK, BEAR, SQUIREEL, TERN, etc. See the substantives.

BLACK DWARF, THE. The title of a novel by Scott (1816). Its scene is laid in the time of Anne, and it is founded on a Scottish legend.

BLACK EAGLE. See **EAGLE**, **BLACK**.

BLACK EAGLE, ORDER OF THE. See **ORDERS**.

BLACK-EYED SUSAN, or **ALL IN THE DOWNS**. The name of a popular comedy of 1829, by Douglas Jerrold founded on Gay's ballad.

BLACKFIN, or **BLUEFIN**. A large whitefish (*Agyrosomus nigripinnus*) of the deep waters of Lake Michigan and certain lakes in New York State, distinguished by its blue-black lower fins. See **Plate of WHITEFISH**, etc.

BLACKFISH. Any one of a variety of dark-colored fishes. In the United States the name refers mostly to the tautog (see **TAUTOG** and **Colored Plate** accompanying the article **FISH AS FOOD**). Others are a sea bass (*Centropomus striatus*) of the east coast, and a minnow (*Orthodon macrolepidotus*) of the Pacific coast.

In Alaska the local "blackfish" is a small fresh-water fish (*Dallia pectoralis*), set apart as the sole representative of the family **DALLIIDÆ** and the order **XENOMI**, which is only 8 inches long. It inhabits the streams and ponds of northern Alaska and Siberia and exists in countless numbers in all the ponds and shallow waters, forming the chief food of the natives. "The species feeds on plants and worms. Its vitality is extraordinary. Blackfishes will remain frozen in baskets for weeks, and when thawed out are as lively as ever." Indeed Turner tells of a frozen individual swallowed by a dog which escaped in safety after being thawed out by the heat of the dog's stomach. Its body is oblong, color nearly black, and its structure implies an ancient type. See **Plate of KILLIFISHES**, etc.

In England the name is given to one of the ruffs, a scumbroid (*Centrolophus niger*), about 2 feet long, having somewhat the shape of a perch, with a single long, rather low dorsal fin. It is good to eat and occurs rather abundantly in the deeper waters off the south coast of Europe.

BLACKFISH. A black killer whale of the genus *Globicephalus*. Several species inhabit northern seas. One of these is the bottle head, caving, or pilot whale (*Globicephalus melas*) of British waters. The common blackfish of the Atlantic is *Globicephalus brachypterus*, and that of the north Pacific *Globicephalus scammonii*. They roam about in herds, like grampuses, and often enter harbors in pursuit of fishes. They are killed for the sake of a small yield of oil resembling sperm oil, but inferior, the flesh is edible. (See **KILLER** and **CAVING WHALE**.) The name is also given by sailors to various other small cetaceans. Consult Bullen, *Voyage of the Cachalot* (New York, 1898); Scammon, *Marine Mammals of Northwestern North America* (San Francisco, 1874); Goode, *Fishery Industries*, sec. 1 (Washington, 1884); True, "Re-

view of the Delphinidae, in *Bulletin U S Nat Mus*, No. 36 (Washington, 1889).

BLACK FLUX (Lat. *fluxus*, a flowing, flow, from *fluere*, to flow). A mixture of potassium carbonate and charcoal, used as a reducing agent in assaying. It is prepared by mixing one part of potassium nitrate (nitre) with from two to three parts of potassium bitartrate (cream of tartar) and deflagrating by stirring with a red-hot iron until action ceases. The product is powdered and kept in a closely covered jar in order to prevent it from absorbing moisture from the atmosphere. An excellent substitute for ordinary black flux may be obtained by mixing 3 parts of flour with 10 parts of sodium bicarbonate.

BLACK FLY. A gnat of the forest regions of north temperate latitudes, especially tormenting to man and beast, and representing the family Simuliidae. All the insects of this family are short, small, and thick-bodied, having no simple eyes and no transverse suture in the thorax, they rarely exceed one-fourth of an inch in length. The larvae of these flies are aquatic, unlike mosquitoes, living in swift-running streams. Their eggs are deposited in closely packed layers on rocks near or below the surface of the water, into which the larvae drop when freed from the egg and become attached to plants, stones, etc., by a silken thread, or sometimes to each other, forming long floating strings, they soon pupate within silken cocoons, open at the ends so as to admit water. There may be several broods, the last producing young that hibernates in the larval stage. Hence the first emergence of imagoes (flies) is early in the spring. As summer advances, the insects become excessively numerous in such favorable regions for them as the well-watered forests of northern New York, Maine, and Canada, where in hot weather they abound in such swarms as to put a stop to work in the woods, and even to cause the death of poultry and other animals which cannot escape them. In Labrador life is practically impossible away from the seashore while the flies are in force. They suck blood like mosquitoes, but, unlike them, are worse in sunshine, becoming dormant on cloudy days. Thirteen species are known, that of the St. Lawrence valley (*Simulium venustum*) being different from that of Lake Superior. To protect themselves, people build smudges and smear their faces and hands with ointments, of which the best is oil of tar, habitually used by the employees of the Hudson's Bay Company. Consult, for a monograph of the group *Bulletin No. 10, Ent. Division, U S Dept. Agric.* (Washington, 1898). See **BUFFALO GNAT**.

BLACKFOOT. An Algonquian tribe of the plains, formerly roaming over the country about the head of the Missouri, from the Yellowstone northward to the North Saskatchewan and westward to the Rocky Mountains. They are now confined to reservations in Montana and the adjoining territory of British America. The name "Blackfoot" is said to have been given to them from the fact that when they first appeared in the upper Missouri country their leggings were black, as a result of their traveling over the recently burned prairie. They are divided into three great subtribes: the Siksika or Blackfoot proper, Kama or Blood, and Pikuni or Piegan, each in turn being subdivided into bands. The most striking cultural trait is the complexity and number of their ritualistic ceremonies. Associated with them were the

weaker tribes, Gros Ventres, and Sarsi (q.v.). Less than a century ago they were one of the strongest and most warlike tribes of the plains, being estimated as high even as 40,000 souls. They still number over 5000, of whom about 2100 are on the Blackfoot Reserve in Montana, the others being in British America. Grinnell (*Blackfoot Lodge Tales*, 1903) has made an interesting study of their mythology. An exhaustive discussion of their culture has been published by Wissler, *Anthropological Papers, American Museum of Natural History*, vols. ii, 7, vii, and xi. Consult also, McClintock, *Old North Trail* (New York, 1910), and Grinnell, *Blackfeet Indian Stories* (New York, 1913).

BLACK FOREST (Ger. *Schwarzwald*; so called from the dark foliage of its fir and pine trees). A wooded mountain region in the southwestern part of Germany, occupying about two-thirds of the southern part of Baden and one-third of the western part of Württemberg (Map: Germany, C 4). Extending about 100 miles south from Durlach and Pforzheim, its natural boundaries on the east are formed by the Nagold and the Neckar, and on the south and west by the Rhine. Its width varies from about 38 miles in the south to about 14 miles in the north, while its entire area is estimated at about 1900 square miles. The west slope of the region falls off abruptly toward the valley of the Rhine, in contrast to the east slope, whose incline is very gradual. The southern, or upper section, which is the widest part of the region, contains its greatest elevations. Among them are the Feldberg, 4800 feet, the highest peak of the entire region, sending off numerous offshoots, ranging in altitude from 3900 to 1200 feet; the Herzogenhorn, 4610 feet, the Belcher, 4600 feet, and a number of inferior elevations. Near Altbreisach, in the district of Freiburg, is situated the isolated volcanic mass of the Kaiserstuhl. The northern or lower part of the region is inferior in elevation to the southern and is less mountainous in general appearance. Its highest peak is the Hornisgrinde, 3790 feet, and there are a number of other elevations of a little over 3000 feet. The Black Forest, known for its great water supply, gives rise to a number of rivers, including the Danube and Neckar, and contains numerous lakes on its east slope. Geologically the region is composed of Archean granites and gneiss, which form its core, porphyry is found mostly on the sides; and sandstone occurs in the more elevated parts and at the base. The mineral resources of the region are of little importance, and its deposits of silver, cobalt, and copper are practically exhausted, though there are some workable coal seams near Offenburg. Mineral springs, however, are abundant and include such well-known health resorts as Baden-Baden and Wildbad. The climate is on the whole healthful, although somewhat raw in the more elevated parts. In the plains agriculture and cattle raising are pursued with more or less success, and here are some vineyards on the western slope. Up to a height of about 2000 feet there is a luxuriant growth of oaks and beeches, above which, to about 4000 feet, is a thick black belt of firs, which gives the region its name. The chief occupation of the inhabitants is the production of wooden clocks, musical instruments, and other manufactures of wood as well as watches. The Black Forest, which is much frequented, abounds in well-kept roads, and passes, among which the

Hollenthal Pass, near Neustadt, is the best known and is crossed by a number of railway lines. Two of the passes, the Knebis and the Holle, acquired considerable celebrity during the wars of the French Revolution. The first, situated on the borders between Baden and Württemberg, at the source of the Murg, was taken by the French in 1796 and in 1797; the Holle is known in connection with Moreau's retreat in 1796.

The Black Forest has been made the scene of many weird and curious stories, and it is associated with a vast number of legends, folk tales, and popular superstitions.

BLACK FRIARS. See DOMINICANS.

BLACK-FRIARS THEATRE. The first regular playhouse in the district of Blackfriars, London. It was erected in 1596 by James Burbage, who got its site and part of its structure as a gift from Sir Thomas Cawarden's executor. Shakespeare played here in 1598 in Ben Jonson's *Every Man in his Humour*. Burbage's company, which occupied the place, was known first as the Lord Chamberlain's Company and then as the King's Servants. The theatre was torn down in 1655.

BLACK FRIDAY. The name applied to two disastrous days in the financial history of the United States. On Friday, Sept. 24, 1869, a panic was caused in Wall Street by the effort of Fisk and Gould to corner the gold market, gold rising to 163½, and on Friday, Sept. 19, 1873, occurred in the New York Stock Exchange the great financial crash which was followed by the widespread "panic of 1873." For "Black Friday" of 1869 consult *The Yale Review*, vol. iii (New Haven, 1896); and Andrews, *The United States in our own Time* (New York, 1903).

In England the name is given to Dec. 6, 1745, the day on which news reached London that the Pretender had arrived at Derby; again, May 11, 1866, when the failure of Overend and Gurney brought on a disastrous panic. Consult *Julgar's Short History of Fables* (New York, 1893). Good Friday is also known as Black Friday in the Western church, because on that day clerical vestments and altar draperies are black.

BLACK GAME, or HEATH GAME. See BLACKCOCK.

BLACK GUARDS. A name originally applied to the scullions and lower servants of the English court, who were clothed in black garments. Gibbon says "those who carried coals to the kitchen, rode with the pots and pans, and were in derision called the Black Guards." The title is recognized in an official proclamation of 1683, which begins, "Whereas, a sort of vicious, idle, and masterless boys and rogues, commonly called the Black Guard, with divers other lewd and loose fellows," etc.

BLACK GUM, or SOUR GUM. The popular name of the *Nyssa sylvatica*, the pepperidge and tupelo of our Middle and Southern States. It grows in thick forests, usually in or near swamps, and attains a height of 80 to 90 feet, has crooked branches, and is densely covered with bright-green leaves in tufts at the ends of the branches, bears flowers of greenish hue, ovoid fruits, becoming blue-black as they ripen; wood close-grained and very tough, but not durable. The timber is used for hubs of wheels and in other places where splitting is to be avoided. It is planted as an ornamental tree in England.

The cotton, or Tupelo gum, of the Southern

States is *Nyssa aquatica*, a tree 80 to 100 feet high, with light but not strong wood, extensively used for woodenware, fruit and vegetable boxes, etc. The wood of the roots is very light and is sometimes used for floats for fish nets. Sour tupelo, or Ogechee lime, is *Nyssa ogeche*, a smaller tree, that bears edible fruits.

BLACK HAWK (1767-1838) A celebrated chief of the Sac Indians. In 1788 he succeeded his father as head chief of the Sacs. In 1804 the Sacs and Foxes agreed, for an annuity of \$1000, to give up to the United States their lands east of the Mississippi, but Black Hawk promptly repudiated this arrangement, and in the War of 1812 took part against the United States. The cession of the disputed territory was again provided for by treaties in 1815 and 1816, the latter being signed by Black Hawk, and in 1823 the majority of the Sacs and Foxes, under Keokuk (qv), moved across the Mississippi, a new treaty being signed at Prairie du Chien, on July 15, 1830. When the whites began to occupy the vacated lands, Black Hawk threatened retaliation and by crossing the Mississippi with a small force in June, 1831, precipitated the Black Hawk War. The Indians were defeated by General Dodge, near the Wisconsin River, on July 21, 1832, and by General Atkinson, at the Bad Axe River, August 1-2, and Black Hawk surrendered on August 27. He and nine other warriors were held for a time as hostages, and after being taken to several Eastern cities, were confined in Fortress Monroe until June 8, 1833. The Sacs and Foxes under Keokuk soon moved to a reservation near Fort Des Moines, where Black Hawk died, Oct. 3, 1838. Consult Pattison, *Life* (Boston, 1834), Drake, *Life* (Cincinnati, 1846). Also consult an article, "Story of the Black Hawk War," by Thwaites, in vol. vii of the *Collections of the Wisconsin State Historical Society* (Madison, 1885), id., "Chapters in Fox River Valley History," ut supra (Madison, 1913), Frank E. Stevens, *The Black Hawk War* (Chicago, 1903), Wakefield's *History of the Black Hawk War*, edited by F. E. Stevens for the Caxton Club (Chicago, 1908).

BLACKHEAD 1 A scaup duck (See SCAUP). 2 A minnow (*Pimephales promelas*). 3 A minute blemish in the skin, making a dark spot, a comedo.

BLACKHEAD (so named because the disease affects the color of the head), or ENTEROHEPATITIS. A malignant, contagious disease of turkeys, due to the attack of protozoan parasites (*Amoeba meleagridis*, or *Eimeria (Oococcidium) anatum*). Birds attacked by the disease show loss of appetite, weakness, and emaciation. Diarrhea is a pronounced and constant symptom. Discolorations of the head and comb frequently occur, from which the disease takes its name. Young birds seem to be most susceptible to the disease. Little success has attended remedial treatment of blackhead. Reliance must be placed for the most part on prevention, for which purpose roosting places and feeding-grounds should be thoroughly disinfected by means of carbolic acid or other chemicals, isolation of sick birds from the flock and feeding on easily assimilable feed. Turkeys apparently resist the disease better in warm, dry weather than in wet weather. See DIARRHEA, WHITE, OF CHICKS.

BLACKHEATH An elevated, open common, in the southeast of London, England,

lying chiefly in the metropolitan borough of Lewisham. It covers 267 acres, commands a fine view of great extent, and, being a healthful tract, many villas have been built on its margin. There is a tradition that golf was first played in England here by King James I and some of his Scottish adherents in 1608. The Roman road to Dover crosses it. Blackheath was the scene of several insurrections, including those of Wat Tyler (1381) and Jack Cade (1450), and was also a noted place for highwaymen. Consult Drake, *History of Blackheath* (London, 1886).

BLACK HILLS A name applied at various times to different sections of country lying between the Missouri River and the Rocky Mountains, but now used only to indicate a mountainous region partly in northeastern Wyoming, but principally in South Dakota (Map South Dakota, B 5). They cover a total area of about 6000 square miles, 1893 square miles of which have been set apart by the United States government as a forest reserve (See FOREST RESERVES). They are drained and nearly surrounded by the two main forks of the Cheyenne River (qv). Their altitude ranges from between 2500 and 3000 feet at their base, to the summit of Harney Peak, 7216 feet in height. The mountains were formed by a local uplift, which raised the Archean and later formations into a concentric fold. The Black Hills district was first partly explored in 1874 by an expedition under General Custer, when gold was discovered. In 1876, after some hostilities, a treaty made with the Sioux Indians opened the country to settlement, and Deadwood, Central City, Lead City, and other towns grew up very rapidly. The Black Hills constitute one of the richest gold-mining districts in the United States and have yielded over \$100,000,000. Silver, copper, tin, and iron ores also occur within their limits, besides coal, salt, petroleum, mica, gypsum, and building stone. About one-third of the area is covered with dense dark forests of pine, whence the name, while deciduous trees are abundant. The climate is salubrious, the soil fertile, and the hills are well adapted to grazing purposes. See SOUTH DAKOTA.

BLACK HOLE An appellation familiarly given to a dungeon or dark cell in a prison. The name is generally associated with the horrible confinement of a party of English in an apartment called the "Black Hole of Calcutta," on the night of June 20, 1756. The garrison of the fort connected with the English factory at Calcutta was captured by the Nawab Siraj-ud-Daula, who caused all of the prisoners taken, 150 in number, to be confined in an apartment 18 feet by 14 feet and 10 inches. This cell had only two small windows, obstructed by a veranda. The crush was dreadful, and after a night of excruciating agony from pressure, heat, thirst, and want of air, there were in the morning only 23 survivors. One of them, Mr. John Z. Holwell, published a narrative of their sufferings in 1758. See HINDUSTAN, also Macaulay's essay on Clive.

BLACK HORSE (a fish). The Missouri or gourd-seed sucker (*Cylopterus elongatus*), usually about 2 feet long, "a peculiar species with small head, elongate body, and jet-black coloration, which comes up the smaller rivers tributary to the Mississippi and Ohio in large numbers in the spring." See PLATE OF SUCKERS.

BLACKIE, JOHN STUART (1809-95). A Scottish philologist. He was born in Glasgow

in 1800, but received his early education in Aberdeen, where his father was agent for a bank. After going through the usual course of a Scottish university education—partly at Marischal College, Aberdeen, partly at Edinburgh—with a view to the Church, he went in 1829 to Germany and studied for some time at both Göttingen and Berlin. He thus acquired a mastery of German and an acquaintance more extensive than ordinary with German literature. On his return, having abandoned the thought of entering the Church, he began the study of law and passed as advocate at the Edinburgh bar in 1834. But he soon found the practice of the profession uncongenial and devoted himself thenceforth to literary pursuits. Among his earliest productions was his translation, into English verse, of Goethe's *Faust* (1834). He wrote also about this period numerous articles in the *Foreign Quarterly Review*, the *Westminster*, *Blackwood*, and *Tait*, chiefly on German subjects. In 1841, on appointment by the crown, he became professor of humanity (Latin) in Marischal College, which chair he held until, in 1852, he was elected to the Greek chair in the University of Edinburgh. From the beginning of his professional career he had been incessant in advocating educational reform in Scotland and took an active part in the movement that led, in 1859, to the remodeling of the Scottish universities. During 1874-76 he advocated throughout the country, with great enthusiasm, the foundation of a Celtic chair in Edinburgh University and was successful in raising upward of £14,000 for its endowment. Of works of a professional and philological kind may be mentioned the lectures *On the Studying and Teaching of Languages*; *On the Rhythmical Declamation of the Ancients*; *The Pronunciation of Greek*; *Accent and Quantity* (1852). Among the most matured and scholarly of his productions is his metrical translation, with notes, of the dramas of *Æschylus* (1850). In 1853 he spent above three months in Athens acquiring a knowledge of the modern language; and as fruits of the visit there appeared articles on the subject in the *North British* and *Westminster* reviews. In 1886 he published *The Iliad of Homer*, translated into English verse, with commentary and introductory dissertations, in which he endeavored to present Homer to the English reader as a popular singer; he maintained the unity of the Homeric poems. He resigned his professorship in 1882 and died March 2, 1895.

Besides his works on philological and educational subjects, Blackie made excursions into other fields. In 1858 he published a treatise on *Beauty*, in refutation of Lord Jeffrey's association theory. Others of his works are *Lays and Legends of Ancient Greece, with other Poems* (1857); *Lyriical Poems* (1860); *Musa Burschicosa* (1869); *War Songs of the Germans*, a translation (1870); *Four Phases of Morals* (1871); *Songs of the Highlands and Islands* (1872); *Self-Culture* (1873); *Horæ Hellenicæ* (1874); *Songs of Religion and Life* (1876); *Natural History of Atheism* (1877); *Lay Sermons* (1881); *The Wisdom of Goethe* (1883); *Life of Burns* (1887); *Essays on Subjects of Moral and Social Interest* (1890).

BLACKING. A preparation employed for producing a black, glazed, shining surface on leather. There are numerous recipes for making blacking, but they all involve the use of a

pigment, which is usually ivory black, bone-black, or lampblack, mixed with a vehicle which is usually some combination of oil, vinegar, beer, molasses, water, and hydrochloric or sulphuric acids. Blacking intended for harness usually has glue, gelatin, gum arabic, beeswax, suet, soap, shellac, or some resinous compound added to the vehicle. The fact that the addition of sulphuric acid to ivory black and sugar produces sulphate of lime and soluble acid phosphate of lime, which makes a tenacious paste, is the foundation of many of the compositions used as blacking. The famous English blacking known as Day and Martin's consists of bone-black, sperm oil, molasses, vinegar, and sulphuric acid. These ingredients, when mixed together in the order named, produce a thick, tenacious paste, which is lugged by the addition of vinegar and put into stoneware bottles. A familiar recipe for a liquid blacking is as follows: eight ounces of ivory black; 6 ounces of brown sugar; 1 ounce of sweet oil, triturate until the oil is thoroughly mixed in, then add one pint of stale beer. A paste blacking which may be easily made consists of ivory black, 4 pounds; molasses, 3 pounds; hot sperm oil, 9 ounces; gum arabic, 1 ounce, and vinegar, 12 ounces. These ingredients are mixed together and allowed to stand for about a week, with an occasional stirring, when the blacking is ready for use. By adding more vinegar the compound may be liquefied. A well-known recipe for harness blacking is as follows: beeswax, 1 pound; ivory black, $\frac{1}{4}$ pound; Prussian blue, 1 ounce; ground in 2 ounces of linseed oil; oil of turpentine, 3 ounces; copal varnish, 1 ounce; mix well together and form into cakes while warm. In founding (see **FOUNDING**) the name "Blacking" is given to various washes of powdered charcoal, sea coal, or graphite with which the surfaces of models are coated to give the casting a smooth surface and to prevent the molten metal from penetrating the same.

BLACK-JACK. The name given by miners to zinc sulphide or blende, which is of black color. It was also the name applied in former times to a kind of drinking flagon made of hardened leather.

BLACK KNIGHT, THE. 1. The name of a character in the early romances, son of Oriana and Amadis of Gaul. 2. Richard Cœur de Lion was known in Scott's novel *Ivanhoe* as The Black Knight or The Black Sluggard, on account of the suit of black armor and the black shield he bore during his wanderings in England.

BLACK KNIGHT, COMPLAINT OF THE. A poem written by Lydgate, but erroneously included in some of the early editions of Chaucer.

BLACK LAKE. A town in Megantic Co., province of Quebec, Canada, situated on the Quebec Central Railway, 55 miles south of the city of Quebec (Map: Quebec, G 4). It has various manufactures. Pop., 1901, 1216; 1911, 2045.

BLACK LAW. In American history, a name applied to any one of a series of laws, passed in various border and Northern States before the Civil War, sharply discriminating against free negroes who wished to emigrate to such States and become citizens thereof. Thus, in some States, certificates of freedom were to be filed, negroes were to be rigidly excluded from the militia and from the public schools, and no negro was to testify in cases in which any white man was directly interested. More

or less stringent laws were passed in Virginia, Maryland, Delaware, Mississippi, Indiana, Illinois, Iowa, Oregon, and New Mexico (Consult Wilson, *Rise and Fall of the Slave Power in America* (Boston, 1872-75))

BLACK LEAD See GRAPHITE

BLACK LEG (so named because the tumors affect the legs oftener than other parts of the body), **BLACK QUARER**, or **SYMPTOMATIC ANTHRAX** An infectious disease due to the action of *Bacillus chauveaui*. It is confined almost entirely to cattle, but cases have occurred also in sheep, goats, camels, pigs, and horses. Man is immune to it. The disease is characterized clinically by the development of tumors in the muscles of various parts of the body, producing, when stroked, a crackling sound, which serves to distinguish this disease from anthrax. After death the tumors become infiltrated with blood and serum containing gas bubbles, and thus again distinguishes blackleg from anthrax, as the tumors of the latter are not found to contain any gas. Further, in blackleg the spleen is not affected and the blood coagulates quickly, while in anthrax the spleen is much enlarged and the blood clots more slowly. Blackleg has long been known as a disease of cattle, but has, until within recent years, been generally confused with anthrax. It may also be mistaken for malignant edema. The appearance of the swellings, which are restricted to certain regions and to young animals, in those parts of the body with abundant musculature is indicative of blackleg. The blackleg bacterium does not develop in the presence of free oxygen. In the blood it is slightly motile. The symptoms of blackleg are loss of appetite, debility, and great elevation of temperature. The disease runs its course very rapidly and is fatal in nearly all cases. Cattle between the ages of six months and four years are most susceptible, young calves and old animals being more resistant. Fat cattle seem to be especially liable to infection. The symptoms usually appear suddenly within from one to three days after infection. The tumors may develop at once or may be preceded by the symptoms of fever and trembling. A lameness of the legs is usually observed and is due to the muscular tumors which almost always accompany the disease. The animal manifests considerable pain and falls to the ground soon after the development of the first symptoms. The part which is most affected becomes swollen and assumes a black or blue color, which is due to the infiltration and coagulation of blood within it. In many cases natural infection takes place through wounds, but it more frequently results from the consumption of infected feed or drinking water.

Blackleg is found in nearly all countries of the globe. In the mountains of France it is known as *mal de montagne*, in Denmark as *rosksyge*, and in Germany as *Rauschbrand*. In the United States it is most prevalent in Texas, Kansas, Nebraska, South Dakota, and Colorado.

Medical treatment of blackleg has been uniformly unsuccessful and is not to be recommended. On the other hand, preventive vaccination has given very satisfactory results. Out of 500,000 cattle vaccinated in Europe, only one-half of one per cent. subsequently died of blackleg. Equally striking results have been obtained by the Bureau of Animal Industry of the United States Department of Agriculture. This bureau has perfected a method of producing immunity

against blackleg by one vaccination, requiring less time than the old method, in which two inoculations were made, with an attenuated and strong vaccine, respectively. Stockmen may now obtain the vaccine and inoculate their own cattle. For further study of blackleg, consult "Special Report on Diseases of Cattle," *Report of United States Department of Agriculture* (Washington, 1912), *Bureau of Animal Industry, 15th Annual Report*, p. 27, Butya and Marek's *Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. 1, Hoate's *System of Veterinary Medicine*, vol. 1.

BLACK LETTER (*Black Letter*). A name commonly applied in England and America to the printing types which are most generally known on the Continent as Gothic, in contradistinction to the Roman type that came into use subsequently. The first printed books imitated every peculiarity of the contemporary manuscripts, and, as printing was first practiced in Germany and the Netherlands, the first types were copies of the letters in use in those countries in the middle of the fifteenth century. Two sorts of letters have been employed in the writings of Western Christendom. The Gothic style dates from about the middle of the twelfth century, the type which imitated it, first used c1445, spread with the art of printing into most European countries, until the classical taste reverted to the more graceful letter known as Roman, which is a revival of what is known in paleography as the Caroline minuscule, of the kind used in the eleventh and twelfth centuries. Aldus in 1501 attempted to supersede the Roman letters by what have been called Aldine or Venetian, but are best known as Italic characters. These can scarcely be said to have come into much more than temporary or exceptional use, while the Roman letters rapidly spread from Venice all over the west of Europe. Although thus supplanted in general use, the Gothic or Black Letter was long retained for special purposes, such as the printing of Bibles, prayer books, proclamations, and acts of Parliament. Characters similar to the Black Letter still continue to be used in Germany, but of late hygienic considerations have led to a movement in favor of a general adoption of the Roman letter even there. For specimens of all the types used in England in the fifteenth century, consult Duff, *Early English Printing* (London, 1896).

BLACK LIGAMENT See BLACK DROP

BLACK LILY See FRITILLARY

BLACK LIST A list of persons, either (1) against whom the compiler would warn others, or (2) with whom he refuses to have business transactions, or (3) with whom he seeks to induce others not to have business relations. An example of the first class in England is the official list of defaulters on the Stock Exchange, in the United States, the list of those against whom unsatisfied judgments are standing, or who have given chattel mortgages on stock in trade, or whose credit is poor. These and similar lists are published by mercantile agencies and others, and are considered not only valuable to the business community, but usually fair and lawful. And yet printing a person's name in such a list may subject the publisher to an action for libel. In order to defend successfully such an action, the publisher must prove that the statement made in the list about the plaintiff was true, or else that it was a correct transcript of a public record, or a fair and accurate report of a

judicial proceeding, or that it was made upon a privileged occasion. Such a statement is privileged when it is made in answer to questions by persons having a legitimate reason for asking them. as when A, to whom B has applied for credit, inquires about B's financial condition. An example of the second class of black list is one kept by a railroad company of persons dismissed from its employment for incompetency, discourtesy to patrons, or other cause, in order that its agents may not reengage them. The third class is illustrated by lists, kept by manufacturers or dealers forming an association or combination for the control of a particular line of business, of those who refuse to come into the association; or by lists kept by labor unions of non-union workmen or of those employing such workmen, with a view of preventing the employment of the blacklisted workmen or of boycotting the employers. In some States of the United States blacklisting has been made a misdemeanor by statute, punishable by fine or imprisonment. Consult the authorities referred to under the titles LIBEL and CONSPIRACY, and Eddy, *Law of Combinations* (Chicago, 1901). In England the term "black list" is also applied to the official list kept by the police authorities of persons who have been convicted under the Inebriates Act, 1898, as habitual drunkards. The person so "blacklisted" is forbidden to obtain from any licensed tavern, inn, or club any intoxicating liquor during three years after such conviction, nor is any licensed person or club permitted to supply him. A violation of the prohibition is dealt with as a misdemeanor. Consult Licensing Act, 1902, 2 Edw. VII, c. 28. See also BOYCOTTING.

BLACK/MAIL (*black + mail*, a small piece of money, rent, tribute, Fr. *maillie*, OF. *maaille*, LL. *medalla*, medal). A term which has three distinct significations in English law: 1. It was applied to rents received in work, grain, or baser money, as distinguished from rents received in silver or white money (*mailles blanches*). (See RENT.) 2. It was applied to the tribute levied by freebooters, in the four northern counties of Northumberland, Westmoreland, Cumberland, and Durham. By 43 Eliz., c. 13, § 1 (1601), it was made a felony without benefit of clergy to pay or receive this tribute, or blackmail, and similar legislation was enacted in Scotland. The practice does not appear to have ceased until after the legislative union of Scotland and England. 3. At present it is applied both in England and the United States to the criminal offense of attempting to extort money or property by threats of various kinds. These threats are usually to accuse a person of a crime, or to injure his person or property, or to defame him, or to impute to him some deformity or disgrace. As a rule, it is no defense to the charge of blackmailing that the person threatened with exposure of criminal or shameful conduct is guilty of the offenses imputed to him, nor that the attempt at extortion fails. The criminality of the offense consists in its tendency to induce a breach of the peace, and in some cases its tendency to pervert justice. By some statutes only written threats made for the purposes of blackmail are punishable criminally, but in most of the States, as in England, the offense is the same whether the threats are made orally or in writing. Consult the authorities referred to under CRIMINAL LAW, and see EXTORTION.

BLACK/MAR, FRANK WILSON (1854-). An American economist and educator; born at West Springfield, Pa. He was educated at the University of the Pacific, and at Johns Hopkins, where he was an instructor in history in 1887-88, and fellow in history and politics in 1888-89. From 1889 to 1899 he was professor of history and sociology at the University of Kansas, and was appointed to the chair of sociology and economics there in the latter year. In 1897 he organized the graduate school of the university and was elected its dean. He was at one time prominent in the promotion throughout the West of the university extension movement, speaking and writing extensively on topics of history, economics, and sociology. He edited the *Cyclopedia of the History of Kansas*. His publications include *Spanish Colonization* (1890), *Spanish Institutions in the Southwest* (1891); *History of Higher Education in Kansas* (1900); *Life of Charles Robinson, the First Governor of Kansas* (1900); *The Elements of Sociology* (1905); *Economics for High Schools* (1907); *Play-grounds and Parks* (1910).

BLACK MONDAY. A name applied to any Monday marked by a memorable disaster. In 1209 some 500 of the English who had settled at Dublin, while they were celebrating Easter Monday, were massacred at Collenswood by the native Irish of the neighborhood. Easter Monday was long celebrated as Black Monday by Dublin. Two such days occurred within a short period of English history, and both, by a curious coincidence, were Easter Mondays. In 1351 there was a tremendous hailstorm, and many people perished from cold. Nine years later, when the army of Edward III was lying before Paris, another severe storm cost the lives of a large number of men and horses. The impression of these calamities was so lasting that Shakespeare used the expression colloquially (*Merchant of Venice*, Act II, Scene 5).

BLACK MONKS. See AUGUSTINIANS.

BLACK/MORE, SIR RICHARD (c.1650-1729). One of the court physicians in the reigns of William III and Anne. He is remembered as the most heavy and voluminous poetaster of his time. Besides numerous essays Blackmore wrote at least six long epic poems: *Prince Arthur*, *Bliza*, *Alfred*, *The Redeemer*, *Nature of Man*, and *The Creation*. The last named was pronounced by Addison to be "one of the most useful and noble productions in our English verse." It was also praised by Johnson. But few modern readers are likely to agree with these judgments. Blackmore, who appears to have been a good and well-meaning man, was ridiculed without mercy by Pope and other wits of the time, and his poems are really worthless. Consult: Johnson, "Blackmore," in *Lives of the Poets* (London, 1779-81); the *Spectator*, No. 339; the *Dunciad*, bk. ii, pp. 259-268 (London, 1729).

BLACKMORE, RICHARD DODDREDGE (1825-1900). An English novelist. He was born at Longworth, Berkshire, June 7, 1825; the son of Rev. John Blackmore. Graduating from Exeter College, Oxford, in 1847, he was called to the bar five years later and practiced as a conveyancer till his health failed. He then took up fruit growing at Teddington, a little way up the Thames from London. He died at Teddington, Jan. 20, 1900. He began his literary career as a poet, publishing *Poems by Melancton* (1853); *Epullia* (1854); *The Bugle of the Black Sea*

(1855), *The Fate of Franklin* (1860), and a translation of Vergil's *Georgics* (complete in 1871). His first novel, *Clara Vaughn*, appeared in 1864. It was followed by *Chadock Novell* (1866), *Lorna Doone* (1869), *The Maid of Sker* (1872), *Alice Lorraine* (1873), *Cripps the Carrier* (1876), *Emma* or, *My Father's Sin* (1877), *Mary Anselley* (1880), *Christovell* (1882), *Remarkable History of Tommy Upmore* (1884), *Springhaven* (1887), *Kit and Kitty* (1889), *Polydross* (1894), *Fringilla* (1895), *Tales from the Telling-House* (1896), *Daniel* (1897). Though Blackmore thought some of his other books better than *Lorna Doone*, his reputation rests almost wholly upon this romance of the seventeenth century. It abounds in beautiful descriptions, is elevated in tone, and is written in a rhythmic prose which is rare in our literature. It has made Exmoor and the neighboring district famous. Consult F. J. Snell, *Blackmore Country* (New York, 1906).

BLACK MOUNTAINS A mountain group in Buncombe and Yancey counties, North Carolina, forming a spur of the Blue Ridge and a part of the Appalachian system (Map North Carolina, B 4). They lie between the French Broad River and its main tributary, the Nolichucky, and have a northwest and southeast trend transverse to the main line of the Blue Ridge elevations. The Black Mountains are the culminating points of the Appalachian system. Mount Mitchell, the highest peak, is 6711 feet, and Balsam Cone, Black Brothers, Hany Bear, Cattail Peak, Mount Gibbs, and Mount Buckley are more than 6500 feet above the sea. They form the divide between the Tennessee and Catawba river basins. Their slopes are forested with evergreens, while their valleys in places contain rich soil that is well adapted for agricultural purposes. See APPALACHIANS, BLUE RIDGE.

BLACK OAK See OAK.

BLACKPOOL (so named from a pool now drained, Ir and Gael *poll*, hole, pit, bog, AS *pōl*, Ger *Pfuhl*, pool, puddle) A flourishing town and popular watering place of Lancashire, England, on the Irish Sea, about 46 miles north of Liverpool. It is sometimes called the "Brighton of the North" (Map England, C 3). It has an excellent bathing and promenade beach, a fine esplanade, three piers, a winter garden and pavilion, an aquarium, and theatres. The principal streets and piers are lighted by electricity. Blackpool was incorporated as a borough in 1876 and as a county borough in 1904. Its water supply is obtained from the Fylde water works, managed by a board composed of representatives from Blackpool, Flatwood, Lytham, and St. Anne's-on-the-Sea. The town owns its gas works, electric light plant, markets, slaughterhouses, and cemeteries. It also owns its street railways, which are operated by the overhead trolley system, and has a line connecting Blackpool with Lytham, another favorite bathing place, and St. Anne's-on-the-Sea. There are a technical school, a so-called continuation school, three public libraries, and a hospital. A branch railway connecting Blackpool with the Preston and Wyre Railway affords easy access from Preston, Liverpool, Manchester, and all parts of the kingdom. Blackpool is annually visited by over 100,000 tourists. Pop., 1891, 23,846, 1911, 58,376.

BLACK PRINCE See EDWARD, THE BLACK PRINCE.

BLACK QUARTER See BLACKLEG.

BLACK RACER See BLACKSNAKE.

BLACK RAIN. Showers of black rain have been recorded on many occasions in Ireland and less frequently in other portions of Europe. The blackness comes from various sources, such as the soot from city fires and especially forest fires, which is washed down by rain, black fungi of fungus spores—such as produce smut, mildew, and rust—carried up by gusts of wind and subsequently falling with the rain. In a few special cases the spores of fungi, after being wetted by the rain, grow rapidly on the ground and produce a black coating, which has not necessarily fallen with the rain, but is often spoken of as black rain. See DUST, ATMOSPHERIC.

BLACK RIVER. A river in northern New York, rising in the southwestern part of the Adirondack region and flowing southwest, then northwest, 130 miles through Herkimer, Oneida, Lewis, and Jefferson counties to Black River Bay, at the extreme eastern end of Lake Ontario (Map New York, E 2). Numerous falls and rapids, with great possibilities for development, furnish abundant water power to half a dozen villages and the city of Watertown. From Lyons Falls to the mouth of the river, a distance of 72 miles, the fall is about 500 feet. Boats pass from this river just above Lyons Falls to the Erie Canal at Rome, N. Y., through the Black River Canal.

BLACK RIVER, or BIG BLACK. An affluent of White River, which, rising in Reynolds Co., Mo., and flowing through Missouri, bends toward the southwest, enters Arkansas, and joins the White River, a few miles above Newport, Jackson County (Map Missouri, F 5). It is about 400 miles long and is navigable for about 100 miles, except in the dry season. Valuable timber is found along its banks, and the lower regions produce good crops of cotton.

BLACK RIVER FALLS. A city and the county seat of Jackson Co., Wis., 171 miles northwest of Milwaukee, on Black River, and on the Chicago, St. Paul, Minneapolis, and Omaha Railroad (Map Wisconsin, C 4). Falls on the Black River afford extensive water power, and in the vicinity are granite quarries and deposits of iron and kaolin. The city has also flour mills, a brewery, a foundry, machine shops, and nurseries, and is the commercial centre for a large agricultural district. The water works and electric light and power plant are owned by the municipality. The business portion of the city was almost entirely destroyed by a flood in 1911, the property loss amounting to more than \$1,000,000. It has been rebuilt, and a solid concrete wall erected for protection against floods. Pop., 1890, 2261, 1900, 1938, 1910, 1917.

BLACK ROCK See BRIDGEPORT, CONN.

BLACK ROD, USHER OF THE (so called from the staff he carries). An officer of the House of Lords. He is chief gentleman usher to the sovereign and belongs to the Order of the Garter. His principal duty is to summon the House of Commons to the Lords when the royal assent is given to bills, or when royal speeches are read, and to take into custody any peer guilty of breach of privilege. The office also exists in the self-governing British commonwealths of Canada, Australia, and Cape Colony.

BLACK ROD OF SCOTLAND (*Rod*, a representation of Christ crucified, AS *rōd*, cross, akin to OS *rōda*, Dutch *roede*, rod). A famous relic brought to Scotland (c 1070) by Margaret,

wife of King Malcolm. It was a black rood of ebony which was believed to be a portion of the cross on which Christ was crucified and was held in the highest veneration by the Scotch kings. It fell into the hands of the English during the invasion of that country by David II in 1346.

BLACK ROT. See GRAPE.

BLACK SALSIFY. See SCORZONERA.

BLACK SEA (Lat. *Pontus Euxinus*, Gk. *Ἰόντος Εὐξείνος, Pontos Euxeinós*, hospitable sea, originally *ἄλγεινος, alexinós*, inhospitable; Turk. *kara deniz*, black sea). An inland sea lying between eastern Europe and Asia Minor and connected with the *Ægean* Sea by the Bosphorus, the Sea of Marmora, and the Dardanelles (Map: Europe, G 4). It is bounded on the north by European Russia; on the east by Caucasus; on the south by Asia Minor; on the west by European Turkey, Bulgaria, Rumania, and Russia. It has a length from east to west of about 750 miles, a greatest width of 380 miles, and covers an area (not including the Sea of Azov) of about 165,000 square miles. The Crimean Peninsula projects into the Black Sea from the north, forming the Sea of Azov and the Gulf of Perekop. The former is almost entirely cut off from the Black Sea and is very shallow. The Black Sea is very deep; the floor of a great part of the central basin lies more than 6000 feet below the surface, and the greatest depths considerably exceed 7000 feet. The Black Sea receives the drainage of a large part of central Europe through the Dnieper, Dniester, Bug, and Danube; of a considerable section of eastern Russia through the Don (which flows into the Sea of Azov); of the western Caucasus region through the Kuban and a number of smaller rivers; and of northern Asia Minor through the Tehoruk, the Yeshil Irmak, the Kizil Irmak, and the Sakaria. Tidal action is scarcely perceptible, but the sea level rises and falls with the increase and decrease in volume of the tributary waters. There is a strong surface current setting towards the Bosphorus, and an undercurrent flowing in an opposite direction from the *Ægean* Sea. The latter current is heavy and saline, and to its agency is due the phenomenon that the waters of the Black Sea contain nearly 2 per cent of salt, although constantly fed by large rivers. The Black Sea is visited by severe storms of both local and general character. On the north shore the southerly winds are most dreaded, while near the Bosphorus the so-called *porcias* from the northeast are particularly violent. The climate, notwithstanding its southern position, is marked by considerable severity. In winter heavy fogs form, which obscure the sunlight and lend a dark aspect to the waters, thus partially justifying its name. The Black Sea is of great economic importance to the Russian Empire, as it furnishes an outlet for the extensive agricultural region of the south. Communication is maintained with the Caspian Sea by a railway from Baku to Batum, between which points there is also a pipe line for the transport of petroleum. The principal ports on the Black Sea are Odessa, Poti, and Batum, in Russian territory, and Samsun and Trebizond, in Turkey. There are no islands worthy of mention.

BLACK SILVER. A name given, on account of its color, to the mineral stephanite (q.v.) which is a silver sulphantimonite found

in Saxony, Mexico, Nevada, and elsewhere, and valued as an ore of silver.

BLACKSNAKE, or **BLACK RACER**. A common colubrine serpent (*Zamenis* [formerly *Bascanium*] *constrictor*), prevalent over eastern North America from Canada to Florida. It is slender in form, but rarely if ever exceeds 6 feet in length. The color of Eastern adults is uniform, lustrous pitch-black above and slate-color beneath, sometimes tinged with greenish white, lower jaw, chin, and sometimes edges of the upper-lip plates, white; tongue, black. Specimens from the West and Southwest represent a distinct color variety, *flaviventris*, exhibiting a more or less bright olive green, with the whole under surface greenish white to bright yellow; hence the Western names "blue racer," "yellow-bellied," and "green racer." The young under about 18 inches long are variegated with dark blotches upon dusky olive, with light margins on the scales, especially along the sides, but there is considerable variation from dark to very pale gray. This is one of the most ubiquitous, numerous, and vigorous of Ameri-

THE BLACKSNAKE.

a, top of head, b, under side; c, profile, d, face; e, arrangement of body scales.

can snakes. It is at home on the ground, where it runs with amazing swiftness; but it is also an expert climber, scaling trees and searching their topmost branches, many yards above the ground, with as great ease as it explores bushes and rocks; it will leap more than its own length from tree to tree when in haste. It is also a swift and powerful swimmer and seeks much of its food in swamps and along streams. Its food consists mainly of frogs, toads, other snakes, small mammals, birds and their young, and eggs, together with some insects. These are captured by a stealthy approach and swift stroke or chase and more often by night than by day. It is very useful to the farmer in destroying great numbers of moles and mice, but also is the most indefatigable and successful searcher for birds' nests.

For years it has been supposed that objects of special animosity to the blacksnake are the copperhead and rattlesnake, whose trail it has been said to follow by scenting, like a dog; and, having overtaken one of these sluggish reptiles, it leaps upon it, avoiding the stroke by its swiftness, catches it by the back of the neck, and wrapping itself about it, crushes, bites, and shakes the life out of it, after which it swallows it whole. This is absolute fiction, for the only interest which this serpent takes in others of its kind is in the case of small ribbon or garter snakes, which indeed it kills but *not* by constricting. When held in the hand, a blacksnake will sometimes coil about the arm of a man, as it would brace itself among the branches of a tree, but the pressure could not injure a child, and the snake may readily be

unwound with one hand. The blacksnake is altogether harmless to man, and even when teased until it bites, it can inflict only the merest scratch. It has courage and will sometimes advance toward a man, but will flee at full speed if approached closely. Large ones are easily killed by quite small dogs, and among its enemies are all the carnivora, especially, perhaps, the skunk and badger. It is inclined to frequent a limited area continuously.

These serpents hide away in hollow stumps and underground dens at the approach of cold weather, where often several will entangle themselves into a ball for mutual comfort and remain torpid until spring. They breed during the summer, the female—which is larger and darker than the male—laying 15 or 20 eggs in a hollow in a sunny bank, amid the dry dust of a decaying stump, under flat stones, or perhaps within an old dung heap. There is no direct proof of the statement that the mother remains near the eggs until the young hatch and then takes care of them and defends them from danger. This snake is tamable, but individuals differ in temperament and docility, some showing much intelligence and kindness, while others are mischievous. Several other species of the genus belong to the southwestern United States, Mexico, and the West Indies, and the Texan whip snake (qv) is a near relation. The chain snake is sometimes called "mountain blacksnake." Other blackish serpents known as blacksnakes include a colubrine of Jamaica (*Oxyophis ater*), the death adder (qv) of Australia and Tasmania, and some others, notable for dark hues. See PLATE OF SNAKES, AMERICAN HARMLESS.

BLACK SNAKE-ROOT. See CORNUS.

BLACKSTONE A town in Worcester Co., Mass., 2 miles northwest of Woonsocket, R. I., on the Blackstone River and on the New York, New Haven, and Hartford Railroad (Map Massachusetts, D 3). It has a public library and extensive manufactures of cotton, woolen, rubber, and felt goods. The government is administered by town meetings held once a year to pass on matters relating to appropriations, bridges, highways, etc. Settled about 1700, Blackstone was separated from Mendon in 1845 and named in honor of William Blackstone, the first settler on the site of Boston. Pop., 1900, 5721, 1910, 5648. Consult *History of Worcester County* (2 vols., Boston, 1897).

BLACKSTONE, WILLIAM (?-1675) An early colonist in New England. He left England to avoid the dictation of the Church of England and was the first white man to settle on the site of Boston, Mass. (1623). To escape the arbitrary and dictatorial methods of the Puritans he sold his 800 acres of land for £30 in 1634, and became the first white settler within the limits of the present Rhode Island. Consult Winsor, *Memorial History of Boston*, vol. 1 (Boston, 1880).

BLACKSTONE, SIR WILLIAM (1723-80) A celebrated English jurist and law writer. He was the son of a silk mercer in London and was born there July 10, 1723. At the age of 15, having obtained a scholarship from the Charterhouse School, where he was educated, he was sent to Pembroke Hall, Oxford. There he was fortunate enough to obtain a second scholarship and remained till, in 1744, he was admitted a fellow of All Souls' College. During this period he divided his time between Oxford and London,

attending the courts of law at Westminster with the view of qualifying himself for his future profession. In 1746, at the age of 23, he was called to the bar, where his success was for some time in doubt. However, in 1749, he was appointed to a minor judicial office—that of recorder of Wallingford, in Berkshire.

In 1753 he was a candidate for the chair of civil law at Oxford, but, failing to receive the appointment, he went nevertheless to the university and delivered a course of academic lectures on English law which attracted wide attention. In the next year he published *An Analysis of the Laws of England*, based on Sir Matthew Hale's *Analysis of the Civil Part of the Law*, which he greatly admired as "the most natural and scientific of all the schemes hitherto made public for digesting the laws of England."

A few years later, a Mr. Viner, the celebrated author of Viner's *Abridgment*, having left a large sum of money to endow a chair of English law in the University of Oxford, Blackstone was in 1758 appointed first Vinerian professor. The lectures which were the fruit of this appointment not only made him famous as an expositor of English law, but assured his success at the bar. Accordingly, in the following year, he returned to Westminster Hall and resumed practice, and, as the political doctrines which he taught as a lecturer had been such as to commend him to the notice of the Tory government of that day, he obtained its patronage and in 1761 was made King's counsel. In the same year he married Sarah, daughter of James Clitherow, of Boston House, Middlesex. Shortly afterward he was appointed principal of New Inn Hall, Oxford. Other honors followed fast, and he became successively member of Parliament (1768), bench of the Middle Temple, and solicitor-general to the Queen, and was offered the post of Chief Justice of the Court of Common Pleas in Ireland, which he declined. In 1765 Blackstone published the first volume of his lectures, and the remaining three volumes between that date and 1769. These lectures form his celebrated *Commentaries on the Laws of England*. His practice continuing to increase, he resigned his Oxford appointment in 1766. Four years later he was offered the Solicitor-Generalship, and after declining it was knighted and made a justice of the Court of King's Bench and a few months later of the Court of Common Pleas. The remaining years of his life were spent in the discharge of his duties as a judge, and, in conjunction with John Howard, in laboring for the reform of the inhuman prison system of his day. He died, Feb. 14, 1780, at the age of 57.

The fame of Blackstone rests mainly upon his *Commentaries*. His other legal works were relatively unimportant, and, though his merits as a judge were considerable, they were, perhaps, not such as, of themselves, to have made his reputation outlive him. As a commentator he had many excellences. His style was in general clear and gracefully ornate, and his illustrations pleasing and felicitous. So long as he confined himself to exposition—i.e. the accurate statement in scholarlike English of the doctrines of English law that had theretofore lain buried in the technical treatises of lawyers like Littleton and Coke—Blackstone was unsurpassed and rendered an important service to his country and the legal profession. But he was ambitious of

combining with this exposition the higher task of explaining the reasons for the law as well as its merits and defects. Unfortunately he had not the requisite qualifications for this wider survey of legal principles and institutions. His knowledge of English history was, as Hallam tells us, superficial, and his study of the philosophy of law had been imperfect. With the works of Montesquieu and Beccaria he was, indeed, acquainted, but the use which he makes of them shows only too clearly that he had not mastered them or fully imbibed their spirit. His political philosophy was, indeed, that of his time—a period of stagnation in the progressive evolution of political institutions. He had no more doubt than Edmund Burke of the divine origin of the British Constitution, and the rule of the people and their affairs by the “gentlemen of independent estates and fortune,” to whom his famous lectures were addressed, seemed to him the perfection of human government. His eloquent exposition of Tory principles subjected his work to attacks from various persons whom he describes as “zealots of all denominations, religious as well as civil,” including the author of the *Letters of Junius*.

As an institutional treatise, the *Commentaries* leaves much to be desired, the order and arrangement being unscientific and empirical. Notwithstanding its defects, the positive merits of the work—its systematic character, its comprehensiveness, the accuracy of its exposition, and the dignity and charm of its style—have made it the best-known and in many respects the most influential treatise in English law. All subsequent commentaries, including those of Broom, Stephen, and Kent, have been modeled upon it, and it continued to be for 100 years the foundation of all legal education in America.

Indeed, it would be difficult to exaggerate the influence of Blackstone's work on the bar or on the course of legal development in this country. Its success was instantaneous. Two years after the publication of the fourth and concluding volume of the work in England, it was republished in Philadelphia, and it is said that 2500 copies of the book were immediately absorbed in the Colonies before the outbreak of the Revolution. Edmund Burke, in a celebrated speech delivered in the House of Commons, in 1775, asserted that nearly as many copies of the *Commentaries* had been sold in the Colonies as in England. From its appearance it was the favorite, if not the only text-book of the American law student, and it came to be regarded by the courts, as well as the legal profession, not only as an indispensable means of acquiring a knowledge of the law, but as the final and authoritative statement of its rules and principles. A learned American commentator on Blackstone, the late William G. Hammond, declares that, “upon all questions of private law at least, this work stood for the law itself throughout the country and, at least for a generation to come, exercised an influence upon the jurisprudence of the new nation which no other work has since enjoyed and to which no other work can possibly now attain.” While the work has long since lost its unique position of a legal authority, its influence as an indispensable part of the education of the American lawyer has only recently begun to wane. It still forms a part of the regular work of instruction in many American law schools, while, of the multitude of young men and women who still come to the

bar without a law-school training, it is safe to say that a large majority read Blackstone, in whole or in part. Doubtless, it is to the long predominance of the Blackstonian tradition in this country, to its influence in forming the mind of the American lawyer, that we are largely indebted for the consistency and unity of our American common-law system.

Numerous editions of the *Commentaries* have been printed, the most important being those of Archbold, Chitty, and Christian in England and those of Cooley, Sharswood, Kerr, Hammond, and Lewis (Philadelphia, 1898) in the United States. As more than a century has elapsed since the *Commentaries* were composed, so many alterations and additions are requisite to adapt them to the existing state of the law that it may be said that their purpose has been served and that they are now valuable chiefly as materials for the history of the law.

In addition to the *Commentaries* Blackstone wrote several essays on legal topics which were collected and published under the title of *Law Tracts* (1750), besides political writings of some importance in their day, but not permanently enduring. He is also the editor of 20 volumes of reports of cases decided in the courts of King's Bench and Common Pleas, commencing with the term in which he was called to the bar and continuing with some intervals through the whole period of his life. The introduction to this work by James Clitherow, Blackstone's brother-in-law and executor, contained a biographical sketch which has formed the basis of all subsequent memoirs.

Consult also *The Law Magazine*, vol. xv (London, 1836), and *The Dictionary of National Biography*, vol. v (London, 1886).

BLACK STONE OF MEOCCA. A sacred stone in the Kaaba at Mecca, which was said to have been given by an angel to Abraham and to have been originally white, but blackened by the sins of mankind. The stone is probably a meteorite.

BLACKSTONE RIVER. A river of Massachusetts, rising near Worcester, flowing southeast through Rhode Island, and emptying into the Providence River, near Providence (Map: Massachusetts, D 3). In the upper part of its course the river flows through a series of small lakes and ponds. Below Pawtucket it is known as the Seekonk. It is the most important river of eastern New England south of the Merrimack and is noted for the amount of power it furnishes, there being along its banks a succession of mills. It is about 70 miles long and drains above Pawtucket an area of 458 square miles. It falls over 400 feet from Worcester to the sea.

BLACKTAIL. An American deer, notable for its black tail: (1) the mule deer (q.v.); (2) the Columbian deer (*Odocoileus columbianus*) of the coast region, from central California to Alaska. It is one-third smaller than the mule deer, but has similar antlers. In summer it is reddish, but in winter brownish gray, mottled with black, darkest along the spine. “Top of head chestnut and black; black stripe over the eyes, meeting on forehead; chin white, behind is a black patch; face gray; upper throat, posterior portion of under parts, and base of tail, white; rest of under parts mottled similarly to the back; chest sooty; legs dark cinnamon, inner side white; tail above black, . . . beneath, white” (Elliot). Alaskan specimens are paler. This deer exists only between the moun-

tains and the coast and frequents the forested foothills and valleys covered with chaparral, where it is tolerably abundant. Its habits are similar to those of the mule deer. Consult Farrell, in Shields's *Big Game of North America* (Chicago, 1890), Van Dyke, in *The Deer Family* (New York, 1902), and the authorities referred to under DEER. For illustration, see Plate of DEER OF NORTH AMERICA.

BLACK TIN. A name applied to tin ore ready for smelting. See TIN.

BLACK-VAR/NISH TREE See MELANORRHEA.

BLACK VOMIT. The dark matter vomited in yellow fever, usually a sign of fatal termination of the disease. It is in part coagulated blood. The fever itself is sometimes called the "black vomit." See YELLOW FEVER.

BLACK WAD. Native black *pyrolusite* or *wad*. It is often synonymous with graphite.

BLACKWALL. Part of Greater London. For Blackwall Tunnel, see LONDON.

BLACK WALNUT. See WALNUT.

BLACK WARRIOR. (from the Choctaw name *Tuscaloossee*) (Map Alabama, B 2). A river of Alabama, formed by the junction of several large streams in Walker County. Sipsey Fork, coming in from the northwest, and Mulberry and Locust forks, from the northeast. It flows southwest, joining the Tombigbee River near Demopolis in the west-central part of the State. It is navigable to Tuscaloosa, above which city it has a considerable fall and furnishes extensive water power.

BLACK WARRIOR, THE. An American merchant vessel which, touching at Havana in February, 1854, on its way from Mobile to New York, was seized by the Cuban officials for violating the customs regulations of that port. Her cargo was confiscated, and her captain heavily fined, in spite of the protests of the American consul. The affair caused great excitement in the United States, especially in the South, and was the subject of a spirited correspondence between the American and Spanish governments. Had it not been for the strong feeling aroused throughout the North at that time by the debates over the Kansas-Nebraska Bill (qv), it is possible that the slave power, desirous of obtaining Cuba, would have succeeded in forcing the administration to use this as a pretext for a war of conquest against Spain. Spain finally restored the confiscated cargo and remitted the captain's fine. For a good account of the negotiations over the *Black Warrior* incident, consult Rhodes, *History of the United States from the Compromise of 1850*, vol. II (New York, 1893). Consult also, James, "The *Black Warrior* Affair," in the *American Historical Review*, vol. 12 (Lancaster, Pa., 1906), and, for much material on the incident, House Document No. 86, *Case of the Black Warrior and Other Violations of the Rights of American Citizens by Spanish Authorities* (Washington, 1854).

BLACK WATCH. A famous Highland regiment in the British army. In 1688 the Earl of Athole was commissioned to organize a guard for the maintenance of peace in the Highlands. They were known as the *Feroceadan Dubh* and wore a dark colored tartan, which distinguished them from the *Saghdlean Dearg*, or "red soldiers," as the regular troops were called. The different companies were engaged in the military police work, for which they were formed,

until 1740, in which year they were regularly organized into the Forty-second Regiment of the Line. Their war history begins at Fontenoy, and few regiments in the British service excel them in the number and character of their battle honors. But, it is interesting to note, service in the Black Watch was not always esteemed, particularly in the earlier days, for in 1743 a large portion of the regiment mutinied and fled to the north, only to be surrounded and forced to surrender, the ringleaders being put to death. Consult Burton, *The Black Watch* (London, 1910). See HIGHLANDERS.

BLACK WATER. See TEXAS FEVER.

BLACKWATER. The name of several rivers and streams in Great Britain and Ireland. The most important are 1 The Blackwater of Cork County, which rises in the west of Kerry County, flows past Millstreet, Mallow, Fermoy, Lismore, and Cappoquin, and enters the sea at Youghal harbor (Map Ireland, C 4). It has a course of 100 miles, is the seventh in size of the Irish rivers, abounds in salmon, and is navigable for barges for the last 15 miles of its course to Mallow. 2 The Blackwater of Ulster, 50 miles long, which rises on the confines of Tyrone and Fermanagh counties, runs past Caledon and Chalemont, and falls into the southwest corner of Lough Neagh. 3 The Blackwater of Essex, England, 40 miles long, which rises in the northwest of the county, flows past Coggeshall to Maldon, where it becomes an estuary opening into the North Sea. 4 The Blackwater, an affluent of the Boyne River in Navan County, Ireland, 40 miles long.

BLACKWATER STATE. Nebraska. See STATES, POPULAR NAMES OF.

BLACKWELL. A city in Kay Co., Okla., 111 miles north of Oklahoma City, on the Chickasaw River, and on the Atchison, Topeka, and Santa Fe, and the Frisco Lines railroads (Map Oklahoma, D 2). It is the seat of the Oklahoma State College (Baptist) and has several parks. There are glass, brick, and clay works, and flour mills, extensive deposits of natural gas are found in the vicinity. Pop., 1890, 2283, 1900, 2644, 1910, 3266.

BLACKWELL, ALICE STONE (1857-) An American reformer, niece of Elizabeth Blackwell. She was born in East Orange, N. J., graduated in 1881 at Boston University, of which she became a trustee, and aided her father and mother in editing *The Woman's Journal*. In 1885-1905 she also edited a paper called *The Woman's Column*. Devoting her main energies to the cause of woman's suffrage, she was made chairman of the literature committee of the National American Woman Suffrage Association and became a contributor to its *Political Equality* series. She also labored for the Armenians and other oppressed peoples. Besides many articles in periodicals, she wrote *Armenian Poems* (1896), *Songs of Russia* (1906), and *Songs of Grief and Joy* (1907), translated from the Yiddish of Ezekiel Leavitt.

BLACKWELL, ANTOINETTE LOUISA BROWN (1825-) An American minister and author, born at Henrietta, N. Y., and educated at Oberlin College, Ohio. In 1853 she was ordained pastor of the Congregational Church at South Butler, N. Y., and discharged her parochial duties for two years, when ill health compelled her to resign. Afterward she devoted herself to the exposition of philosophical views in literary form. Later she became a Unitarian.

and a leader in the woman suffrage movement. Her principal works are: *Studies in General Science* (1869); *The Seas throughout Nature* (1875); *The Physical Basis of Immortality* (1876); *The Philosophy of Individuality* (1893); *Sea Drift, or Tribute to the Ocean* (1903).

BLACKWELL, ELIZABETH (1821-1910). The first woman who ever obtained a medical diploma in the United States. She was born in Bristol, England. Circumstances induced the family to emigrate to New York, and they afterward went to Cincinnati. Miss Blackwell in 1838, with two elder sisters, opened a boarding school, which soon had a large attendance. She, however, chafed at the limitations which society had imposed on women. At length, in 1844, the school was given up, Miss Blackwell determining to become the medical apostle of her sex. After three years' further work as a teacher, during which time she devoted the whole of her leisure to the study of medical and anatomical books, she went to Philadelphia, where she applied in vain for admission into the medical schools. Failing in this, she entered on a course of private anatomical study and dissection and of midwifery, with Professor Allen and Dr. Warrington of Philadelphia. After strenuous efforts she at last obtained admission to Geneva Medical College, Geneva, N. Y., in 1847, graduating with the highest honor in 1849. During the two years of her study she conducted herself with a propriety and discretion that gained for her the esteem and respect of all her fellow students. Shortly after her graduation she visited Europe in order to prosecute further her medical studies. In Paris she was told that it would be impossible for her to gain entrance to the schools or hospitals there unless she adopted male attire—a suggestion repugnant to her taste and to the great object she had in view, i.e., the recognition of female physicians. After much perseverance she was at length admitted into the Maternité and was permitted to visit other hospitals. After studying at St. Bartholomew's Hospital, and the Woman's Hospital, London, she returned to New York in 1851 and there established herself in practice. In 1852 she delivered a series of lectures to women, on health and physical development, and published a work entitled *The Laws of Life, Considered with Reference to the Physical Education of Girls*; and in 1853 established the New York Infirmary for Women and Children, which proved so successful that she was induced in cooperation with her sister Emily, to found, in 1868, The Woman's Medical College of the New York Infirmary. In 1868 she settled in London and became connected with the Women's Medical College there. Her published works include: *Counsels of Parents on the Moral Education of their Children in Relation to Sex* (1879); *Corruptions of Neo-Malthusianism: the Influence of Women in the Medical Profession* (1890); *Pioneer Work in Opening the Medical Profession to Women* (1895). Consult Vaughan, "The Early Days of Elizabeth Blackwell," in *Fortnightly Review*, N. S., vol. xciv (London, 1913).

BLACKWELL, EMILY (1826-1910). An American physician, born at Bristol, England. When she had earned enough money to enable her to study medicine, she applied for, but was refused, admission at the Geneva Medical School, at which her sister Elizabeth (q.v.) had been allowed to study. After being refused at 10

other schools she finally obtained admission to the free hospital of Bellevue in New York City, and after an interval was received by the Western Reserve University, where she finished her course. After studying at Edinburgh and under some of the greatest surgeons of Paris, she became associated with her sister in the foundation of hospitals and dispensaries, and the chief professional events of their lives they shared.

BLACKWELL, GEORGE LINCOLN (1861-). An American Bishop of the African Methodist Episcopal Zion church. He was born in Henderson, N. C., of slave parents, graduated in 1888 from Livingstone College, Salisbury, N. C., and in 1892 from the School of Theology of Boston University. He had entered the ministry of the African Methodist Episcopal Zion church when 20 years old; in 1893-06 he was dean of its theological school at Livingstone College, and in succession was general agent of the denominational publishing house and editor of its Sunday-school literature (1896-1900), its general secretary (1900-04), and its general secretary and missionary secretary (1904-08). In 1908 he was consecrated a Bishop of his church, which he represented as delegate in the ecumenical councils at London (1901) and at Toronto (1911). He wrote *The Model Homestead* (1893), *Cloaks for Sin* (1904), and *A Man Wanted* (1907).

BLACKWELL, THOMAS (1701-57). A classical scholar of some eminence, born in Aberdeen, Aug. 4, 1701, he studied Greek and philosophy in Marischal College and took the degree of M.A. in 1718. In December, 1723, he was appointed professor of Greek in Marischal College and in 1737 published anonymously at London an *Inquiry into the Life and Writings of Homer* (2d ed., 1748), and, in 1747, *Proofs of the Inquiry into Homer's Life and Writings*. In 1748 he published, also anonymously, *Letters Concerning Mythology*. The same year he was made principal of Marischal College; and at the commencement of the session of 1752, on his recommendation, a new order in teaching the sciences was introduced into the college. In 1753 he published the first volume of his *Memoirs of the Court of Augustus*. The second volume appeared in 1755, and the third, left unfinished by him, was completed by John Mills in 1704. His works show wide reading, but are marked by lack of method and order. He died March 8, 1757.

BLACKWELL'S ISLAND. A narrow, rocky island in the East River, forming part of New York City, between Manhattan Island and Long Island, about 1½ miles long by one-eighth of a mile wide (Map: New York City, E 4). It is used exclusively for the penal institutions and hospitals under charge of the city of New York. See NEW YORK CITY.

BLACKWOOD. See ACACIA; KINGWOOD.

BLACKWOOD, FREDERICK TEMPLE HAMILTON-TEMPLE (1826-1902). See DUFFIERIN AND AVA, MARQUIS OF.

BLACKWOOD, WILLIAM (1776-1834). A distinguished Edinburgh publisher, the originator of *Blackwood's Magazine*. He was born in Edinburgh, Nov. 20, 1776. After serving his apprenticeship to the bookselling business in his native city, and prosecuting his calling in Glasgow and London, he settled in Edinburgh as a bookseller—principally of old books—in 1804. On April 1, 1817, at which time he had become a publisher on his own account, he issued the

first number of *Blackwood's Magazine*. The literary ability displayed in this periodical was so much in advance of the monthly magazines then existing that, after a little disappointment at first, it soon became a great success. Its remarkable popularity was sustained by the papers of John Wilson, J. G. Lockhart, James Hogg, and other writers, whom Blackwood had the liberality and tact to attract to his standard. Overwhelming its political and literary opponents, now with the most farcical humor, and now with the bitterest sarcasm—sometimes with reckless injustice—the magazine secured for itself a prodigious reputation, more particularly among the Tories, of whose political creed it has always been a resolute adherent. William Blackwood conducted the magazine until his death, Sept. 16, 1834. The publishing business has been greatly extended by the descendants of the founder. Consult *William Blackwood and His Sons* (Edinburgh, 1897-98), the first two volumes of which are by Mrs. Oliphant, the third, dealing with John Blackwood, by his daughter, Mrs. Gerald Porter.

BLACKWOOD RIVER. A river in West Australia, which enters Flinders Bay, just east of Cape Leeuwin, in lat 34° 14' S and long 115° 12' E (Map Australia, B 5). It flows through the counties of Durham and Nelson, first to the west and then to the south, traversing a district of wood and pasture. It is navigable for boats to a distance of 25 miles from the sea.

BLACKWOOD'S MAGAZINE. A famous magazine founded by the Edinburgh publisher, William Blackwood, in 1817, subsequently conducted by his son, John Blackwood, and still one of the important English periodicals in literature, philosophy, and politics.

BLADDER, URINARY (probably akin to the verb *to blow*). The membranous sac which receives the urine in man and animals after it is secreted by the kidneys. The bladder wall consists of three coats—a lining mucous membrane, a middle muscular coat, and an outer coat which is serous where the organ is covered over by peritoneum, and fibrous throughout the rest of its extent. The mucous membrane of the bladder is lined with stratified squamous epithelium (see EPITHELIUM) and contains small racemose glands (see GLAND) and lymph nodules. The muscle of the middle coat is of the involuntary type and consists of inner and outer layers which are longitudinal and of a middle circular layer. The serous coat consists of a connective-tissue layer covered by a layer of flat endothelial cells. Where the serous coat is wanting, a fibrous layer covers the muscular coat and blends with the surrounding connective tissue.

The average capacity of the bladder is one pint. Its shape is somewhat conical, the apex being upward, and the anterior part of the base constricted at the commencement of the urethra, forming the neck of the bladder. On each side, rather below its middle, open the ducts from the kidneys (the ureters), an imaginary line drawn between them, and from each end of this line others drawn to the neck of the bladder, form an equilateral triangle. In this space, which is called the *trigone*, the mucous membrane is not thrown into folds, but is smooth and very sensitive, the slightest pressure upon it gives rise to a desire for micturition. The bladder is situated in the pelvis, in adults, be-

hind the pubes, in front of the rectum in the male and the uterus in the female, but much higher in the young. It is kept in position by four true or membranous ligaments, and false ligaments formed of folds of the peritoneum. In the male in front of the neck of the bladder lies the prostate gland, surrounding the first part of the urethra (qv). Like all cavities lined by mucous membrane, the bladder is subject to catarrhal inflammation, accompanied by an increased secretion of mucus, with fermentation, rendering the urine turbid, causing a frequent and painful desire to micturate, and constitutional disturbances. The symptoms may be relieved by hot applications, together with opiates, internal antiseptics, and diuretics. If there is much mucus or blood or decomposed urine in the bladder it may be washed out with a solution of boric acid, or other mild antiseptic. If there is any known cause for this inflammation, as a stone, it must be removed.

Some persons are troubled with a frequent desire to pass water, and many persons with chronic cystitis never effectually empty their bladders, always leaving a portion of "residual urine" which keeps up the irritation. See CYSTITIS.

Paralysis of the bladder may be the result of accident, or disease of the nervous centres, or overdistention. In this condition the urine accumulates and dribbles away and must be drawn off by the catheter (qv). This dribbling, or *incontinence*, is to be distinguished from irritable bladder, as it is often the sign of a distended bladder. Retention of the urine may be caused by mechanical obstacles to its exit, such as a hypertrophied prostate gland, by paralysis, or by an absence of volitional power over the muscles. This last is termed *hysterical retention*, and is common in young girls, in persons suffering from seasickness, from nostalgia. Retention also results occasionally from operation or from accident, such as a broken leg, etc. Any long-continued inflammation or obstructive difficulty is usually followed by a thickening of the walls of the bladder itself, or *hypertrophy*. The mucous membrane may form pouches in these thickened walls—a condition which is called *sacculated bladder*. The organ is also liable to be attacked by various tumors and tubercles.

The bladder may be ruptured by accident from without, as, for instance, by a blow. This accident is usually fatal if prompt surgical aid is not secured.

BLADDER CAMPION. See SILENE.

BLAD'DERNUT' (for derivation see below), *Staphylea*. A genus of plants, the type of a small family, Staphyleaceae. Only about 11 species are known, which are found in very different climates and scattered over the world. They are mostly small trees of rather elegant appearance. The seeds contain a considerable quantity of a fixed oil, which is slightly purgative. The common bladder-nut (*Staphylea trifolia*) is a native of the east of Europe and of temperate parts of Asia, which has been admitted into the British flora, but was in all probability introduced as an ornamental tree. It is frequently planted in shrubberies, as is also *Staphylea trifolia*, a North American species with ternate leaves. The wood of both is firm and white, well suited for the purposes of the turner. The seeds may be eaten, but act as a mild aperient. The flower buds are pickled as

capers. The name "bladdernut" has reference to the curious inflated membranous capsule and the hard, bony "testa" of the seed. The name "Staphylea" is from the Gk. *σταφύλη*, *staphylē*, a bunch of grapes, and has reference to the racemed flowers. See Plate of *BIGNONIA*, ETC.

BLADDERWORM. An encysted larval tapeworm. See HYDATID; TAPEWORM.

BLADDERWORT (so named from the little bladders on the leaves which float the plant at the time of flowering), *Utricularia*. A genus of plants of the family Lentibulariaceae, containing about 75 species, the bright blossoms of which, along with those of water lilies, etc., adorn the surface of lakes, ditches, and marshes in almost all parts of the world. In the United States are found a dozen or more species with yellow, violet, or purple flowers. Great Britain has only three species, all of which have yellow flowers. These plants are very interesting from the provision made for the expansion of their flowers above water, although the whole plant is ordinarily submerged. The stems and leaves are furnished with numerous little bladders, which are filled with water till the time of flowering, when they become filled with air, and this, again, gives place to water after flowering is over, so that the seeds are ripened at the bottom. The bladders have an orifice guarded by bristles and other armature. Aquatic insects sometimes enter them, are imprisoned, and the plant utilizes the products arising from their decay. See Plate of *BIGNONIA*, and cut ("a") in **CARNIVOROUS PLANTS**.

BLADENSBURG. A town in Prince George Co., Md., 6 miles northeast of Washington (Map: Maryland, K 5). Here, on Aug. 24, 1814, a British force of 6000 men, under General Ross and Admiral Cockburn, with a loss of about 500, defeated 7000 Americans under General Winder. The British then entered Washington without further hindrance. Bladensburg was formerly a noted dueling ground; and here, in 1820, Commodore Decatur was mortally wounded by Commodore Barron. Pop., 1890, 503; 1900, 463; 1910, 400. Consult articles on the battle and on the Bladensburg dueling grounds in the *Magazine of American History*, vols. xv and xxv (New York, 1877-93).

BLAENAVON, blā-nā'von (Cymr., Celt. *blaene*, source + *avon*, river). A coal-mining town and railway junction in Monmouthshire, England, on the Avon, $4\frac{1}{2}$ miles southwest of Abergavenny (Map: England, C 5). There are iron and steel works, rolling mills, and blast furnaces in the vicinity. Pop., 1891, 11,400; 1901, 10,900; 1911, 12,010.

BLAEU, blou, **BLAEUW**, or **BLAUW**. A family of learned Dutch publishers. The founder of the firm was Willem Janszoon Blaeu (1571-1638), a mathematician, born at Alkmaar, Holland. He was a pupil in astronomy of Tycho Brahe and secured a considerable reputation by publishing terrestrial and celestial globes, excelling in beauty and accuracy everything that had preceded them. The *Novus Atlas* (6 vols., 1634-62) is his principal work. His sons, Cornelius (died 1650) and Joan (died 1673), carried on his business together until the death of Cornelius. Their *Atlas Major* (11 vols., 1662) is a splendid work, and the maps are valuable from the light they throw on local history. Two of Joan's sons carried on their father's business until about 1700. Some of their classical publications, especially *Cicero's Orations* (1690), are

still highly prized. Consult Baudet, *Leven en werken van Willem J. Blaeu* (Utrecht, 1871).

BLAGOVIESHTCHENSK, blā'go-vyeshl'-chēnsk (Russ. City of the Annunciation) Capital of the governor-generalship of the Amur, on the left bank of the Amur, at its junction with the Seya, on the Manchurian frontier (Map: Asia, M 3). It is one of the most prosperous towns in east Siberia, due chiefly to the gold mines in the vicinity. There are iron foundries and flour mills and an active trade in tea, grain, and cattle is carried on. Only a military outpost in 1856, Blagovieshtchensk became in 1858 the capital of the Amur region. In 1868 it had 3344 inhabitants; in 1880, 20,212, and in 1904, 40,399 inhabitants. In July, 1900, the Chinese made a feeble attack upon it, and this led to a general massacre of the peaceful Chinese residents of the city and environs. The Russian authorities ordered them to pass over the Amur into Chinese territory without providing boats. From 10,000 to 15,000 perished by drowning.

BLAINE. See NANTYGO and BLAINE.

BLAINE, JAMES GILLESPIE (1830-93). One of the most brilliant, resourceful, and popular of American party leaders. He was born, of Scotch-Irish parentage, at Brownsville, Pa., on Jan. 31, 1830, and graduated in 1847 at Washington College in his native State. He began his career as a teacher in the Western Military Institute, Georgetown, Ky. (1848-51), and in the Pennsylvania Institute for the Blind, Philadelphia (1852-54), when he removed to Augusta, Me., where he became one of the editors of the *Kennebec Journal* (1854-57). In 1857-60 he undertook the editorship of the *Portland Advertiser*, an influential daily newspaper. The prominence which he soon acquired led to his election to the State Legislature as a Republican. He served from 1859 to 1862 in the Lower House of that body, was Speaker in 1861 and 1862, and in 1859-81 was chairman of the Republican State Committee. Rising rapidly to a commanding place, he was elected in 1862 to the House of Representatives, where he served until 1877 and distinguished himself both as an eloquent debater and as a master of parliamentary law. He was Speaker of the House in 1869-75. He vigorously supported the administration of President Lincoln during the Civil War, opposed the "greenback" movement of 1867-68, and later he succeeded in modifying some of the most radical measures proposed by Thaddeus Stevens at the time of reconstruction. (See **RECONSTRUCTION**; **STEVENS**, **THADDEUS**.) While Speaker he was most successful, showing readiness and nerve, and also personal courtesy to his opponents both within and without the Republican party. The only exception to this statement is to be found in his withering retort to Roscoe Conkling, whom he likened to a turkey gobbler, thereby incurring an enmity which in after years helped to mar his own political ambitions. (See **CONKLING**, **ROSCOE**.)

So pronounced a personality as Mr. Blaine's very naturally led to many controversies that were acute and of which the effects were seen when, in 1875, the Democrats gained control of the House for the first time since the close of the Civil War. A measure to grant complete amnesty to all ex-Confederates was opposed most vehemently by Mr. Blaine, who in a series of passionate and able declamations sought to strike from the list of those to whom this amnesty was to be granted the name of Jefferson

Davis In the course of this debate Blaine showed remarkable power in reviving the smoldering resentments that dated from the days of the war, and he provoked the Southern leaders to utterances which gave Blaine a chance to fan the embers of sectional hatred into a fierce flame. On June 5, 1876, not long before the National Republican Convention was to nominate a candidate for the presidency, there occurred the highly dramatic incident which has to do with what are known in American political history as the "Mulligan Letters" (qv). On this occasion Mr. Blaine, after denying the right of the House to compel him to produce his private correspondence, did nevertheless, after a brief pause, produce a packet of letters and, saying that he invited "the confidence of forty-four millions of his countrymen," read them one by one, making comments on them and explanations of them. In the brief debate which followed Mr. Blaine completely routed his adversaries, and an adjournment of the House was taken amid a scene resembling pandemonium. Mr. Blaine had won a brilliant triumph for the moment and had apparently made of his enemies his footstool. Such, however, was not the unanimous opinion even of his own party. The letters written to James Mulligan and to Warren Fisher showed that the writer of them had at the time (to use his own words) been "crippled and deranged" in his finances, and that he had sought pecuniary assistance because of his own influence as a member of the House of Representatives. One of them ended with the significant words, "Burn this letter." It was also made clear by a letter dated Oct. 4, 1869, that Blaine, while Speaker, had helped to thwart a measure which would have been unfavorable to his own financial associates. Therefore, when the Republican Convention met, although Blaine on the seventh ballot received 351 votes, a combination of all his opponents upon Rutherford B. Hayes, of Ohio, effected Blaine's defeat and made Hayes the Republican candidate against that very able Democratic statesman, Samuel J. Tilden, of New York. The result of the election was disputed, and an Electoral Commission (qv), created by Congress to canvass the returns, seated Mr. Hayes with a majority of only one electoral vote.

Though he did not secure the nomination, "The Plumed Knight," as Col. Robert Ingersoll had styled him in his nominating speech, was elected, in the same year, to the United States Senate. As a Senator, he opposed the Bland Silver Coinage Act (see Bimetallism), supported ship subsidies, spoke and voted against the unrestricted immigration of the Chinese, and strongly favored a high protective tariff and a subsidy for various American industries. In spite of his defeat in 1876 he was still the unquestioned leader of his party, so that in 1880 he was once more a candidate in the Republican Convention in opposition to Grant. The Convention, after taking 36 ballots, gave the nomination to a "dark horse" in the person of James A. Garfield, of Ohio, upon whom the adherents both of Blaine and of John Sherman united. Garfield defeated Gen. W. S. Hancock in the ensuing election and in March, 1881, appointed Blaine to be Secretary of State, an office which he held for only eight months. After the death of President Garfield the presidency devolved upon Vice-President Arthur, then a close friend of

Conkling, who, as already stated was inimical to Blaine. During these eight months as Secretary of State, Blaine attempted to bring about a modification of the Clayton-Bulwer Treaty, advocated a Pan-American Congress, and also aroused criticism by his determination to prevent the transfer of territory from Peru to Chili. This was charged to be due to his alleged interest in the so-called Shepherd claims (qv), but public opinion did not sustain this assertion. His resignation was inevitable, and he now found himself relegated to private life for the first time in very many years. He turned his attention to the preparation of a work entitled *Twenty Years of Congress*, of which the first volume appeared in 1884 and had a favorable reception.

In this same year, however, he was once more a candidate for the presidential nomination, and this time successfully. Nevertheless, the opposition to him within his own party was very bitter, so much so that large numbers of independent Republicans, who were popularly known as "Mugwumps" (qv), voted against him, especially in New York, Connecticut, and Massachusetts, and cast their ballots for the Democratic candidate, Grover Cleveland, of New York, who had been elected Governor of that State by the enormous plurality of 192,000 votes two years before. The political campaign of 1884 was unparalleled in American political history for the malignity with which both candidates were assailed and for the outrageous indecency of the stories that were circulated concerning their private lives. (See CLEVELAND, GROVER.) Blaine made extensive tours throughout the country, during which he showed all of his characteristic adroitness and fervid eloquence, but the issues by which he hoped to win had ceased to interest the country. Sectional animosity was dying out. People were tired of what was known as "waving the bloody shirt," and the Democratic platform had been so ably drawn as to subordinate the tariff question. The result, therefore, turned chiefly upon the respective merits of the two candidates, and here Cleveland was held to be superior to Blaine in political integrity and civic virtue. Various reasons have been assigned for the defeat of Blaine, but they may be probably summed up as resulting, first, from the hostility of Mr. Conkling and his adherents, second, from the defection of the independent Republicans, and third, from the fact that, although Mr. Blaine was himself friendly to the Catholic voters, and though his own sister was the Mother Superior of a convent, he had allowed the Rev. Samuel D. Burchard (qv), the spokesman of a number of Protestant clergymen, to style the Democratic party (October 29, 1884) "the party of Rum, Romanism, and Rebellion." This inadvertence of Blaine was accounted for by the fact that he did not notice the famous phrase and took "Romanism" for Mormonism.

Betaking himself once more to literary labor, he completed the second volume of his *Twenty Years of Congress* (1886) and also wrote a volume called *Political Discussions* (1887). He also visited Europe and was in Florence at the time when the Republican Convention met in 1888. Blaine's name was again mooted as that of a candidate, but it was withdrawn at his own request, and his adherents secured the nomination of Benjamin Harrison, of Indiana, who was elected. President Harrison appointed

Blaine Secretary of State, in which office he served until 1892. As Secretary of State he secured a favorable treaty with Germany concerning the Samoan Islands (q.v.); assembled and presided over the first Pan-American Conference (q.v.); and engaged in a controversy with Lord Salisbury over the Bering Sea fisheries (see **BERING SEA CONTROVERSY**); compelled the Chilean government to admit the inviolability of the American legation at Santiago, to dismiss its Foreign Secretary for having made public a letter which spoke of President Harrison and Secretary Blaine in terms of insult, and to pay an indemnity to the families of certain American sailors who had been wantonly killed by a mob in the streets of Valparaiso; and took a firm stand in the matter of the lynching at New Orleans of the 11 Italians accused of assassinating the chief of the police of that city.

In 1892 Blaine's relations with the President became difficult, owing, it is said, to a falling out between Mrs. Harrison and Mrs. Blaine. In June, just before the Republican Convention was held at Minneapolis, he resigned from the cabinet, and his name was unsuccessfully presented to the convention which renominated Harrison. Blaine had, in fact, become broken down in health. He retired to his home in Maine and there died on Jan. 27, 1893.

Bibliography. There exists as yet no adequate account of the life and political services of Mr. Blaine. The standard biography at the present time is that written by Stanwood (Boston, 1905), but Mr. Stanwood's close relationship to the Blaine family made it impossible for him to write of his subject with a spirit of historical detachment. The reader is, however, referred to his *History of the Presidency* (Boston, 1898) for much valuable information, and also to Mr. Blaine's own books already cited. *The Biography of James G. Blaine* (Norwich, 1895), by Mary Abigail Dodge ("Gail Hamilton"), contains many interesting facts, but is in the nature of a panegyric rather than of a critical biography. Reference may be made to: Conwell, *The Life and Public Service of James G. Blaine* (Muskegon, 1884); Crawford, *James G. Blaine* (Philadelphia, 1893); Ridpath, *The Life and Work of James G. Blaine* (New York, 1893); Brooks, *Statesmen* (New York, 1893); Varigny, *Les Etats-Unis* (Paris, 1892); *The Letters of Mrs. James G. Blaine*, ed. by Beale (2 vols., New York, 1908); an article in *McClure's Magazine*, vol. xiv (1900); Harry Thurston Peck, *Twenty Years of the Republic*, especially chaps. i, v, and vi (New York, 1906; last reprint, 1913); id., *American Party Leaders*, chap. v (New York, 1914).

BLAINVILLE, blān'vél', HENRI MARIE DUCROTAY DE. See DUCROTAY DE BLAINVILLE.

BLAIR. A city and the county seat of Washington Co., Neb., 25 miles north by west of Omaha, on the Chicago and Northwestern, and the Chicago, St. Paul, Minneapolis, and Omaha railroads (Map: Nebraska, H 3). It contains Dana College and the Crowell Memorial Home for retired Methodist ministers. The city has canning, horse-collar, and cider, vinegar, and pickle factories, and a proprietary establishment. The water works are owned by the city. Blair adopted the commission form of government in May, 1914. Pop., 1900, 2970; 1910, 2584.

BLAIRE, ANDREW ALEXANDER (1848-).

An American chemist, born in Woodford Co., Ky. He graduated at the United States Naval Academy (1866) and became an ensign in the navy, but afterward devoted himself to analytical chemistry, especially analysis of iron and its ores. From 1875 to 1878 he was employed in testing iron and steel for the United States government at the Watertown Arsenal, and from 1879 to 1881 acted as chief chemist to the United States Geological Survey and the Tenth Census. At the termination of this engagement he devoted himself to the practice and improvement of the methods of technical analysis. Besides a number of original papers and reports on various special subjects of metallurgy, he wrote *The Chemical Analysis of Iron* (1888; 7th ed., 1912).

BLAIR, FRANCIS PRESTON (1791-1876). An American journalist and politician, born in Abingdon, Va. He graduated at Transylvania University, Ky., in 1811 and soon afterward became prominent in State politics. He strongly supported Henry Clay for the presidency in 1824, but in 1828 became an enthusiastic adherent of Andrew Jackson. In 1830 he went to Washington, on Jackson's invitation, to assume the editorship of the *Globe*, which was the official organ of the Democratic party until 1845, when President Polk forced Blair's resignation. Blair supported Van Buren in 1848 and Pierce in 1852, but afterward joined the newly organized Republican party, and in 1856 presided over the Pittsburgh Convention. In 1860 he was an active supporter of Abraham Lincoln. In December, 1864, he made an unofficial visit to Richmond and proposed to Jefferson Davis and others who were influential in the Confederate government the arrangement of a peace on the basis of a joint campaign by the Northern and Southern armies against Maximilian in Mexico. This proposal, though wholly unofficial, led to the famous peace conference of Feb. 3, 1866, at Hampton Roads, between President Lincoln and the Confederate representatives, Stephens, Hunter, and Campbell.

BLAIR, FRANCIS PRESTON, JR. (1821-75). An American lawyer, politician, and soldier, born in Lexington, Ky. He graduated at Princeton in 1841, was admitted to the bar in 1842, and removed to St. Louis to practice law. In the Mexican War he served in the United States army as a private. Afterward he was editor for a time of the *Missouri Democrat*, became prominent in State politics, was a member of the Missouri Legislature from 1852 to 1856, and after 1856 served for several years in Congress as a Republican. At the outbreak of the Civil War he was the leader of the Union party in Missouri, and by his energy, tact, and political sagacity was largely instrumental in preventing that State from joining the Confederacy. In April, 1861, he entered the Federal army as a colonel, and before the close of the following year had risen successively to the rank of brigadier general (1862) and of major general (1862). He led a division under Sherman at Vicksburg in 1862-63, commanding the assault upon Chickasaw Bluffs (Dec. 26, 1862), and in 1864 took a prominent part, as division commander and temporarily as commander of the Seventeenth Corps, in the famous march to the sea. He was nominated as Collector at St. Louis and as Minister to Austria by President Johnson in 1866, but, owing to his views on reconstruction, the Senate refused to confirm.

either appointment. Afterward he joined the Democratic party, was its candidate for Vice President in 1868, and from 1871 to 1873 was a member of the United States Senate. He published *The Life and Public Services of Gen. William O. Butler* (1848) and *Colonization and Commerce* (1859).

BLAIR, HENRY WILLIAM (1834-) An American politician and lawyer, born in Hampton, N. H. He received an academic education, was admitted to the bar in 1859, and was prosecuting attorney for Grafton County in 1860. During the war he was lieutenant colonel of the Fifteenth New Hampshire Volunteers. He was a member of the New Hampshire House of Representatives in 1866, of the State Senate, from 1867 to 1868, and Republican Representative in the Forty-fourth and Forty-fifth Congresses. From 1879 to 1891 he was United States Senator. He was appointed Minister to China in 1891, but that government declined to receive him owing to the language used by him in various speeches against the Chinese. He gained considerable reputation as a reformer by his bill to prohibit the sale and manufacture of liquors and his measures to promote public education.

BLAIR, HUGH (1718-1800) A Scottish divine and man of letters. Born in Edinburgh, April 7, 1718, he was educated at the university of his native city, where he attracted the attention of his instructors by an *Essay on the Beautiful*. In October, 1741, he was licensed to preach by the presbytery of Edinburgh, and after occupying the churches of Colleslie in Fifeshire, Canongate Church in Edinburgh, and Lady Yester's, he was promoted in 1758 to the highest position attainable by a Scotch clergyman—one of the charges of the High Church, Edinburgh. His discourses, which display little power or originality of thought, were yet greatly admired on account of their polished style. In 1759 Blair commenced a series of lectures on composition at the university, and three years afterward, a new chair of rhetoric and belles-lettres, with a salary of £70 a year, being created by the crown, Blair was made professor. He held this appointment until 1783, when he resigned, and in the same year published his *Lectures*, which obtained a reputation that time has ultimately sanctioned. His first volume of sermons, which appeared in 1777, proved a great success. George III. showed his appreciation of them by bestowing on Blair, in 1780, a pension of £200 a year. These sermons are now considered as moral essays rather than sermons. Blair's critical acumen was not great, since he strenuously defended the authenticity of Ossian's poems. He died Dec. 27, 1800. For his life, consult Finlayson (London, 1801) and Hill (Edinburgh, 1807).

BLAIR, JAMES (1656-1743) A colonial clergyman and educator, the founder and first president of the College of William and Mary in Virginia. He was born in Scotland, graduated at the University of Edinburgh in 1673, removed to England in 1682, and in 1685 was sent to Virginia as a missionary of the Church of England. He was minister successively at Henrico City, Jamestown, and Williamsburg, and after 1689 was Commissary of Virginia. In this capacity he did much to raise the character of the provincial clergy and to rectify many clerical abuses. In 1690, at a time when there was only "one privately endowed school

and a few old field schools' in the Colony, he took up the work of founding a college in Virginia, and in the same year began soliciting subscriptions for an institution which was to provide for "the Education of our Youth, a constant supply of our Ministry, and perhaps a foundation for ye Conversion of our neighboring Heathen to the Christian Faith." In 1691 he went to England and there, in 1693, secured a charter for the College of William and Mary. On his return he worked indefatigably to secure the immediate election of buildings, and until his death was president of the college. After 1693 Blair was also a member of the Council of Virginia, of which he was for some time President. In this capacity he was instrumental in securing the removal of three governors in turn. It has been said of Blair that he did more than any other one man for the intellectual advancement of Virginia during the Colonial period. He collaborated with Henry Hartwell and Edward Chilton in the preparation of a valuable work entitled *The Present State of Virginia and the College* (London, 1727), probably the best extant account of Virginia in the latter part of the seventeenth century, and published an elaborate series of sermons on *Our Saviour's Divine Sermons on the Mount* (4 vols., 1772, 3d ed., 1740), which have been much commended by theologians. Consult D. E. Motley, "Life of Commissary James Blair, Founder of William and Mary College," in Series 19, No. 10, of *Johns Hopkins University Studies* (Baltimore, 1901).

BLAIR, JOHN INSLEY (1802-99) An American capitalist and philanthropist. He was born in Warren Co., N. J., and from 1811 to 1819 worked in a small store in Hope, N. J. Later he removed to Blairstown, became interested in the Oxford Iron Furnace in Warren County, and in 1846 was associated with the Scranton Brothers in the first attempt to manufacture iron with anthracite coal. He and his associates constructed the road which subsequently became known as the Delaware, Lackawanna, and Western. In later life he was connected, either as builder or director, with 20 railroads, and at one time was said to own more miles of railroad than any other man in the world. He gave large sums to Princeton, Ginnell, and Lafayette colleges, and about \$600,000 to the Presbyterian Academy at Blairstown, and contributed toward building over 100 churches in the towns laid out along the lines of his railroads.

BLAIR, MONTGOMERY (1813-83) An American lawyer and statesman, the son of Francis P. Blair, Sr. He was born in Franklin Co., Ky., graduated at West Point in 1835, and served for several months in the first Seminole War. He then resigned from the service, studied law, was admitted to the bar in 1839, and began to practice in St. Louis. He was for a time United States district attorney for Missouri, was mayor of St. Louis in 1842-43, and from 1843 to 1849 was judge of the Court of Common Pleas of that city. In 1852 he removed to Maryland, where he devoted his attention as a lawyer chiefly to important cases before the United States Supreme Court and quickly became prominent as a Democrat in State politics. From 1855 to 1858 he was United States solicitor in the Court of Claims, and in 1857 was the counsel for the defendant in the celebrated *Dred Scott Case* (q.v.). Strongly disapproving of the attitude of the Democratic party toward the repeal

of the Missouri Compromise in 1854, he joined the newly organized Republican party in 1856, and in 1860 was chairman of the State Republican Convention. In 1861 he became a member of Lincoln's cabinet as Postmaster-General, and continued in that office until September, 1864, when he resigned. During his term money orders first came into use, and free delivery in cities and the sorting of the mails on postal cars were introduced. After the war Blair returned to the Democratic party, and in 1876-77 was a supporter of Tilden in the Tilden-Hayes controversy. He published his *Speech on the Causes of the Rebellion* (1864).

BLAIR, ROBERT (1699-1746). A Scottish clergyman and writer. He was born in Edinburgh, was educated at the university there and in Holland, was licensed to preach in 1729, and from 1731 until his death was settled at Athelstaneford in East Lothian. Besides an elegiac poem and several paraphrases of Scripture which have been totally forgotten, he wrote the forcible but strikingly lugubrious poem of 767 lines, entitled *The Grave*, which, first published in 1748, enjoyed considerable popularity and was frequently reprinted.

BLAIRSVILLE. A borough in Indiana Co., Pa., 53 miles by rail east of Pittsburgh, on the Pennsylvania Railroad and on the Conemaugh River, here spanned by two bridges (Map. Pennsylvania, C 6). It is the seat of Blairsville College (female), a Presbyterian institution opened in 1851, and has a public library. In the town are railway shops, foundries, and machine shops, enameling plants and manufactories of plate glass and lumber. Blairsville was settled in 1818 and was incorporated in 1825. The government is vested in a mayor, elected every three years, and a unicameral council. The water works are owned by the borough. Pop., 1910, 3572.

BLAISE. See BLASIUS.

BLAKE, EDWARD (1833-1912). A Canadian statesman. He was born in the county of Middlesex, Ontario, and was educated at Upper Canada College and Toronto University, where he graduated in 1854. He chose the legal profession, was called to the bar in 1856, and soon gained a large equity practice. His keen interest in the issues which precipitated Confederation (see CANADA, *History*), together with his ability as a lawyer and public speaker, early indicated his aptitude for politics. In 1867 he was elected a Liberal member of the House of Commons and also of the Ontario Legislature, representation in both houses then being legal. In 1869 he became leader of the Liberal Opposition in the Ontario Legislature, and in 1871, after the resignation of John Sandfield Macdonald, he became Premier of the province. The abolition of dual representation in 1872 caused him to resign the provincial premiership and enter Dominion politics. In 1873 he took a prominent part in opposing the political bargain commonly known as the Pacific Railway Scandal, which caused the overthrow of the administration of Sir John Alexander Macdonald. His parliamentary and platform speeches at this crisis displayed powers of argument and destructive criticism which enabled him intellectually to dominate his party during the remainder of his Canadian activity. In the Liberal cabinet of Alexander Mackenzie, Blake in 1873 became a minister without portfolio and soon resigned on account of ill health,

but after recovery he accepted in 1875 the office of Minister of Justice. His ability in constructive legislation was chiefly shown in the measure creating the Supreme Court of Canada, but after 1878, when the Mackenzie government was defeated, further opportunity of this kind was denied him. In 1880 he was chosen leader of the Liberal Opposition; but in subsequent general elections his party was unsuccessful, and in 1887 he resigned. Mr. (afterward Sir) Wilfrid Laurier being appointed his successor. Reasons for partial disagreement with his party and for his retirement from its leadership were disclosed in a letter published in 1891, in which he opposed, as leading to political absorption by the United States, the policy of commercial union advocated by a section of the Liberals. In 1892, in response to an invitation by Irish Nationalists, he entered Imperial politics and was elected member for South Longford, Ireland, in the British House of Commons. He rendered signal service to the Nationalists, his Canadian experience enabling him authoritatively to present the cause of Irish home rule in its more hopeful aspects and larger Imperial relations. In 1896 he was a member of the committee appointed to investigate South African affairs, and his work in connection therewith was notable for his cross-examination of Cecil Rhodes. In addition to his political services Blake frequently appeared, both in Canada and Britain, as legal counsel in cases of high importance and also as arbitrator. He was deeply interested in higher education and founded scholarships in political science in Toronto University, of which he was for a time chancellor. In the earlier part of his career he was an ardent advocate of Imperial federation, but later became more conservative in his outlook. He was a man of high moral ideals and strict political integrity, and though but a short time in office, he strongly influenced public opinion and the course of legislation. In 1907 he retired from public life and returned to Toronto, where he afterward died. Consult Dent, *The Last Forty Years* (Toronto, 1881), and Willison, *Sir Wilfrid Laurier and the Liberal Party* (Toronto, 1903).

BLAKE, ELI WHITNEY (1795-1886). An American inventor. He was born in New Haven, Conn., and graduated at Yale in 1816. Blake assisted his uncle, Eli Whitney (q.v.), in the management of the gun factory at Whitteville and on his uncle's death assumed full charge. In conjunction with his brother, he afterward established a hardware factory at Westville. Blake is best known for his invention of a stone-breaking machine. He wrote several scientific papers, the most noteworthy being *Original Solutions of Several Problems in Aerodynamics* (1882).

BLAKE, FRANCIS (1850-1913). An American inventor, born at Needham, Mass. In 1866-79 he was connected with the United States Coast Survey and in 1878 invented the transmitter for telephone instruments, which, known under his name, has become the most extensively used throughout the world. He patented other electrical devices, also.

BLAKE, JAMES HOPWOOD (1843-1901). An English geologist and surveyor, born in London. He was educated there at King's College and apprenticed to the civil engineer Brereton, under whose direction he was for several years engaged in railway engineering and construction in

Cornwall and South Wales. In 1868 Blake joined the Geological Survey of Great Britain and was commissioned to prepare large scale maps of certain portions of southern England. He surveyed parts of Somerset, Suffolk, and Norfolk, and studied the phenomena of the drift deposits of those regions. Several contributions, embracing the results of his observations on the drift and the Mesozoic formations, have been published in the *Memoirs of the Geological Survey of the United Kingdom* and in the *Geological Magazine*.

BLAKE, LILLIE DEVEREAUX (1835-1913) An American woman suffragist and reformer. She was born in Raleigh, N. C., and was educated in New Haven, Conn. She married, in 1855, Frank G. Q. Umsted, a Philadelphia lawyer, who died in 1859, leaving her with two children to support. She turned her attention to literary work, her first story, *A Lonely House*, appearing in the *Atlantic Monthly*. In the next few years she completed two successful novels, *Southside* (1859) and *Rockford* (1862). In 1866 she married Giffill Blake, a wealthy New York merchant. She was one of the active promoters of the movement that resulted in the founding of Barnard College and was prominent as a speaker on educational topics. She also identified herself with the woman's suffrage movement and delivered many addresses on the subject throughout the country. She was president of the New York State Woman's Suffrage Association from 1879 to 1890 and of the New York City Woman's Suffrage League from 1886 to 1900. She was largely instrumental in securing the passage in 1880 by the New York Legislature of the law permitting woman's suffrage in school elections and was the author of the law providing for matrons in the police stations passed in 1891, and of that requiring storekeepers to provide seats for saleswomen. In addition to the books mentioned, her writings include *Fettered for Life* (1872), a novel dealing with the woman's suffrage question, *Woman's Place To-day* (1883), lectures delivered in reply to a series of Lenten sermons on "Woman," by the Rev. Morgan Dix, *A Daring Experiment* (1894).

BLAKE, ROBERT (1590-1657) An English soldier and admiral of the Commonwealth. The eldest of 12 sons of a merchant, he was born at Bridgewater, Somerset, in August, 1590. He studied at Oxford from 1615-25, taking his degree of M. A. in 1623 at Wadham College. When the Civil War broke out, he raised a troop in Somersetshire and narrowly escaped hanging for prolonging the defense of Bristol, when the Governor had capitulated. Parliament subsequently appointed him lieutenant colonel, and by his obstinate defense of Lyme with 500 men against Prince Maurice's 5000, he seriously damaged the reputation of that warrior, who retired in disgust. In 1644 he surprised Taunton, of which place he was made Governor, and gave proof of no mean military skill by defending the place against an overwhelming force, until the town was little better than a heap of ruins, when the siege was raised. In 1649, in conjunction with two other officers of equal rank, he was appointed general of the sea, the two services, military and naval, at that time not being distinct. This was Blake's true sphere. After an exciting hide-and-seek chase of several months, in 1651 he destroyed the squadron of Prince Rupert, which had sought safety in the

Tagus, and forced the Royalists to surrender Guernsey, Jersey, and the Scilly Isles. On the outbreak of the Dutch War in March, 1652, he was made sole admiral of the fleet for nine months, and during this year fought four engagements with Dutch fleets under Tromp, De Ruyter, and De Witt. In the first, on May 19, the Dutch retreated under cover of darkness, with the loss of one man-of-war captured, and another sunk. In the next engagement, a squadron of 12 ships, sent to protect the herring vessels from the attacks of Blake, were captured, and in the third, on September 23, 3 Dutch vessels were destroyed, and the rear admiral taken. On November 29 a fleet of 80 vessels, under the command of Tromp, encountered Blake with only 40 off the Goodwin Sands. The result of the action was the loss of 6 English ships—2 captured and 4 destroyed, the rest, in a shattered condition, sought safety in the Thames. There is a story, now discredited, that Tromp tied a broom to the masthead of his vessel, and sailed through the Channel, intimating that he had swept English vessels clean out of it. If he did, his pride was short-lived, for by February, 1653, Blake was at sea again with 80 ships, and falling in with Tromp with about an equal force, was at once attacked, but after a three days' running fight, the Dutchman was forced to seek shelter in the shallow waters of Calais, with a loss of 11 men-of-war, and 30 of a fleet of merchantmen he had in convoy. The English lost only one ship, but Blake was severely wounded. On the 3d and 4th of June his coadjutors, Dean and Monk, won another victory over Tromp, and his wound alone prevented Blake from taking part in the engagement of July 31, which finally shattered the naval supremacy of Holland. In 1654 Blake was appointed by Cromwell to command an English fleet in the Mediterranean, where he soon made the British flag respected by Dutch, Spanish, and French. The Dey of Tunis refused to pay homage to it. Blake attacked his capital, burned the Turkish fleet of nine ships which lay before it, accomplished a landing, and with a body of 1000 men annihilated an army of 3000 Turks. He next sailed to Algiers and Tripoli, landed, and set free all the English who were detained as slaves. He concluded alliances favorable to England with Venice and Tuscany. In 1657 he defeated the Spaniards at Santa Cruz. This was, perhaps, one of the most daring actions in Blake's career. With a wind blowing right into the bay—which was very strongly defended—Blake dashed in, attacked and destroyed the Spanish galleons and slipping in the harbor, and, the wind fortunately changing, sailed out again with a loss of only one ship and 200 men. The Spanish loss in men and property was immense, and the terror the action inspired insured increased respect to the English flag. His health now failed, he returned to England, and died, as his ship entered the harbor of Plymouth, Aug. 7, 1657. Cromwell honored his memory by a solemn funeral procession, and caused him to be interred in Westminster Abbey, whence his body, with those of other Revolutionary celebrities, was removed by royal command at the Restoration. Consult Gaudiner, *History of the Commonwealth and Protectorate* (New York, 1894-1901), with full citation of the original authorities, Samuel Johnson, *Life of Blake* (London, 1792), Dixon, *Robert Blake* (London, 1852), Stevenson, *Admiral Robert*

Blake (London, 1910). For the principal original materials, consult *Calendars of State Papers, Domestic* (London, 1649-57), and Thurlow, *State Papers* (London, 1742).

BLAKE, WILLIAM (1757-1827). An English engraver and poet. He was born in London Nov. 28, 1757. In 1789 he published *Songs of Innocence*, followed in 1794 by *Songs of Experience*, showing the two contrary states of the human soul, with about 60 illustrations remarkable for their original manner. The poems were equally singular, but many of them of the purest poetic quality. Some marginal designs for Young's *Night Thoughts*, executed by Blake, were greatly admired by Flaxman. Blake lived in the full belief that he held converse with the spirits of the departed great—with Moses, Homer, Vergil, Dante, and Milton. He published numerous designs, chiefly of religious and cognate subjects, among the best of which are his *Inventions to the Book of Job*, and the illustrations of Blair's *Grave*. He died (Aug. 12, 1827) in poverty and obscurity, with the conviction that he was a martyr to poetic art. The influence of Michelangelo is traceable in his art; but the imagination which produced his bold and often curious designs was peculiarly Blake's own, while in his diction, though at times almost irrational, he was, according to Swinburne, "the single Englishman of supreme and simple poetic genius of his time," and Charles Lamb regarded him as one of the most extraordinary persons of the age.

He has of late been made the object of a sort of cult. The facts of Blake's early life are recorded in a book, now rare, written by Dr. Malkin, *A Father's Memoirs of his Child* (1806). Consult: Gilchrist, *Life and Works of William Blake* (2d ed., London, 1880); Swinburne, *William Blake: A Critical Essay* (London, 1868); *Poetical Works of William Blake*, ed. W. M. Rossetti (London, 1874); and *Works*, edited with lithographs of the illustrated "Prophetic Books," and memoir and interpretation, Ellis and Yeats (London, 1893); besides his *Life* by Russell (London, 1906) and Selincourt (1909); and among other recent books of a biographical character, Selincourt, *William Blake* (London, 1909); Ellis, *The Real Blake* (London, 1907); Chesterton, *William Blake* (London, 1911). A. G. B. Russell, *Engravings of William Blake* (1912); Mrs. Blake's letters were edited by Tatham (New York, 1906), with a short biography. The essays on Blake in W. B. Yeats, *Ideas of Good and Evil* (1903), are excellent.

BLAKE, WILLIAM HUME (1809-70). A Canadian jurist. He was born in Kiltegan, county Wicklow, Ireland, and was educated at Trinity College, Dublin. Undecided temporarily as to his future course, he studied surgery under Sir Philip Crampton, and afterward began to study theology with the view of entering the Church of England, but in 1832 he emigrated to Upper Canada and settled on a farm in Middlesex County. In a few years he removed to Toronto, studied law, and in 1838 was called to the bar. He soon attained eminence in his profession, but was strongly interested in the political issues which agitated the province and ardently sympathized with the Reformers in their struggle for responsible government. (See *POLITICAL PARTIES, Canada*.) In 1848 he was elected to the Legislature for East York (now Ontario County) and in the same year was ap-

pointed Solicitor-General for Upper Canada in the Lafontaine-Baldwin ministry. His powers of debate and oratory were great and on two or three occasions rose to heights altogether exceptional, but his parliamentary career was short. In 1849 he prepared the act reforming the practice and organization of the Court of Chancery in Upper Canada and resigned from the ministry in order to become in 1849 the first chancellor of the court. His judgments commanded wide respect and placed the business of the court upon a sound basis. In March, 1862, he resigned on account of failing health, and eight years later he died in Toronto.

BLAKE, WILLIAM PHIPPS (1826-1910). An American scientist. He was born in New York, graduated at the Sheffield Scientific School in 1852, was mineralogist and geologist of the Pacific Railroad Exploring Expedition of 1853, and author of several of the reports. He edited the *Mining Magazine* (1859-60), was mining engineer for the Japanese government in 1862, and in 1863 was appointed professor of mineralogy in the College of California and geologist to the State Board of Agriculture. He was commissioner for California at the Paris Exposition of 1867, was executive commissioner for Connecticut in the Centennial Exposition, and was special agent to Vienna in 1873. From 1896 to 1905 he was professor of geology and director of the School of Mines at the University of Arizona, and in 1898, territorial geologist. He published *Silver Ores and Silver Mines* (1860); *Report on the Production of Precious Metals* (1867); *Ceramic Art and Glass* (1878); *Tombstone and its Mines* (1902).

BLAKE/LOCK, RALPH ALBERT (1847-). An American landscape and figure painter. He was born and educated in New York City, where he graduated from the City College in 1869. His art is self-acquired, the result of many experiments. His early work is therefore crude, but his progress was rapid, and at his best he ranks as one of the foremost American landscape painters, particularly in evening and moonlight subjects. His theme is usually the forest primeval with mysterious glades peopled by red men. He is essentially a tone painter, who sees in nature the means of attaining emotional effects rather than a subject to be literally transcribed. His principal pictures include: "Indian Girl, Uinta Tribe," "Shooting the Arrow" (1880), "Bannock Wigwam in Peaceful Vale" (1883), "Autumn" (Mrs. Kurtz, New York); a beautiful moonlight scene, in the Lambert collection, Paterson, N. J., "Sunset, Navarra Range" (W. T. Evans, New York); the "Pipe Dance," Metropolitan Museum of New York, one of his finest productions. Before 1900 he lost his reason and is no longer productive. In 1913 he was accorded the tardy honor of membership in the National Academy of Design.

BLAKELY, blak'li, JOHNSON (1781-1814). An American naval officer, born near Seaford, Ireland. He emigrated with his parents to the United States, graduated at the University of North Carolina in 1800, and in the same year entered the United States navy. In 1813 he became commander of the *Wasp*, a new sloop of war, and in his first cruise captured the English sloop *Reindeer*. On another cruise he captured several prizes and defeated the *Acon* and the *Aialanta*. Late in 1814 the *Wasp* left on a cruise, but never returned to port, and was presumably wrecked.

BLAKESLEE, ALBERT FRANCIS (1874-) An American botanist, born at Geneseo, N. Y., brother of George Hubbard Blakeslee. After graduating from Wesleyan University (Conn.) he served as assistant in botany at Harvard in 1899-1900, as instructor at Radcliffe College in 1900-02, and as a teaching fellow at Harvard in 1901-03. He was a collector in Venezuela for the Harvard Cryptogamic Herbarium in 1903, and an investigator in Europe for the Carnegie Institution in 1904-06, taught botany at Harvard, and in 1907 became director of the Summer School of the Connecticut Agricultural College. He is known for his investigations of sex in plant life. His works include *Sexual Reproduction in the Mucosaeae* (1904), and *Trees in Winter* (1911, new ed., 1913).

BLAKESLEE, GEORGE HUBBARD (1871-) An American educator and author, born in Geneseo, N. Y., brother of the preceding. He graduated from Wesleyan University in 1893 and studied also at Johns Hopkins, Harvard (Ph.D., 1903), Berlin, Leipzig, and Oxford. In 1903 he became instructor of history in Clark College and in 1911 professor of the same subject in Clark University, Worcester, Mass., where he was associated with President G. Stanley Hall in founding and editing *The Journal of Race Development* and in organizing the annual conference at Clark University on international problems. In 1906-08 he traveled in Russia, China, the Philippines, and Hawaii, and his principal published works deal with the Orient. They include contributions to the *Outlook* and other periodicals, and the books *The Far East* (1906), *The Near East and Africa* (1910), *Japan* (1911). He edited *China and the Far East* (1910) and *Japan and Japanese-American Relations* (1912)—both volumes of Clark University lectures.

BLANC, CHARLES (AUGUSTE ALEXANDRE PHILIPPE) (1813-82). A French historian and critic of art. He was born at Castres and was a brother of the historian Louis Blanc. He studied engraving with Calametta and Mercuri, achieving some proficiency in the art, but he is chiefly known through his writings and critical work. In politics an ardent Republican, he was head of the Department of Fine Arts in the Ministry of the Interior from 1848 to 1852 and again from 1871 to 1873. He was chosen to the French Academy in 1876 and became professor of aesthetics at the College de France in 1878. He is chiefly known as the editor of and contributor to the *Histoire des peintres de toutes les écoles* (14 vols., 1849-75), for which he wrote biographies of the artists of the Dutch and French schools. This work was also published in English. He also wrote *L'Œuvre complet de Rembrandt* (1873), *Grammaire des arts du dessin* (1876), a very important work, and *Grammaire des arts décoratifs* (1881), its sequel. He was the founder and until his death the editor of the *Gazette des Beaux-Arts*.

BLANC, JEAN JOSEPH LOUIS (1811-82). A French socialist and historian, born in Madrid, Oct. 20, 1811. In 1820 he was placed in the college at Rodez, in 1830 he went to Paris and became a clerk in an attorney's office for a short time, and in 1832 became private tutor at Arras. Here he resided for two years, contributing largely, on literary and political subjects, to the *Progrès du Pas-de-Calais*. He afterward went to Paris, where he contributed to various political papers, and where in 1839 he founded

the *Revue du Progrès*, in which he first laid down some of his socialistic theories. In this journal, too, he brought out his famous treatise on socialism, the *Organisation du travail*, which in 1840 appeared in a reprint. The book obtained for its author general recognition as one of the ablest of Socialist writers, as well as wide popularity among the French workingmen, who were captivated by the brilliancy of the writing, the apparent simplicity of the scheme, and the freshness of the views advocated. The book denounces the doctrine of individualism, i.e., individual and competitive efforts in labor, and advocates the absorption of the individual in a vast "solidarity," where "each would receive according to his needs and contribute according to his abilities." Blanc next published (in 1841-44) a historical work entitled *Histoire de dix ans, 1830-40*, aimed with deadly effect against the Orleans dynasty. Louis Philippe afterward declared that "it acted like a battering ram against the bulwarks of loyalty in France." It owed its success partly to the exposure it gave of the scandalous jobbery and immorality of the crown and its advisers, partly to that passionate ardor which substituted vehemence for history, and its academic pomp of style. This was followed by the first volume of a *Histoire de la révolution française*, in which the author's aim was to describe, from his own point of view, not only the incidents of the first Revolution, but the social history of the eighteenth century. In the February Revolution of 1848 Blanc played an important part. His popularity with the working classes led to his being appointed a member of the Provisional government. On February 25 he forced his colleagues in the Provisional government to accept the principle of a governmental guaranty of employment. Three days later he demanded the creation of a ministry of labor, but was induced to accept instead the appointment of a commission authorized to inquire into the conditions of labor. Louis Blanc was made the head of this commission, but found himself quite without power to achieve anything of importance. At the same time Marie, Minister of Public Works, began, but without Blanc's cooperation, to establish the so-called national workshops (*ateliers nationaux*), which were to make effective the governmental guaranty of employment. All men out of employment, it was proclaimed, might appear at certain public offices and demand work on public improvements. Those thus employed were to receive two francs a day, those for whom no work was found were to receive one franc. The object of the Minister of Public Works was to make the *ateliers nationaux* as wasteful as possible, in order to discredit Louis Blanc. In this he was quite successful. The number of men on the public works steadily increased, the waste of public money was enormous. When the plan was abandoned, serious rioting followed, in which Louis Blanc, though always opposed to violence, was compromised. A proposal was made to prosecute him, but it was negatived by the National Assembly. After the June insurrection he was again accused and prosecuted for conspiracy, but he contrived to escape to London, where he resided until the fall of the Empire. During his exile he devoted himself to political and historical literature. In 1849 appeared his *Appel aux honnêtes gens* and *Catéchisme des socialistes*, in

1850, *Pages d'histoire de la révolution de février*, and in 1851, *Plus de Girondins; la république une et indivisible*. He acted also as correspondent for several Parisian journals, and a collection of his letters from London was published under the title *Dix années de l'histoire d'Angleterre* (10 vols., Paris, 1879-81). The work which has secured him the most enduring reputation is his *History of the French Revolution*, in 12 volumes, written during his residence in England. It is characterized by extensive and original research, which has frequently enabled the author to reverse the common verdicts on historical personages and to explode many of the extravagant stories of that stormy period. On the fall of the Empire in 1870 Blanc returned to France, and in 1871 he was elected to the National Assembly, where he pursued a policy of consistent radicalism without returning to his former Socialist theories. Louis Blanc may be regarded as the founder of state socialism. He was a vigorous critic of the anarchistic doctrines of Proudhon. Individual liberty, he believed, could exist only under a strongly centralized government. Industry, however, was not, according to his system, to be centralized. It was to be conducted in social workshops, in which the workers cooperate freely, choosing their own managers. The state was to provide credit to launch the workshops; beyond that it had nothing further to do except to fix prices of products. Consult Fiaux, "Louis Blanc," in *Portraits politiques contemporains*, vol. ii (Paris, 1883), and A. Jonannet, *Les théories sociales de L. Blanc* (Dijon, 1902).

BLANC, LE, le blān (Fr. the white; see below). A town in the department of Indre, France, beautifully situated on the Creuse, which divides the town into two parts, about 32 miles west-southwest of Châteauroux (Map: France, N., G 6). It is known principally for the beautiful Lake Blanc (3450 feet above sea level), near which it is situated, so called from the reflection of the quartz lining its bottom. Le Blanc has cloth and linen-yarn mills, potteries, tanneries, vinegar works, forges, etc., utilizing the surplus waters of the lake to furnish power for its machinery. It is very ancient and was frequented by the Romans. Pop., 1901, 6663; 1911, 6493.

BLANC, blānk, LUDWIG GOTTFRIED (1781-1866). A German philologist and Dante scholar. He was born in Berlin, and after studying at the French Theological Seminary of his native city, was called to a pastorate at Halle, in 1806. In 1811 he was suspected of having taken part in a conspiracy against King Jerome of Westphalia and was imprisoned until 1813, when he was released by a Russian flying corps. He was made professor of Romance languages at the University of Halle in 1822, and from 1838 to 1860 was one of the preachers at the cathedral of that city. Professor Blanc is known chiefly for his numerous and scholarly treatises on Dante. His most important works are his *Grammatik der italienischen Sprache* (1844), the first attempt to trace the history of the development of the forms and laws of that language; *Vocabolario Dantesco*, in French (1852); and his translation in unrhymed iambic verse of the *Divine Comedy*, with commentary (1864). His *Handbuch des Wissenschaftigen aus der Natur und Geschichte der Erde und ihrer Bewohner* (1867-69) also enjoyed a wide popularity.

BLANC, blān, MARIE THÉRÈSE. See BENTZON, TH.

BLANC, MONT. See MONT BLANC.

BLANC, (PAUL), JOSEPH (1846-1904). A French historical painter. He was born in Paris and studied with Bin and Cabanel, obtaining in 1867 the Roman prize. Among his principal canvases are: "Perseus" (Luxembourg, 1870); "The Invasion" (1873, Museum, Sedan); "The Vow of Clovis in the Battle of Tolbiac" (1876), containing many portraits of contemporary politicians, and the "Baptism of Clovis," both in the Pantheon, "Bigand's Wife" (1878); "The Triumph of Clovis" (1881); "The Tiber" (1885). His chief mural paintings are in the War Ministry and the cupola of the Hôtel de Ville, Paris, and in the churches of St. Paul and St. Louis, Paris, and of St. Pierre, Douai. He received a gold medal at the World's Fair of 1889 and was made professor in the Ecole des Beaux-Arts.

BLANCHARD, blān'chard, AMY ELLA (1856-). An American writer of juveniles. She was born in Baltimore, studied art in New York and Philadelphia, and for two years taught drawing and painting in Plainfield, N. J. Among her many stories for girls are: *Holly Berries*, in collaboration with Ida Vaughn; semi-historical tales like *A Girl of '76* (1898), *A Heroine of 1812* (1901), and *A Frontier Knight* (1904); and the "Corner" and "Little Maid" series.

BLANCHARD, EDWARD LITT LAMAN (1820-89). An English journalist and dramatist. He was born in London and in 1831 accompanied his father, the well-known comedian, William Blanchard, to New York, where he appeared upon the stage. Returning to England, he was engaged during the rest of his life as a dramatic critic for various papers and a writer of numerous plays, farces, and pantomimes. Of the latter he composed more than 100, which for their prettiness and ingenuity of conception have rarely been equaled, furnishing the Drury Lane pantomime for 37 consecutive years. He was also a prolific writer of short stories and was a staff writer at different times on the *Sunday Times*, the *Weekly Dispatch*, the *Observer*, the *London Figaro*, and the *Daily Telegraph*, his connection with the latter paper extending from 1863 until his death. He edited Thomas Dugdale's *England and Wales Delimited* (1860) and Willoughby's *Shakespeare*; and was the author of two novels, *Temple Bar* and *Man Without a Destiny*, and of several guidebooks. Consult Scott and Howard (editors), *Life of E. L. L. Blanchard* (London, 1891).

BLANCHARD, blān'shār', EMILE (1820-1900). A French naturalist, born in Paris. As assistant naturalist to the museum, he was several times appointed to represent Milne-Edwards in the entomology course. He became a member of the Academy of Sciences in 1862 and president of that institution in 1881. The following are his principal works: *Histoire naturelle des insectes orthoptères, neuroptères, etc.* (3 vols., 1840-41); *Histoire des insectes, traitant de leurs mœurs et de leurs métamorphoses en général* (2 vols., 1845); *La zoologie agricole* (1854 et seq.); *L'Organisation du règne animal* (1851-64); *La voie chez l'homme et les animaux* (1876); *La vie des êtres animés* (1888).

BLANCHARD, FRANÇOIS (1738-1809). A French aeronaut. In 1784 he attempted to build a balloon with wings or sails and a rudder, and

in 1785 he crossed the English Channel by balloon. In the same year he used, for the first time, a parachute according to Montgolfier's ideas and laid claim to the invention. He went to the United States in 1796 and gave many balloon exhibitions. In 1798, at Rouen, he took up 16 persons in a single balloon and landed them safely 15 miles away. His wife, **MARIE MADELINE SOPHIE ARMAND** (1778-1819), took part in the exhibitions with him and, after his death, with others. She lost her life in her sixty-seventh ascension. See **AERONAUTICS**.

BLANCHARD, JACQUES (1600-38). A French painter of the Renaissance. He was born in Paris and studied there under Nicholas Ballery. In 1624 he went to Rome with his brother, Jean Baptiste, and also spent some time in Venice and Turin. In Italy he studied the great Italian masters, especially Titian. Later both brothers worked in Lyons under Horace Le Blanc. Jacques was called by his contemporaries the "French Titian," because of the resemblance of his art, especially in color, to that of the great Venetian. Of his "Holy Families" and "Madonnas," which are especially prized, good examples are in the museums of Nantes, Bayonne, Bayeux, Toulouse, and Cherbourg. In the Louvre he is represented by "Charity" and a "St Paul in Meditation" (though this latter is possibly by his brother, Jean Baptiste), in the Metropolitan Museum, New York City, by "Venus and Adonis."

BLANCHARD, NEWTON CRAIN (1849-). An American legislator and public official, born in Rapides Parish, La., and educated at Louisiana State University and (in law) at Tulane. In 1879 he was a member of the Louisiana Constitutional Convention and from 1881 to 1893 was Representative in Congress. He was appointed (1893) United States Senator to fill the unexpired term of E. D. White, became in 1897 an associate justice of the Supreme Court of Louisiana, and from 1904 to 1908 was Governor of the State.

BLANCHARD, blan'chard, SAMUEL LAMAN (1804-45). An English journalist and author, born at Great Yarmouth. He was educated at St Olave's School, Southwark, and became clerk to a proctor of Doctors' Commons. He began at an early age to write for a journal called *The Drama*, was a traveling player and subsequently a proof reader. In 1827 he was appointed secretary to the Zoological Society and in 1828 published *Lynx Offerings*, a volume of verse dedicated to Charles Lamb. He was appointed acting editor of the *Monthly Magazine* in 1831 and in 1832 of the *True Sun*, a Liberal newspaper. He also edited the *Court Journal* in 1837, the *Courier* in 1837-39, *George Cruikshank's Omnibus* in 1842, and was a member of the *Examiner* staff from 1841 until his death. Among his friends were Douglas Jerrold, Dickens, Leigh Hunt, B. W. Procter, Browning, Cruikshank, and Bulwer-Lytton. Some of his essays were collected by Bulwer-Lytton as *Sketches of Life* (1846), and his poems by Blanchard Jerrold (1876). Another collection of essays appeared in 1855 as *Corporation Characters*.

BLANCHARD, THOMAS (1788-1864). An American mechanic and inventor. Among his inventions were a machine for making tacks, one for turning gun barrels, a lathe for turning gunstocks and other irregular shapes, a steam-wagon, before locomotives were used, contrivances to aid steamboats in ascending rapids, and

a machine for bending large timber. He received more than 25 patents for important inventions. The principle of his lathe for irregular shapes is now used in the pantagraph for reproducing statuary.

BLANCHE, blansh, AUGUST THEODOR (1811-68). A Swedish poet. He was born in Stockholm and studied law at the University of Upsala, but soon turned to literature, in which he soon established a reputation by his comedies *Kika Morbror* (1845), *Huttbarnet* (1847), and *En tragedi i Wimmerby* (1848). These and many others are still considered among the ornaments of Swedish dramatic literature. He also contributed brilliant sketches of Stockholm folk life to the feuilleton column of the *Illustrerad Tidning*. His complete works with a biographical sketch by Hedin, were published at Stockholm (15 vols., 1889-92).

BLANCHEFLEUR, blansh'fler'. See **FLORE ET BLANCHEFLEUR**.

BLANCHE OF CASTILE, kas-tel' (1188-1252). The daughter of Alfonso IX of Castile and Eleanor, daughter of Henry II of England. She was married, May 23, 1200, according to treaty, to Louis, heir apparent to the crown of France. After the death of her husband in 1226 she was regent during the minority of her son, Louis IX (qv), and as such she had to struggle against almost continuous revolts, and succeeded in suppressing a formidable conspiracy of the nobles. She acquired Toulouse by treaty and compelled the submission of the Duke of Brittany. Possessed of remarkable executive talent, she supervised personally all the departments of government, not excepting the army. She married her son to Margaret of Provence in 1234, and when she resigned her office two years later, she left France in a most flourishing condition. From 1248 to 1252 Blanche again acted as regent while Louis was gone on a crusade. The common people of France rebelled against the heavy taxation necessitated by the large outlays of the King on his crusading expeditions, but she put them down with a strong hand and in spite of all these embarrassments successfully conducted the government of the realm. France has seldom had so able a ruler, or one whose death was more universally lamented. She died in November, 1252. Consult Petit-Dutaillie, *Etude sur la vie et le règne de Louis VIII* (Paris, 1894), and Berger, *Histoire de Blanche de Castille* (Paris, 1895).

BLANCH FEE, or **BLANCH HOLDING** (Fr. *blanc*, white, referring to the payment in white metal, i. e., silver). One of the ancient feudal tenures in the land law of Scotland, the duty payable to the superior, or lord of whom the land was held, being in general a trifling sum expressed in silver instead of gold, or merely illusory, as a peppercorn. Anciently many estates in Scotland were held, both of the crown and other superiors, by this tenure, but with the decay of feudal tenures it has become obsolete. See **FEE**, **FEDERALISM**, **TENURE**.

BLANCHING (Fr. *blanchir*, to make white, from *blanc*, white, cf. Eng. *blank*). A process by which gardeners arrest the formation of chlorophyll and certain secretions in plants by the exclusion of light, thus depriving the leaves of much of their color and bitterness and making them more palatable. Celery and sea kale are familiar examples. Blanching practices vary with varying climatic and soil conditions. Blanching is generally effected by heaping earth

or litter or by placing boards about the parts to be bleached, tying heavy paper about the plant, covering with boxes or pots perforated at the top, etc. See CHLOROPHYLL.

BLANKENHORN, MAX LUDWIG PAUL (1861-). A German geographer. His publications include: *Die Geognostischen Verhältnisse von Afrika* (1888); *Grundzüge der Geologie und Physikalischen Geographie von Nord-Syrien* (1891); *Entstehung und Geschichte des Toten Meeres* (1896); *Geologia Aegyptens* (1901); *Naturwissenschaftliche Studien am Toten Meer in Jordantal* (1912).

BLANCO, blay'kō, CAPE. See CAPE BLANCO.

BLANCO, GUZMÁN. See GUZMÁN BLANCO.

BLANCO, JOSÉ FELIX (1782-1872). A Venezuelan patriot, born at Caracas. He was ordained as a priest in 1801, but nevertheless took an active part in the movement for Venezuelan independence and became chaplain in the Revolutionary army. In 1818 his favorable report upon the possibilities of the campaign induced Bolívar to invade New Granada. In 1830 Blanco was made brigadier, and after the separation of Venezuela from Colombia, became, successively, Governor of Maracaibo, Minister of War (1837), and Minister of Finance (1854). The fall of Monagas forced him to retire, and he returned to the Church. The best years of his life were spent in preparation of his work, in 16 volumes, *Documentos para la historia de la vida pública del Libertador de Colombia, Perú y Bolivia*, published posthumously in Caracas in 1877.

BLAND, EDITH NESBIT (1858-). An English poet, born in London, and educated in London and on the Continent. She married Hubert Bland in 1879. Her publications include verse and several delightful children's books and stories. Her poem on the Queen (1901) was by far the best occasioned by the death of Victoria. Among her publications are: *Lays and Legends* (1st series, 1886; 2d series, 1892); *Leaves of Life* (1888); *A Pomander of Verse* (1895); *In Homespun* (1896); *Songs of Love and Empire* (1897); *Grim Tales* (1893); *The Story of the Treasure-Seekers* (1896); *Pussy and Doggy Tales* (1899); *The Book of Dragons* (1900); *The Literary Sense* (1903); *The Phoenix and the Carpet* (1904); *The Rainbow and the Rose* (1905); *The Incomplete Amovist* (1906); *The House of Arden* (1908); *Daphne in Fitzroy Street* (1909); *Railway Children* (1913).

BLAND, RICHARD PARKS (1835-99). An American legislator, born near Hartford, Ky. He emigrated to Missouri, thence to California, and from California to Utah Territory, where in 1860 he was admitted to the bar. Having returned to Missouri, he there continued the practice of law and in 1872 was elected as a Democrat to the National House of Representatives, in which he served until 1895 and from 1897 until his death. As a Congressman he is best known for his connection with the free-silver movement. In the Forty-third Congress he stoutly opposed the bill for the demonetization of silver, afterward styled by him "the crime of '73." He voted in 1874 for the bill, vetoed by President Grant, for the increase of greenback circulation, and in 1878 introduced a bill, the famous Bland Silver Bill, which, as amended by the Senate and passed over the veto of President Hayes, provided for the coinage of not less than \$2,000,000 nor more than \$4,000,000 worth of silver bullion a month, and continued in force

until repealed by the passage of the Sherman Law in 1890. His published speeches include *Proposed Annexation of Hawaii* (1898). Consult W. V. Byars, *An American Commoner: The Life and Times of R. Parks Bland* (Columbia, Mo., 1900). See BIMETALLISM.

BLAND, THEODORIC (1742-90). An American patriot and author. He was born in Prince George Co., Va., was educated in medicine in Edinburgh, and practiced in Williamsburg for some years. On the approach of the Revolution he took an active part in the controversies with Lord Dunmore (q.v.) and attracted especial attention by a series of papers written under the pen name "Cassius." When the Revolution came on Bland became captain of the first troop of Virginia cavalry. In 1777 he joined the main army and later rose to be colonel. He was an intimate friend and confidant of Washington. He was a member of Congress from 1789 to 1790. The *Bland Papers*, which contain valuable historical material covering the period of the Revolution, were collected and edited by Charles Campbell (Parkersburg, 1840).

BLANDRATA, blán-drá'tá, properly **BIANDRATA**, byán-drá'tá, Grogro (c.1515-c.1588). An Italian physician. He was born at Saluzzo, Piedmont. He practiced at Pavia, but, suspected of heresy, was compelled to escape to Geneva. Here his anti-Trinitarian views, which persisted despite the *Responsum ad Questiones G. Blandratos* (1559) of Calvin, involved him in violent controversy with the latter. From Geneva he went to Poland and subsequently to Transylvania, where he became physician-in-ordinary to Prince John Sigismund, whom he numbered among his converts. In both countries he was the first to introduce the doctrines of Unitarianism. In 1566 he defended his doctrines against Reformed theologians in public disputation. In his old age he lost his youthful ardor for proselyting and became reconciled with the Catholic church. His most important work, the *Professioni di fede antitrinitaria*, was edited by Henka (1794). Consult Malacarne, *Commentario delle Opere di Giorgio Blandrata* (Padua, 1814).

BLANKENBERGHE, blán'ken-bér'k. A favorite seaside resort in the province of West Flanders, Belgium, on the North Sea, 9 miles north of Bruges, and 12 miles northeast of Ostend. It has a fine beach, a paved promenade along the sand dunes 22 yards wide and over a mile in length, handsome residences, and a casino with a concert room to accommodate 4000 persons. Its popularity dates from 1840, and it is now visited annually by over 25,000 tourists. Permanent pop., 1900, 5640; 1910, 6053.

BLANKENBURG, RUDOLPH (1843-). An American manufacturer, philanthropist, and public official, born in Lippe-Deimold, Germany. He was educated in private schools and in the Real Gymnasium of that city. In 1865, removing to the United States, he was for 10 years traveling salesman and buyer for a manufacturing house, and later built up an important business of his own. He retired with great wealth in 1909. Since 1877 he had been active in reform politics and in attempts to bring about civic improvements in Philadelphia, early helping to establish the charity organization in that city, and also prominent on the Citizens Permanent Relief Commission, designed to furnish assistance to the region in Russia suffering from famine. In the 1905 reform movement he was elected county commissioner by nearly 50,000

majority His three years' salary, amounting to \$15,000, he gave to the police, firemen's and teachers' pension funds In 1911 he became candidate of the Keystone party (a fusion of Democrats and Independents) for mayor of Philadelphia The city had been for years under the domination of a notoriously corrupt Republican organization The election of Nov 8, 1911, resulted in the choice of Mr Blankenburg by a plurality of about 4000 votes His administration became notable for many important improvements in the city's government and in its business and commercial affairs The carrying out of his plans received something of a check in the fall of 1913, when, although he himself continued in office, the Republicans gained a majority in the city council Mayor Blankenburg is known as a contributor of articles and papers on political, social, and religious subjects to magazines and newspapers, and as a speaker in many States He was for many years an extensive traveler in foreign countries

BLANKET (Fr *blanket*, originally, a kind of white woolen stuff, dimin of *blanc*, white, cf Eng *blank*) A sheet of heavy woolen or partly woolen cloth, which is used for beds, for horse coverings, and to wrap around the person In the early years of the last century, especially from 1812 to 1816, the manufacture of blankets in the United States was confined to the production of coarse qualities, chiefly for the military and naval forces The War of 1812 gave a great impetus to woolen manufactures, and factories sprang up everywhere, but with the restoration of peace these enterprises met with disaster because of the superior goods that were imported at much lower prices In 1831 a large mill for the manufacture of cotton-warp blankets for the use of slaves was erected near Pendleton, S C It is said that in the same year a factory was built near Buffalo, N Y, for the manufacture of Mackinaw or Indian blankets In 1860 the census reports stated that the manufacture of blankets was carried on in 19 different States, and that the total output was 616,400 blankets, which were produced chiefly in Maine, Massachusetts, New Hampshire, Pennsylvania, and California The manufacture of blankets increased largely during the Civil War and in the years immediately following, and the importations decreased proportionally Since that time the values of the finer grades of white bed blankets have become much reduced, and the production of the poorer qualities discontinued Since about 1880 great advances have been made in the manufacture of blankets, and those of lighter weight, but more fleecy finish, are preferred to the heavy grades of former years Superior grades were formerly manufactured in California and Oregon, costing over \$20 per pair, or more than \$2 per pound All-wool blankets can be obtained from \$5 upward, while cheap blankets can be bought as low as \$2 a pair

The best blankets are made wholly of wool, but those of medium or inferior qualities are formed of cotton warp and woolen filling threads, the aim of the manufacturer being to raise the fibres of the woolen yarn into a loose, soft mat on the face of the blanket so as to hide the threads below Extraordinarily fine woolen blankets have been made in Mysore in India, some of which, it is said, are so delicate that though 18 feet long, they can be rolled inside a hollow bamboo Such fancy blankets

cost about \$150 The blankets made by the Navajo (qv) Indians of northern Arizona and New Mexico are much sought after where durability and warmth are desired The Navajos occupy a reservation of 8,000,000 acres in northern Arizona and New Mexico, they are the most civilized of the Indian tribes, and number about 16,000 They possess about 1,000,000 sheep, which they raise for their wool to make into blankets The wool which comes from their flocks is rudely carded and spun on a spindle resembling a boy's top The loom consists of two horizontal beams, one hung above the other and the warp stretched between The shuttle is a stick The colors most used are black, red, blue, and yellow, the patterns are geometrical designs The value of a Navajo blanket depends upon its weight The average weight is 20 pounds, and the value in 1913 was from \$1 to \$2 per pound They were much sought after by tourists as well as for decoration, on account of the rich coloring Blankets are also made by other Indian tribes of the Southwest, and specimens are shown in the accompanying Colored Plate Consult Hollister, *The Navajo and his Blanket* (Denver, 1903).

BLANK VERSE (refers to absence of rhyme, probably from *blank*, lacking a part necessary for completeness, as eg in "blank" cartridges, containing powder but no ball) Verse without rhyme The typical line contains five feet, or measures each measure having two syllables A stress of the voice, varying in degree, comes regularly on the second syllable in each measure, though this stress is frequently thrown back upon the first syllable Still greater ease of movement is attained by an extra syllable at the end of a line or before the caesura Any measure may also contain three syllables, and irregular measures occur in which there is only one syllable This structure may be illustrated in the following lines from *Macbeth*, if, however, we neglect the so-called anacrusis (See **ANACRUSIS**)

The classical productions of the Greek and Roman poets—at least such of them as have come down to us—are composed usually without rhyme, and, accordingly, when the passion for imitating classical models set in, rhyme came to be looked upon as an invention of Gothic barbarism, and attempts were made in several countries to shake it off The first specimen of blank verse in English is a translation from Vergil's *Æneid*, by the Earl of Surrey (d 1547), but it had been used by Italian and Spanish writers as early as about the beginning of that century Surrey derived it from Italy First employed in the drama by Sackville in *Gorboduc* (1561), it was perfected by Marlowe and Shakespeare It has since continued dominant in our poetic drama if we except the effort made by Dryden and others, after the Restoration, to return to rhymed plays But in other kinds of poetry, it was not till the appearance of *Paradise Lost* (1667) that it could be said to have taken root, and even then the want of rhyme was felt, as the poet expected it would be Many poets have since followed Milton's example, and English narrative, didactic, and

descriptive poetry is partly in blank verse and partly in rhymed couplets. Of recent poets, Wordsworth, Tennyson, and Sir Edwin Arnold have written the best blank verse. In Italian, French, and Spanish it never became popular; but under the influence of the English example, it was introduced into Germany by Lessing and others. Consult: Mayor, *Chapters on English Metre* (London, 1886, revised ed., 1901); J. Schipper, *Englische Metrik*, part II (Bonn, 1888); Gummere, *A Handbook of Poetics* (New York, 1885); Oman, *Versification* (London and New York, 1900); and George Saintsbury, *Historical Manual of English Prosody* (1910). BLANQUI, bli'nik', JÉRÔME ADOLPHE (1798-1854). A French economist. He was born in Nice, Nov. 28, 1798. After 1814 he pursued his studies in Paris, where, under the influence of J. B. Say, he turned to political economy. Upon Say's recommendation he was appointed in 1825 professor of history and of industrial economy in the Commercial School in Paris. On the death of Say he was appointed professor of industrial economy in the Conservatoire des Arts et Métiers and was one of the editors of the *Dictionnaire de l'industrie manufacturière, commerciale et agricole*. At the instance of the Academy of Moral and Political Sciences he prepared studies of economic conditions in Corsica, Algeria, and in England. He died in Paris on Jan. 28, 1854. His principal works are: *Résumé de l'histoire du commerce et de l'industrie* (Paris, 1820); *Précis élémentaire d'économie politique, précédé d'une introduction historique, et suivi d'une biographie des économistes*, etc. (1826); and most important of all, *Histoire de l'économie politique en Europe, depuis les anciens jusqu'à nos jours, suivie d'une bibliographie raisonnée des principaux ouvrages d'économie politique* (4th ed., 1860).

BLANQUI, LOUIS AUGUSTE (1805-81). A French revolutionist and a member of the Paris Commune. He was a brother of Jérôme Adolphe Blanqui, and was born at Puget-Théniers, in the department of Alpes-Maritimes, Feb. 7, 1805. While studying law and medicine in Paris, he became closely identified with the revolutionary movement and took an active part in the disturbances which led to the overthrow of Charles X. He became one of the most prominent leaders of the Parisian proletariat and an irreconcilable enemy of the bourgeois government of Louis Philippe. With Barbès he was the instigator of the insurrection of May 12, 1839, and as a result was condemned to death, the sentence being commuted, however, to imprisonment for life. The February Revolution set him free. He was one of the leaders of the mob which, on May 15, 1848, attempted to storm the hall of the National Assembly and was condemned to 10 years' imprisonment. Liberated in 1859, he lived in London for some time, and returning to Paris in 1861, speedily succeeded in incurring a sentence of four years' imprisonment as an instigator to riot. In 1871 he took part in the insurrection which led to the establishment of the Paris Commune, and became subsequently a member of the Communal government. After the taking of Paris by the troops from Versailles, Blanqui was sentenced to transportation to New Caledonia; but in con-

sideration of his infirmities, the aged man was sent to prison instead. He was pardoned in 1879 and died Jan. 1, 1881. With Armand Barbès, whose coadjutor he was in the events of 1839 and 1848, Blanqui stands out as the type of the fanatic reformer engendered by the French Revolution and the democratic movement of the nineteenth century. Idealist and fighter, but impractical, he was a lineal descendant of the men of 1793, who attempted to regenerate the world through terror. The sincerity of his beliefs was attested by nearly half a lifetime spent in prison. Blanqui was the author of a scientific work entitled *L'éternité dans les astres* (1872). His writings on economic subjects were published in 1855, under the title of *Critique sociale*. The name "Blanquistes" is now borne by the radical wing of the Socialist party in France. Consult Da Costa, *Les Blanquistes* (Paris, 1912).

BLANQUILLO, blan-kel'yó (Sp. whitish, dimin. of blanco, white). A fish of the family Latilidae (see TILFISID), which inhabit warm seas. A common species in southern California is the yellowtail (q.v.), but the name is most specifically applied to the reddish *Caulolatilus chrysops* of the Gulf of Mexico.

BLANTYRE. The chief town of Nyasaland Protectorate (q.v.).

BLARER. See BLAURER.

BLARNEY (Ir. *blarne*, a little field, from Gael. *blair*, *blar*, a plain). A village in Ireland, 4 miles from Cork, having a castle built in 1449 by Cormac McCarthy. Near the castle are the "Groves of Blarney" and on the summit of the castle tower is the Blarney Stone, the kissing of which is said to endow one with the gift of coaxing, wheedling, and flattering. The true stone, however, is one set into a wall, where it can be kissed only by a person held over the parapet. The name has given a noun, a verb, and a participle to the English language.

BLASCO IBÁÑEZ, bli'skó é-bá'nyáth, VICENTE (1867-). A Spanish novelist, journalist, and politician. In his youth he was politically and philosophically turbulent and was frequently arrested and condemned to imprisonment. Before 1913 he was recognized as beyond dispute the head of the younger school of novelists in Spain. Intensely interested in the social revolution, he preaches the gospel of constancy in labor on every possible occasion and with all the means at his command—through his novels, his newspaper (*El Pueblo*), and his position as Republican deputy from Valencia to the National Congress. His preaching does not degenerate, however, into mere sermonizing, and his theses are driven home by the truth and force of the circumstances portrayed. His novels immediately subsequent to *La Barraca* (1890) are not considered the equal of that powerful and gripping tale; but in later years his art seems to be improving constantly, and critics are hailing his more recent works as successive advances. Particular mention should be made of his *Sónnica la Cortesana*, wherein he essays the historical novel and depicts the glories of Saguntum in its heyday three centuries before Christ (Eng. trans. by Frances Douglas, New York, 1913). There are, besides, *La Catedral*, *El Intruso*, *La Bodega*, and *La Maja Desnuda*, which is considered by many the best novel he has written thus far. Consult F. Vézinet, *Les maîtres du roman espagnol* (Paris, 1907), and J. Fitz-

maurice-Kelly, *Chapters on Spanish Literature* (London, New York, 1908)

BLASER, blä'zër, GUSTAV (1813-74) A German sculptor. He was born in Dusseldorf and studied with Rauch at Berlin for 11 years. The years 1844-45 he passed at Rome, whence he was called to Berlin to design one of the eight marble groups adorning the Schlossbrücke, a task in which he was eminently successful. The group executed by him, and entitled "Minerva Leading a Youthful Warrior into Battle," is considered the best of the series. His subsequent works include "St Matthew, the Apostle," a statue of colossal proportions (church at Helsingfors), "The Prophet Daniel" (Royal Castle, Berlin), "Borussia" (New Museum, Berlin), the equestrian statue of Frederick William IV, on the Rhine Bridge, Cologne, "Hospitality" (National Gallery, Berlin), and busts of Emperor William I, the Empress of Russia, Von Alvensleben, Von der Heydt, Alexander von Humboldt, Rauch, Abraham Lincoln (at Washington), and many others. His work resembles that of his master, Rauch.

BLASHFIELD, EDWIN HOWLAND (1848-) One of the foremost American mural painters. He was born in New York City and educated in the Boston Latin School. From 1867 to 1870 he studied in Paris with Bonnat and was also aided by Gérôme and Chapu. From 1870 to 1881 he lived for the most part in France and Italy, also visiting Greece and Egypt. Until 1892 he was a figure and genre painter, his best-known paintings of this kind being "Christmas Bells" and "The Angel of the Flaming Sword." Since that time he has devoted himself entirely to decorative painting and ranks among the highest in this art in America. Among his best-known decorations are the cupola of the Liberal Arts Building at the Chicago Exposition (1893) and the ceiling of the grand ballroom of the Waldorf Astoria, representing "Dance" and "Music." He has been president of the Society of American Artists and is a member of the National Academy. Among his figure pieces "Christmas Bells" and the "Angel with the Flaming Sword" both of 1891, are best known, but he is chiefly noted for a large panel in the Appellate Court, New York, the great central dome of the Congressional Library at Washington, representing the "Development of Civilization," the decorations of the Baltimore courthouse, "Washington resigning his Commission" and "Lord Baltimore's Edict of Toleration." More recently he decorated the entire chancel of St Saviour's, Philadelphia, the chapel of the College of the City of New York, with a representation of the universities of the world, and two lunettes in the Senate Chamber, State Capitol of Minnesota, the courthouse in the Federal Building, Cleveland, four pendentives and the dome of the courthouse, Newark, N. J., the State Capitol at Madison, Wis., the courthouse of Youngstown, Ohio, and the State Capitol of South Dakota. He also furnished decorations for many private residences, such as the upper room of W. K. Vanderbilt, New York, and the library of G. W. Drexel, Philadelphia. For his mural decorations in the courthouse of Youngstown, Ohio, and the State Capitol of South Dakota he received the gold medal of the Architectural League in 1911.

Blashfield is an excellent draftsman, whose work is characterized by refinement of form

and elegance of composition, and more recently by soft and attractive color, but there is a certain sameness about his figures, which often lack virility, nor is his work always strictly decorative. He took a prominent part in founding the former Society of American Artists, of which he was president, he is, besides, a member of the National Academy of Design, the Society of Mural Painters, and the American Academy of Arts and Letters. In conjunction with his wife, he is widely known as an author on art subjects, among their joint works being *Italian Cities* (1900, new ed. 1913) and, aided by A. A. Hopkins, an admirable English edition of Vasari's *Lives of the Painters* (4 vols., 1897). In 1913 he published *Mural Painting in America and the Modern Tendency*.

BLA'STIUS, or BLAISE A saint and martyr of the Roman Catholic church. He was Bishop of Sebaste, in Cappadocia, when Licinius began a bloody persecution of the Christians. Blasius left the town and concealed himself in a chasm in the rocks, but his abode was discovered by the prefect, Agricola, while out hunting. The saint was conveyed to Sebaste, and as he steadfastly refused to deny Christ and worship the heathen gods, he was first tortured and then beheaded (316). All the details about his life and death are legendary. He was widely venerated in early times. The wool combers claim him as their patron, for the singular reason that he was tortured, among other instruments, with a wool comb. The practice of invoking St Blasius in cases of sore throat is said to have originated in the circumstance that, when young, he saved the only son of a rich widow from being choked by a fish bone. St Blasius's day is the 3d of February.

BLASNÁVAC, or BLASNÁVATZ, blas'ná-vats, MILIVOJE PETROVITCH (1826-73) A Serbian soldier and statesman. He was born at Blasnava (district of Krágyevatz), and studied in Berlin in 1848. Upon the outbreak of the Hungarian Revolution (1848) he joined the volunteer corps of General Kitchinn against the Hungarians and commanded the Serbian artillery until the close of the war. After the accession of Prince Michael Obrenovitch to the throne of Serbia, Blasnava was appointed colonel (1862) and Minister of War (1865), in which capacity he created a national militia of 80,000 men. After the assassination of Prince Michael (June 10, 1868), he proclaimed Milan as Prince of Serbia and maintained the public order. He was a member of the regency during the minority of Prince Milan, and upon the accession of the latter to the throne (Aug 22, 1872) was appointed president of the ministry.

BLASPHEMY (Gk. βλασφημία, blasphemía, speech or word of evil omen). At common law, the criminal offense of speaking or publishing words vilifying or ridiculing the divine Being, the Bible, the Church, or the Christian religion, with the intent to shock and insult or to pervert believers. The offense is a misdemeanor punishable by fine and imprisonment in the discretion of the court. Formerly in England the punishment might extend to banishment or the pillory, while in Scotland, as late as 1813, the death penalty might be imposed. Apart from its character as a crime, blasphemy is also a sin, punishable as such, not by the common law but by the ecclesiastical courts in England, and even in the United States, where such courts do not exist, it may still subject the

blasphemer to expulsion from a church or religious society.

Two reasons are assigned by the courts for treating blasphemy as a crime: 1. It tends to produce a breach of the peace by leading to violent altercations between the blasphemer and those who are shocked and outraged by his language. 2. Christianity is a part of the common law, and therefore blasphemy tends to subvert the law and to destroy the very foundation of civil society. Because of its offensiveness to the majority of virtuous people, and because it is considered injurious to the tender morals of the young, it is often spoken of by judges as a public nuisance, and when it is written or printed, it is deemed a libel.

Formerly any attack upon Christianity or any argument against its fundamental doctrines, as those were understood by the Established Church, amounted to the crime of blasphemy; but a different view now prevails both in England and in the United States. It is the manner rather than the matter of the utterance or publication that renders it blasphemous. Lord Chief Justice Coleridge declared in 1883, in one of the few modern cases on this subject, that "if the decencies of controversy are observed, even the fundamentals of religion may be attacked without a person being guilty of blasphemous libel." Similar views had been expressed still earlier by Chancellor Kent in New York and Chief Justice Shaw in Massachusetts. The latter had defined the crime as "a willful and malicious attempt to lessen men's reverence of God," and the former had defined it as consisting "in maliciously reviling God and religion." In line with these opinions is the following statement from a decision of the Supreme Court of Pennsylvania: "No author or printer, who fairly and conscientiously promulgates opinions with whose truths he is impressed, for the benefit of others, is answerable as a criminal. Audacious and mischievous intention is, in such a case, the broad boundary between right and wrong; it is to be collected from the offensive levity, scurrilous and opprobrious language, and other circumstances, whether the act was malicious." A sober, serious, and reverent statement of one's honest opinions, however heretical, is not at present punishable as blasphemy. Undoubtedly the provisions of the Federal and State constitutions, guaranteeing religious freedom and guaranteeing liberty of speech and the press, have helped to modify the judicial conception of this crime.

While blasphemy is still a crime in England and in most of the United States, prosecutions for the offense have become very rare. Though always punishable, it is seldom punished. In some of the United States it has ceased to be a crime. Such seems to be the case in New York.

Consult Stephen, *History of the Criminal Law of England* (London, 1883); also the *Encyclopedia of the Laws of England*, 2d ed., vol. ii, p. 202 (London, 1906); Bishop, *New Commentaries on the Criminal Law* (Chicago, 1892); and the *New York Penal Law*, Laws of 1900, chap. 40.

BLASS, bläs, FRIEDRICH WILHELM (1843-1907). A German classical scholar, born at Osnabrück, Hanover. From 1860 to 1863 he studied at Göttingen and Bonn; he then for some years taught at various gymnasia and at the University of Königsberg. He was professor in the University of Kiel from 1876 to 1892, and joined the faculty of the University of Halle in

1892. His works include: *Die Griechische Beredsamkeit von Alexander bis auf Augustus* (1865); *Die attische Beredsamkeit* (3 vols., 2d ed., 1887-98); *Ueber die Aussprache des Griechischen* (3d ed., 1888); *Plutarch, Tiberius, und Gaius Gracchus* (1875); chapters on *Hermeneutik und Kritik, Palaographie, Buchwesen, und Handschriftenkunde* in vol. i of Müller's *Handbuch* (1891); *Grammatik der neutestamentlichen Sprache* (1896); *Philology of the Gospels* (1898); *Die Rhythmen der attischen Kunstprosa* (1901); *Die Rhythmen der asiatischen und römischen Kunstprosa* (1905). He also edited for the Teubner series of classical authors the orations of Æschines, Andocides, Antiphon, Demosthenes, Dinarchus, Hyperides, Isocrates, and Lycurgus; *Bacchylides Carmina* (3d ed., 1904); *Acta Apostolorum* (1894-96); *Evangelium Lucae* (1897); Aristotle's *Ἀθῆναια Πολιτεία* (4th ed., 1904); revised Kühner's *Grammatik der griechischen Sprache* (i. i, 2, 1890-92), and was a frequent contributor to philological journals. In 1906 he produced an edition of the *Choephori* of Æschylus (q.v.).

BLAST FURNACE. See IRON AND STEEL.

BLASTING (AS. *blast*, OHG. *bläst*, a blowing; cf. OHG. *blāsan*, breath, snort, Ger. *blasen*, to blow, Eng. *blaze*, to spread a report, just like the slang *blow*). Blasting is the art of splitting, loosening, or fracturing rock, ores, and other similar material, by means of explosives applied in holes or chambers. The several operations necessary to secure this result are: (1) boring, mining, or excavating the hole in the material to be blasted; (2) charging, or inserting the explosive compound which is to perform the work; (3) tamping, or the filling up of all or part of the remaining hole with suitable material; and (4) firing, or the application of heat or electricity to cause the explosion.

The effect of an explosion is to cause a sudden development of gases which exert such a pressure when confined as to rupture, or tend to rupture, the confining walls.

There are several factors governing the effects of a blast, the more important of which are: (1) the strength of the rock, (2) the strength of the explosive and its characteristics, (3) the size and form of the chamber, and (4) the character of the fuse, tamping, etc.

Blasting is most frequently applied in mining operations.

History. Present methods of blasting are of comparatively recent date, for it was not until 1320 that gunpowder is supposed to have been invented, and almost 100 years later before it is recorded as having been put to practical use for blasting in mines. Among the ancient Egyptians, we are told by Diodorus that they made use of hand tools, wedges, etc., to loosen or break rocks of large size, supplementing this, however, by the fire-setting system. This latter consisted in the heating, by a fire, of the rock to be broken, and then suddenly chilling it with water, the rapid contraction causing the rock to split. According to Livy, Hannibal made use of the same means to clear a road when crossing the Alps into Italy.

The above methods of breaking rock were not only used by the ancients, but we find to-day the use of wedges and the combination of wedges known as the "plug and feathers" for splitting blocks of rock in quarries; in cold climates the expansion of water in freezing is employed in quarry work; compressed air, hydraulic cart-

ridges, and hmc cartridges are also used, especially in coal mines

The first record of gunpowder's application to mining is in 1613, when Martin Weigel, chief mine boss at Freiberg, Germany, is known to have employed both drilling and blasting for the excavation of ore. At first wooden plugs were used to tamp the holes, but in 1685 clay and other similar soft material was satisfactorily substituted. That blasting became, at least to some extent, quite general by 1634-44 is proved in the fact that some of the mine accounts in the Harz district show a powder expense. Not until 1670, however, was blasting introduced into England through the importation of some German miners, and it was still later, 1724, that from the same source it was brought to Sweden.

Changes and developments in the practice were slow. In 1696 narrow bore holes were substituted for wide ones, but until 1720 the boring was done by two hammers on one drill. By 1791 sand tamping had come into practice, and in 1831 the great advance had been made, by Bickford's patent, of the safety fuse. That same year Moses Shaw, of New York, took out a patent for a method of blasting several holes at the same time by means of electricity. High explosives, i. e., gun cotton and nitroglycerin, were not discovered till 1846 by Schonbein and Sobrero, and it was as recently as 1849 that Couch, of Philadelphia, made the first percussion rock drill.

Methods. The use of high or low explosives, or a mixture of both, the dimensions, location, and arrangements of holes, and the method of charging and firing will depend upon the character of the ground and the size of the product desired, such as large building blocks of broken stone for macadam. In hard, compact rock and close work, such as the driving of tunnels and shaft-sinking, high explosives such as dynamite are used. In open cut work and in "chamber blasting" large charges of low-grade powder or a mixture of dynamite and black powder are employed. In the mining of coal, hard shale, or soft rock black powder or a low-power explosive is used. Low-power explosives have a slow lifting effect resulting in comparatively coarse sizes, whereas high explosives have a quick rending action tending to fracture the rock into small pieces. For the mining of coal the United States Bureau of Mines has carried on extensive tests to determine the proper explosive to use to avoid mine explosions, and a large number of bulletins have been issued to which the reader is referred.

The diameter and depth of holes vary greatly. In tunneling and shaft sinking in hard rock, where high explosives are used, the diameter varies from $\frac{3}{4}$ to $1\frac{1}{2}$ inches, while in softer formations, where low explosives are employed, the diameter is greater. In open cut and bench work, where the ground is soft, such as iron-ore banks and large mineral deposits, holes from 4 to 10 inches are drilled, enlarged at the lower end by exploding a small charge of dynamite ("springing"), and then fired with a large charge of black powder thereby reducing the amount of drilling required per ton of material broken. This method can be carried out on a still larger scale, known as "chamber blasts," and a mountain of rock broken down with one charge. It consists of driving a small tunnel or sinking a shaft at the end of which

chambers are prepared to receive a heavy charge of explosive, after charging these chambers with low explosives with the possible addition of a small percentage of high explosive the openings are sealed with broken rock and the charge fired. Rock for the building of a dam, by the Pike's Peak Power Company, was obtained by the latter method as follows: A tunnel, 135 feet long with 70 feet of cross drifting at its face, was driven into a hill 75 feet below the apex. In the cross drifts a charge of 35,000 pounds of black powder and 144 pounds of dynamite was distributed and fired with electric exploders. The explosion broke 110,000 cubic yards of rock, equivalent to 80 per cent of the rock above the tunnel level.

The location of holes for effective results is an important consideration. In tunneling, shaft sinking, and in rock work in general, when the rock shows planes of weakness, hand-driven holes should be made as nearly perpendicular as possible to these planes. With machine drills and work of a more extensive nature the location and arrangement will depend on local conditions and must be determined by experience. In charging, the explosive should completely fill that section of the hole it occupies, and the remaining portion of the hole should be filled with tamping, this is especially true with dynamite. A slight air cushion in the hole, due to improper charging, weakens appreciably the force of the explosive. In charging with black powder the hole should first be made dry, the powder is then poured into the hole, or in case the hole is horizontal the powder may either be shoveled in paper bags, or a long spoon-like scoop may be used. A safety fuse or electric cap should be used with its lower end well buried in the powder. In charging dynamite in dry holes the paper of the cartridges, with the exception of the one carrying the firing cap, should be slit lengthwise with a knife, and after the insertion of each stick it should be pressed with a wooden hammer. In wet holes the paper on the cartridge should not be slit. Steel and iron rods should not be used for tamping, and dynamite should not be rammed, but merely pressed, in the hole. The fuse cap, or the electric detonator, is usually placed in one of the last sticks.

If a fuse is to be used, it should first be cut square across, preferable with a fuse cutter, the cap slipped over the end, and crimped with a "crimper," but not crimped between the teeth. No effort should be required to slip the cap on, as either pressing or twisting may explode it. At the other end the fuse is slit to expose the powder core for lighting with a candle flame or torch. In the driving of tunnels or shaft sinking firing with fuse is the common practice, as it permits of timing the blast of each hole or set of holes by varying the length of the fuse, certain holes can be fired first by using shorter fuses thereby relieving the burden on succeeding holes. For open cut work and where greater advantage can be derived by simultaneous explosion of charges, electric firing is resorted to. The electric detonator with varying lengths of fuse wires, depending on the depth of the hole, is used. After charging, the fuse wires from each hole are connected, right and left, with those of the adjacent holes so as to form a continuous circuit with the holes in series, the end wires of the first and last holes are then connected with "leading wires" that run to an electric battery. The final connection with

the battery should not be made until all workmen are at a safe distance.

Misfires are due to many causes, such as defective caps, short circuiting, or poor splicing, in case of electric firing; a break in the powder thread of a fuse, etc. In case of a misfire when a fuse has been used, several hours should be allowed before approaching the holes, as there is always a possibility that the flame may smoulder and slowly creep past some break in the powder thread causing an unexpected explosion. It is always dangerous to remove the tamping from a hole, and some municipalities prohibit it, requiring that a new hole be drilled at least 12 inches away from the old hole. If the tamping is to be removed, a copper or wooden spoon should be used.

The largest blast on record was that made in connection with the deepening of that part of the channel of the East River known as Hell Gate, which connects Long Island Sound with upper New York Bay. This specific blast dislodged 270,717 cubic yards of rock, and in it 42,500 cartridges, containing 240,399 pounds of the explosive rackarock and 42,331 pounds of dynamite were used. The explosive alone cost \$110,950. Of more recent date was the submarine blast of 38 tons of dynamite, which took place at Henderson's Point, Portsmouth Navy Yard, on July 22, 1905. The object of the blast was to remove a ledge of trap rock some 400 feet wide at the base and projecting into the channel, so as to make entrance to the dry dock less difficult. It was desired to excavate to a depth of 35 feet below mean low water three acres of this material; 35,000 cubic yards were successfully removed without accident, and at a total cost of \$750,000.

Perhaps the largest and most systematic blasting operations of modern engineering construction were in the excavation of the Panama Canal, especially in the removal of the rock and other material from Culebra Cut. The blasting here was on a scale commensurate with the other parts of the work, and the largest single blast was one of 40 tons of dynamite at the blowing up of Gamboa Dyke, which protected the Culebra excavation at its northerly end from the floods of the Chagres River. After the excavation of the cut was completed, 1000 holes were drilled in the dyke, and each was loaded with from 80 to 100 pounds of dynamite. On October 10, 1913, when President Wilson, in Washington, closed a circuit, this blast was exploded, and a breach was made in the dyke which enabled the water to flow into the cut. See PANAMA CANAL.

Bibliography.—For a comprehensive discussion of blasting operations, consult: Drinker, *Tunneling, Explosive Compounds and Rock Drills* (New York, 1874); for a more concise description, in Prelini, *Tunneling* (New York, 1901); Foster, *A Treatise on Ore and Stone Mining* (London, 1905; 6th ed., 1910); Bulletins of the United States Bureau of Mines or Explosives (Washington, D. C.); Gillette, *Rock Excavation, Methods and Cost* (6th ed., New York, 1904); id., *The Elements of Mining and Quarrying* (2d ed., London, 1910). See EXPLOSIVES.

BLASTOIDEA. See PENTREMITES.

BLASTOMYCO'SIS. A disease caused by a yeast fungus, the blastomyces. It is essentially a slow, indolent, but progressive pustular inflammation of the skin, especially that of the face

and hands, and causes great disfigurement when allowed to progress unchecked. In rare instances the lungs may become infected from breathing in the yeast fungi, death taking place from general septic poisoning. Before 1894, when Gilchrist (and about the same time Buschke and Busse) showed the true nature of the disease, it was confounded with syphilis, epithelioma, and lupus, which latter it resembles in many ways. The treatment consists in opening the pustules when they form, exposure to the X-rays, and the internal administration of potassium iodide.

BLATCH, HARRIET STANTON (1856-). An American reformer, daughter of Elizabeth Cady Stanton. She was born in Seneca Falls, N. Y., graduated from Vassar College in 1878, studied in Berlin and Paris, and in 1882 married Henry Blatch, an Englishman. She took a prominent part during her 20 years' residence in England in the work of the Fabian Society, of the Women's Industrial Union, and of woman's suffrage organizations. Her studies of English village life carried on with Charles Booth were embodied in a thesis for which she received a master's degree from Vassar in 1893. She carried on her mother's work in America for the improvement of the legal status of women and was chosen president of the Women's Political Union and of the League of Self-Supporting Women (founded 1907).

BLATCHFORD, SAMUEL (1820-03). An American jurist. He was born and educated in the city of New York, graduating from Columbia College in 1837, and was admitted to the bar in 1842. In 1845 he removed to Auburn, N. Y., and joined the law firm of which William H. Seward was the head, but in 1854 he returned to New York City and soon became a prominent member of the admiralty bar and a favorite counsel in patent cases. In 1854 he was appointed judge of the United States District Court for the Southern District of New York, and in 1878 United States circuit judge for the Second Circuit. His learning, courtesy, and patience and the skill which he brought to bear on the complicated patent cases that came before him for decision made him highly esteemed as a judge, and he was in 1882, by appointment of President Arthur, promoted to the Supreme Court of the United States as associate justice, where he repeated the success of his earlier judicial career. He published in 1886 a volume of *Reports of Cases of Praxis*.

BLATCHLEY, WILLIS STANLEY (1850-). An American naturalist and geologist, born at North Madison, Conn. He graduated at Indiana University in 1887; was a member of Scoville's scientific expedition to Mexico (1891), of the Arkansas Geological Survey (1890-90), and of the United States Fish Commission (1893). In 1894 he became State Geologist of Indiana, and edited vols. xx-xxv of the *Annual Reports, Department of Geology and Natural Resources of Indiana* (1895-1902). He also published *A Nature Wooing* (1902); *Orthoptera of Indiana* (1903); *Boulder Rovers* (1906); *Coloptera of Indiana* (1910); *Woodland Idylls* (1912); *The Indiana Weed Book* (1912).

BLATHWAXT, WILLIAM (c.1649-1717). An English statesman, born at St. Martins-in-the-Fields. He held in succession a number of public offices and, in November, 1688, accompanied James II and his army to Salisbury in the capacity of Secretary of War, and seems to have conducted nearly all the affairs of the

army. Owing to his linguistic attainments he became a favorite with William III, whom he accompanied on his campaign in Flanders. He was a member of Parliament almost uninterruptedly from 1685 to 1710.

BLATTIDÆ (Lat. *blatta*, cockroach, moth). A family of cursorial Orthoptera, including the ordinary cockroach. The Blattidæ are the oldest known insects, being found as fossils in the Middle Silurian of France. See COCKROACH.

BLAUBOK, blou'buk, or **BLUEBUCK** (Dutch *blaauwbok*, blue buck). A large hippopotragine antelope (*Hippotragus leucophaeus*) of South Africa, which has been extinct since 1799. At present only five mounted specimens are known, these being in the museums of Paris, Leyden, Vienna, Stockholm, and Upsala respectively. When alive, it was restricted to the southwestern corner of Cape Colony. It measured only 40 inches to the withers and had horns hardly over 20 inches in length. These were stout and swept back from the forehead in a sabre-like curve, making most effective weapons of defense. The general color was bluish gray. Closely related is the magnificent, jet-black sable antelope (*Hippotragus niger*) from the eastern Transvaal and Mashonaland northward. The sable antelope is a very dangerous animal when wounded or at bay and has often been known to kill dogs and even lions. It breeds readily in captivity and becomes very tame, so that there is no immediate danger of its extermination. The third species is the roan or equine antelope (*Hippotragus equinus*), which is found all over Africa south of the Sahara, except in the Congo forest. It is pale brown, with a parti-colored face. *Hippotragus bakeri*, or Baker's antelope (qv), is by some considered a distinct species, or again only as a subspecies of the roan.

BLAUD'S PILLS. A common ferruginous preparation, composed of iron sulphate, potassium carbonate, sugar, tragacanth, althea, and glycerin. They are given in the simple forms of anemia (qv), usually in conjunction with a laxative, to overcome their constipating effects. See IRON, MEDICINAL USES OF.

BLAUER, blou'ër, or **BLARER**, AMBROSUS (1492-1584). A German religious reformer. He was born at Constance and studied at the University of Tübingen. In 1515 he entered the Benedictine monastery at Alpirsbach, where he afterward became prior. In consequence of his advocacy of the doctrines of Luther, however, he was deposed in 1521. He then became a Protestant preacher at Constance and was sent to regulate the ecclesiastical affairs at Memmingen (1528) and Ulm (1531). In 1534 Duke Ulrich summoned him to Württemberg, where during a period of four years he introduced the principles of the Reformation into the Church, his sphere of activity embracing 62 towns and 450 villages. In consequence of his leaning toward Zwingli, however, he was, at the instigation of the extreme Lutherans, dismissed from his office. Afterward he expounded the new doctrine in Isny, Lindau, and Augsburg. In addition to numerous letters, which are valuable as historical documents, he left a number of writings bearing upon the Reformation. For his biography, consult: Keim (Stuttgart, 1860), Pressel (Elberfeld, 1861), *Briefwechsel der Bruder Ambrosius und Thomas Blauer, 1509-1587* (3 vols., Freiburg, 1900-12).

BLAUVELT, blou'vêlt, LILLIAN (1873-

) An American singer, born in Brooklyn, N. Y. She early appeared as a violinist, subsequently studied vocal music with Bouhy in Paris, and appeared at the Théâtre de la Monnaie, Brussels, in *Faust* and other operas. Afterward she sang in concert and oratorio and continued solely in those fields. Her debut in England was made in 1898 at the Queen's Hall symphony concerts. She has sung throughout Europe, in the United States, and in Canada.

BLAUW. See BLEAU.

BLAVATSKY, bla-vats'ká, HELENA PETROVNA HAHN-HAHN (1831-91). A Russian traveler and theosophist, born in Ekaterinoslav, southern Russia. She traveled widely, penetrated to Tibet, and dealt much in spiritism and the occult. In 1873 she came to the United States, where, with H. S. Olcott, she in 1875 founded the Theosophical Society. In 1879, under her direction, a branch of the society was organized at Bombay, India, and the official journal, *The Theosophist*, was established. She met numerous "adepts" in India and elsewhere, and did somewhat to popularize the content of Buddhist philosophy alike among foreigners and native Indians, but the imposture of her miraculous pretensions has been adequately demonstrated by V. S. Solovoyoff in his work, *A Modern Priestess of Isis* (trans. by W. Leaf, London, 1895), and by the investigations of the Society for Psychical Research in 1884. Although but slightly acquainted with Sanskrit, she wrote voluminously on the ancient esoteric doctrines of India. The accredited text-book of her disciples is her *Isis Unveiled* (1876), which displays the subtitle "A Master Key to the Mysteries of Ancient and Modern Science and Theology." At the time of her death she was the leader of nearly 100,000 Theosophists in England, France, the United States, and India. An abridgment of her works was edited and published by Katharine Hillard in English (New York, 1907). Consult Olcott, *Old Diary Leaves* (New York, 1895). See THEOSOPIHY.

BLAYDES, FREDERICK HENRY MARVELL (1818-1908). An English classical scholar, a descendant of Andrew Marvell. He was educated at first at St. Peter's School, York, and later had a distinguished career at Oxford. In 1843-86 he was vicar of Harringworth in Northamptonshire. During this period, as before, he devoted himself primarily to the study of the Greek dramatists, publishing many editions and papers, which were all characterized by great boldness in the handling of the text, this freedom in conjecture detracts somewhat from the value of his work. He was an honorary LL.D. of Dublin University, honorary Ph.D. of the University of Budapest, and a fellow of the Royal Society of Letters at Athens. His long array of writings includes editions, with critical notes and commentaries, of various plays of Aristophanes (1873-93), an edition of all the plays, with critical notes only (1886), editions of all the plays of Sophocles (1859-1905), editions of three plays of Æschylus (1898-1900), *Adversaria Critica in Comicoorum Græcorum Fragmentis* (1890), *Adversaria Critica in Tragicorum Græcorum Fragmentis* (1894), *Adversaria Critica in Æschylum* (1895), *Adversaria Critica in Variis Poetis Græcos et Latinos* (1898), a paper on Euripides (1901), and a paper on Herodotus (1901). His last works were *Analecta Comica Græca* (1905) and *Analecta Tragica Græca* (1906).

BLAYDON. A coal-mining town in Durham, England, on the right bank of the Tyne, 4 miles west of Newcastle (Map: England, E 2). Its municipal life is active; it owns its water supply, maintains a technical school, and has fine modern public buildings. Its principal industries are coal mining, and the manufacture of clay products, bottles, and chemical manure.

BLAZE DE BURY, blâz' de bu'rê', ANGE HENRI (1813-88). A French author. He was born in Avignon and was a son of the author Castil Blaze. In 1839 he published his first comedy in verse, *Le souper chez le commandeur*, the first of a series of contributions to the *Revue des Deux Mondes*, with which publication he was associated for 40 years. Under the influence of the Romantics he devoted himself to the study of German literature and in 1840 published his translation of Goethe's *Faust* (14th ed., 1880), a work which obtained a wide circulation. His other works on the German poets include *Ecrivains et poètes de l'Allemagne* (2 vols., 1846); *Les poésies de Goethe* (1862); *Les écrivains modernes de l'Allemagne* (1868); *Mes souvenirs de la "Revue des Deux Mondes"* (1888); *Goethe et Beethoven* (1892, posthumous). His wife, Madame PAULINE ROSE STEWART BLAZE DE BURY, was well known as a writer under the pseudonyms "Arthur Dudley" and "Maurice Flassan." She also published, under her own name, *Voyage en Autriche, en Hongrie, et en Allemagne* (1851).

BLAZONRY. See HERALDRY.

•BLEACHING (AS. *blæcan*, to grow pale, Ger. *bleichen*, to whiten; cf. *B. bleak*, Ger. *bleich*, pale, AS. *blāc*, *blæc*, pale, shining). The art of removing coloring matters from animal and vegetable substances, leaving the material uninjured but of a light or white color, so that, as in the case of fabrics, they may be readily dyed to some desired shade. The origin of bleaching is unknown, but the art is believed to have been practiced before the Christian Era, and the "fine linen" mentioned in the Bible is supposed to have been bleached. It is thought to have been practiced by the ancient Babylonians, Egyptians, and other Eastern peoples, and was for the most part applied to vegetable fabrics, such as flax, hemp, and cotton, or the cloths made from them, although the bleaching of silk has long been known in China. Originally the atmosphere and the sun's rays alone were used for bleaching, and the plan followed was to spread the cloth on a grass field called a *bleaching green*. The fabric was sprinkled with water several times a day, and after several months of exposure it became white. No improvements of importance occurred until the eighteenth century, when Holland became the principal seat of industry, and there the material was steeped in a solution of potash lye for several days and then in buttermilk for about a week, after which it was washed and bleached on the ground. The satisfactory results thus obtained led to the name "Hollands" being given to the excellent fabrics bleached in that way, while a quality of linen, much in demand, which was spread on grass fields, was called "lawn." The next improvement was the use of dilute sulphuric acid in place of buttermilk, by which the duration of the process, formerly about eight months, was reduced to one-half that time. In 1785 the remarkable bleaching properties of chlorine were discovered by Berthollet, and its application to the bleaching

of cloth soon followed. At first the chlorine was used in its gaseous state, and it was found that it destroyed color by uniting chemically with the coloring principle, thus decomposing the color; but as the chlorine also united with hydrogen of the fibre it destroyed the fabric. Subsequently javelle water, obtained by dissolving chlorine in dilute potassium hydroxide, was employed; but in 1799 the dry calcium hypochlorite, or bleaching powder, came into use and is still largely employed, although for some purposes hydrogen peroxide is now preferred.

Cotton Bleaching. When yarn and thread are bleached, the process consists in boiling the material in a dilute solution of caustic alkali and washing, then steeping in a solution of bleaching powder and washing, after which it is steeped in sulphuric acid and again washed, then heated in a soap solution with the addition of a small quantity of bluing, after which it is passed through a dumping machine consisting of wooden rollers, containing a solution of indigo, then washed and dried again. In the case of cotton cloth or calico the process is somewhat more complicated, but consists essentially in the treatment of the material in baths of lime, lye, bleaching powder, and sulphuric or hydrochloric acid, with thorough washing after each step. In bleaching, as preparatory to calico printing, the use of a caustic alkali solution and of rosin soap follows the lime boil. This is "Printer's Bleach." It should be mentioned that an electric bleaching process has been introduced, the principal feature of which is that the bleaching liquid, as hypochlorite, is obtained by passing an electric current through solutions of sodium or magnesium chloride or a combination of the two.

Linon Bleaching. The process employed for removing colors from linen is similar to that employed for cotton, although the natural impurities are greater in the flax fibre than in the cotton. These are rendered soluble by alkaline boilings, after which the coloring matters that still remain are oxidized and destroyed by baths of hypochlorites, or bleaching powder, the processes as given for cotton being repeated several times, according to the perfection of bleach desired. It is sometimes found desirable, especially when linen cloth is bleached, to introduce a step called *grassing*, which consists in exposing the material in a field to the action of air, light, and moisture for several days. It is believed that by this method the full strength of the fibre is more completely retained. There are four grades of linen bleaching—quarter, half, three-quarter, and full bleach. In linen yarns the loss of strength is estimated at 20 to 30 per cent for full bleach, and 15 per cent for half bleach, while ordinary cotton loses only about 5 per cent.

Wool Bleaching. The special feature in which this differs from the preceding methods is in the preliminary process, which is called *scouring*. Wool fibre usually contains from 30 to 70 per cent of foreign matter, consisting of dirt, and especially of fatty matters secreted by the animal, called *yolk*. This is divided into two parts: (1) "wool perspiration," which is soluble in water, and consists essentially of potassium compounds of *oleic* and *stearic* acids, thus constituting an important source of potash; and (2) a compound insoluble in water and composed of cholesterol in combination with fatty acids. The scouring process consists in dipping the loose wool into dilute

soap solutions which form emulsions with the *yolk*, or in treating the wool to the successive action of fat solvents, such as carbon disulphide or naphtha. The scouring machine is usually a long narrow trough, divided into several tanks or bowls. The first bowls are scourers, the last are rinsers. Wringers are attached to each bowl. When the wool yarn is scoured, the process is similar, although the machinery is somewhat different. Wool cloth is scoured by passing the material as an endless band through the scouring liquid and then through a pair of squeezing rollers. Even after scouring, wool cloth retains a faint yellow tint, which is then removed by bleaching. This is accomplished by the action of sulphurous acid, which is formed by burning sulphur in a closed chamber while the scoured and washed material, still wet, is suspended on poles, or the woolen material may be immersed and moved about in a solution of sulphurous acid. Hydrogen and sodium peroxides are now being used for wool bleaching. The effect is more permanent than with sulphur.

Silk Bleaching. Raw silk contains a gelatinous substance called *sericin*, or *silk glue*, which, with calcareous and other mineral matter, is removed by working the silk in a scouring solution of soap at 95° C. This process is called *stripping*. The crude material may lose as much as 30 per cent in this operation, but the average loss is 20 to 25 per cent. The bleaching process is similar to that described under *Wool Bleaching*, and consists in exposing the wet scoured silk to the action of gaseous sulphurous acid. The use of hydrogen peroxide for bleaching silk is becoming more and more extensive. The method consists in steeping the silk in a dilute solution of hydrogen peroxide, made slightly alkaline with ammonia or sodium silicate until it is sufficiently bleached. The bleaching of paper stock, as cotton and linen rags or paper, and the bleaching of straw, as well as the bleaching of animal products, as beeswax, feathers, hair, ivory, oils, and sponges, will be found described in special articles under the names of these products.

Bibliography. J. Gardner, *Bleaching, Dyeing, and Calico-Printing* (London, 1884), *Modern Bleaching and Finishing*, by a practical working bleacher (London, 1897), Engelhardt, *Hypochlorite und elektrische Bleiche* (Halle a S., 1903), and for briefer reference, Thorp's *Outlines of Industrial Chemistry* (New York, 1906), where a bibliography of bleaching and dyeing will be found, Bottler, *Modern Bleaching Agents and Detergents* (London, 1910), Hubner, *Bleaching and Dyeing of Vegetable Fibrous Materials* (London, 1912). Consult also works on dyeing.

BLEACHING POWDER, or CALCIUM HYPOCHLORITE. An important bleaching agent and disinfectant. It is a mixed salt, containing calcium chloride and calcium hypochlorite. The process for its manufacture patented by Charles Macintosh, of Glasgow, in 1799, is still largely employed and consists essentially in the absorption of chlorine by dry slacked lime. The chlorine gas has been hitherto obtained exclusively from the action of hydrochloric acid upon manganese dioxide, but electrolytic chlorine is now used extensively. The lime used is ordinary limestone calcined in any convenient kiln and then slacked with the calculated amount of water. It is spread on the floor of a stone or leaden chamber, into which the chlorine gas is

introduced. Rotating cylinders in which the lime is propelled by an endless screw, while chlorine passes through, are also used. The absorption is considered complete when a sample of the product is found to contain about 37 per cent of active chlorine. As thus obtained, bleaching powder is a white or grayish-brown powder with a strong, pungent odor of chlorine, which is, however, destroyed in time, the substance gradually undergoing decomposition.

BLEAK, or BLICK (from the pallid color of the scales). A minnow (*Alburnus alburnus*) of the family Cypripidae. It is about 6 inches long, and slender, resembling the dace, but darker on the back, with silvery sides and white fins. It inhabits in active shoals the streams of England and the Continent, spawning in May, and is much esteemed as food by anglers and as a pet in the aquarium. The silvery substance beneath the scales is used for the manufacture of artificial pearls, as in several related fishes.

BLEAK HOUSE. The title of a novel by Charles Dickens (1852-53). It exposes the interminable delays in chancery. The name is that of Mr Jarndyce's residence and is said to have been drawn from a dairy house at Broadstairs, Kent, occupied by Dickens in summer. See SUMMERSON, ESTHER.

BLEASE, COLEMAN LIVINGSTON (1868-) Governor of South Carolina. Governor Blease was born in Newberry Co., S. C., and was educated at Newberry College and at Georgetown University, receiving the degree of LL.B. from the latter institution in 1899. He was admitted to the bar in this year and practiced law at Newberry. He was a member of the State Legislature from 1890 to 1898, and of the Senate from 1904 to 1908. He was chosen Governor on the Democratic ticket in 1910 and was reelected for a second term in 1912. Governor Blease has won considerable notoriety by the stand he has taken in his messages to the Legislature against negro education and by urging a law to prevent white persons teaching negroes. In 1912 the Legislature accused him of trading in pardons and exacting tribute from illegal rum shops. At the Governors' conference held in Richmond in the first week of December, 1912, Governor Blease defended lynchings under certain conditions and announced his intention of pardoning at least 800 convicts.

BLEB (allied to Eng. *blob, blub*). A circumscribed elevation of the superficial layers of the skin which contains fluid, usually serous in character. Blebs are really large vesicles or pustules and occur in certain skin diseases, as erysipelas, pemphigus, or in burns.

BLECH, blek, LEO (1871-) A German composer and conductor. He was born in Ar-la-Chapelle, April 21, 1871. Although he began life as a business man, he devoted much time to music. After a year of study with Bargiel and Rudloff at Berlin, he returned to his native town as conductor of the municipal theatre, where he produced his first opera, *Aglaia*, in 1893, without much success. After the lukewarm reception of his second opera, *Cherubino* (1894), he temporarily abandoned composition and devoted his summer vacations from 1895 to 1898 to a course of thorough study with Humperdinck. In 1899 he accepted the post of first conductor at the German theatre in Prague. Here he achieved distinction both as conductor and composer, so that in 1906 he was called to Berlin as one of the conductors of the Royal Opera. His

two greatest successes are the one-act comic operas *Das war Ich* (Dresden, 1902) and *Versiegelt* (Hamburg, 1908), the latter of which was also heard at the Metropolitan Opera House in New York (1912). His other works are the operas *Aschenbrodel* (1905) and *Alpenkonig und Menschenfreund* (1903); three symphonic poems *Die Nonne*, *Trost in der Natur*, *Waldwanderung*; two choral works with orchestra, *Von den Engeln* and *Sommernacht*; compositions for piano, and songs. Consult E. RYCHONSKY, *Leo Blech* (Prague, 1905).

BLECHEN, blĕk'ĕn, KARL EDUARD (1798-1840). A German landscape painter. He was born at Kottbus and until his twenty-fourth year followed a commercial career. He then studied with Lutke in the Berlin Academy and engaged for three years in scenic painting for theatres. A journey to Italy in 1828-29 was notable for his art. Heretofore romantic in character and composed from studies, it now became more realistic. In 1831 he was made professor and in 1835 a member of the Berlin Academy. The principal collection of his works is in the National Gallery, Berlin, which possesses 60 paintings and studies. Of these the most important is the "Camp of the Semnones" (1828), which marked an epoch in the development of German landscape.

BLEDOW, blă'dô, LUDWIG (1795-1846). A German chess player, born in Berlin. He founded the Berlin chess school, which flourished from 1837 to 1842, and contributed greatly to the development of the game, under the direction of Bledow, Paul Rudolf von Bilgeur (q.v.), Hanstein, Nayet, Schorn, Horwitz, and Von Heydebrandt and der Lasa (called "the Pleiades"). He established the first chess paper published in Germany (1846). His arrangement of the 100 games of the Syrian master Stamma was published by Von Oppen (Leipzig, 1865). The extensive collection of chess literature which he had accumulated during his lifetime was bought by the Royal Library in Berlin.

BLEDSE, blĕd'sô, ALBERT TAYLOR (1809-77). An American metaphysician and educational author. He was born in Frankfort, Ky.; graduated at West Point in 1830, and became a lieutenant of infantry, but resigned in 1832, and was professor of mathematics successively in Kenyon College, in Miami University, and in the universities of Virginia and Mississippi. During the Civil War he was Assistant Secretary of War in the Southern Confederacy. He was a frequent contributor to periodical reviews and at the time of his death was editor of the *Southern Review* (Methodist). His published works include: *An Examination of Edwards on the Will* (1845); *Theodicy: or, Vindication of the Divine Glory* (1853; 6th ed., 1856); *An Essay on Liberty and Slavery* (1856); *Is Davis a Traitor? or was Secession a Constitutional Right previous to the War of 1861?* (1860); *Philosophy of Mathematics* (1866).

BLEEDING (hemorrhage). One of the most serious accidents that can happen to an animal, and one which constitutes a serious complication in surgical operations. As there is but a limited quantity of blood in the body (about one-tenth of the body's weight), and as the sudden escape of a large portion of it is sufficient to cause death, every one should be instructed as to the measures which experience has shown to be the most efficient for preventing a dangerous loss of blood. Bleeding may be either from a wounded artery or vein, or occur as a general oozing

from a raw surface or a mucous membrane, or the blood may escape into the surrounding tissues or into a cavity like the pleura and remain concealed.

Arterial Bleeding. This is recognized by the florid redness of the blood and by its issuing from the cut vessel in jets. If a large artery be wounded, the first gush of blood may prove fatal, but generally there are rapid and feeble pulse, frequent and irregular breathing, intense pallor; cold, moist skin, possibly nausea and vomiting, and prostration merging into unconsciousness, and the patient faints. The artery draws up within its sheath (see ARTERY); the blood, no longer impelled vigorously by the heart, clots about the wound and within the arterial tube. This clotting, favored by fainting and reduced blood pressure, constitutes natural hemostasis, and is sufficient in many cases to prevent a recurrence of the bleeding; but, as a rule, it is necessary to use surgical or other artificial means for restraining the flow of blood till adhesion (q.v.) can occur between the cut surface of the coats of the artery. The principal surgical means are: immediate pressure, which may be applied by pressing the finger tip on the place whence the blood is seen to flow, and may be kept up by pads secured with a bandage to the part; pressure on the artery above, or near the wound, which requires some knowledge of anatomy, but not more than any intelligent person may easily acquire. Thus, pressing on the inside of the arm, about midway between its front and back, will press the brachial artery (q.v.) against the bone, and arrest bleeding from wounds of the forearm and hand. Pressure on the middle of the groin with a thumb placed crosswise will control the stream of blood in the femoral artery, so that none can escape from any wound in thigh or leg below the point where pressure is made. Pressure on the course of the vessel may be effected temporarily by tying a handkerchief round the limb above where it is injured and then inserting a stick and twisting it sufficiently tight. This is the principle of the tourniquet, which was invented by Morel, a French surgeon, at the siege of Besançon in 1674. (See TOURNIQUET.) The objections to pressure as a means of arresting hemorrhage are, that it is very painful, that it includes the vein, and thereby engorges the limb with blood, and may cause gangrene if continued for any length of time. Actual cautery with the hot iron is occasionally useful in bleeding from a bone, or at some points where pressure or ligatures cannot be efficiently applied. It is the oldest method of stopping bleeding and until the eighteenth century was much in use. If used, the iron should be at a white heat, the wound pressed for an instant, and then the iron should be held in contact with the bleeding vessel. It causes an eschar or slough, with shriveling of the artery; and if the latter be small, it effectually stops the bleeding until the eschar drops off, when the vessel may be found still pervious at the wounded part, and the danger of bleeding be as great as at first. Ligature, or tying the artery, is a very old method of arresting hemorrhage and certainly the best. A ligature should be applied to each extremity of the cut artery. (See LIGATURE.) **Acupressure** (q.v.), introduced by Sir James Y. Simpson of Edinburgh, is useful in a few instances where the arteries are too brittle to permit ligation, but is now rarely employed.

Venous Bleeding. This is recognized by the dark color of the blood and its continuous flow.

Pressure is generally found sufficient to arrest it, and it should be applied directly over the wounded part. Ligatures are used somewhat as in arterial hemorrhage. Bleeding from large venous trunks, or sinuses, is controlled by packing the vessel with a gauze plug.

Capillary Bleeding. This is distinguished by oozing, with a tendency to spontaneous arrest. It is rarely dangerous, except in hemorrhage from the mucous membrane of the stomach. Water at a temperature of 116° F will arrest it, or cold, or the actual cautery. The old styptics (as alum, tannin, cobwebs, etc.) are not used by surgeons, as they cause unclean clots, which invite sepsis and secondary hemorrhage.

Parenchymatous Bleeding. This occurs in organs wherein small arteries empty directly into veins without intervening capillaries, as the spleen. Hot water, or cold, or dilute acetic acid may arrest it. Transfusion of blood from another person, or introduction of salt solution into the venous system of the patient, is very frequently a resort in severe hemorrhage. Some persons, known as "bleeders," have a congenital tendency to bleed (the hemorrhagic diathesis), if such a one have a trifling cut, or have a tooth pulled, he may bleed to death. An extract made from suppurational capsules (qv) sometimes controls this variety of bleeding. See BLOOD.

Bleeding, or Bloodletting. Blood may be drawn from a vein (phlebotomy—venesection), or from an artery (arteriotomy). The veins most commonly opened for this purpose are the median basilic (see ARTERY), but those of the lower limbs are occasionally selected. The patient should be placed sitting up in bed, as he may lose a dangerous amount of blood without showing the usual premonitory symptoms if his head be kept low. The venous return should now be obstructed by a bandage, and when the veins swell, one should be selected, and slit with a lancet. When the desired quantity has escaped, the surgeon's thumb should be placed on the cut and kept there till the bandage is removed, when a small pad of gauze, held in place by a bandage, will prevent further bleeding, and the wound will speedily heal. Phlebotomy was at one time habitually resorted to in inflammatory diseases, and even when there was no positive disease it was often done, particularly in the spring and autumn, as a hygienic precaution. It is now rarely used. Local bloodletting by means of cupping or leeches is used in certain conditions, such as pleurisy, sciatica, inflammation resulting from injury to a joint, etc. See VENESECTION.

BLEEK, bläk, FRIEDRICH (1793-1859). A German biblical scholar. He was born at Altona, Holstein, July 4, 1793, educated at the University of Kiel (1812-14), and in Berlin, under De Wette, Neander, and Schleiermacher (1814-17). In 1818 he became tutor in theology in the University of Berlin. Soon afterward he published essays on the *Origin and Composition of the Sibylline Oracles* and on the *Authorship and Design of the Book of Daniel*, in which he attracted attention by solid learning, thorough investigation, and candor of judgment. In 1823 he became professor extraordinary, and in 1829 he accepted the chair of theology in the University of Bonn, where for 30 years he labored with constantly increasing success, due to the thoroughness of his investigations, the impartiality of his judgments, and the clearness of his methods of presentation. He died suddenly of apoplexy, Sunday, Feb. 27, 1859, having given his

regular lecture on the previous day. He was among the precursors of the modern views on the Old Testament subjects, but upheld traditional opinions regarding the New Testament. His defense of the genuineness of the Gospel of St. John is regarded as one of the strongest that have yet appeared. Translated are his *Introduction to the Old Testament* (2 vols., London, 1869, reprinted 1 vol., 1875), and his *Introduction to the New Testament* (2 vols., Edinburgh, 1869), and *Lectures on the Apocalypse* (London, 1875). His great work on the Epistle to the Hebrews (3 vols., 1828-40) is untranslated. The Introductions just mentioned were published by his son from his notes (Berlin, 1880 and 1862, respectively), later so edited by Wellhausen (last ed., 1893) and Mangold (latest ed., 1886) as to make him the channel of views he certainly did not stand for while he lived.

BLEEK, WILHELM HEINRICH IMMANUEL (1827-75). A German philologist, son of the preceding. He was born in Berlin, was educated in Bonn and Berlin, and in 1855 went with Bishop Colenso to Natal. The next year he settled in Cape Town, where in 1880 he became curator of the important library of the Governor, Sir George Grey. He was distinguished for researches in the languages of Africa. His works, written chiefly in English, include *The Languages of Mozambique* (1856), *The Library of Sir George Grey* (2 vols., 1858-59), the uncompleted *Comparative Grammar of South African Languages* (2 vols., 1862-69), *Reynard the Fox in South Africa* (1864), *Handbook of African, Australasian, and Polynesian Philology* (3 vols., 1858-63), *Ueber den Ursprung der Sprache* (1868), translated into English under the title, *The Origin of Language* (1869), *Specimens of Bushman Folklore* (Eng. trans., 1911).

BLEIBTREU, blip'troi, GEORG (1828-92). A German battle painter. He was born at Xanten and studied at the Düsseldorf Academy and under Theodor Hildebrandt. He first became known through the picture entitled "Destruction of the Kiel Turner-Corps at Flensburg" (1862), which was followed by paintings descriptive of episodes of the War of Liberation and the battles of Frederick the Great. In 1858 he settled in Berlin, and in the war with Austria (1866) accompanied the Prussian army in the suite of Prince Frederick Charles. During the campaign of 1870 he was attached to the suite of the Crown Prince. His works have fine detail and broad conception. The following are a few of his best productions: "Battle of Grossbeeren" (1857), "Episode from Battle of Waterloo" (1858), "Battle of Königgrätz" (National Gallery, Berlin), "Surrender of Napoleon after Sedan", "Attack of Saxon Corps at Saint-Privat" (1880).

BLEIBTREU, KARL (1859-) A German poet, critic, and dramatist. He was born in Berlin, the son of the battle painter, Georg Bleibtreu. Educated in Berlin and London, he did editorial work for a few years, proclaiming in his *Revolution der Literatur* (1886) the modern naturalistic tendencies of the younger Berlin school of authors. These looked up to him and to Friedrich Nietzsche as rising stars of the first magnitude. In 1889 he assisted in the founding of the *Freie Bühne* in Berlin after the model in Paris. In his early works, as, for instance, his *Dies Ira, Erinnerungen eines französischen Offiziers an Sedan* (1884), he shows a remarkable talent for depicting battle scenes. He pub-

lished rapidly and extensively in many fields: the drama (*Lord Byron*, 1886; *Karma*; *Weltgericht*; etc.), lyrics (*Kosmische Lieder*, 1890), novels (*Herzica*, 1890; *Geist*; *Grossenwahn*, 1888, etc.), history (*Geschichte und Geist der europäischen Kriege unter Friedrich den Grossen und Napoleon*, 1892), military science (*Zur Geschichte der Taktik und Strategie*, 1897), literary history (*Geschichte der deutschen Litteratur*, 1911). His work shows power and individuality (often too much ego), but his literary method is hasty and uneven, so that he has left no one well-rounded and developed artistic production.

BLEICHRÖDER'S, blīk'rū-dēr-z. The banking house in Berlin established by Samuel Bleichröder (died in 1855) in 1803 and continued by his son, Gerson Bleichröder (1822-93), under whose management it has become one of the most important private banking institutions in Europe. The house of Bleichröder dates its larger influence from its numerous transactions carried on with the Rothschilds and the patronage of Bismarck. Its financial relations with the Prussian government began with the large subscriptions by Gerson Bleichröder to the building of the Prussian railroads. Financial advice and assistance were also sought from Bleichröder by the King of Prussia in 1866, and again in 1871, when the treaty of peace concluding the Franco-Prussian War was negotiated at the headquarters of the German army at Versailles. In recognition of his services, Gerson Bleichröder was elevated to the hereditary nobility in 1872. The banking business was subsequently conducted by his sons, Hans Bleichröder, Georg Bleichröder (died 1902), and his cousin Julius Leopold Selwachach (died 1898).

BLEMYES, blēm'ī-z, or **BLEMYES** (Gk. Βλέμυες, Βλῆμυες). An ancient African people living in and around the Libyan Desert. In the third century, while Egypt was under Roman rule, they made predatory incursions into that province, and Diocletian made important concessions to them. They were powerful and troublesome as late as the seventh century, and old authors tell strange stories of their savage appearance and habits. It is supposed that the Ababdeh, the Bisharin, and other tribes are their descendants.

BLENCK, blēnk, BMLL (1832-1911). A German statistician. He was born in Magdeburg and studied law and cameralistics in Berlin. In 1869 he became a member of the Royal Bureau of Statistics and in 183 director of that institution. The course reorganized by him and designed for the education of the higher government officials employed in the departments of statistics has produced excellent results. Since 1882 Blenck has been the editor of all publications issued by the Prussian Department of Statistics, in which a number of his scientific articles appeared. His independent writings include the following: *Das königlich preussische statistische Bureau beim Eintritte in sein neuntes Jahrzehnt* (1885); and *Das königliche statistische Bureau während der Jahre 1885-96* (1898).

BLENDE (Ger. from *blenden*, to blind, delude; see below), or **SPIALERITE**. A zinc sulphide that crystallizes in the isometric system and is usually found containing sulphide of iron, which gives it a dark color, in consequence of which it is familiarly known among the Cornish miners as "black-jack." It occurs both massive and crystallized and in color is black or brown, and sometimes red, yellow, or green. It is found in the Harz Mountains, in Saxony, in

Cornwall, England, and with lead ores in various localities in Missouri, Wisconsin, Iowa, and Illinois, in the United States. It is a valuable ore of zinc, and when pure contains 67 per cent of that metal. The sulphur which it contains has been used for the manufacture of sulphuric acid. The name was given to it by German miners because, while it resembled the mineral galena, it yielded no lead.

BLÉNEAU, blā'nō' (*Blanoilus*, *Blannellus*, of the Middle Ages). A village of France, situated in the department of Yonne, about 29 miles west-southwest of Auxerre. It is celebrated as the scene of a two days' battle between the Prince de Condé and Turenne (April 6-7, 1652). The first day Condé gained an advantage over Turenne's army in the latter's absence, but during the night Turenne arrived, and the next day he overwhipped the Spanish troops of Condé.

BLENHEIM, blēm'im (Ger. *Blindheim*). A village of Bavaria, 23 miles north-northwest of Augsburg (Map: Bavaria, D 4). It is memorable in connection with the great victory won by Marlborough and Prince Eugene over the French and Bavarians under Tallard, Marsin, and the Elector of Bavaria Aug. 13, 1704. The battle, however, did not actually take place here, but at a village in the vicinity called Höchstädt, about a mile north of the Danube, and is known to the Germans by that name. The French had massed their forces on their right and left wings, thinking the centre sufficiently protected by a narrow stream in front. Marlborough perceived the weak point in their line, and ordering an assault on the enemy's wings, to hide his real purpose, he with the mass of his army forded the stream, broke the French centre, took them in flank, and utterly destroyed the hostile army. Of 56,000 French and Bavarians, 14,000 were taken prisoners and 25,000 perished by the sword or in the Danube. The loss of the victors amounted to about 5000 killed and 8000 wounded. Near Blenheim the French defeated the Austrians, June 19, 1800.

BLENHEIM DOG, or **MARLBOROUGH DOG**. See SPANIEL.

BLENHEIM HOUSE. The seat of the Duke of Marlborough, erected near Oxford at the public expense in the reign of Queen Anne as a testimony of gratitude to the victor of Blenheim (q.v.). For this purpose £500,000 was voted, but that sum did not suffice for the completion of the work. The royal estate of Woodstock, in which it stands, was granted at the same time. The building was designed by Sir John Vanbrugh, and is a striking monument, combining grandeur and picturesqueness to a remarkable degree. The length of the principal front is 348 feet, with advancing wings and a projecting pier brought together with insweeping curved lines toward the centre. The interior is proportionately magnificent, and the collection of paintings is one of the most valuable in Great Britain. In the grounds are a triumphal arch, and a column 130 feet high, surmounted by a statue of Marlborough. An inscription on the pedestal, written by Bolingbroke, recites the public services of the hero. The Manor of Blenheim Park embraces a circuit of about 12 miles. Consult Taunt, *Blenheim and Woodstock* (Oxford, 1909).

BLENK, JAMES HUBERT (1856-). An American Roman Catholic archbishop, born at Edenkoben, Bavaria. He was educated at St. James College, Baltimore, and at the Jefferson College, in Convent, La. After entering the So-

cety of Mary (1874) and studying in the Irish and French Marist Houses of Study and at the Catholic University of Dublin, he was ordained a priest in 1885 and in the same year became professor at Jefferson College, of which he was president in 1890-96. He was rector of a church in Algeirs, La., in 1897-98, and in 1899, after serving as auditor to the Apostolic Delegation to Cuba and Porto Rico, was consecrated Bishop of Porto Rico. In 1906 he was made Archbishop of New Orleans.

BLENKER, blĕnk'ĕr, Louis (1812-63). A German-American soldier, born in Worms, Germany. He was one of the leaders of the German Revolutionary party of 1848, and as commander of the Freischaren (Free Corps) took Ludwigshafen (May 10, 1846), occupied the city of Worms, and made an unsuccessful attack on Landau. When the Prussian troops entered the Palatinate, he fought in several of the engagements in Baden, but after the suppression of the revolution was compelled to flee to Switzerland, whence he emigrated to the United States. Upon the outbreak of the Civil War he organized the Eighth Regiment, New York Volunteers, of which he became colonel. For his gallantry in the first battle of Bull Run he was raised to the rank of brigadier general of volunteers. In 1862 he commanded a division in western Virginia and took an active part in the battle of Cedar Keys, but soon afterward was superseded by General Sigel. He was mustered out of service March 31, 1863, and died in October of injuries sustained while with his command at Warrenton, Va.

BLANNERHASSSETT, HARMAN (1764-1831). A wealthy British emigrant to America, accidentally conspicuous through his connection with the conspiracy of Aaron Burr (qv). He was born in Hampshire, England, was educated for the law at Trinity College, Dublin, married his niece, Adeline Agnew, then only 18 years of age, in 1796, and, in consequence of the social ostracism he thus brought upon himself, broke the entail upon the extensive Blennerhassett estates and emigrated to America in 1797. In the following year he bought the island later known by his name, in the Ohio, a few miles below Parkersburg, W. Va., where he built a large mansion and amid luxurious surroundings dispensed a generous hospitality. A man of scholarly tastes, he spent much of his time in study and in the making of original experiments in the natural sciences. He was visited by Burr in 1805 and was by him involved in the ambitious schemes which within the next two years brought about their ruin. For his complicity in these schemes he was twice arrested, but was free from criminal prosecution after Burr's acquittal at Richmond. A large part of his extensive property, however, passed to his creditors. He was thereafter engaged as a cotton-planter, with little success, near Port Gibson, Miss., removed to Montreal in 1819, practiced law there until 1822, when he returned to Ireland, and, after a few uneventful and unsuccessful years, died on the island of Guernsey, Feb. 1, 1831. His wife was a woman of considerable literary talent and published *The Deserted Isle* (1822) and *The Widow of the Rocks and Other Poems* (1824). She returned to America in 1842 and presented a claim to Congress for a reimbursement of her husband's losses at Blennerhassett Island, but she died in New York before final action could be taken. Consult: Salford, *Life of Norman Blennerhassett* (Cincinnati, 1853), and also Salford

(editor), *The Blennerhassett Papers, Embodying the Private Journal of Harman Blennerhassett* (New York, 1864). An article, "The True Story of Harman Blennerhassett," by Therese Blennerhassett-Adams, in vol. lxxi of the *Century Magazine* (New York, 1901), gives for the first time, on the authority of family papers, the real cause of Blennerhassett's emigration to America, together with some details concerning the Blennerhassett family.

BLANNERHASSSETT, SIR ROWLAND (1839-1909). A British publicist and educator, born in county Kerry, Ireland, and educated at Christ Church, Oxford, and at the universities of Louvain, Munich, and Berlin. He was chosen member of Parliament as a Liberal from Galway, (1865), represented county Kerry in the House of Commons (1880-85), was an inspector of schools (1890-97), and during the period 1897-1905 was president of Queen's College, Cork. He wrote much in the reviews, chiefly on foreign topics. A strong opponent of the Pan-Germanic movement, his publication of an interview with Emperor William II, in the *Daily Telegraph* in 1908, was one of the most sensational political episodes of that year.

BLÉNORRHOËA (Gk βλέννα, blenna, thick mucous discharge + ῥοία, rhoia, a flow, flux). A term applied to an unusually copious discharge from any mucous membrane. The term is now but seldom used. In discharges called blennorrhical a mixture of epithelial scales is shed in large quantities from the mucous membrane (mucous cells) and occasionally pus cells. In blennorrhoea of the lachrymal sac, if the inner corner of the eye be pressed by the fingers, an opaque, milky fluid will appear between the lids, instead of the transparent tears which are present when the lachrymal apparatus is in health. After inflammation of the genito-urinary mucous membrane a gleet discharge frequently occurs and continues for a long period. The treatment consists in establishing a robust state of health by tonics, fresh air, and careful regimen, with astringent lotions applied directly to the mucous membrane, to lessen the secretion, and occasional caustic stimulants, as the nitrate of silver, to alter the condition of the secreting membrane. See GONORRHOËA.

BLENNY (Lat. blennius, blennius, Gk βλένιος, blennios, from βλέννα, blenna, slime, mucus). A representative of a genus (*Blennius*) of spiny-rayed fishes, remarkable for the abundance of slimy matter with which their skin is covered. Many are scaleless. The body is generally of an elongated form. They have only one dorsal fin, which, however, in many is deeply divided. They are distributed in the seas of all parts of the world. The true blennies are small fishes living in small shoals, frequenting rocky coasts, and often found in pools left dry by the tide, or even among the wet seaweeds, where they are capable of subsisting for a much longer time than that of the absence of the tide. They possess the power of using their ventral fins to aid them in moving about among rocks and seaweeds, and from this ability to move about out of the water are sometimes called lizard skipper. They are hardly edible, but are much in request for the aquarium on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. Many of the Blenniidæ family retain their eggs within the oviduct until they are hatched, so that the young are produced alive and capable of seeking their own food. Compare GOBY.

BLEPH'ARITIS (Gk. βλέφαρον, *blepharon*, eyelid). A chronic inflammation of the margins of the eyelids. It is very common, particularly in children, and occurs in persons who are debilitated, with poor hygienic surroundings or uncleanly habits. It is also a result of insufficient sleep, or may follow measles, chronic conjunctivitis, or exposure to dust, smoke, or wind. Very frequently it shows the presence of errors of refraction, requiring correction by eyeglasses. The superficial form is characterized by redness, itching, soreness, and swelling of the margins of the lids, with a formation of white scales between the lashes, which are loose. There is sensitiveness to light. If ulceration occurs, the lashes are glued together by yellowish crusts, which cover the ulcers. As in the other form, the lashes fall out, but in cases with ulceration they are not replaced. Ectropion (q.v.) or trichiasis (q.v.) may follow. The affection is chronic and very obstinate, but will usually yield to treatment.

BLEPH'AROPLAST' (Gk. βλέφαρον, *blepharon*, eyelid + πλάστος, *plastos*, formed, molded; referring to the cilia; see below). In plants, a name given by Webber to certain bodies occurring in connection with the formation of the male cells of one of the Cycads (*Zamia*). The same structures have been found in other Cycads (*Cycas*, etc.), in the Maidenhair Tree (*Ginkgo*), and in various fern plants. In the Cycads two blepharoplasts appear at opposite poles of the nucleus of the cell that is to produce the two male cells, and when it divides, each male cell receives a single blepharoplast. In all cases the function of the blepharoplast is the formation of cilia, by means of which the male cells may swim. Originally spherical in form, it becomes drawn out into a narrow band, which disposes itself in a spiral against the inner surface of the wall of the male cell, and from which cilia are developed which pierce the wall. The radiations which surround the blepharoplasts, and their position at opposite poles of the nucleus, have suggested that they are concerned in the formation of the spindle which precedes cell division, but more evidence is needed before this view can be accepted. Many believe that the blepharoplast, while only a transient structure, is a genuine Centrosome (q.v.), while others contend that it is a unique organ of the cell. Homologous bodies have been described under the names "Höcker," "Körnchen," "Nebenkern," "attraction sphere," "directive sphere," and "centrosome-like body."

BLÉRÉ, blá'rá'. A town in the department of Indre-et-Loire, France, situated on the left bank of the Cher, about 15 miles east-southeast of Tours. Bléré is the entrepôt for most of the traffic on the Cher and is noted for a handsome sixteenth-century chapel. Pop., 1901, 3288; 1911, 3533. The famous castle of Chenonceaux (q.v.) is 4 miles distant.

BLERIOT, LOUIS. See **AERONAUTICS**, *Monoplanes*.

BLES, blēs, HENRI MET DE, called CIVETTA (c.1480-1550). An important Flemish painter. His real name is unknown, Bles being a nickname referring to his shock of white hair, Civetta, another used by the Italians on account of the usual presence of an owl in his pictures. Of his life nothing definite is known except that he was probably born at either Bouvignes or Dinant and lived for some time at Antwerp. Although his work was much prized in Italy, it is uncertain whether he ever visited there. His only signed painting, the "Adoration of the

Magi," is in the gallery of Munich. The Metropolitan Museum of Art possesses two paintings attributed to him—the one a beautiful triptych in an original frame, the central panel representing the "Last Supper," the wings "Abraham and Melchizedek," and the "Fall of Manna." His work is characterized by a tendency to caricature features and by excellent rendition of landscapes.

BLESBOK, blēs'bōk. An African antelope (*Alcephalus albifrons*) grouped loosely under the Dutch name "hartebeest," although not in the typical genus *Bubalis*. See **HARTEBEEST**.

BLES'INGTON, MARQUETTE, COUNTESS OF (1789-1849). An English leader of society and well known as an author. She was born Sept. 1, 1789, at Knockbrit, near Clomzel, Tipperary, Ireland, where her father, Edmund Power, was settled. At the age of 15 she was married to Captain Farmer, and shortly after his death to Charles John Gardiner, Earl of Blessington. With him she took several extensive journeys on the Continent, where, as well as in London, she gathered around her all the most distinguished men of the time. In Genoa she formed an intellectual friendship with Lord Byron and afterward resided in Paris until the death of her husband, in 1829. He left her a fortune, which enabled her to gratify her literary tastes. She held a little court of her own at her family mansion, Gore House, Kensington, a suburb in the West End of London. Her celebrated soirées were frequented by many of her distinguished contemporaries. Her subsequent connection with the Count d'Orsay (who had married Lord Blessington's daughter, by a former wife) placed her in an equivocal position as regards society, and consequently, on the accession to power of Louis Napoleon, with whom both were intimate, they left England for France, where she died in Paris, June 4, 1849. Besides editing *The Keepsake* for 10 years and doing other miscellaneous literary work, she wrote several novels and sketches of life and scenes in France and in Italy. Her most valuable production is the *Conversations with Lord Byron* (1834), which helped to place the poet in a more favorable light before his countrymen. Consult Madden, *The Literary Life and Correspondence of the Countess of Blessington* (3 vols., London, 1855), and an article by Lyndon Orr entitled "Lady Blessington and Count d'Orsay" in *Munsey's Magazine* for July, 1911.

BLES'SON, JOHANN LUDWIG URBAN (1790-1861). A Prussian military writer, born in Berlin. He entered the Pioneer Corps in 1813, served in the War of Liberation as an officer of engineers, was for some time a teacher in the military school in Berlin, and retired in 1829 with the rank of major. He wrote a number of military works, including *Beitrag zur Geschichte des Festungskrieges in Frankreich 1815* (1818); *Übersicht der Belagerungskunst* (1827); *Übersicht der Befestigungskunst* (2 parts, 1827-34); *Geschichte der Grossen Befestigungskunst* (1830).

BLEWFIELD'S. See **BLUEFIELDS**.

BLICHER, blik'ēr, STEEN STEENSEN (1782-1848). A Danish lyric poet and novelist, born at Vibum, Oct. 11, 1782. He translated *Ossian* (1807-09) and followed this with poems and novels of little importance till he began to cultivate the field of Jutland peasant stories and legends (1820), in which he excelled among Danish writers and ranks very high in the world's literature. He was a close and sensitive

observer of the comedy and tragedy of the commonplace sphere in which his pastor's life was passed and rendered his observations with sympathetic art and rare love of nature. He died at Spentrup, March 26, 1848. "The Snow Bells" and "Birds of Passage" are his best later poems. *The Knitting-Room*, a collection of poems and stories largely in Jutland dialect, is characteristic of his simple naive humor. His collected tales (*Jydske Romanzer, Nationalnoveller*, etc.) appeared 1833-36, and in 1882 under the title *Samlede noveller og skizzer* (2d ed, 20 vols, 1893-94). The collection *Gamle og nye Noveller* (7 vols, Copenhagen, 1846-47) contains a humorous autobiography. *Blücher's Poems* appeared in two volumes (1835-36), supplemented by two others (1870). Consult Kristensen and Lund, *Blücher's Liv og Gjerning* (Copenhagen, 1882), Hansen, *Blücher* (Copenhagen, 1879), Hansen, *S. S. Blücher's barndom og ungdom* (Copenhagen, 1902).

BLIDA, blé-da' A town of Algeria, 30 miles southwest of Algiers. It is beautifully situated on the borders of the fine plain of Metidja, at the base of the Atlas Mountains. The town is fortified with ramparts and towers, which command the passes of the Atlas. The streets are of modern appearance, and there are numerous mosques, churches, arcades, barracks, a military hospital, and a railway depot. The Oued-el-Kebir, through an aqueduct, supplies power to large corn mills and several factories and yields an abundant water supply to the town, which contains many fountains and irrigated gardens. Exports consist of oranges, grain, cotton, tobacco, raisins, etc. Cedar and cork trees abound in the vicinity, and copper and lead mines are worked. In 1825 and in 1867 Blida was almost destroyed by earthquakes. Pop., 1891, 11,404, 1896, 13,028, 1901, 29,469, 1911, 35,461.

BLIGH, blī, WILLIAM (1754-1817) An English admiral, celebrated in connection with the mutiny of the *Bounty*. He was born, according to his statement, at Tynant, St. Tudy, Cornwall, 1753. It is probable, however, that he was the son of John Bligh, of Tretawne, and born at Plymouth, Sept. 9, 1754. He entered the navy and as sailing master accompanied Captain Cook on his second voyage around the world (1772-74). At Otaheite the breadfruit tree was discovered, and on Dec. 23, 1787, "Breadfruit Bligh," as he had been nicknamed, was appointed commander of the *Bounty*, with orders to sail to Otaheite or Tahiti, collect breadfruit tree plants, and transport them for introduction to the West India colonies. On the way from Tahiti to Jamaica a part of the crew mutinied and forced the captain and 18 men into the ship's launch, which they cast adrift, turning their own course back to Tahiti. The captain and his companions, who had very little provisions and no sextant or map, arrived, after three months of severe hardship, at the island of Timor, a distance of 3600 nautical miles from the point where they were abandoned. To Bligh's skill and courage is due the fact that not a single life was lost. On Bligh's arrival in England a man-of-war, under Captain Edwards, was sent, at his instance, to capture the mutineers. Some of them were seized, the rest had escaped to Pitcairn Island (qv), with Fletcher Christian, the leader of the mutiny, accompanied by a number of Tahitian men and women. Their place of refuge, however, was not dis-

covered until 1808, when an American ship accidentally touched at the island. At that time drunkenness and unbridled passion had left only one of the mutineers, John Adams, remaining, who had succeeded in instilling morals and religion in the little community there. Their fortunes form the subject of a poem by Byron, entitled *The Island of Christian and his Commanders*. Bligh was again sent out to collect breadfruit trees and convey them to the West Indies, in which he was successful. In 1794, during the French Revolutionary War, Bligh commanded a ship of the line, but again exciting the disaffection of his men by his harshness, they mutinied and ran the ship into a French harbor. In 1797 he commanded the *Director* at Camperdown, when Admiral Duncan defeated the Dutch Admiral De Winter, the same year he distinguished himself by his fearlessness at the mutiny at the *Nore*. In 1801, as commander of the *Glatoon* at Copenhagen, he was personally thanked by Nelson. In 1808 Bligh was appointed Governor of New South Wales, but in his prohibition of the unlimited importation of ardent spirits his conduct was so tyrannical that the military officer of the colony summarily arrested and kept him imprisoned for over two years. The officer, Major Johnson, was subsequently cashiered. Bligh, on returning to England, was made rear admiral in 1811 and vice admiral in 1814. He died Dec. 7, 1817. For narrative, consult Bligh, *The Mutiny of the Bounty* (Philadelphia, 1790).

BLIGHTIA, blī-fī-a See **ARKE**.
BLIGHT, blīt (perhaps akin to *bleal*, pale, wan). A name applied to diseases of a number of plants and to the parasites which cause them. The term has been very vaguely and variously used, having in fact been applied to almost every disease of plants caused by the condition of the atmosphere or of the soil, the attacks of insects, parasitic fungi, etc. As now used by botanists, the term "blight" is limited to attacks of parasitic fungi and bacteria. Among the numerous plants subject to blight are the apple, pear, strawberry, tomato, potato, bean, eggplant, currant, raspberry, and grape (qv).

BLIGHT, AMERICAN See **AMERICAN BLIGHT**.
BLIGHT' BIRD A small insect-eating bird (*Zosterops oerulescens*) of New Zealand, so called because it frees fruit trees of blighting insects. See **WHITE-EYE**.

BLIND, EDUCATION OF THE In every generation of children a certain proportion, varying according to social conditions and climatic influences, are born blind or with such defective organs of sight as to become blind. With the improvements in cleanliness and in sanitary appliances at orphan asylums and houses of refuge, blindness has decreased in the United States in recent years. According to the census reports of 1900, there were about 8 blind persons in every 10,000 of the population. Most of the blind are born of the poor, and even the few who are not so born tend to sink into the dependent class. Hence, in all civilized countries, blindness and pauperism have been synonymous terms, although many of its victims are endowed with keen sensibilities and suffer more from their low social position than from their physical infirmity. The nineteenth century saw a wonderful revolution in the condition of the blind. They have emerged from a state of utter ignorance, dependence, and general wretchedness, and while many have become well-educated, independent, self-supporting citi-

zens, the condition of all has been greatly improved. For this radical change much credit is due to the blind themselves, for the eagerness with which they have taken advantage of the opportunities offered them, and for the brave and successful struggle to overcome the obstacles in their path. Since their infirmity cuts them off less than the deaf from social intercourse with the world at large, they are, as a rule, more cheerful and happy than the latter, while a tendency to conceit is doubtless attributable to the consciousness that they have had to contend with very great difficulties.

History of Institutions. The first book calling attention to the condition of the blind was published in Italy in 1646, and we find, from this time onward, an increasing interest in the subject of blindness and its effect on the human mind. Locke, Leibnitz, Condillac, Reid, and Diderot wrote upon it, and Rousseau endeavored to bring the question out of the region of abstract speculation into that of practical everyday life. Raised print had been long, though dimly, foreshadowed, and a number of blind persons had received assistance in their studies from tangible apparatus, such as raised letters and ciphering tablets, before Valentine Haüy began his work. To him, however, belongs the honor of inventing embossed books for the blind, as well as of founding in Paris, in 1785, the first school for their instruction. The Royal Academy made a report on his work in that year, and while pointing out the features which his system had in common with the agencies previously employed by individual blind persons, declared that to him alone were due their perfection, extension, and systematization. The school for the blind aroused great interest in Paris, and Louis XVI took Haüy into favor, bestowing several offices upon him. In the dark days of the Revolution Haüy and his school suffered much, but he continued his work, under great difficulties and privations, educating some pupils who became famous. Haüy's long, faithful, arduous, and fruitful labors in behalf of the sightless earned him the title of "Father and Apostle of the Blind." He published an essay on their education and continued his work in Russia and Prussia after he had been obliged to give it up in Paris.

England followed the lead of France by establishing in 1791 the School for the Indigent Blind in Liverpool, the object of which was to teach poor blind children to work at trades, to sing in church, and to play the organ. In 1793 Mr. David Miller, a blind man, and Rev. Dr. David Johnston founded the Royal Blind Asylum and School in Edinburgh, the main purpose of which was to train the blind to habits of manual labor, though in later years the directors have devoted increased attention to the intellectual development of the pupils. The Bristol Asylum for the Blind was opened in 1793, its object being to teach sightless children such handicrafts as would enable them to earn their own living. They also receive instruction in music and the English branches. The School for the Indigent Blind in London was established in 1790. Its chief object was instruction in manual labor, but a more liberal scheme of education was adopted after a time. Similar establishments were founded in Norwich, Glasgow, York, Manchester, and elsewhere. The organized efforts made in Great Britain for the relief of the blind were founded upon the idea, that as a class the blind must necessarily remain at the foot of the

social scale, forever dependent upon the more fortunate classes. Hence most of the British schools have never taken a high stand in their literary or musical training. The Royal Normal College and Academy of Music for the Blind was established in London, 1872, by an American, Mr. F. J. Campbell, a blind man, who had been educated and had taught at institutions for the blind in the United States, and who brought American teachers and methods to England. There are also in Great Britain societies for teaching the adult blind to read, and circulating libraries of books in raised type have been established in London, Brighton, and many provincial towns. The Association for Promoting the General Welfare of the Blind, which has been in operation for 50 years, supplies regular work to many at their own homes and finds employment for others in its workshops.

In most of the European institutions the prevailing idea is that what is done for the blind is in the spirit of favor and charity rather than of right and obligation. A large number of the so-called schools, especially those in Great Britain, are mere asylums, chiefly supported by annual contributions, which are made and received in the nature of alms. Even in those establishments which are endowed and supported by the governments the pupils are brought up under such influences as favor the segregation of the blind into a class by themselves and do not inspire the desire for usefulness and self-maintenance.

At the beginning of the nineteenth century institutions for the blind, mainly fashioned after the model set by Haüy, were established in various parts of Europe. The Vienna Institution was founded in 1804, Dr. Klein, a blind man, being its director for about 50 years. That of Berlin was established under the superintendence of Herr Zeune in 1806, Haüy having paved the way for it on his way to Russia. In 1808 three institutions were established—one in Amsterdam by an association of Freemasons, one in Prague by a charitable society, and one in Dresden. In 1809 Haüy put the school in St. Petersburg in operation, and Dr. Hirzel organized that of Zürich. In 1811 the Society of the Chain, an organization similar to the Freemasons, started an institution in Copenhagen, and many others were founded soon afterward. All the principal countries of Europe have special institutions for the instruction of the blind in the rudiments of learning, in music, and in mechanical arts. There are more than 150 of these on the Continent, many being under government supervision or control.

In the United States of America the education of the blind rests on a different basis. As soon as their claims to a share of the benefit of common-school learning were urged, it was conceded not as a matter of charity, but as a matter of right. The most valuable distinctive feature of the American institutions is that they constitute an integral part of the educational system of the country. The right of the blind to participate in all the educational benefits provided for every child in the Commonwealth is acknowledged by the State in its sovereign capacity, and since they cannot be taught in the common schools, an express provision is made for their instruction. This policy has acted very favorably upon the blind and has inspired them with self-respect and a worthy ambition to be independent.

The general system adopted in the American

schools is as follows (1) to give to all pupils the same sort of instruction, and to the same degree, as is given in the best public common schools, (2) to teach them the elements of vocal and instrumental music, (3) to train them in some sort of simple handicraft by which to earn a livelihood. Owing, however, to the prevailing desire of the young in America to strike out in new directions, to the general preference for brain work rather than hand work, and to the disadvantage at which the blind do mechanical work, comparatively few, hardly two-tenths, it is said, practice for a living the handicrafts which they have learned at the several institutions. Most of the graduates resort to various branches of the musical profession, teaching the elements of vocal and instrumental music, playing upon organs, tuning pianos, or trading in musical instruments. Some graduates take petty agencies and with a guide go about the country peddling on their own account. Others, favored by friends, find employment in some of the establishments where hand work combined with a certain amount of headwork is required. A few work diligently at their trades and earn an honest and comfortable livelihood. The general condition of the graduates is affected by the prevailing feeling of compassion, which, it must be said, is often abused by the blind. Upon the whole, however, the general effort made to lift the blind out of the pauper class has had very satisfactory results. There is doubtless a greater proportion of really self-supporting blind persons in the United States than in any other country. This is owing mainly to the public institutions for their education and training, especially to the pioneer school, the Perkins Institution, on which the others are modeled to a great extent, and to its director for 45 years, Dr Samuel Gridley Howe. Dr Howe, the Hero of America, possessed not only the humanity and inventive genius characteristic of the famous Frenchman, but also great executive ability.

The first school for the blind in the New World was founded in Boston, Mass., chiefly through the efforts of Dr John D. Fisher, a young physician, who had visited the French school. It was incorporated by Act of Legislature March 2, 1829, as the New England Asylum for the Blind. The State granted its aid from the beginning, this being proportioned at first to the number of beneficiaries received and educated, and active work was commenced in 1831, when Howe was engaged as director. Exhibitions of the pupils were given before the Legislature at an early date, and much interest and enthusiasm were aroused. Col Thomas H. Perkins gave his mansion in Pearl Street to the institution, which was renamed in his honor, as the Perkins Institution and Massachusetts Asylum (now School) for the Blind. The other New England States promptly took measures to secure for their blind children the advantages of instruction, but instead of erecting institutions at home, they sent their beneficiaries to the Massachusetts school.

Instruction in the literary department included not only the simple branches of a common-school education, but also some higher mathematics, astronomy and natural philosophy. The study of languages, too, was introduced at an early date, but, of course, the main emphasis was laid on a solid English education. In addition to vocal music and instruction upon the piano and

organ, the foundation for an orchestra was immediately commenced. The tuning of pianofortes, taught as a practical employment, has proved to be a lucrative one. The pianos of the public schools of Boston have been tuned and kept in repair by the blind for the past 25 years. Physical training, both in the gymnasium and out of doors, has always been insisted upon, and the pupils are gently stimulated to run about and play like other children. The Perkins Institution soon surpassed the European institutions and has long been the best school of its kind in the world. A printing press was started at an early date, and many improvements in the apparatus for the education of the blind were made. A detachment of pupils visited various parts of the country, and they were exhibited before the legislatures and people of twelve different States for the purpose of inducing them to make provision for similarly afflicted persons within their own limits. These exhibitions were so effective that "provision for the education of the blind was made in those States before the representatives of the people had time to wipe the tears from their eyes."

In 1837 Dr Howe began the education of Laura Dewey Bridgman, a child seven years old, who had become blind, deaf, and dumb from scarlet fever at the age of two. It had been supposed up to that time that a person in Laura's condition could not be taught the use of language, and Dr Howe's success elicited great interest, his reports detailing the progress of his pupil being translated into several European languages. His methods, which remain the standard ones, may be thus briefly stated. Upon articles in common use, such as spoons, forks, and keys, labels were pasted, containing their names printed in raised letters. Laura felt of these carefully and soon distinguished the difference between the crooked lines—spoon and key. Then small detached labels containing the same names were given to her, and the child, observing their similarity, laid these on the articles thus designated. The same process was repeated with all the articles she could handle. After a time the labels were cut up into their component letters, and these were arranged side by side. They were then mixed in a heap, and a sign was made to her to arrange them herself. The meaning of these exercises now dawned upon her mind, and the important step was taken. Laura's education was continued until she was 20. She learned to converse fluently in the manual alphabet, to read easily, and to write well and correctly. She studied arithmetic, algebra, geography, history, and elementary physiology. She was an expert needlewoman, could sew on the sewing machine, and knit fine lace. With Oliver Caswell and other blind deaf-mutes, Dr Howe began first with the manual alphabet, instead of with printed labels. The Perkins Institution has maintained as a specialty the teaching of blind deaf-mutes, Helen Keller having begun her education under the direction of this school.

The separation of the sexes was early insisted upon by Dr Howe, on the ground that while marriage between defectives is always unfortunate, it is especially so in the case of a class so helpless as the blind. In 1868-69 the cottage or family system was introduced, the State of Massachusetts appropriating nearly \$100,000 for cottages for the girls.

The Kindergarten for the Blind, an offshoot

of the parent institution, was founded in 1887 by Michael Anagnos, the son-in-law and successor of Dr. Howe, who has continued the policy of the latter and has greatly enlarged the work of the institution. An opportunity is thus afforded for a continuous education from the earliest stage to the gates of the college, where it is thought more desirable to have the blind mingle with the seeing than to remain segregated as a class apart.

The work of educating the adult blind in their own homes was begun in Massachusetts in 1900, the Legislature appropriating a sum of money to be expended by the Perkins Institution in this way. Several teachers were employed, and the enterprise proved so successful that the State increased its appropriation the following year. Instruction is given in reading and in several branches of handicraft, suited to the sex and the physical condition of each person. The institution places at the disposal of these outdoor pupils, free of all charge, its large library of books in embossed type of four different kinds. In this manner an attempt is made to solve the problem of educating, cheering, and rendering in a measure self-supporting and independent those who become blind after the period of childhood and youth has passed.

The first thought and purpose of building up special institutions for the instruction of the blind seem to have occurred to benevolent persons in New England, New York, and Pennsylvania almost simultaneously, but without concert. The New York Institution for the Blind was incorporated April 22, 1831, through the efforts of Dr. Samuel Akery and Mr. Samuel Wood. On March 15, 1832, Dr. John D. Russ began the education of three pupils, and, although he resigned his position in 1836, he continued to manifest much interest in the improvement of educational appliances for the blind.

The progress of the school was for some years retarded by the want of an efficient head to direct its affairs. In 1845 Mr. James F. Chamberlain was elected superintendent, and the institution entered upon an era of prosperity and advancement which has continued to this day. The excellent Pennsylvania Institution, which has grown to be among the foremost of the world, was founded in Philadelphia by the Society of Friends in 1833. Robert Vaux had for some years urged the necessity of making such a provision for the education of the blind. Julius R. Friedlander, the first principal, had had experience in European institutions for the blind and came to Philadelphia in the hope of establishing a school for their benefit. He organized the school with great care and deliberation, gave exhibitions of the attainments of his pupils before the legislatures of Pennsylvania, Delaware, and New Jersey, and obtained appropriations for the support of beneficiaries from each of these States and later from Maryland. The Ohio School for the Blind was established at Columbus in 1837. The Virginia school opened at Richmond in 1838, and that of Kentucky at Louisville in 1842. In 1910 there were 48 State Schools for the Blind with 531 instructors and 4323 pupils, of whom 419 were in kindergartens, 1317 received instruction in vocal music, 1752 in instrumental music, and 2855 were in the industrial departments. The libraries contained 80,774 volumes in raised type and 34,756 volumes in ordinary print. The value of property was reported as \$6,606,186.

In Europe Mr. Anthony Buckle, superintendent of the Yorkshire school, who died in 1900, did much for the elevation of the blind in the industrial and moral scale, as well as for their intellectual and spiritual enlightenment. The *Ecole Braille*, situated at Saint-Mandé, one of the suburbs of Paris, is administered with vigor and efficiency by Monsieur A. Péphan. It is under the control of the municipal authorities and entirely supported by the city. The *Institution Nationale* of Paris, the school founded by Haüy, is liberally supported by the state, and its pupils, selected from a large number of applicants residing in all the districts of France, are, as a rule, superior in intelligence to those of other European and of American schools. The institutions for the blind of Germany do not differ from those of France in any of the fundamental principles upon which the work is conducted. They employ a class of instructors superior to those of any other country. Few of the teachers are blind, and most of them are graduates of the German universities. The Imperial institution for the blind in Vienna now occupies a fine building, situated near the Prater, and well calculated to meet all demands for the physical, mental, moral, and spiritual development of its inmates. In addition to a commodious and well-equipped gymnasium, excellent school and music rooms, and a printing office with the necessary tools and machinery, it contains a museum, which is the best of its kind in Europe, in arrangement, classification, and proper display of its contents. It is not so rich in collections of specimens of apparatus as that of Paris. The director, Prof. Alexander Mell, is the author of the *Encyclopädisches Handbuch des Blindenwesens*—an important work on the blind and the methods and appliances employed in their instruction and training.

An international congress for the amelioration of the condition of the blind was held in Paris in connection with the Universal Exposition of 1900. Germany, England, Denmark, Sweden, Holland, Russia, Hungary, Switzerland, Italy, Portugal, the United States, Belgium, and France were represented, the two countries last named having the largest number of delegates and the controlling influence. There is an American Association of Instructors of the Blind, which meets biennially.

Books. In all the branches of instruction for the blind, while oral teaching is of no small importance, aid is derived from the use of books and apparatus adapted to the sense of touch. The process of printing embossed books consists of pressing the type strongly on heavy paper, in such a way as to produce letters in relief.

The first characters adopted by Haüy in 1785 were those of the Illyrian or Slavonic alphabet, doubtless on account of their square form. Large editions of a few works were printed at great expense in his system, which gave 365 letters on 50 square inches of surface. About 40 years later James Gall, a printer and publisher of Edinburgh, took up the work, being deeply impressed with the importance of putting the Bible into the hands of the blind. He printed his first book in 1827 and in 1834 published the Gospel of St. John, the first book of the Scriptures ever printed for the blind. In 1838 he printed for the British and Foreign Bible Society the Gospel of Luke and the Acts of the Apostles. His labors extended over a

period of 12 years. While at first he was obliged to contend with apathy and incredulity, much interest was eventually excited in his work in Great Britain and elsewhere. He used a modified Roman letter, choosing the lower-case alphabet in preference to capitals, whose uniformity renders them difficult to distinguish by the touch. His system gave 526 letters on 50 square inches. Meantime Dr Howe, when beginning the work of educating the blind at the Perkins Institution, found himself seriously hampered by the fact that at that time (1832) only three embossed books in English were in existence. By dint of various improvements, such as stereotyping, using thin paper expressly prepared, and reducing the size of the letters, he succeeded in cutting down the bulk of the books one-half, and the expense of printing to one-quarter of what it had been. Thus the Boston method gave 702 letters to 50 square inches, 21 editions of books being printed in a short time. A further improvement gave 1067 letters to the same space. Dr Howe was extremely desirous of giving the Bible to the blind, and in 1836 the entire New Testament was

alternately, the letters being reversed in alternate lines.

Nearly all the supposed improvements for facility in reading were made upon the idea that, as the majority of the blind are adults, all methods must be directed for their benefit—a theory which does not recommend itself to Americans, who consider the education of the young as of the first importance. Of these new methods only two have any prominence at the present time. Dr Moon's complex line type and the arbitrary point character. The former uses a combination of Roman letters with arbitrary characters, reversing the lines like Frere, but not the letters. His system is read with facility owing chiefly to its large type, measuring one-fourth of an inch. It was meant for elderly blind persons and for those whose hands are roughened by manual labor. It is well adapted for these two classes, but is too unwieldy for general use. The 64 volumes of the Moon Bible can be printed in eight volumes in Roman type. It also has the disadvantage of being illegible to seeing persons. Dr Moon has printed many books in English and in foreign languages. A

printed at the Perkins Institution. Numerous text-books were also issued.

The first printing in Philadelphia (in 1833-34) gave only 200 letters to 50 square inches, and was abandoned. In 1836-37 work was resumed with an improved method giving 826 letters. John Alston was the inventor of the Glasgow system, which gave 891 letters, using capital letters, however, as did the Philadelphia type. He printed the Gospel of St Mark in 1837, the New Testament in 1838, and the whole Bible in 1840. Dr Howe finishing his task of issuing the Bible in 1843. Alston's type was too small to be legible, and his system did not stand the test of time. Mr Lucas, of the Bristol Institution, invented a system of stenographic printing, with arbitrary characters and many contractions, by which he secured largeness of type and diminished the size of the book. In 1839 a society was formed to aid Lucas in printing the Bible and teaching the blind to read on his system. As this system was phonetic, it did not teach correct spelling, which is in any event difficult for the blind to master. Mr Frere, of London, also invented a phonetic system about 1836, as well as return lines. His books are read from left to right and from right to left

society has been formed to extend his system, and the blind are taught by it in their own homes. It requires, however, special teachers.

The arbitrary point character was invented by Charles Barbier, a Frenchman, and arranged in its present form by Louis Braille, one of the blind professors at the Institution Nationale of Paris. It consists of six dots. One or more of these are placed in various positions, making 62 varieties of form. One great advantage of this character is that it can be used by the blind for writing to others in their condition. Another is that it affords an excellent method for writing and printing music. It is extensively used and is a valuable invention. Mr William B Wait, the superintendent of the New York Institution for the Blind, arranged a modification of the point system, the dots of his method being placed horizontally. The friends of the point system would be glad to abolish the Roman letter altogether, whereas the advocates of the latter are glad to avail themselves of both methods, which are taught side by side in some institutions. They point out that seeing persons use three distinct methods for their educational purposes: Roman letter for reading, script letter for writing, and an arbitrary arrangement of characters

for music. There would therefore seem to be no reason why the blind should not employ two: Roman letter for reading and the point for writing and music.

Since the time of Haüy thoughtful educators have dwelt on the importance of using seeing methods as far as possible for the instruction of the blind. The point is to rescue the sightless from segregation as a class apart and to give them as many interests as possible in common with the rest of the world. Thus, owing to the influence of Mr. Gall, the modified Roman letter was adopted by the Royal Society of Arts. In 1851 the Royal Commissioners of the Exhibition of the Works of Industry of All Nations, held in London, recommended the universal adoption of Dr. Howe's books (the Boston type). In 1872 the American Association of Instructors of the Blind passed a series of resolutions in favor of the adoption as far as practicable of seeing methods. In 1876 the London School Board, after a patient and careful examination of the arguments advanced by some of the ablest educators of the blind in England, decided to adopt the methods used by seeing children in ordinary schools. In the reports of the Perkins Institution Dr. Howe urged constantly the minimizing in every possible way the difference between the blind and the seeing. Dr. Frank Rainey, of the Texas Institution, declares that "If we use the ordinary methods, the child will think and talk like seeing persons, whereas if we use odd or extraordinary methods, it will not have the same conceptions of concrete things as we do."

A great advantage of the Roman letter over the point is that blind children can get their early training from teachers in the public school, or from their parents, under the former system, and they themselves can in turn, after they have grown up, teach seeing children, making fairly good governesses for families. The punctuation of the point system is complicated, and the omission or abrasion of one single point alters the entire letter. "Any system where frequent substitution of its characters is necessary for its perfection is essentially weak in all its parts, and is fearfully defective in that its structure depends upon position, reversion, and substitution."

The principal printing establishments in the United States are: 1. The American Printing House for the Blind at Louisville, Ky. Congress has since 1879 appropriated \$10,000 a year in support of this enterprise, the publications being distributed *pro rata* among the institutions of this country. 2. The Howe Memorial Press at the Perkins Institution, Boston, which has an endowment fund of nearly \$150,000, raised by private subscription.

The first circulating library for the blind in the United States was established at the Perkins Institution in 1882, although books had been lent to the blind free of charge before this time. Philadelphia and New York also have libraries of this sort, and departments for the blind have been instituted in the State Library of New York at Albany, and in several of the principal cities of New England.

Apparatus. Among the early appliances for writing may be mentioned the "string alphabet" invented by Messrs. Milne and Bain of the Edinburgh Asylum. It consisted of knots tied upon cord. Gall's writing stamps, which date from 1838, were much used. Saint-Clair and Gall invented processes for guiding the pencil in

an ingenious but slow and tedious way. Guldberg, of Copenhagen, also invented a method of pencil writing. The modern methods employed in the best American institutions are (1) the ordinary typewriter and (2) tablets for point writing, according to the Braille and kindred systems. This has the great advantage of being legible by the blind themselves, but is a slow process. It is gradually replaced in advanced work by the Hall-Braille writer—an adaptation of the principles of the typewriter to the printing of point characters, made by Mr. Frank H. Hall, of the Illinois Institution for the Blind. The followers of the New York point system use a similar machine called the kaleidograph, the invention of Mr. Wait, of the New York Institution. A third process consists in writing with a pencil on a grooved sheet of cardboard or aluminium, thus forming a square handwriting. This method has the advantage of extreme simplicity and cheapness and has been much used by the blind for many years.

For *arithmetic*, W. H. Taylor, of York, England, invented an octagonal ciphering board, with cells into which type may be placed in different positions to represent the digits. A modification of this board was made at the Perkins Institution and manufactured by one of its graduates.

For the study of *natural history*, relief representations of animals are employed, also stuffed specimens of birds and animals. Papier-mâché models, life-size, assist the blind in the study of anatomy, while for botany these are greatly enlarged.

The early maps for the blind were made in Europe, on boards and by hand, the process being tedious and expensive. Dr. Howe, in 1836, invented an atlas which is thought to have been the first book of maps for the blind ever made. At the present time the blind are aided in their study of geography by wooden wall maps in relief; dissected maps, also of wood, made at the American Printing House for the Blind, Louisville, Ky., and at the Perkins Institution in Boston; and embossed maps printed on paper by the British and Foreign Blind Association, London, and by Mr. Kunz, Illzach, Alsace.

All the *kindergarten* occupations, except drawing and painting or color work, are used with the blind children. In the kindergarten at Jamaica Plain, Mass., the following changes have been made in the ordinary appliances, to fit them for the use of the blind: The tables are marked out in inch squares by grooves instead of by lines. For the use of the gift representing surface, line, and point, frames 2 inches high and the length and breadth of the kindergarten tables have been prepared. These frames are stuffed with horsehair, and covered with cloth stitched in inch squares with coarse silk. The cushions thus formed are placed on the tables, and the tablet rings and half rings (having been previously drilled, two holes in each) are pinned on to the cushions. Sticks large enough to have holes drilled in them are used in place of the regular kindergarten sticks, and beads one-quarter inch in diameter are used to represent the point. By pinning the forms they make to these cushions, the children are able to examine their work with their fingers without displacing it and can thus "see" what they have accomplished. In the use of the parquetry, the circles, squares, etc., are not pasted on plain paper, as is usual in the kindergarten, but square and

oblong cards of different sizes with raised lines, forming inch squares, printed on them have been substituted. See KELLER, HELEN

BLIND, blind, KARL (1826-1907) A German agitator and writer. He was born at Mannheim, and while a student at Heidelberg was imprisoned for his revolutionary activity. In 1848 he participated in the uprising in Baden and had to flee, wounded. The next year he joined the band of liberals headed by Struve which invaded southern Germany. He was taken prisoner and sentenced to eight years' confinement. He was, however, set free by the populace and went to Karlsruhe, whence he was sent by the provisional government as an envoy to Paris. Expelled from France, he went to Brussels, and then (1852) to London, where he found rest. There for many years he kept up his political agitation through articles in many journals and in intercourse with Garibaldi, Mazzini, Louis Blanc, and other democratic leaders, but after 1866 his writings became less revolutionary in tone, in consequence, perhaps, of the death of his stepson, who in May of that year attempted to assassinate Bismarck and committed suicide in prison. Blind published a great number of political essays and brief articles on history, mythology, and German literature. Among his works are *Fire-Burial among our German Forefathers*, *A Record of the Poetry and History of Teutonic Chantations*, *Ygdrasil*, or, *The Teutonic Tree of Existence*, and biographies of Freiherrn, Ledru-Rollin, and Francis Deák. In 1897 he contributed an autobiographical sketch to the *Conhill Magazine*, London.

BLIND'AGE (from *blind*, in the sense of invisible, making invisible, as in "blind story") A screen to shelter troops from an enemy's fire, constructed of lumber and earth, trees inclined against walls, bushes, etc., depending upon the available materials and ingenuity of construction. The effective defense of Ladysmith, Kimberley, and Mafeking, in the Boer War, 1899-1902, and the concealment of the Japanese trenches at Port Arthur (1904), was rendered largely possible by the clever construction of improvised bombproofs and shelters. See FORTIFICATION.

BLIND BEGGAR'S DAUGHTER OF BETHNAL GREEN An English ballad in two parts, of the time of Queen Elizabeth. The blind beggar has a fair daughter, Bessie, whom a knight falls in love with and marries. At the wedding feast the blind beggar turns out to be Henry, son of Sir Simon de Montfort. Day, in 1659, and Knowles, in 1834, produced dramas entitled *The Blind Beggar of Bethnal Green*, founded on this poem.

BLIND FISHES (OF CAVES) See CAVE ANIMALS.

BLIND HARRY See HARRY THE MINSTREL.
BLIND'NESS Want of sight may arise from any cause within the eye intercepting the rays of light on their way to the optic nerve, or from disease, defect, or injury of the optic nerve or optic tracts, or of the visual centres in the brain. Blindness may exist from birth or be acquired. It may be present during the day or the night and may be permanent or transient, complete or partial. *Congenital blindness* is due to deficient development of the nervous apparatus or to defect in the globe, to cataclat (qv), to defect or disease of the cornea, choroid coat, optic nerve, or retina, or to tumours. *Acquired blindness* may be due to injury of the eye or wounds of the head, or operations, or sympathetic irritation, to ophthalmia neonatorum, trachoma, diseases of the cornea, iris, choroid, or retina, to glaucoma or tumours, or to chronic disease of the kidneys, heart disease, syphilis, disease of the brain or its meninges, or of the spinal cord, certain fevers, poisoning by lead, alcohol, particularly wood alcohol, or tobacco, etc. See AMAUROSIS, AMBLYOPIA, ASTHENIOPIA, HEMERALOPIA, NYCTALOPIA, EYE, DISEASES OF THE, COLOR BLINDNESS.

BLIND PREACHER, THE The Rev William Henry Milburn, for many years the chaplain of the United States Senate.

BLIND RIVER A town in Algoma District, province of Ontario, Canada, situated on the north shore of Lake Huron and on the Canadian Pacific Railway, 20 miles east of Thessalon (Map Ontario, A 1). It has important lumber industries. Pop, 1901, 2056, 1911, 2558.

BLIND SHELL See PROJECTILE.

BLIND SNAKE See BLINDWORM.

BLIND SPOT A roundish oval spot in each retina, which is blind. It corresponds to the place of entry of the optic nerve. The spot is some 1.8 millimeters in width, i.e., subtends an angle of some 6° (the limits given by Helmholtz are 18° 55' and 12° 25'). That it is totally

BLIND SPOT OF LEFT EYE (plane projection). Reduced from a large diagram, in which the distance from the inner edge of the point of fixation *a*, to the inner edge of the blind spot was 54.5 mm. The distance of the point of fixation from the eye in the experiment was 22 mm.

blind, whether to brightness or color, was first proved by the French physicist Mariotte in 1668 and is easily demonstrable. Its form differs somewhat in different eyes. With careful observation it can be shown to possess certain irregular prolongations, which represent the course of the large blood vessels that enter the eye along with the nerve.

A striking experiment may be performed as follows. Close or bandage the right eye, and with the left gaze steadily at a point upon a wall or screen some 7 feet distant. Let another person seat himself directly before the wall, on your left-hand side, in such a position that his

forehead is on a level with the point of gaze, and his nearer cheek some 50 centimeters distant from it. If your gaze remains constant, his face will entirely disappear, and the wall will seem to extend continuously away from you on the left. By spreading a sheet of paper on the wall, and noting the points at which a colored pencil, moved to and fro by an experimenter, disappears and reappears, you can make an accurate map of the blind spot, including the vascular prolongations mentioned above.

This experiment raises a difficulty. You fail to see the face, and yet you see something, i.e., the unbroken color of the wall. The blind spot is thus filled out with color sensation. Now in binocular vision this result might have been expected. For the optic nerve enters the eye on the nasal side of each retina; so that when we are using the two eyes together for purposes of visual perception, superposing (as it were) the one upon the other, and laying temporal half over nasal and nasal over temporal, the area that is blind in the one eye will correspond to an area in the other that is endowed with normal vision; the two eyes supplement each other. Further, the result would not be surprising, if it were gained in monocular vision, but under the ordinary conditions of seeing; for the eye is intrinsically a moving organ, and we instinctively turn the spot of clearest vision (see *EYE*) upon any object in the visual field that we wish to observe. But what of the result, in monocular vision, when we have taken especial pains to restrain the eyeball from movement?

PROJECTION OF BLIND SPOT OF RIGHT EYE.

O, optic axis; *ba*, area of optic nerve; *AB*, area of blind spot as projected on the screen *CAB*.

Let us look at the experimental data. 1. There seems to be no doubt that the spatial value of the blind spot, in visual perception, is entirely normal; points seen on the inner and outer edges of the spot do not approximate or run together,

as they would if the spot were wholly indifferent for purposes of space perception. Paste nine large letters, in three vertical columns of three letters each, upon a sheet of paper. Hold the paper at such a distance and in such a position before the eye that the central letter of the square falls within the blind spot, while the surrounding eight letters are still visible. You will find that the surrounding letters still form a square for perception; whereas, if the blind spot had no spatial function, the two letters to right and left of the central would approach each other, and the whole figure would take on an hour-glass form. 2. If the surface at which we are looking is uniformly colored, the blind spot is filled out by this color. This law was demonstrated by our first experiment. It may also be proved as follows. Paste on a sheet of paper a colored ring, large enough to contain the blind spot within it. Let the ring be so wide that the spot slightly overlaps its inner edge. You see a solid disk, of the color of the ring. 3. If the surface is checkered or variously colored, there is (for practiced observers) no filling of the spot. Paste upon a sheet of paper a rectangular cross, the two vertical arms of red and the two horizontal of blue, with the four arms mitred at the centre. Hold the paper in such a way that the centre, with its two red and two blue triangles, falls at the centre of the blind spot. At first you will think that you see the two red or the two blue arms as a continuous band of red or blue; with practice, you will be able to convince yourself that at the central point of the figure you really see nothing.

The last of these three facts is intelligible enough: if the spot is blind, it stands to reason that one does not see with it. The first two facts, however, require explanation. We may (a) attempt a peripheral theory of the phenomena; that is to say, we may assume that the retinal sensations set up in the neighborhood of the blind spot somehow "irradiate" over the spot itself. The irradiation can hardly be thought of as physical, an irradiation of the stimulus. We must rather suppose that the local signs attaching to retinal points along the edge of the spot are extensible signs, carrying with them the sense values and space values of the whole blind area. When one is required to localize a pressure upon the skin of the back, one may make a mistake of as much as 5 centimeters in any direction; the local sign is extended so far in all directions. The local signs of the particular ring of retinal tissue under consideration would be similarly extended, only that the direction of their extension (towards the centre of the spot) is limited by the structure and function of the rest of the retina. If this explanation appear far-fetched, we may have recourse (b) to a central theory; that is to say, we may assume that the blind spot is filled out by "association" or "imagination," by centrally aroused sensations (see *SENSATION*), while the periphery is and remains blind. There is no inherent difficulty in this view, and it accords well with the fact that the unpracticed observer sees the spot as filled, while the more practiced observer is aware that he does not see with it at all. We must then suppose that the local signs of the rim of the spot have taken shape under the same general laws that have conditioned visual local signs at large; and we may, perhaps, suspect that their development has been influ-

enced, in each eye, by the normal space values of the corresponding area of the other eye

Bibliography H von Helmholtz, *Physiologische Optik* (Hamburg, 1911), Titchener, *Experimental Psychology* (New York, 1901), Wundt, *Physiologische Psychologie* (Leipzig, 1910)

BLINDSTORY A story or other architectural horizontal division in a building, either outside or inside, which is without windows or other openings of importance in the outer walls. On the outside it may consist of a blank wall or of a series of blind arcades. On the inside of churches the term is applied especially to the middle story of the nave or choir above the side aisles and below the clearstory (qv), when without windows itself. It thus corresponds in position to the *triforium* (qv), and the term is applicable to the triforium where this is without exterior lighting. The windowless upper portion of the exterior walls of St Paul's Cathedral, London, and of the Pantheon at Paris, constitutes in each case a blindstory, masking a clearstory behind it, and in many picture galleries and museum buildings the upper story is a blindstory, the light being received through skylights in the roof.

BLIND TOM (c 1850-1908) A musical prodigy, a blind and almost idiotic negro born of slave parents near Columbus, Ga., and called Thomas Bethune after his master. His musical genius attracted wide attention, and from 1861 he was frequently exhibited in New York. He was able, after a single hearing, to render even complicated music on the piano. After playing, he generally sprang up and applauded himself vociferously. He reappeared on the stage in New York in 1904-05, but he was difficult to manage, and his growing mental infirmity caused his final withdrawal, and he died in Hoboken, N. J.

BLIND WORM (Dan *blindorm*, so called on account of the small size of the eyes), or **BLIND SNAKE** A name given to certain worm-shaped burrowing reptiles and amphibians. It applies especially to those of three groups, none of which is really blind.

1 The serpent-like lizards of the family Anguillidae, of which the common blindworm, orvet, or slowworm (*Anguis fragilis*) of Europe and western Asia is a type. Both the body and tail are elongated and serpent-like and rarely more than one foot long, it possesses no external traces of appendages, but has internally a rudimentary shoulder girdle, sternum, and pelvis, placing it intermediate between the lizards, which have four legs, and the snakes, in which all traces of limbs are lost, indeed, it has been proposed to put several snake-like lizards, with more or less degenerate legs, together with some of their allies, into one group and call them serpent lizards (Saurophida). The eyes are bright, but small, giving rise to the belief that the animal is blind, and it has movable eyelids—a decidedly lizard-like character. It feeds on slugs and insects and is perfectly harmless. It is so very timid that when startled its muscles contract violently, and the tail is rendered so stiff and brittle that it is easily broken. Thus when seized by an attacking bird or mammal, the tail remains in the mouth of the assailant, while the blindworm makes its escape. Blindworms bring forth their young alive and winter together in numbers under brush and leaves or in loose, dry soil. Several genera of the same fam-

ily and presenting similar characteristics inhabit the warmer parts of America, some of which have part or all of their limbs externally developed, the beautiful green, brown-banded, many-keeled lizard (*Gerrhonotus multicarinatus*) of California is an example. In this lizard the tail is so easily detached that the creature is able voluntarily to discard this member as it scampers away. The abandoned tail twists and wiggles violently, and if it falls among dried leaves, causes such a commotion that the attention of the pursuer is very likely attracted, while the lizard keeps swiftly on its way.

Best known, however, is the "glass-snake," frequently found in the loose soil of dry fields from Illinois to Florida and westward into Mexico. It has no feet, but by serpentine movements is able to move with considerable swiftness and, when overtaken, can hardly be captured without injury, for its tail is so loosely articulated and so free of muscles that it breaks off like a bit of glass, to be quickly renewed by a new growth if the animal is not further harmed. It is yellowish green above, with black lines. "The snout is long and pointed, the ear pits large, the eyelids well developed, and each flank is provided with

"GLASS-SNAKE" LIZARD
a, top of head, b, side of head

what is ordinarily a deep groove, but which, on the animal's swallowing some large object, appears as a tract of elastic skin, the rigid skin of the body generally being incapable of expansion." It is perfectly harmless. Its technical name is *Ophisaurus ventralis*. Consult Cope, *Crocodilians, Lizards, and Snakes* (Smithsonian Institution, Washington, 1900), and Ditmars, *The Reptile Book* (New York, 1907).

2 A family of true serpents (Typhlopidae), called "blind snakes," because their eyes in all cases are minute and weak and in some are almost invisible under overlapping plates. They rank lowest among serpents, are only a few inches in length, and have rigid bodies suitable for burrowing, shaped much like those of earthworms and with curved tails. They occur in all the warmer parts of the world, boring their way through the loose topsoil and feeding on worms, grubs, and insects, and in India sometimes appear in large numbers above ground after showers, inspiring the natives with foolish dread, for they are quite harmless. Numerous genera and species inhabit the warmer parts of America. Consult Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851).

3 The Cœlophidae, a family of degenerate urodelous amphibians for a long time classed among reptiles. The body is vermiform and without limbs, all traces even of the pelvic and pectoral girdles having been lost. The ribs are too short to encircle the body, and the vertebrae are articulated as in fishes and lower amphibia, and not as in snakes. There are small scales in the skin, the eyes are very small, and in some species are covered entirely by the skin. There is neither tympanic membrane nor tympanic cavity. • The small

mouth lies on the ventral side of the conical head, and there is no tail, for the vent opens at the posterior end of the body. All these departures from the typical amphibian type are adaptive, fitting the caecilians for their subterranean burrowing life. The young are hatched with external gills and gill slits and for a time lead an aquatic life. The caecilians inhabit warm countries and feed on earthworms and insect larvae; they are most abundant in South America, and Mexico and Ceylon possess several species. Sometimes they are called blindworms, but these amphibia should not be confused with the lizards and snakes above mentioned.

BLIRK. See BLEAK.

BLISS, CORNELIUS NEWTON (1833-1911). An American merchant and politician, born in Fall River, Mass. He was a clerk in New Orleans and subsequently in Boston, and in 1866 was admitted a partner in the commission business of J. S. & E. Wright & Co., of the latter city. In 1881 his firm was merged into that of Bliss, Fabyan & Co., of New York. He was chairman of the Republican State committees of New York of 1887 and 1888, and treasurer of the Republican National committees of 1892, 1896, 1900, and 1904. In 1897-98 he was Secretary of the Interior in President McKinley's cabinet. An attempt was made to draw him into the controversy brought about by the charges of Alton B. Parker that large contributions had been made to the Republican campaign fund by corporations of the country, but he refused to make any public statement in regard to the matter.

BLISS, DANIEL (1823-). An American missionary and educator, born in Georgia, Vt. Graduating from Amherst College in 1852 and from Andover Theological Seminary in 1855, he was ordained to the Congregational ministry and was sent (1856) to Mount Lebanon by the American Board of Commissioners for Foreign Missions. In 1862-64 he was acting secretary of this board in New York City and then returned to Syria, where he was for 38 years president of the Syrian Protestant College at Beirut. In 1902 he became president emeritus, being succeeded by his son Howard Sweetser Bliss. Frederick Jones Bliss is also his son. He published, in Arabic, *Natural Philosophy* and *Mental Philosophy* (1874).

BLISS, EDWIN MUNSELL (1848-). An American Presbyterian theologian, born in Erzurum, Turkey, a son of Isaac G. Bliss, formerly agent of the American Bible Society for the Levant. He was educated at Robert College, Constantinople (1862), and afterward at Amherst and Yale. He edited the *Encyclopedia of Missions* in 1889-91 and also the second edition (1910), was associate editor of *The Independent* in 1891-1901, and an editorial writer on *Harpers's Weekly* and the *New York Times* in 1901-02. Of the Foreign Missions Industrial Association he became general secretary in 1905 and of the Census Bureau a special agent in 1907. He published *The Turk in Armenia, Crete, and Greece* (1896); *The Missionary Enterprise* (1908).

BLISS, FREDERICK JONES (1859-). An American archaeologist, born on Mount Lebanon, Syria, son of Daniel Bliss and brother of Howard S. Bliss. He graduated at Amherst College (1880), was principal of the preparatory department of the Syrian Protestant College at Beirut for three years, and finished a course at Union Theological Seminary in 1883, but was not ordained to the ministry. After inde-

pendently conducting researches in Syria, he became associated in 1890 with the work of the Palestine Exploration Fund, and this connection was maintained for 10 years. He superintended the excavations at Tell-el-Hesi, on the site of Lachish (1891-93), and at Jerusalem (1894-97). At the former place he discovered, in 1892, the first cuneiform tablet found in Palestine—a letter from Pabî referring to Sipti Bool and Zimrida of Lachish, known from the Tell-el-Amarna tablets; at Jerusalem, with A. C. Dickie, he traced the buried ancient south rampart with remains of towers, gates, streets, etc. He assisted in placing on a firm basis the scientific study of Syrian pottery. In 1911 he became dean for men at the University of Rochester. His writings include: *A Mound of Many Cities* (1892); *Excavations at Jerusalem, 1891-97*, with R. A. S. Macalister (1898); *Excavations in Palestine, 1898-1900* (1902); *The Development of Palestine Exploration* (1906); *The Religions of Modern Syria and Palestine* (1912).

BLISS, HOWARD SWEETSER (1860-). An American Congregational clergyman and educator, son of Daniel Bliss and brother of Frederick Jones Bliss. He was born on Mount Lebanon, Syria, where his parents were Congregational missionaries; graduated from Amherst College in 1882 and from Union Theological Seminary, New York City, in 1887; studied at Mansfield College (Oxford University) and at Göttingen and Berlin and in 1890 was ordained to the ministry. He was assistant pastor of Plymouth Church, Brooklyn, until 1894, and pastor of the Christian Union Church in Upper Montclair, N. J., in 1894-1902. In the latter year he succeeded his father as president of the Syrian Protestant College in Beirut.

BLISS, TASKER HOWARD (1853-). An American soldier, born at Lewisburg, Pa., and for two years a student at the university of that city (now Bucknell University). He graduated from West Point in 1875, was professor of military science at the Naval War College from 1885 to 1888, and spent two years as military attaché at Madrid. Upon the close of the Spanish-American War, in which he had served during the Porto Rican campaign of 1898, he was appointed Collector of Customs at the port of Havana and in 1902 was made special envoy to Cuba, to negotiate the treaty of reciprocity between Cuba and the United States. He was commandant of the Army War College in 1903, from 1905 to 1909 held commands in the Philippines, in the early part of 1911 commanded the provisional brigade on the southern California border during the Mexican Insurrection, and was then for a short time commander of the Western Department. After Aug. 12, 1911, he was commander of the Department of the East. He was made brigadier general, U. S. A., in 1902.

BLISS, WILLIAM DWIGHT POMER (1856-). An American Episcopalian clergyman and social reformer. He was born in Constantinople, Turkey, and was educated at Robert College, Constantinople; Phillips Academy, Andover, Mass.; Amherst College (1878), and Hartford Theological Seminary (1882). He organized the first Christian Socialist Society in the United States in 1889, and he was president of the National Social Reform Union. He was rector at Amityville, L. I., in 1902-06, and at West Orange, N. J., in 1910. He was investigator for the United States Bureau of Labor in 1907-09.

He was editor of *The Dawn* (1889-96), of the *American Fabian* (1895-96), of the *Encyclopedia of Social Reform* (1898, rev. 1908, 3d ed., 1910), and in 1901 of the publications entitled *The Social Unity* and *The Civic Councilor*. He also published a *Handbook of Socialism* (1895) and *What is Done for the Unemployed in European Countries* (1908).

BLISS, WILLIAM JULIAN ALBERT (1867-) An American physicist, born in Washington, D. C. He graduated at Harvard in 1888 (A. B.) and received a "proficient in electrical engineering" at Johns Hopkins in 1890. He was assistant in physics at Johns Hopkins from 1895 to 1898 and associate in physics there from 1898 to 1901, when he became collegiate professor of the same subject. His publications include a *Manual of Experiments in Physics*, in collaboration with Joseph S. Ames (1897).

BLISTER BEETLE A dark-colored, elongated beetle of the family Meloidæ, so named because the dried and pulverized bodies of certain of them are used to make blister plasters. They are also called oil beetles (q. v.), because some species, as of Meleoe, exude a disagreeable yellow fluid from the kneejoints when disturbed. In the adult stage these beetles occur on foliage and flowers, especially the goldenrod, and several kinds are destructive to the potato plant. The food habits of the young are very different from those of the parent. These beetles illustrate a method of insect development termed hypermetamorphosis. (See METAMORPHOSIS.) The best-known one is the cantharis, or Spanish fly (*Lytta vesicatoria*), of southern Europe, which is bright green and about an inch long. It is gathered from its food plants—hilar, privet, etc.—at night, when at rest, by beating the bushes and catching the insects in a cloth, by persons who guard their faces with veils and gloves against the acrid volatile discharges of the beetles. They are killed usually by immersion in hot vinegar and water and then dried and put into air-tight bottles. Several other species of blister beetles are similarly used in other parts of the world.

The active principle of the blistering flies is *cantharidine*, $C_{12}H_{12}O_4$, which possesses such powerful properties that one hundredth of a grain placed on the hip rapidly causes the rise of small blisters. Administered internally, blistering flies cause heat in the throat, stomach, intestines, respiratory organs, etc., and in large doses, they give rise to inflammation of a serious nature and sufficient to cause death. Externally they are employed as a blistering agent. There are various medicinal preparations of blistering flies, such as *cerate of cantharides*, which contains 320 parts of cantharides to 180 parts yellow wax, 180 parts of resin, 220 parts of lard, and 150 parts of oil of turpentine, *tincture of cantharides*, procured by digesting blistering flies in proof spirit, etc., but that most commonly employed is *plaster of cantharides*, or *blistering plaster*, obtained by heating and straining 1000 parts of Burgundy pitch with the strained liquid. See BLISTERS, MELOIDÆ (for bibliography), and illustration on Colored Plate of BEETLES.

BLISTERS (also Old Dutch *bluyster*, blister, of *blast*, blow) Medicinal agents which, when applied to the skin, raise the cuticle into small vesicles filled with serous fluid. They are applied either in the form of plasters or in a

fluid state. The most common blister in use is made of cantharides (see BLISTER BEETLE) mixed with varying proportions of lard and wax to form an ointment. If applied too long it may produce sores which are difficult to heal. Mustard (*Sinapis nigra*) is frequently used, but seldom left on sufficiently long to produce blistering. Croton oil, strong liquor ammoniac and tartar-emetic ointment are also occasionally used in practice. Blisters are especially useful in inflammations of serous membranes, as pleurisy, in glandular tumors, in indolent ulcers, and for the relief of muscular pain, as well as for chronic joint affections. The term is also applied to elevations of the cuticle filled with serum or blood. See COUNTERIRRITANTS.

BLISTER STEEL See IRON AND STEEL.
BLITHE'DALE ROMANCE, THE Hawthorne's novel founded on the Brook Farm experiment. It is regarded by some as the finest of the author's works.

BLITONG See BILLITON.

BLIZZARD A severe, blinding storm of fine dry snow, with a freezing wind. This word is popularly said to have originated in the United States and is in fact on record there as early as 1830 or 1840, but more recent investigations have shown that it is used in analogous sense in the local dialect of Lancashire, England, where it can be traced back for several centuries and is usually spelled *blesard*. It came to be widely employed in 1880-81 in connection with the severe storms in the Western States and has been in almost universal use since the great storm of March, 1888, when snow fell to the depth of three feet over the Atlantic States and New England and was drifted by gales of wind for several days into drifts of 5, 10, and 20 feet deep, causing a general suspension of traffic. A similar storm occurred in eastern Virginia and Maryland in February, 1898, and one is also recorded for the neighborhood of Norfolk, Va., in the early part of the last century. The most destructive blizzards, because of the intense cold, occur in the region between Dakota and Missouri and Ohio. Similar storms of snow and wind are also frequent in Great Britain. These storms correspond very nearly to the *purga* of Siberia and the *buran* of Russia. They are due essentially to the rapid southward flow of a mass of cold air pushing outward from a large region of high barometric pressure. They have a well-defined front edge, which advances with great regularity, the rate of progress being by no means so rapid as that of the wind itself, whence we infer that the wind at the front must be rising upward and flowing over. The general rate of progress is therefore due, not to the wind as such, but to the differences of density and pressure prevailing in the atmosphere on either side of the front. On this account it has become possible for the officials of the United States Weather Bureau to forecast the advance of a blizzard with considerable accuracy, and very few cases occur in which the citizens are not abundantly forewarned.

BLIZZARD STATE, South Dakota. See STATES, POPULAR NAMES OF.

BLOAT (Icel *blotna*, to become soft, *blauti*, soft, wet), HOVEN, or TYMPANITES. A condition in cattle or sheep in which, owing to the formation of gas in the rumen, or first stomach, this organ becomes painfully distended. The trouble frequently occurs from eating too much, easily fermenting food, especially green feeds, such as alfalfa, clover, or other legumes. Eating un-

due quantities of grain sometimes produces the same effect. Cases of bloat are most frequent among animals that are unaccustomed to grazing on green legumes. Relief may usually be attained in mild cases by administering moderate doses of salts or medicines stimulating the removal of the contents of the rumen. One pint of linseed oil or a pound of Epsom salts would be a suitable dose for a cow and about one-fifth that amount for a sheep. If simple remedies fail, and the breathing becomes distressed, and the animal stupid, the gas may with safety be allowed to escape by an external opening made with a cannula and trochar, or with a large pocket or table knife, at a point on the left flank intermediate between the last rib, the lumbar vertebra, and the prominence of the hip joint.

BLOCH, blóg, CARL HEINRICH (1834-90). A Danish painter. He was born in Copenhagen and studied at the Copenhagen Academy. From 1852 to 1865 he was in Italy, and in 1883 he was appointed a professor at the Copenhagen Academy. He first achieved a reputation for portrait and genre pictures, the latter drawn from Jutland and Zealand. His most celebrated paintings, however, are historical and religious. The list of his works includes: "Peasant's Cottage" (1858); "Roman Street Barber" (1864); "Christian II in Prison at Sonderburg" (1871, Royal Gallery, Copenhagen); "James of Scotland Visiting Tycho Brahe," and two large historical frescoes at the University of Copenhagen. The best work of his last years is a series of small landscapes. The Royal Gallery possesses the best and largest collection of his paintings, which are good in composition but poor in color. Consult Hannover, *Danische Kunst des 19ten Jahrhundert* (Hanover, 1907).

BLOCH, JEAN DE (1830-1902). A Polish financier, economist, and writer on military affairs. He was born at Radom, of Jewish parents. He was administrator, under government appointment, of the entire railway system connecting the Black Sea and the Baltic and holder of the concessions for numerous lines. He was active in promoting an industrial movement in Poland. This he furthered by his large interests in the lumber and sugar trades, of which he became the actual head. He was constantly engaged in scientific and philanthropic enterprises among the poorer classes. He first became known to the world at large, however, as a propagandist of universal peace, partly by his articles in French, German, and English periodicals and his war-and-peace museum at Lucerne, but more particularly through his great work published at St. Petersburg in 1893 (7 vols.), and in abridged form translated into English by R. C. Long as *The Future of War in its Technical, Economic, and Political Relations* (1899; in England as, *Is War Now Impossible?*). In this book the author argues that under modern conditions a war would necessarily be of such length as to result in the starvation of the contending powers, consequent revolution, and the destruction of the state, and hence that it is unlikely to be entered upon in the future.

BLOCH, MARCUS ELIESER (1723-99). A German ichthyologist, born of poor Jewish parents in Anspach. He was permitted to grow up in ignorance, and at 19 he had read nothing except a few useless rabbinical treatises. He then became an assistant to a Jewish surgeon in Hamburg and learned German and Latin.

He decided to study medicine, went to Berlin, and devoted himself with indefatigable zeal to anatomy and other branches of natural history. His great work is the *Allgemeine Naturgeschichte der Fische* (12 vols., Berlin, 1872-95, with 432 colored plates), long the most comprehensive work on ichthyology, and still valuable, especially for its pictures. His collection of fishes went to the Berlin Zoological Museum.

BLOCH, MORITZ. A Hungarian philologist and theological writer. See BALLAGI, Mór.

BLOCHMANN, blóc'man, KARL JUSTUS (1786-1855). A German educator, born in Reichstädt (Saxony). He studied at the University of Leipzig and from 1809 to 1816 was an instructor in Pestalozzi's school in Yverdon, Switzerland. In 1818 he became assistant director of a newly opened school at Dresden. In 1824 he there opened, with royal sanction and support, the Blochmann Institute, a secondary school for boys, which in 1829 was united with the Vizthum Gymnasium and long enjoyed considerable fame. His method was in general similar to that of Pestalozzi. He wrote what is perhaps the best German biography of Pestalozzi. *Heinrich Pestalozzi, Züge aus dem Bilde seines Lebens und Wirkens* (Leipzig, 1846 and 1897).

BLOCK. An instrument used in practical mechanics, and especially on board ship, for changing the direction in which a rope leads or for gaining power at the expense of speed. It consists of a framework, or shell; one or more pulleys, or sheaves; a hook, shackle, or other means of attachment to other objects; a pin or pivot-bolt for the sheaves to revolve upon; and, generally, a strap or rope or iron to which the hook or shackle is attached. Blocks are classed in several ways according to the number of sheaves, as *single, double, treble, fourfold*, etc.;

BLOCKS.

a, double block; b, treble block; c, long-tackle block; d, clew-line block; e, snatch block.

according to their design, as *snatch blocks, fiddle blocks, gin blocks, secret blocks, sister blocks, cheek blocks, clump blocks*, etc.; and according to their use as *cat blocks, quarter blocks, clew-line blocks, topsail halliard blocks*, etc. The apparatus called a *tackle* or *purchase* consists of two blocks and the rope (called the *fall*) which *reeves* (i.e., passes) through them. One end of the fall, called the *standing end*, is made fast to the *breech* (the part opposite the hook) of one of the blocks; from this the fall leads through the other block and then back through the first one; if the blocks are double, treble, fourfold, etc., the fall leads back and forth through the blocks until all the sheaves are filled. See TACKLE.

BLOCK, blók, MAURICE (1816-1901). A French statistician and economist. He was born in Berlin, but was naturalized in France, where he served in the Ministry of Agriculture from

1844 to 1852 and then in the bureau of statistics till 1862, devoting himself thenceforth exclusively to authorship. Among his numerous works on agriculture in various countries of Europe, on French statistics and finances, and on socialism in Germany, the most important are *Des charges de l'agriculture dans les divers pays de l'Europe* (1850), *Dictionnaire de l'administration française* (1862), which won for him his great reputation, *Statistique de la France* (1860), *L'Europe politique et sociale* (1869), *Traité théorique et pratique de statistique* (1878), *Petit manuel d'économie pratique* (1890), which was translated into 11 languages, and *Les progrès de la science économique depuis Adam Smith* (1890). From 1856 he edited *L'Annuaire de l'économie politique et de la statistique*, and he also published several statistical works in German.

BLOCKADE (Fr. *bloquer*, to obstruct, block, bloc, block) In war, the investment by military or naval forces of an enemy's city, port, or sea-coast. A blockade may be military, in which case the object of the operation is the capture of the invested place, or commercial, for the purpose of shutting out neutral commerce from access to the blockaded port or coast.

The right to establish a blockade rests in the general right which every belligerent power possesses of distressing the enemy and weakening its power of resistance. (See **BELLIGERENT**.) As such it imposes upon neutral powers the obligation of respecting the blockade even though they may suffer loss thereby through the interruption of their commerce with the blockaded nation. But the blockading power has no right to demand from neutrals any active cooperation in maintaining the blockade, and accordingly the latter are not called upon to employ preventive measures to restrain their own subjects from violating the same. The responsibility for maintaining the blockade rests wholly on the blockading power.

Commercial Blockade—A commercial blockade is usually a naval operation conducted with the object of closing the ports of the enemy against foreign commerce.

At the commencement of such a blockade a delay is usually granted by international comity to permit neutral vessels in port to sail, which during the American Civil War was fixed at 15 days. Ten to 15 days may be considered the usual period in current practice. Neutral men-of-war on diplomatic errands and ships in distress are generally allowed entry to a blockaded port.

The rules of international law relating to blockades are a development of the last 100 years. In 1804 Prussia, in alliance with Napoleon, seized Hanover and declared her ports closed to England. The latter retaliated by proclaiming the coast from the Elbe to Brest under blockade. Napoleon in 1806 issued the Berlin Decree, laying the whole British coast under blockade. England followed with the Orders in Council putting a blockade on the coast from the Elbe to Italy. These were mere "paper blockades," as neither power could actually cover the coasts with blockading squadrons; but they served to render any neutral liable to seizure who went from an English to a continental port, or vice versa. The subsequent development of commerce and the recognition of neutral rights finally led to the Declaration of Paris in 1856, which requires that a "blockade,

to be binding, must be effective." The United States was not a party to this convention, but during the Civil War was the first power practically to enforce its rules. The Crimean War, the American Civil War, and the war between the United States and Spain for the liberation of Cuba furnished the best examples of modern blockades.

It is now a settled principle of international law that a valid blockade must fulfill the following conditions: (1) It must be ordered by the sovereign or war-making authority of the belligerent power, (2) it must be brought to the notice of the neutral powers affected by it, and (3) it must be effective. 1 As to the first condition, it is sufficient to say that a blockade ordered or instituted by the military or naval power without direct authority of the belligerent government, as by the admiral in command, at a blockaded point, is wholly void and may be disregarded with impunity. 2 Notice may be given in two ways: by diplomatic announcement to neutral powers and by a warning at the blockaded port. The French rule requires both. But the diplomatic notice, after a reasonable length of time, under modern conditions of communication, implies presumptive knowledge of the blockade on the part of all shipowners. If the blockade is raised temporarily, as by the approach of an enemy's fleet or for any other cause, excepting storms, a new diplomatic notice is necessary. 3 The rule for an effective blockade was adopted to prevent the widespread inconveniences resulting from the so-called "paper" or "cabinet" blockade. The Declaration of Paris defines an effective blockade as one "maintained by a force sufficient really to prevent access to the coast of an enemy." It requires that the evasion be made a dangerous act.

To render a capture valid an actual attempt to break an effective blockade must appear. This may be evidenced by the ship's papers, her course, or the master's instructions. The penalty for breach is confiscation of the ship and cargo. But no punishment can be inflicted upon the crew. The doctrine of "continuous voyages" requires that though a ship may touch at a neutral port, if her eventual destination is a blockaded one, she is liable. When from peace or other causes the investment ceases, the blockade must be declared raised.

The maintenance of an effective naval blockade depends primarily upon the possession of great naval superiority by the blockading force. From the standpoint of grand strategy the blockade of an enemy's coast is desirable if the enemy depends upon foreign commerce for his munitions of war, or the materials of which they are made, or if the sea affords assistance to his land operations, or for the protection of the commerce of the nation establishing the blockade. A blockade may also be desirable for the purpose of cutting off food supplies and general imports, but its importance, based on those grounds, is frequently overestimated. The importance of maintaining a blockade depends largely upon the amount of trade interrupted. If a country has a land frontier, it is manifest that this must be controlled or the blockade will be annoying only and not vitally important.

The difficulty of maintaining a blockade is at present less than it has been at any time in the history of maritime war, notwithstanding the torpedo boat—surface and submarine. The ac-

actual blockading force need be composed of light vessels only, in part of the large torpedo craft commonly called torpedo-boat destroyers. The heavier ships, especially at night, should lie farther out, beyond the easy range of torpedo-boat attack; but within supporting distance of the inner fleet should the enemy attempt a sortie in force. The maintenance of this condition depends upon the possession by the blockading power of a base in the enemy's territory where coal and supplies may be taken on board, or where at least there may be found a safe anchorage and refuge for the smaller ships in case of very heavy weather. During the continuance of such weather the heavy ships can move farther in, replacing the lighter ones which have been compelled to leave station, so that the blockade is not broken.

The most perfect blockade of a long coast was that maintained by the United States navy during the Civil War. The conditions were as favorable as can ever be expected. The South possessed a long land frontier, but except along the Mexican border it was dominated by the United States forces. The Federal navy held several bases in the enemy's territory and could have had others had it been deemed necessary. As the South had almost no seagoing naval force, many of the blockading ships were lightly armed merchantmen commissioned as auxiliaries. Blockading fleets will always be largely composed of such craft if the extent of blockaded coast is great, because no nation has a sufficient number of regular warships available for such duty, and for stopping merchant vessels such auxiliary ships are quite as good as more powerfully armed and better protected ships. One of the closest blockades ever maintained was that of Santiago by the fleet under Admiral Sampson during the Spanish War. Seven of the heaviest ships in the navy lay in a semicircle about the entrance to the harbor, about 2000 yards apart, and from 4000 to 6000 yards from the entrance. In addition to these there were several cruisers, auxiliary yachts, and torpedo boats. At night auxiliary cruisers and steam launches patrolled the entrance, which was lighted up by search lights of one of the battleships. Not even a skiff could have left the harbor unobserved.

The establishment of a blockade of the enemy's coast protects a country's commerce because it prevents, or tends to prevent, the fitting out of cruisers to prey upon it. But the war against commerce—what the French call the *guerre de course*—is becoming of less and less importance. The capture of merchant vessels has never seriously affected the result of a war, and the operations of "commerce destroyers" are likely to be attended with difficulties. It is no longer possible for them to keep the sea for long periods, as their radius of action is limited by their coal supply. Furthermore, merchant vessels of belligerents are likely to be transferred to neutral flags if the insurance rates rise unduly through greatly increased danger of capture. And, lastly, the tendency of modern warfare is towards increased exemption of private property from capture. See DECLARATION OF LONDON.

Military Blockade.—A military blockade is designed to shut off an enemy from his source or base of supplies, make him ineffective, and eventually force him to surrender through lack of food, water, ammunition, or other supplies. It

is not a regular siege, in the sense that organized efforts are made to take the base by assault; neither is it necessarily accompanied by a regular bombardment, though it may be subject to such intermittently. The military blockade, from the point of international law, does not occupy so important a place as the naval operation.

Pacific Blockade.—While apparently a contradiction in terms, a blockade being essentially a military or naval operation and therefore on its face an act of war, the pacific blockade has apparently established itself as a legitimate means of coercing a weak power to observe its international obligations without resorting to war for that purpose. It is a modern development and has usually been the act of several Powers acting in concert. It was first employed in 1827, when the combined fleets of Great Britain, France, and Russia blockaded a portion of the Turkish coast. Recent instances of its exercise were the blockade of Crete by the Powers in 1897, the blockade of Venezuelan ports by Great Britain, Germany, and Italy in 1902 and of Turkish ports by the Powers in 1905. The essentially pacific character of such a blockade is evidenced by the rules governing its exercise adopted by the Institute of International Law. These are as follows: (1) vessels under a foreign flag may freely enter in spite of the blockade; (2) a pacific blockade must be officially declared and notified and must be maintained by a sufficient force; and (3) vessels of the blockaded power which do not respect the blockade may be sequestered. The blockade having ceased, they must be restored with their cargoes to their owners, but without compensation for the detention.

While these rules are not binding on the Powers, they are in accord with the best practice and are likely to be followed in the future. See INTERNATIONAL LAW, and the authorities there cited.

BLOCK BOOKS. See PRINTING.

BLOCK COAL. A name given to certain noncoking bituminous coals of Ohio and Indiana, on account of the cube-like forms into which they break. See COAL.

BLOCKHOUSE. A temporary military fortification, usually made of logs banked with earth and surrounded by a stockade. Its construction will depend largely on the service it is intended for, the country in which it is used, the troops occupying it, and the material available. Blockhouses were extensively used in the American Civil War of 1861-65; for instance, to protect the long line of communications of Sherman's army in the Atlanta campaign. The Spaniards, during the closing years of their occupation of Cuba, adopted them extensively, notably along the line of the "Trocha." The vastness of the theatre of operations in the British-Boer War of 1899-1902, and the extreme mobility of the Boers, compelled the British to secure all cleared country by an extensive system of blockhouses, built at intervals of from 600 to 1000 yards, and connected when possible by wire entanglements. Such defenses can be made more or less strong and defensible, depending on time and conditions. See FORTIFICATION.

BLOCK ISLAND. An island in the Atlantic, 10 miles south of the Rhode Island shore and northeast of Long Island (Map: Rhode Island, B 5). It is about 8 miles long and from

2 to 4 miles wide, forming the town of New Shoreham, Newport Co, R I, well known as a popular summer resort. There are lighthouses on the northern and southeastern extremities. The island was named by Adriaen Block, who visited it in 1614, was first settled in 1662 and was captured by French privateers in 1689. In 1720 a ship bearing emigrants from the Palatinate was wrecked here, and this, together with the occasional appearance of an *ignis fatuus* off-shore, gave rise to the legend which forms the subject of Whittier's "The Palatine" and of Dana's "The Buccaneers." Pop., 1890, 1320, 1900, 1396, 1910, 1314. Consult Livermore, *A History of Block Island from 1614 to 1876* (Hartford, 1877).

BLOCK PRINTING See PRINTING

BLOCKSBURG, blocks'berk (corrupted, in German popular speech, from *Brocksberg*, the Brocken Mountain). A name given to various mountains and hills in Germany, but preeminently to the Brocken, 3745 feet, the highest point of the Harz Mountains, and indeed, of the north of Germany (Map Germany, D 3). In old legend it is the favorite haunt of the witches, where they celebrate the night of the first of May, *Walpurgisnacht* (see *WALPURGA*), with wild orgies. Almost all mountains thus haunted have been famous as places of sacrifice in the ages of paganism. See *BROCKEN*.

BLOCK-SIGNAL SYSTEM A method in use on railways to insure increased safety by keeping trains a certain distance apart, by dividing the line into blocks or sections, the entrances to which are guarded by appropriate signals for the government of the train. The blocks may be of any reasonable length, depending upon the physical characteristics of the line and the frequency with which the trains are run. On lines of heavy traffic the blocks are often only several hundred yards long, while on lines with a light traffic they may be three miles in length. The block systems used in modern railway practice are (1) The manual, (2) the controlled manual, which includes the staff, and (3) the automatic. In manual blocking the signals at the entrance to each block are operated and controlled by the signalman at that station. In controlled manual-block systems the signals at the entrance of each block are controlled either electrically or mechanically by the signalman in the next station ahead, but are operated by the signalman at the entrance to the block, or the signals are operated as in the manual or controlled manual systems, but are placed in the danger position automatically by the train after the rear car passes them. In train-staff blocking a special machine is located at the entrance to each block which contains a number of train staffs. The engine driver receives one of these staffs upon approaching the block, and until this staff is carried to the next block and inserted in the machine there, no more staffs can be taken from either machine. The control between the two machines is maintained by electricity. In the automatic system the operation of the signals is entirely automatic, generally through the agency of electricity or a combination of electricity and compressed air, and no signalmen are required. With any of these systems either absolute blocking or permissive blocking may be practiced. In absolute blocking two trains are never allowed to be in the same block at the same time. In permissive blocking a second train may be allowed after a certain time has

elapsed to enter a block before the first train has left it, the second train being compelled to run at decreased speed and observe caution.

The accompanying diagram shows a double-track railway arranged with block signals. The blocks are the spaces between A—B, B—C, and C—D. At A, B, and C there are signal stations, with three signals for each track. These signals are an advance signal, a distant signal, and a home signal. Should all these signals be at safety, the train passes the station into the next block, but should the home signal be at danger the train stops. The advance and distant signals are simply to show the engine driver the condition of the next home signal sufficiently in advance to permit him to slow up his train ready for a stop should it be at danger.

There are various types of signals in use in the United States. The present standard is the semaphore arm, and the principal other types are the disk signal, improperly called the banjo signal, and the revolving banner type of signal. The semaphore signal consists of an arm 4 feet long attached near the top of a post, the arm standing normally in the horizontal position projecting to the right of the post as seen from an approaching train. To give the indication to proceed the arm is moved downward for signals working in the lower quadrant and upward for signals working in the upper quadrant. Upper quadrant signals are now standard, although until recently the lower quadrant signals were standard and are still used on a large proportion of the mileage of roads using block signals.

Block signals control the use of a section of track and show whether or not the track is occupied. Two arms may be used on a post, the upper to indicate immediate control and the other to repeat the indication of the upper arm on the next signal in advance. The upper arm is called the home signal, and the lower arm the distant signal. The distant signal is usually placed on a separate pole about 3500 feet in the rear of the home signal when a block system is in use having blocks longer than half a mile. At night the indication is given by the color of the light. The colors used are red, yellow, and green. Red indicates the home signal at stop, yellow the distant signal at stop,

and green either signal at clear. Thus, with both home and distant signals on the same post, a red light above a yellow would show the block occupied and would indicate stop; a green above a yellow, that the block was unoccupied but that the next home signal was at stop, and two green lights, that the next two blocks were both clear. There are also three position signals now in use in both the upper and lower quadrant. The three positions of the arm are horizontal 45° from the horizontal, and 90° from the horizontal. Horizontal indicates stop, 45° that the next home signal is at stop, and 90° that the next two blocks are clear. Color indications are, of course, red corresponding with horizontal, yellow corresponding with 45° , and green corresponding with 90° .

In all but the automatic systems the signals are thrown to safety (they are so arranged that they always stand at danger until pulled to the safety position) by pulling the levers resembling the reversing lever of a locomotive. These levers are located in the signalman's tower, and are connected to the signals by means of wires or rods. In the automatic system these signals are operated by the train itself; the wheels pass over track instruments or levers and set in motion certain mechanical or electrical operations, as a result of which the signals are removed.

In manual blocking, which is extensively used in England, each signalman controls the signals at his station. The code signaling between the block stations is generally done by means of electric bells. British lines also use in manual blocking an indicator giving a visual indication of the condition of the block. The block station has, for each block, an indicator connected by an electric circuit with a similar instrument at the other end of the block. On the dial of the indicator appear the words, "line clear," "train on line," and "line closed." By placing the hand of the indicator over any of these phrases, the instrument at the other end gives a like indication. The method of operation of the system is as follows: Attention is first called on the bell, and then station A will give to station B what is called the "be ready" signal, consisting of a certain number of strokes on the bell, varying so as to indicate the nature of the train. The man at station B, if the previous train has passed his station and he knows that the block between A and B is clear, repeats this signal. The train is then dispatched from A, the man at A gives the signal "train on line," the man at B acknowledges this by moving his own indicator, and, through the connection, the one at A to "train on line," and at once gives the "be ready" signal to station C. As soon as the train has passed B the man at B moves his indicator, and therefore the indicator at A, to "line clear"; and upon this being acknowledged by A the indicator is left vertical, signifying "line closed," and the operation has been completed so far as that particular train and particular block are concerned.

In controlled manual blocking the manipulation of the signals at the entrance to the block is controlled electrically by the signalman at the block station in advance. In what is termed the auto-manual system there is at each block station a track circuit of at least two or three rail lengths, which is used for automatically replacing the home signal to danger when the rear end of a train passes that signal. The

locking instruments are generally placed in front of the signalman and over the levers with which they operate. Each block station has one of these instruments for each block, the two instruments at the opposite ends of a block being connected by an electric circuit. The code signaling between the stations is accomplished by bell, as in manual blocking. The mode of operation is as follows: Prior to starting a train from A, the signalman there asks B to unlock the signal at A; and when B does so A throws his signal to safety, allowing the train to proceed towards B. As the rear of the train passes the home signal at A, that signal is thrown to danger by the local track circuit. As soon as his home signal goes to danger, A throws his lever to its normal position of danger, thereby locking it so that the signal cannot be thrown to safety again without permission from B. A drop-slide indicator or annunciator forms a part of the electric mechanism, displaying through a slotted opening on the front of the instrument case the words "free," "locked," and "train in block." By a system of electric locking working in connection with the indicators, and operated in part by the train through track circuits, B is unable to clear A while there is a train in the block.

A train-staff machine consists of an iron pillar with a vertical slot through nearly its entire length, in which is a supply of staffs. The head of the machine, called the "locking case," contains the electrical apparatus for manipulating the machine. Only one staff can be withdrawn at a time from the two machines governing a block; and this only with the consent of the signalman at the receiving station, who alone controls the staffs at the sending station. Another staff cannot be removed from either machine until the one already out is restored at one or the other end of the block. Since an engineman is not allowed to enter a block without a staff and only one staff can be out at a time, the method of operation is obvious.

Automatic block signals are operated by power, usually either by direct electrical current or by compressed air. The control of the power is effected by means of relays provided with contacts which open and close the circuit to the motor or regulate the pressure of the air. With the motor control the motor must be energized to give the proceed indication, and the signal assumes the stop position when the motor circuit is open. The control of the signal circuits is through the operation of a track circuit of which the rails form a part. The track is divided into sections of from 3000 to 5000 feet in length, each section separated from the next by an insulated rail joint. There is a battery at one end of the section and a relay at the other. When the block is unoccupied by a train, there is a current passing from the battery through one rail through the relay and back to the other rail, and from there back to the negative pole of the battery. While the relay is energized by this current, it in turn energizes the motor control, causing the signal to stand at clear. When a train passes the signal running on to the track circuit, the wheels of the train permit the current to flow from one track to the other without passing through the relay. The relay, of course, is de-energized, and the signal goes to stop. Thus, if there is any failure of the apparatus, the motor controlling the signal is no longer energized,

and the signal goes to stop. Failure, therefore, is on the side of safety. For semaphores worked by electric motors the complete equipment for double-track line with distant signals costs from \$1200 to \$2000 per mile. The maintenance cost would vary from \$175 to \$250 per mile per year.

The total miles of railroad worked by automatic block signals on Jan. 1, 1913, was 22,119—total track miles being 36,934. The total block signals other than automatic, including manual and manual controlled, was 83,950 road miles—108,403 track miles. Of the total automatic signal mileage (road mileage) 227 were exposed disk, 1705 inclosed disk, 435 by electro-pneumatic, 18,931 by electric motor, and 902 by electro-gas. The electro-pneumatic, electric motor, and electro-gas are, of course, semaphore signals. Of the manual block-system mileage (road mileage) 38,106 were by telegraph, 23,002 by telephone, 814 by electric bells, and by controlled manual, 4360, and by electric train staff, 478.

Automatic Train Stop. To be effective, the signals of any of the types mentioned above must, of course, be seen by the man or men in charge of the train. Collisions which have happened on railways where block signaling is installed have, in the majority of cases, been due to the failure of the engineman to observe the signal set against him or to act promptly on the information which the signal aspect has given him. To overcome this difficulty various devices for automatically stopping the train when the signal is set against the train have been experimented with. These devices are called automatic stops, and in its simplest form the automatic stop is a trip, fixed on the roadway and moving in unison with the usual visual signal, which is made to open an air valve on the engine or car, thereby applying the brakes or shutting off the propelling power, or doing both. The most important installations of automatic stops in America are those in use on the Interborough Rapid Transit of New York City and on the Pennsylvania Railroad in the Hudson River tunnels, and at drawbridges between New York and Newark and also on the Hudson and Manhattan tubes. On the Great Western Railway of England have been conducted the longest continued experiments with contacting devices on the ground exposed in winter. The device in use on the Interborough Rapid Transit was installed in 1904 and consists of mechanical trip stops with electro-pneumatic control. Most of these stops are located in subways, but a few are situated on surface lines, where they are exposed to snow and frost. The trip, when the signal is against the train, engages a lever on the first car, which automatically shuts off the power and applies the brakes. The device in use on the Pennsylvania differs slightly in that the lever on the engine is protected from accidental injury and also from being moved so as to cause an unnecessary stop by obstructions along the road. In front of the engine lever which is to engage with the ground apparatus is a bar rigidly fixed so as to clear the way for the lever itself, sweeping aside snow, ice, or an accidental obstruction. The ground apparatus is arranged as a tumbler, and when the rigid bar strikes this apparatus, the tumbler is simply turned over, bringing into the vertical position an arm which is then in position to engage the lever on the engine. The apparatus in use on the Great Western gives the adverse indication

by lifting a vertical engine member as it passes over a ramp on the ground, and a whistle is sounded and the brakes applied. If the block section is clear, an electric current flowing through the ramp and the engine member prevents the sounding of the whistle and the application of the brakes and gives an all-right signal by sounding a bell.

Besides the automatic train stop there are various kinds of cab signals which depend for their operation on the engaging of a lever on the locomotive or car with some part of a ground apparatus. It will be noted that the device in use on the Great Western is a combination of cab signal and automatic stop. Cab signals without the automatic stop have been in use since 1907 on this road. A cab signal which is now being experimented with in America differs quite radically in principle from those in use in the Great Western and most of those which have been experimented with on American roads. The principle in this so-called Cade cab signal is that, instead of some mechanical device being used on the ground apparatus to clear the signal and prevent it from sounding a whistle in the cab, the clearing must be done by the engineman in moving the lever on the engine so that it will not come in contact with the ground apparatus. This type of signal, however, is simply being experimented with at the present time.

Consult also Reports of the Interstate Commerce Commission and particularly *Reports of the Block Signal and Train Control Board to the Interstate Commerce Commission* (Washington, 1908-12), as well as current issues of the *Signal Engineer* and the leading railway papers, which promptly record all new developments.

BLOCK TIN. An inferior variety of tin in the form of blocks. When the metal is reduced from its ores in a furnace, it is first poured into molds. The ingots thus procured are subsequently heated to incipient fusion in a reverberatory furnace, the pure tin, called grain tin, fusing first, is withdrawn, leaving the less pure tin, which is then melted at a higher temperature, poured into molds, and called block tin. See TIN.

BLOCKX, JAN (1851-1912) A Belgian composer. He was born at Antwerp, Jan. 25, 1851. His first musical education he received at the Flemish music school of his native city, where Benoit was his teacher in composition and Callaerts on the piano. Later he studied the piano at Brussels with L. Brassin, and then went to Leipzig. In 1886 he became professor at the Conservatory at Antwerp, and in 1901, after the death of Benoit, the director. At the same time he conducted also several musical societies, the most important of which was the *Cercle artistique*. In his compositions he kept himself remarkably free from the all-pervading influence of Wagner, but consciously followed in the footsteps of his teacher Benoit, directing all his energies towards the building up of a national Flemish school. His principal works are the great choral works for chorus, soli, and orchestra, *Vredesang Het droom vant paradijs*, *Clokke Roelandt*, *Scheidezang*, *Op den spoom*, and the operas *Jets vergeten* (1877), *Maitre Martin* (in French, 1892), *Ierbergprinses*

(1896), *Thiel Uylenspiegel* (1900), *De Bruid der Zee* (1901), *De Capel* (1903), *Blandée* (1908).

BLODGET, LORIN (1823-1901). An American physicist and statistician. He was born in Chautauqua Co., N. Y. In 1851 he became assistant at the Smithsonian Institution in charge of matters relating to climate and atmosphere. In 1857 he issued *Climatology of the United States and of the Temperate Latitudes of the North American Continent*, a work highly praised by Humboldt. He was for several years editor of the *North American* and secretary of the Board of Trade in Philadelphia and had charge of the statistical work in the United States Treasury. His contributions on finance, industrial progress, and kindred subjects comprise many volumes.

BLOEMAERT, blō'mārt, ABRAHAM (1564-1651). A Dutch historical painter and engraver. He was born in Dordrecht, the son of the sculptor Cornelis Bloemaert. He studied with various Dutch and Flemish masters in Holland, Flanders, and Paris, but was most influenced by Dirck Barends, Hieronymus Francken, and Frans Floris, all Italianized painters. He practiced his art in Amsterdam and, principally, in Utrecht, acquiring great wealth and fame. As many as 500 of his works were engraved by other artists. Bloemaert occupies a unique place in Dutch painting. Unlike other important Dutch masters, he followed Italian models and endeavored to establish a Dutch idealistic school. His subjects are mythological and religious and are found in all the chief European galleries, that of Copenhagen being especially rich. He was also a successful wood engraver in chiaroscuro and designed stained glasses and tapestries.

BLOEMFONTEIN, blōm'fōn-tin. The capital of the former Orange Free State, now the Orange River Colony, South Africa, near the Modder River, 95 miles east by south of Kimberley (Map: Orange Free State, C 4). It is situated at an altitude of over 4518 feet, is well built and lighted by electricity. There are a number of fine public edifices. Bloemfontein contains also several educational institutions, including colleges and a theological school, as well as a museum. Its favorable climate, which is very dry, has made the town of importance as a health resort. It is a centre of trade which consists mainly of wool. The industries include manufactories of aerated waters, salt, flour mills, and breweries. This town was one of the important strongholds of the South Africans during the Anglo-Boer War, and surrendered to Lord Roberts without resistance, March 13, 1900, after the Boers were defeated twice in the neighborhood. Its commercial growth dates from the close of the war in 1902. European pop., 1904, 15,501; 1911, 14,720.

BLOIS, blō'iz (ML. *Blesum*, *Blesis*, *Blesia*). The capital of the department of Loir-et-Cher, France, situated on a hill, on the right bank of the Loire, 35 miles southwest of Orleans (Map: France, N., G 5). The most important buildings of the town are the cathedral and castle, each on an elevation on either side of the main street, which runs in a hollow, and a church built in the twelfth century. The streets in the older portion of the town are narrow and tortuous and in places steep. Blois's educational establishments comprise a college, teachers' school, two seminaries, a museum, and a library.

A fine aqueduct of Roman origin, cut in the solid rock, supplies the city with water. It is the market of the neighboring region for agricultural and pastoral products, and carries on an active trade in grain, wines, and live stock. There are manufactories of boots, shoes, biscuits, furniture, and kindred articles, machinery and earthenware, and tanneries, foundries, and vinegar works. The most interesting edifice of the city is the old castle, a masterpiece of the early French Renaissance. Louis XII was born in it, and under its roof Charles, Duc d'Alençon, and Margaret of Anjou were married. The courts of Francis I, Henry II, Charles IX, and Henry III were held here occasionally, and in the castle the Duke of Guise and his brother were murdered, by order of Henry III, on Dec. 23, 1588. Isabella, queen of Charles VI, here found a retreat; it served as a prison for Maria de' Medici; Catharine de' Medici died within its walls; and Maria Louisa held her court here in 1814, after Paris had capitulated. Pop., 1896, 23,542; 1901, 20,422; 1911, 23,955. Consult Le Nail, *Le Château de Blois* (Paris, 1874); Bournon, *Blois, Chambord et les châteaux du Blésois* (Paris, 1908).

BLOK, blōk, PETRUS JOHANNES (1855-). A Dutch historian, born at Helder. He studied at Leyden and in 1884 was made professor of history at Groningen. He later occupied the same position at the University of Leyden and during Queen Wilhelmina's historical studies acted as her instructor. Blok's researches have been in connection with the social-political history of the Netherlands, especially during the Middle Ages. Among his works are: *Eene Hollandsche stad in de middeleeuwen* (1883; 2d ed., 1910); *Eene Hollandsche stad onder de Bourgondische heerschappij* (1884); *Geschiedenis van het Nederlandsche Volk* (8 vols., 1891-97), translated as the *History of the People of the Netherlands* (5 vols., New York, 1898-1912).

BLOMFIELD, blōm'fēld, CHARLES JAMES (1786-1857). Bishop of London; a learned and influential prelate of the Church of England. He was born May 20, 1786, at Bury St. Edmunds, in Suffolk, where his father was schoolmaster. Being well grounded by his father in the classics, Blomfield went to Cambridge, where he took high honors, B.A., 1808, and became fellow of Trinity College. After he had filled several curacies, the Bishop of London appointed him his chaplain, in recognition of his acknowledged philological and theological acquirements. Shortly after, he was called to the living of St. Botolph; in 1824 he was made Bishop of Chester, and in 1828 he was promoted to the see of London, on the translation of Bishop Howley to Canterbury. Blomfield's reputation for classical scholarship rests chiefly in his editions of *Callimachus* (London, 1815), and of several of the dramas of *Æschylus*. In connection with Rennel, he published the *Musæ Cantabrigienses*, and with Monk (1812), *Posthumous Tracts of Porson*, and in 1814 the *Adversaria Porsoni*. He also published lectures on the Gospel of John and on the Acts (1823-28; 3d ed., 1838). Blomfield was exceedingly active in the superintendence of his diocese and was a prime mover in the agitation for the erection of new churches. Under his presidency more churches were erected in London than under any other bishop since the Reformation. He died in London, Aug. 5, 1857. For his biog-

raphy, consult Blomfield (2 vols., London, 1863, 2d ed., 1864), and Biber (London, 1857)

BLOMMAERT, blóm'mart, PHILIPP (1809-71) A Flemish historian and philologist. His most noted work is *History of the Belgians (Aloude geschiedenis der Belgen of Nederduitschers*, Ghent, 1849), urging a German policy as opposed to the French. He published also mediocre poems (1834), a Flemish translation of the *Nibelungenlied* (qv), and learned editions of old Flemish poems of the period from the twelfth to the fourteenth century, *Oudvlaemsche gedichten der XII^e, XIII^e en XIV^e eeuwen* (Ghent, 1838-51), *Leven van St Amand* (1842-43), and *Theophilus, gedicht der XIV^e eeuw* (ib., 1836)

BLOMMAERT, SAMUEL (1590-1670) A Colonial patroon. He bought from the Indians a large tract of land, extending from Cape Henlopen to the mouth of the Delaware River—a tract almost the size of the present State of Delaware. The purchase was ratified by Peter Minuit and his council at Fort Amsterdam in 1630 and is the oldest deed for land in Delaware. The other owner of the land, Samuel Godyn, with Kiliaen Van Rensselaer, De Laet, and De Vries (qv), formed a company to settle this tract, and a colony of 30 was started at Lewes Creek under the governorship of Gillis Hosset. In the same year 12 square miles were added to the company's land by a purchase recorded at Fort Amsterdam. The colony, which had been named Swaanendale, was after a few years destroyed by the Indians in revenge for an act of Hosset's.

BLOMSTRAND, blóm'strand, CHRISTIAN WILHELM (1826-97) A Swedish chemist, born at Wexjö. He studied at the University of Lund and from 1862 to 1895 was professor of chemistry and mineralogy there. In 1861 he undertook a scientific expedition to Spitzbergen and in the same year was elected a member of the Stockholm Academy of Sciences. He discovered manganosite, vallerite, and other minerals, wrote several valuable text-books of organic chemistry, and also *Die Chemie der Jetztzeit vom Standpunkte der elektrotechnischen Auffassung aus Berzelius's Lehre entwickelt* (1899)

BLONDEL, *Fr* pron blón'dél' A noted French minstrel of the twelfth century, called a native of Nesle, a place difficult to identify. According to tradition, Blondel was the favorite of Richard the Lion-hearted, King of England, whom he accompanied to Palestine. While returning to England Richard was imprisoned by Leopold, Duke of Austria, and Blondel, determined to find his master, wandered through Germany in disguise until he came to the castle of Durrenstein, which he heard contained an illustrious captive. Feeling assured that Richard was in the castle, he tried to see him, but, failing, began to sing a song which he and Richard had composed. The first stanza was hardly sung before the well-known voice took up the second. The minstrel was overjoyed and, returning with all speed to England, was the means of securing Richard's ransom. This story dates from the following century and is not known to contain any element of truth. Blondel's poems were published at Rheims, in 1862, by Prosper Tarbé, under the title *Les Œuvres de Blondel de Néelle* (Rheims, 1862)

BLONDEL, blón'dél' The name of two French architects. 1 FRANÇOIS BLONDEL (1617-86) A diplomat, littérateur, military

engineer, and mathematician. He was noted for the triumphal arch of the Porte Saint-Denis in Paris (1674), as well as the Porte Saint-Antoine (not now extant), and became director of the new Académie de l'Architecture in 1672. He published *Cours d'architecture enseigné dans l'académie royale* (1675). 2 JACQUES FRANÇOIS BLONDEL (1705-74) An architect and engraver. He founded one of the earliest French private schools of architecture (1743) and became royal architect. He designed buildings at Metz, Strassburg, and elsewhere.

BLOND ESKIMOS See WHITE ESKIMOS

BLONDIN, blón'dân' (1824-97) A French tight-rope walker, whose real name was JEAN FRANÇOIS GRAVELET, the pseudonym referring to his blond hair. He was born at Saint-Omer, France, became an acrobat in his youth, and was soon famous for his eccentric and daring performances on a tight rope. He came to this country, gave many exhibitions in the Eastern States, and in the summer of 1850 performed the hazardous feat of crossing Niagara Falls on a tight rope. This act he repeated several hundred times, on one occasion carrying a man on his shoulders. Twice thereafter he returned to the United States, the last time in 1888, when the New York City authorities refused to let him perform in Central Park, whereupon he gave a series of exhibitions on Staten Island, and although then 64 years old carried his son on his shoulders across a long rope. He carried a cooking stove to the center of the line, where he made an omelet on it, and performed many other extraordinary feats, such as traversing the rope blindfolded, on stilts, enveloped in a sack, with his feet in waste-paper baskets, and so on.

BLOOD (probably akin to the verb to *blow*, to be in bloom). From the standpoint of histology, blood is usually classed as a tissue. It is developed from the middle layer, or mesoderm, of the embryo, and differs from the other tissues of the body in that its intercellular substance, the *liquor sanguinis*, or blood plasma, is fluid instead of solid. Human blood has a specific gravity varying between 1.056 and 1.066, it has a saline taste, a peculiar odor, and an alkaline reaction. The odor differs in different animals and is due to the presence of excretory products and volatile fatty acids. Its normal proportion to the body weight in man is one-fourteenth or one-thirteenth. When a drop of human blood is examined under the microscope, there are seen floating in the plasma certain foamed elements. We distinguish three main forms: the red blood cell, or corpuscle, the white blood cell, or corpuscle, and the blood plaques, or platelets.

The Red Blood Cells These are minute biconcave disks, averaging 7 to 8 micromillimeters, or about 1-3200 of an inch in their long diameter, and about one-fourth that in thickness. In adult human blood these cells are not nucleated, although in the human embryo they contain nuclei. This round, discoid, non-nucleated red blood cell is characteristic of mammals with the exception of the camel family, in which the red blood cells are non-nucleated, but oval. In birds, reptiles, amphibians, and fishes (with the exception of Cyclostomata, which have nucleated but round cells) the red blood cells are oval in shape and contain nuclei. As regards size, the largest corpuscles are found in the amphibia, those of the Amphibia being as

much as 75 micromillimeters in diameter, so that they may be distinguished by the unaided eye. The following table shows the size of the red blood cells in some of the more common mammals:

Elephant0092 millimeter
Man0079 "
Dog0071 "
Rabbit0070 "
Mouse0067 "
Horse0059 "

In normal human blood there are about 5,000,000 red blood cells per cubic millimeter of blood. As a general rule woman's blood has somewhat fewer than man's. Their specific gravity varies from 1.088 to 1.105. In different animals the number of red cells varies greatly, and the number of cells per cubic millimeter is much reduced in the lower animals, which have very large corpuscles. The redness characteristic of blood is not evident in a single corpuscle, which appears of a light straw color. When, however, a large number of the cells are seen together, the mass appears bright-red. The red blood corpuscles are embryologically of mesoblastic origin, beginning their life history as nucleated cells and as such possessing amoeboid movement and reproductive powers. At birth all nuclei have been lost as well as the powers of movement and of reproduction. After birth the production of new red corpuscles is believed to occur mainly in the marrow of bones. In embryonic life the distinction between red and white cell-producing tissues is not well defined; the entire blood-making system, marrow, spleen, and lymphatic glands, being concerned in the production of both varieties. The question as to the possibility of determining by microscopical examination whether a specimen of blood, particularly a blood stain, is human or animal, often presents itself in trials for murder. By reference to the table given, it will be seen that the red corpuscles in a considerable number of animals so closely approximate in size those of man that a positive answer to the question is often impossible. Then the drying of the corpuscles in a clot, which has to be softened with salt solution before examination can be made, introduces an uncertainty as to whether such corpuscles preserve their normal dimensions. On the other hand, it will be noted that a differentiation between human blood and that of lower animals whose red corpuscles are oval and nucleated—for example, birds and fishes—is comparatively easy. See BLOOD STAINS.

The White Blood Cells. These are much fewer in number than the red cells, the average being about one white cell to every four or five hundred of the red. The proportion, however, varies. They are slightly larger than the red cells, averaging about 8 to 10 micromillimeters in diameter. Their shape varies, largely from their amoeboid movement. They are nucleated, and the protoplasm of the cell body is more or less granular. Several varieties of the white blood cell are recognized, which may be classified as follows: (1) *Lymphocytes*, large and small, having a round nucleus surrounded by a small rim of cell body; and (2) *Leucocytes*, which may be further subdivided into large mononuclear leucocytes, in which there is a round or oval nucleus with considerable cell body; transitional forms, in which the nuclei are irregular in shape; polymorphonuclear leucocytes, in which there are several nuclei, and

eosinophile leucocytes, which contain large granules which stain bright red with eosin. The amoeboid movement of the white cells enables them to change their shape and to accomplish some locomotion. In this way they pass through the walls of the capillaries into the tissues, where they are known as wandering cells. (See CONNECTIVE TISSUE.) The blood platelets are small, non-nucleated, round or oval bodies, about one-third the diameter of the red blood corpuscle. They are found usually in groups and are prone to disintegration. Their function is unknown, but there is reason for believing that they are concerned in the process of coagulation when it occurs. Embryologically the white blood cells are derived, like the red cells, from the mesoblast. In the healthy adult granular white corpuscles, including the polymorphonuclear cells, the eosinophiles, and mast cells, are derived from the bone marrow; the lymphocytes from the lymphatic glands. The blood platelets are, according to Wright, merely bits broken off from the arms of the giant marrow cells.

The Plasma. The fluid portion of the blood, called the plasma, consists of water containing calcium salts, the chlorides of sodium and potassium, phosphates, albumen and other proteins, as well as fatty and extractive substances. The specific gravity of the plasma varies from 1.026 to 1.032.

If blood escapes from the body, coagulation or clotting occurs; after standing awhile, the blood separates into a contracting semi-solid mass, the clot, and a thin red fluid, the serum. The clot is composed of the red blood corpuscles matted together with fibrin (q.v.). The process of clotting is accelerated by cold. In the body clotting of the blood may occur in the blood vessels, in case of an obstruction to the blood stream or infection by bacteria; or it may occur in the neighboring tissues where a blood vessel is ruptured. After death the blood remains fluid in the capillaries, but clots in the veins. Clots are sometimes found in the cavities of the heart. Certain diseases cause alterations in the blood. In a condition called *hemophilia* the blood clots with difficulty, if at all (see BLEEDING); and persons possessing this peculiarity are liable to bleed to death from a small wound, as that left by drawing a tooth. This peculiarity is called the hemorrhagic diathesis, and it is said to be found oftenest among Germans.

The color of the blood is due to the hemoglobin (q.v.) of the red blood corpuscles, the carrier of oxygen from the lungs to the tissues. (See RESPIRATION.) For a description of some of the diseases of the blood, see ANÆMIA. Consult Cabot, *Clinical Examination of the Blood* (New York, 1904), and Da Costa, *Clinical Hematology* (Philadelphia, 1905).

BLOOD, CORRUPTION OF. In English law, the forfeiture of the right of inheritance by the heirs of one convicted of treason or felony. Attainder (q.v.) was the ordinary consequence of judgment upon conviction of a crime involving the penalty of death or outlawry, or it might be imposed on a person accused of treason or felony by act of Parliament. (See BILL OF ATTAINDER.) In any case, however incurred, it had the effect of "corrupting the blood" of the person attained, i.e., of cutting him off from the relationships of consanguinity on which inheritance was made to depend. His children were not his children, and when he died he left no one capable of inheriting from him. The

effect, therefore, was the same as if the attainted person had died without natural heirs his land at once escheated to the lord of whom it was held (see ESCHEAT), subject, however, to the paramount right of the crown to forfeiture of the land, absolutely in the case of conviction for treason, for a year and a day, in the case of conviction for felony. See FORFEITURE.

BLOOD, EATING OF. As among other peoples of antiquity, so among the Hebrews the blood of animals was regarded as the seat and source of life, and hence the blood was forbidden as food. All animal food being originally of a sacrificial character, the prohibition against the eating of the blood, carried back by tradition to the days of Noah (Gen ix 4), is thus shown to be connected with sacrificial observances. In Lev xvi 11, 12, a reason is given for abstaining from eating blood, its use is confined to the sacred act of atonement. It has been suggested that certain peoples did not drink blood, because they believed that, if they did so, the spirit of the animal from which it came would enter into them. Consult Trumbull, *The Blood Covenant*, p 214 f (1885), and Frazer, *The Golden Bough*, vol 1, pp. 178, 179 (1890), Gulland and Goodall, *Blood* (Edinburgh, 1912), Buchanan, *Blood in Health and Disease* (London, 1900), Kastle, *Chemical Tests for Blood* (Washington, 1909). See SACRIFICE.

BLOOD, THOMAS (1618-80). A bold and successful adventurer, commonly known as "Colonel Blood." He was the son of a prosperous blacksmith and was probably born in Ireland, but the place of his birth is uncertain. In the great Irish rebellion he served with the Parliamentary army. He visited England, married a Lancashire lady, was made a justice of the peace by Henry Cromwell, and received large assignments of land in Ireland. He was deprived of these at the Restoration and in a spirit of reprisal associated himself with several disbanded Cromwellians who were ripe for mischief. He put himself at the head of an insurrectionary plot, which was to begin with the seizure of Dublin Castle, and of Ormond, the Lord Lieutenant. On its discovery he escaped, while his chief accomplices were seized and executed, although he made a bold attempt to rescue them. He remained in hiding, but eventually fled to Holland, where he was received with high consideration. He soon found his way back to England, to try what mischief might be brewed among the Fifth-Monarchy men. Finding no prospects of success, he repaired to Scotland, invited by the turbulent state of affairs, and was present at the fight of Pentland, Nov 27, 1666. On the night of Dec 6, 1670, the Duke of Ormond was seized in his coach in St James's Street by a gang of braves, tied on horseback behind one of them, and hurried away toward Tyburn. The timely approach of his attendants at the moment when he had succeeded in struggling with his riding companion to the ground probably saved him from hanging. The leader in this daring villainy was Blood, and so well had he contrived it that he did not even incur suspicion. His next enterprise was still more wild and dangerous. On May 9, 1671, disguised as a clergyman and accompanied by his former accomplices, he entered the Tower with the determination to carry off the regalia of England. After almost murdering the keeper of the jewels he succeeded in carrying off the crown under his cloak, while one of his associates bore away the orb. They

were immediately pursued, however, seized, and committed to the Tower jail. But a singular turn of fortune awaited Blood. At the suggestion of Buckingham, who was accused of having hired Blood to attack the Duke of Ormond, King Charles visited the dauntless miscreant in prison and, degrading the threat that there were hundreds of Blood's associates banded together by oath to avenge the death of any of the fraternity, pardoned him, took him to court, restored to him his Irish estates, valued at £500 a year, and raised him so high in favor that for several years Colonel Blood was an influential medium of royal patronage. After the fall of the "Cabal" ministry Blood became hostile to Buckingham and, accused of originating a scandalous charge against him, was committed to prison. He was bailed out and died in his own house in 1680. Scott introduces Blood in *Peveril of the Peak*. Consult Seeombe, *Lives of Twelve Bad Men* (New York, 1896).

BLOOD/BIRD. The name in southern Australia of several wax-billed finches and other small birds marked with bright red, especially the "soldier bird" (*Myzomela sanguinolenta*), a beautiful species of honey eater, black, with the head, neck, breast, and back of the male rich scarlet.

BLOOD CLAM. See ARE SHELL.

BLOOD FEUD. (AS *fæhf*, from *fah*, inimical, OHG *fæhde* injury, enmity, Ger *Fehde*, feud.) In primitive society, the legalized right of private vengeance for crimes of violence. The institution of the feud and its regulation by law, inasmuch as it involves a restriction on the primary impulse of revenge, marks a great advance in the direction of a settled social order. The primitive theory of the responsibility of the family, clan, and tribe for the acts of its members tended to convert an act of private vengeance into a state of war. The developing sense of law and order restricted the right of vengeance to the immediate family, or next of kin, called the "avenger of blood" (see AVENGER OF BLOOD) of the injured person, and limited the punishment to the person committing the crime or to those who protected him from the vengeance incurred. The right was further restricted by the doctrine of sanctuary and the institution of places of refuge for the manslayer fleeing from the avenger of blood (see ASYLUM, CITY OF REFUGE), and, at a later period, by the institution of the wergild (man price, blood money) with which the hunted criminal might purchase exemption from the vengeance due him. Ultimately the acceptance of this blood money became compulsory, and the codes of early law which have come down to us are full of minute regulations fixing the amount to be paid for various crimes of violence according to the state or dignity of the victim of the crime, and specifying the persons entitled to share in the payment.

The stage of society marked by the blood feud has prevailed among most of the primitive peoples with whose history we are acquainted, and it forms a part of nearly all systems of primitive law. We find marked traces of it in the Mosiac legislation, and it constitutes an important part of the law of the Teutonic communities which planted themselves on the ruins of the Roman Empire. Anglo-Saxon law is largely concerned with it, and in England it survived, nominally at least, in the form of the wager of battle, until abolished by Act of Parliament in 1819. (See BATTLE, TRIAL BY, FEUD.)

Consult: Jenks, *Law and Politics in the Middle Ages*; Maine, *Ancient Law* (London, 1905) and *Lectures on the Early History of Institutions* (6th ed., London, 1893); Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899); and Stephen, *History of the Criminal Law of England* (London, 1883).

BLOODFLOWER (*Hæmanthus*). A genus of bulbous-rooted plants, of the family Amaryllidaceæ, including about 60 species, natives of tropical South Africa, some of which are among the prized ornaments of our greenhouses. They take their name from the usual color of their flowers, which form a fine head or cluster, arising from a rosette of root leaves. The fruit is a berry, usually with three seeds. The leaves of the different species exhibit considerable diversity of form—in some almost linear, in others almost round; in some, also, they are erect, in others appressed to the ground. The bulbs of some of the finest species of bloodflower being very slow to produce offshoots, a curious method of propagating them is resorted to by gardeners, which is occasionally practiced also with other bulbous-rooted plants, by cutting them across above the middle, upon which a number of young bulbs form around the outer edge. *Hæmanthus multiflorus*, *Hæmanthus lindeni*, and *Hæmanthus puniceus* are among the most handsome in hothouse cultivation. *Hæmanthus albiflos* has white flowers, and some of the others are grown as oddities. The inspissated juice of *Hæmanthus tomentosus*, now known as *Buphane disticha*, is used by the natives of South Africa for poisoning their arrows.

BLOODHOUND, or **SLEUTHHOUND**. A variety of hound often used in tracking criminals. See **HOUND**.

BLOODLETTING. See **BLEEDING**; **VENE-SECTION**.

BLOOD MONEY. In early law, the compensation paid by a manslayer to the next of kin of the man slain, securing the offender and his relatives against subsequent retaliation. It was common in Scandinavian and Teutonic countries until after the introduction of Christianity. The amount of the payment was fixed by law, as well as the persons who were entitled to exact and share it. (See **AVENGER OF BLOOD**.) The principle was not limited to cases of manslaughter, but was ultimately extended to all crimes of violence. Certain crimes, however, by reason of their enormity or their sacrilegious character—as slaying a person in church or when sleeping—or because they involved a breach of the King's peace, were "bootless," i.e., incapable of commutation for money. The perpetrator of such an offense came under the King's ban, was outlawed, and abandoned to his enemies. (See **BANISHMENT**; **OUTLAWRY**.) Even in such a case, however, it is provided in one of the barbaric codes of the Middle Ages that the offender "may redeem himself from the wilderness with 40 marks when the injured party has interceded for him." See **BLOOD FEUD**; **WERGILD**, and the authorities there referred to.

BLOOD OF OUR SAVIOUR, also called **ORDER OF OUR REDEEMER AND THE PRECIOUS BLOOD OF JESUS CHRIST**. An order of knighthood in Mantua, instituted by Duke Vincenzo Gonzaga in 1608, on the occasion of the marriage of his son with a daughter of the Duke of Savoy. It consisted of 20 knights, the Mantuan dukes being sovereigns. The collar was embroidered with scrolls containing ingots

of gold in crucibles over a fire, with the words *Domine probasti me*. To the collar was pendant an oval medallion with two angels kneeling before an altar, on which were three drops of blood, with the words *Nihil isto triste recepto*. The name originated in the belief that in St. Andrew's Church, in Mantua, certain drops of our Saviour's blood are preserved. Consult Laurence-Ascher, *Orders of Chivalry* (London, 1887), and Wahlen, *Ordres de Chevalerie* (Brussels, 1844).

BLOOD OF SAINT JANUARIUS, *jân'n-a'-rî-ûs*. See **JANUARIUS**, **SAINT**.

BLOOD PHEASANT, *fèz'ant* (from the red color about the throat and breast). One of several species of small and beautiful Himalayan quail-like pheasants, of the genus *Ithaginis*. See **PHEASANT**.

BLOOD POISONING. See **PYÆMIA**.

BLOOD PRESSURE. The estimation of the blood pressure within the circulatory system has come to possess a considerable significance in the study of diseases. The blood as it flows through the vessels necessarily exerts lateral pressure upon their walls; this pressure being dependent on several factors, viz., the energy of the heart, the volume of blood, the elasticity of the vessel walls, and the peripheral resistance of the capillaries. It is evident that anything which dilates or contracts the blood vessels or affects their elasticity, or any disease of the heart interfering with its propulsive power, correspondingly affects the blood pressure. In the healthy animal the blood pressure, within certain average limits, is maintained with great constancy. The complex nervous mechanisms, controlled both by cerebro-spinal and sympathetic nerve centres, which balance and co-ordinate the activity of the heart and arterial muscles, seem to allow of great local variations in blood flow without disturbing the general arterial pressure.

Hales gave the first demonstration of blood pressure in 1733. This was more than a century after Harvey (q.v.) discovered the circulation of the blood. But no definite advance was made until, in 1828, Poiseuille and Ludwig introduced the mercurial manometer. Since then many instruments have been devised, but the subject is still far from being thoroughly understood. In animals the pressure may be taken directly by inserting a tube into a blood vessel and connecting it with a manometer; in human beings this method is obviously impracticable, and, instead, a sphygmomanometer is used. This instrument consists essentially of a broad band, lined with a flat distensible rubber tube, which fits around the arm, and which is inflated with a rubber tube and bulb, until the artery is compressed and the pulse no longer felt. Another tube connects the armlet with a manometer, and the amount by which the mercury is raised represents the blood pressure. A graphic reading may be obtained by means of a delicate needle floated on the column of mercury. The point of the needle is brought into contact with a revolving cylinder, and the slightest variations of the pulse and pressure thereby recorded. See **SPHYGMOGRAPHY**.

The average arterial blood pressure in healthy adults during cardiac systole varies between 100 mm. and 130 mm. (Janeway): in childhood 90 to 110 mm. may be considered normal. After middle life the pressure increases, still within normal limits, to 145 or 160 mm. Anything

above this point is looked upon as pathological. In kidney or brain diseases a reading of 250 or 300 mm is not uncommon. Blood pressure varies in different individuals, and in the same individuals at different times. It undergoes spontaneous diurnal fluctuations, being lowest during sleep, it is influenced by posture, by the process of digestion, and by external changes of temperature and by altitude, it is raised by muscular exertion and increased by mental emotions. Since an unduly high and steady blood pressure is generally admitted to be a factor in the production of arterio-sclerosis (q.v.), it becomes of interest to know what influences are likely to bring this about. Excessive mental or physical work is an important factor, and so we see the brain worker and the laborer equally affected. Chronic worry, the habitual use of tobacco, overeating, and, to some extent, steady drinking, also conduce to hypertension. Poisons generated within the body cause extreme hypertension, those resulting from Bright's disease, uremia, eclampsia, and intestinal fermentation are common causes. Abnormally low pressure (hypotension) is observed in infectious and wasting diseases, hemorrhage, collapse, and shock. Chronic high pressure may be controlled, in a measure, by regulating the life of the individual. Abstinence from worry and business cares, moderation in eating, drinking, and smoking, and indulgence in the milder forms of outdoor exercise must be enjoined. In sudden rises of the blood pressure, amyl nitrite and nitroglycerin are invaluable remedies, while potassium iodide is the drug most relied upon in chronic cases.

The uses of blood-pressure estimation in medicine are numerous. A knowledge of the true condition of the circulatory system is thereby gained which ordinary palpation of the pulse cannot reveal. By combating hypertension the evils of arterio-sclerosis can often be postponed for years. In surgery it makes possible a more careful choice of anesthetics, and Cushing and Crile have shown that surgical shock can be anticipated and avoided by watching the blood pressure during operations. Consult Janeway, *The Clinical Study of Blood Pressure* (New York, 1904), Crile, *Blood Pressure in Surgery* (Philadelphia, 1903), Faught, *Blood Pressure* (Philadelphia, 1913).

BLOOD RAIN. A shower leaving red stains, due essentially to microscopic organisms containing red oxide of iron. The organisms consist of fungi, numerous specimens of which are carried down from the atmosphere by rain and snow. Such organisms are often capable of imparting to snow a pink, red, or bluish tint, and sometimes exhibit the phenomenon of phosphorescence. Similarly, black rain may be caused by the presence of a black fungus. The above-mentioned low forms of plants grow, especially in torrid zones, in ponds that hold water during a short season of each year, being dried up during seasons of drought which last for several months. From these desiccated basins the fine dust and minute fungi are raised into the atmosphere by wind and carried for hundreds of miles. Decrease of temperature causes rainfall or snowfall, during which the dust particles are carried to the earth. The gray dust, consisting principally of diatoms, being rather denser, may descend without rain. Such dust showers have been observed to fall upon vessels in the Atlantic Ocean as far as 1000

miles west of the coast of Africa. Showers of blood rain and dust are observed principally over the area lying east west, and north of the Sahara, but they are not restricted to this region. See *ÆOLIAN ACCUMULATIONS, RAIN, RED SNOW*.

BLOODROOT. See SANGUINARIA.

BLOOD STAINS. In some criminal trials it is a matter of extreme importance to determine whether certain stains found upon various weapons, upon clothing, or upon carpets, walls, furniture, etc., have been made by blood or by some other substance. Further, there comes up the question as to whether a blood stain has been made by human blood or by the blood of one of the lower animals. The appearance of blood stains varies, depending largely on the character of the substance stained, age of the stain, etc. As a rule, the more permeable the substance, the brighter is the stain. Thus, on cloth the serum is quickly absorbed, leaving a rather bright stain from the colored elements of the blood, while stains on hard surfaces, such as metal and polished wood, are usually of a dark color. The question as to whether a given stain is blood is in most cases comparatively easy to answer. The determination may be made by chemical means, by the use of the microscope, or that of the spectroscope. The *guaiacum test* is as follows: If a drop of blood, or a drop of water with which a blood stain has been moistened, be placed upon a blotting paper and a drop of tincture of guaiacum added, the further addition of a drop of hydrogen peroxide will result in the production of a sapphire-blue color. The fact that certain substances other than blood may give this or a similar reaction tends to vitiate the value of this test. Another test, known as the *hemin test*, is as follows: To a little of the powder scraped from a blood stain is added a drop of glacial acetic acid with a trace of sodium chloride. After standing for some time the mixture is gently heated. As evaporation takes place, the specimen should be examined under the microscope, when numerous rhomboidal crystals will be seen of a reddish, brown, or yellow color. These are produced from the coloring matter of the blood, and are known as hemin crystals. A positive result from this test is extremely reliable. On the other hand, a failure to obtain crystals cannot be considered positive proof that the stain is not blood. Very accurate results may be obtained by *spectroscopic* examination of blood stains. The fact that hemoglobin (from a fresh stain) and hematin (from an old stain) exist each in two states of oxidation, and that each state has its own characteristic absorption bands in the spectrum, increases the accuracy of this test. The *microscope* alone is often of value in determining the nature of blood stains. Thus, if a stain be moistened with a little normal saline solution (sodium chloride 6 per cent in water), and some of the fluid be examined under the microscope, it is often possible, even in the case of very old stains, to recognize the blood corpuscles.

The differentiation of the blood of a man from that of a woman or child, or of the blood of one person from that of another, is apparently impossible. Immunized antiserum, obtained from the blood of rabbits, produces a precipitate with human blood only. Consult Major Sutherland, *Blood Stains Their Detection and the Determination of their Source* (New York, 1907), and

Witthaus and Becker, *Medical Jurisprudence*, vol. iii (New York, 1909). See BLOOD.

BLOODSTONE. See HELIOTROPE.

BLOOD TRANSFUSION. See TRANSFUSION OF BLOOD.

BLOOD VESSELS. See AORTA; ARTERY; CAPILLARIES; VEIN.

BLOOD WORM. The name of various red worms and annelids. That commonly known to anglers as the bloodworm, used for bait, is the worm-like aquatic larva of a midge (*Chironomus*), which swarms about stagnant pools.

BLOODY ASSIZES. The name given to a series of trials for treason conducted by Lord Chief Justice Jeffreys in the western counties of England after the suppression of Monmouth's rebellion in 1685. See JEFFREYS, GEORGE.

BLOODY MARY. The popular designation of the daughter of Henry VIII, Queen of England in 1553-58, because of her persecution of Protestants.

BLOODY TOWER. The name given to one of the towers of the Tower of London, in which Richard III is said to have procured the murder of the young sons of Edward IV.

BLOOM. The white, waxy or glaucous covering of various fruits and leaves, especially common on the leaves of drought plants. See XEROPHYTES.

BLOOM. An appearance on paintings resembling in some measure the bloom on certain kinds of fruit, such as peaches, plums, etc. (hence the name), produced, in all probability, by the presence of moisture in the varnish, or on the surface of the painting when the varnish is laid on. The bloom destroys the transparency, and is consequently very injurious to the general effect of a picture. It is best prevented by carefully drying the picture and heating the varnish before applying it, after which a soft brush should be employed to smooth the surface of the picture, which should be finally placed in the sunshine to dry.

BLOOMARY, BLOOMERY, or BLOMARY, bloom'ā-ri (Eng. *blomm*, AS. *blōma*, a mass or lump, in *iscenes blōma*, a lump or bloom of iron). A furnace or hearth for making wrought iron directly from the ore. See IRON AND STEEL.

BLOOMER, AMELIA JENKS (1818-94). An American reformer. She was born in Homer, N. Y., and for several years lectured and wrote on the temperance question. She was a prominent advocate of woman's suffrage, but is remembered chiefly for her enthusiastic adoption of the so-called "bloomer" costume, originally devised and introduced by Mrs. Elizabeth Smith Miller.

BLOOMFIELD. A town and the county seat of Greene Co., Ind., 78 miles southwest of Indianapolis, on the White River, and on the Evansville and Indianapolis, the Illinois Central, and the Chicago, Indianapolis, and Louisville railroads. It has a Carnegie library, flour and lumber mills, and a chair factory, and manufactures tools, lifting jacks, novelties of steel, iron, wood, and clay, and carries on considerable trade in coal, agricultural produce, lumber, grain, and live stock. Pop., 1900, 1583; 1910, 2069.

BLOOMFIELD. A city and the county seat of Davis Co., Iowa, 70 miles northwest of Keokuk; on the Burlington and the Wabash railroads (Map: Iowa, B 4). It has a fine high-school building, a Carnegie library, opera house,

and is the seat of the Southern Iowa Normal School. Bloomfield's interests are primarily agricultural, and it carries on a large trade in stock, corn, oats, hay, and cattle. The city owns and operates its water works and electric light plant. Pop., 1890, 1913, 1900, 2105; 1910, 2028.

BLOOMFIELD. A town in Essex Co., N. J., adjoining Newark, and 11 miles from New York City; on the Erie and the Lackawanna railroads, and on the Morris Canal (Map: New Jersey, D 2). It is the seat of the German Theological Seminary of Newark (Presbyterian), opened in 1869, Job Haines Home for Aged People; and possesses, among the features of interest, the National Bank Building, Jarvie Memorial Library, Knox Hall, and Westminster and First Presbyterian churches, the latter built in 1790. The town has a number of suburban residences and, as one of its chief attractions, a park developed from the "Common" used during the Revolution as training grounds. There are important manufactures, including woolen cloth, lamps, cod-liver oil, brushes, plumbers' supplies, straw board, silk, electric elevators, hats, rubber goods, paper, pins, and railroad brake shoes. Under a charter of 1900 the government is vested in a mayor and a town council. Pop., 1890, 7708; 1900, 9063, 1910, 15,070. Settled as early as 1675, Bloomfield was a part of Newark until incorporated as a separate township in 1812. Its present name was chosen in 1796 in honor of Gen. Joseph Bloomfield, a Revolutionary officer, afterward Governor of New Jersey. Consult Shaw, *History of Essex and Hudson Counties, New Jersey* (Philadelphia, 1884), and Folsom, *Bloomfield, Old and New* (1913).

BLOOMFIELD, JOSEPH (c.1755-1823). An American soldier, born in Woodbridge, N. J. He attained the rank of major in the Revolutionary War, and from 1801 to 1812 was Governor of New Jersey. He served as brigadier general in the American army during the War of 1812 and from 1817 to 1821 was a member of Congress.

BLOOMFIELD, MAURICE (1855-). An American philologist and Sanskrit scholar. He was born in Bielitz, Austrian Silesia, Feb. 23, 1855. He came to the United States in 1867; studied at the old University of Chicago and at Furman University, Greenville, S. C., and was a graduate pupil of William Dwight Whitney at Yale, 1877-78. He was a fellow of Johns Hopkins University, 1878-79, and then studied in Berlin and Leipzig, 1879-81. On his return to America in 1881 he received an associate professorship in Johns Hopkins, and afterward the full professorial chair of Sanskrit and comparative philology, which he holds in that university. In 1896 Princeton bestowed the LL.D. degree upon him. He is an extensive contributor to the Oriental journals and philological periodicals; and his researches in connection with the Atharva-Veda are especially important. Mention may be made of his edition of the *Kaṣikā-Sūtra*, New Haven, 1890 (American Oriental Society's Journal, vol. xiv); *Hymns of the Atharva-Veda Translated*, Oxford, 1897 (Sacred Books of the East, vol. xlii); *The Atharva-Veda*, Strassburg, 1899 (Bühler's *Grundriss der indo-arischen Philologie*); *The Kasmirian Atharva-Veda*, reproduction of the manuscript by chromolithography (Baltimore, 1901); *Cerberus, the Dog of Hades* (Chicago, 1905); *The Religion of the Veda* (New York, 1908), which

treats the subject thoroughly from the Rig-Veda to the Upanishads, and a *Vedic Concordance* (which appeared in the Harvard Oriental Series, Cambridge, 1906)

BLOOMFIELD, ROBERT (1766-1823) An English pastoral poet. He was born at Honington, Suffolk, Dec. 3, 1766, and was the son of a poor tailor, who died, leaving Robert an infant. His mother with difficulty subsisted by teaching a school, where Bloomfield learned to read. At the age of 11 he was hired to a farmer, but ultimately became a shoemaker in London, where in a poor garret he wrote his *Fanner's Boy*. It was published in 1800, had extraordinary popularity, and was translated into a number of languages. He subsequently published *Rural Tales*, *Wild Flowers*, and other pieces. He died, nearly insane, at Sheffield, Aug. 19, 1823. Consult Weston, *Works of Robert Bloomfield* (London, 1824), and Hart, *Selections from Correspondence* (London, 1870).

BLOOMFIELD-ZEISLER, bloom'feld-ts'ler, FANNY (1866-) An American pianist, born in Bielitz, Austrian Silesia, July 16, 1866. In 1868 her parents came to America, settling in Chicago. At the age of six, before receiving any musical instruction, she began picking out tunes on the piano. In 1877 Madame Essipoff, then on tour in the United States, heard her play and advised that she become a pupil of Leschetzky, which she did the following year, remaining with him until 1883. After successful appearances abroad she returned to America, where she has played with the principal orchestras. She also has given many recitals and has made several brilliantly successful foreign tours, playing in the summer of 1896 at Cologne at the Lower Rhine Music Festival. She is one of the foremost living pianists.

BLOOMINGTON A city and the county seat of McLean Co., Ill., 126 miles southwest of Chicago, on the Illinois Central, the Chicago and Alton, the Lake Erie and Western, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map Illinois, D 3). It contains the construction and repair shops of the Chicago and Alton Railroad, and has extensive coal-mining, pork-packing, stock-raising, vegetable-canning, and stove manufacturing interests, besides flour mills, foundries, harness, agricultural machinery, candy, and plow factories, funneccs, and brickyards. The city is the seat of the Illinois Wesleyan University (Methodist Episcopal), founded in 1852, and at Normal, 2 miles north, is the Illinois State Normal University. Bloomington has several parks, a marble courthouse, a fine city hall, a large public library, two hospitals, four sanitariums, and a beautiful Soldiers' Monument. There is also a soldiers' orphans' home at Normal. Settled in 1831, Bloomington was chartered as a city in 1850 and in 1900 celebrated the semicentennial of its incorporation. Under the charter of 1897, now in effect, the city is governed by a mayor, elected for two years, and a city council. The school board, city attorney, city clerk, superintendent of streets, and city engineer are elected by popular vote. Town meetings are convened annually to levy road, bridge, and town taxes. The city owns and operates its water works and electric light plant. Pop., 1890, 20,484; 1900, 23,286; 1910, 25,768.

BLOOMINGTON A city and the county seat of Monroe Co., Ind., 50 miles southwest of

Indianapolis, on the Chicago, Indianapolis, and Louisville, and the Indianapolis Southern railroads (Map Indiana, C 3). It is the seat of the Indiana State University (qv), and contains besides the college buildings, a fine courthouse, a theatre, and a hospital. The city has vast quarries of oolitic limestone, flouing, planing, and saw mills, and manufactures furniture baskets, harness, gloves and mittens, glass novelties, cresseted paving blocks, brooms, and storage batteries. It was settled about 1818. The government, under a general State law, is administered by a mayor, elected every four years, and a council. The water works are owned by the city. Pop., 1890, 4018; 1900, 6460; 1910, 8838.

BLOOMSBURG A town and the county seat of Columbia Co., Pa., 40 miles southwest of Wilkesbarre, on the Susquehanna River, and on the Lackawanna, the Philadelphia and Reading, the Pennsylvania, and the Bloomsburg and Sullivan railroads (Map Pennsylvania, H 4). It is the seat of a State normal school and has a hospital, a library, and fine county and town buildings. The town is in a region which produces iron and coal and contains, among its industrial establishments, foundries, car works, flour, woolen, silk, and lumber mills, and carriage, furniture, fountain-pen, match, and carpet factories. Pop., 1900, 6170; 1910, 7413.

BLOSSOM, HENRY MARTYN, JR. (1866-) An American playwright and novelist. He was born in St. Louis and for a time was in the insurance business. He wrote a little fiction, including *The Documents in Evidence* and *Cheekers a Hard-Luck Story* (1897), but is better known as the author of the plays, *Cheekers* (dramatized from his book), and *The Yankee Consul*, the comic operas, *Mlle. Modiste*, in which Fritz Schell starred, and *The Slim Princess*, and the musical comedies, *The Red Mill* and *The Man from Cooch's*.

BLOT IN THE SCUTCHEON A The title of a tragedy by Robert Browning (1841), played by Lawrence Barrett in America. It is based upon the fatal consequences of a childish passion, uselessly concealed.

BLOUET, blow'a, PAUL See O'REILLY, MAX.

BLOUNT, WILLIAM (1740-1800) An American politician, born in Bertie Co., N. C. He was a member of the North Carolina Legislature for several terms after 1780, of the Continental Congress in 1783-84, and again in 1786-87, and of the Constitutional Convention of 1787. In 1790 he was appointed by Washington to be Governor of "The Territory of the United States South of the Ohio" (including the present Tennessee), and soon afterward founded the city of Knoxville. When Tennessee was admitted to the Union in 1796, Blount was elected to the United States Senate from that State, but in July, 1797, he was detected in a conspiracy to wrest New Orleans and the Floridas from the Spaniards on behalf of Great Britain and was summarily expelled on a charge of "high misdemeanor entirely inconsistent with his public trust and duty." The pro-British scheme caused much excitement at the time, both in and out of Congress, and has since been known as "Blount's Conspiracy." His formal trial was postponed until 1798, and early in 1799 the Senate decided to dismiss the impeachment on account of a lack of jurisdiction, Blount not then being a member. The whole incident increased considerably Blount's popu-

larity in Tennessee, and soon after his expulsion he was elected to the State Senate, over which he presided for some time. Consult an article by Mrs. M. J. Lamb, in *Magazine of American History*, vol. xiii (New York, 1884).

BLOUSE, blouz (of uncertain origin). A name borrowed from the French for the loose, sack-like over-garment which, as worn in England by wagoners and farm laborers, is called a smock frock. The English smock frock is made of coarse and unbleached linen, sometimes plaited and embroidered. In Germany it is frequently tightened to the body by a belt and is sometimes made of coarse woolen. In Russia blouses, usually of coarse material, are generally worn by peasants and factory hands, while students of gymnasiums frequently wear a finer garment resembling the blouse as a surcoat. France is preëminently the country of blouses, however. There they are worn universally by the laboring classes in towns, and so characteristic is this garment that the French populace is often called the "Blouses." The white blouse is a Sunday dress with the working classes in France, and has often served as a countersign among the leaders of sections in secret societies.

BLOW, blō, Jouyn (1648-1708). An English composer and musician; born at North Collingham (Nottinghamshire). He was trained in music as one of the children of the Chapel Royal under Capt. Henry Cooke. In 1680 he was appointed organist of Westminster Abbey and in 1685 composer-in-ordinary to James II. From 1687 to 1693 he was master of the choristers at St. Paul's Cathedral, and in 1699 became composer of the Chapel Royal. He published *Lessons for the Harpsichord* (1698) and a collection of songs entitled *Amphion Anglicus* (1700). His other works, mostly unprinted, comprise 14 services, about 100 anthems, sacred songs, and many odes, including the setting for Dryden's ode on the death of Purcell (1695).

BLOWFLY. See FLESH FLY.

BLOWGUN. A weapon used both for war and hunting by the tribes formerly inhabiting the Gulf region of the United States, by the Iroquois of New York, by the natives of equatorial South America and by the Malays of the East Indies. It consists of a straight tube from 8 to 12 feet in length, from which a light dart is forcibly expelled by the breath. The tube is made of a hollow reed or cane, the joints of which have been bored or burned through, or from two pieces of wood hollowed out and fitted together in lute fashion. The arrow is usually tipped with poison, so that a slight scratch will produce death or paralysis.

BLOWING MACHINES. Mechanical contrivances for producing an artificial current of air, often of considerable intensity. Properly speaking, a blowing engine should deliver large volumes of air at a low pressure; and when the intensity of pressure becomes greater than a few pounds per square inch and the volume and weight of air less, the machine should be called an air compressor. The dividing line is vague and undefined. For the purpose of description, blowing machines may be divided into the following classes or types: (1) bellows; (2) piston blowers; (3) fan blowers; (4) rotary blowers; (5) jet blowers.

Bellows. Some form of bellows was probably the earliest form of blowing machine. A very primitive form of bellows is still in use in some Eastern countries, consisting simply of the skin

of some animal sewed into a rude bag, with a valve and nozzle. The older forms of domestic bellows are all constructed on the same principle, viz., a chamber formed of two boards with flexible leather sides, having at one end a nozzle with a narrow mouth; and in the lower board a valve of considerably larger area for the admission of air. When the bellows are distended by drawing the boards apart, air is forced in by atmospheric pressure to fill the volume where the reduced pressure prevails, and then, when the boards are being closed, the valve, which opens only inward, is shut by the compressed air; and the latter, having no other escape, is forced out at the nozzle. The great fault of the common bellows is that it gives a succession of puffs and not a continuous blast. A former remedy for this was to use two bellows, so that one was blowing while the other was filling; but it was afterward found that the double bellows secured a still more uniform blast. This machine is merely the common bellows, with a third board of the same shape as the other two placed between them, so as to form two chambers instead of one. The middle board is fixed, and both it and the lower one have valves placed in them opening inward. A weight on the lower board tends to keep the under chamber filled with air, and when this board is raised by a lever or otherwise, the air which it contains is forced into the upper chamber. The exit pipe is attached to the latter, and a weight is placed on the upper board sufficiently heavy to press the air out in a continuous stream, the continuity being maintained by the large quantity of air always present in the upper chamber, as compared with the size of the exit pipe and the uniform pressure of the weight. Sometimes a spring is used instead of a weight to press out the air. This is the usual construction of the ordinary blacksmith's bellows. Even with the double bellows, however, the constant refilling of the upper portion from the lower prevents the blast from being quite regular, and its use is therefore limited to such simple requirements as are furnished by blacksmiths' forges and domestic fireplaces.

Piston Blowers. The Chinese bellows is one of the earliest and simplest forms of piston blowers. It consists of a square chamber of wood, with a close-fitting piston, which, when drawn back, sucks air in through a flap valve like the ordinary bellows valve, and when pushed forward compresses this air and forces it out through a nozzle. The modern form of piston blower is virtually an air pump or compressor for producing low pressures. (See AIR COMPRESSORS.) Its most extensive use is for supplying the air blast to blast furnaces, Bessemer converters, etc. Steam is the power most commonly used; but gas engines have recently been introduced, and any other power, such as a fall of water, may be employed. A blowing engine of modern construction usually consists of a steam cylinder and an air cylinder set tandem, either vertically, one above the other, or horizontally, one ahead of the other, with a common piston rod and a heavy fly wheel to regulate the operation. The air cylinder is usually placed uppermost in a vertical engine and foremost in a horizontal engine, and the air is usually compressed on both the forward and the return stroke of the piston. Often the steam cylinders are compounded and the air cylinders may compress in two or more stages,

if the pressures are high. The air from the air cylinder passes sometimes into a receiver, but more often directly into the blast pipes, which are made large enough to act as a receiver or reservoir for maintaining a steady supply of air to the furnaces.

The following are brief descriptions of representative modern blowing engines: A blowing engine built in Philadelphia is a horizontal cross-compound engine, with a high-pressure steam cylinder 44 inches in diameter, a low-pressure cylinder 81 inches in diameter, and two vertical air cylinders each 84 inches in diameter, all with a stroke of 60 inches and making 60 R.P.M. The engine uses steam of 165 lbs. per sq. in. pressure, and the air blast has a pressure of 30 lbs. per sq. in. Vertical blowing engines are often used to supply the blast for blast furnaces. Such engines may have high-pressure steam cylinders 50 inches in diameter, low-pressure steam cylinders 96 inches in diameter, air cylinders 96 inches in diameter, and a piston stroke of 60 inches.

The latest development in blast-furnace blowing is to use blowers driven by gas engines that operate on blast-furnace gas. Engines of this type that develop 1000 horse power each, are in use at the plant of the Lackawanna Steel Company, Buffalo, N. Y., and at Gary, Ind.

Disk Blowers. Disk blowers consist of an axle carrying several blades arranged something

are built of varying sizes, from 1 foot to 8 feet in diameter, and have a capacity of from 1500 cubic feet to 90,000 cubic feet of air per minute, depending upon their size and the speed at which they are run.

Fans. The general name of "fan" is given to all air machines in which a series of radial

FAN BLOWER.

PERIPHERAL DISCHARGE CONE FAN.

like the blades of a screw propeller and revolving concentric with and inside of a cylindrical casing open at both ends. The air current will be parallel to the shaft which drives the fan. This form of blower is used chiefly for ventilating purposes and in such cases is set in the wall of a building with one end of the cylindrical casing opening into the building and the other end opening to the outside air. In this position the axle and blades are rotated by means of an electric motor or belt, and by means of this rotation suck and force the vitiated air from the room into the outer atmosphere. By setting the blower so that it faces into the building, fresh air from the outside may be forced into the room instead of the foul air being drawn out. The familiar "electric fan" is a form of disk or helical blower. Disk blowers

blades or vanes on a revolving axis give a rapid radial rotary motion to the air between them. This rotary motion develops a centrifugal tendency in the revolving air, and it tends to move radially outward and be discharged at the periphery of the wheel. The entry of air is at the centre of the side of the casing and the discharge is in the direction of a tangent. This gives an involute form to such casings. By the use of the high velocities of electric motors or steam turbines, fans can develop high pressures, especially when arranged in series. The Sirocco fan has numerous blades, short radially and long axially. The blades curve forward and give the air a greater velocity than that of the tips of the blades.

Positive Blowers. A form of rotary blower much used is the positive blower, of which

POSITIVE BLOWER.

the Root blower, which is shown above, is a familiar example. This blower consists of

two encased "revolvers," shaped something like a figure 8 and carried by two horizontal shafts, which are connected by gear wheels outside of the casing, so that their relative motion is invariable. These "revolvers" fit the casing closely, and also mesh closely with each other when revolving. As is clearly shown by the engraving, the air is taken in at the bottom of the casing and forced out at its top. These blowers can develop considerably greater pressure than disk blowers.

Jet Blowers. A jet of steam or of water forced through a pipe of small diameter inserted in an air pipe of larger diameter, open at both ends, creates a current of air through the air pipe in the direction of the escaping jet, which is often used for blowing purposes. The most familiar forms of steam-jet blowers are the exhaust nozzles used in the smokestacks of locomotives and fire engines. In these instances the exhaust steam from the engine cylinders is employed to furnish the steam-jet. A water-jet blower, called a *trompe*, was frequently used in the early days of metallurgy to furnish the blast for iron furnaces. In this device a stream or jet of water fell downward through a vertical pipe having openings for the admission of air at its top and terminating at its bottom in an air-tight reservoir. The air sucked in at the top of the pipe by the falling water rises to the top of this reservoir, from which it is piped off for use, while the water remains at the bottom and is drawn off by suitable valves or openings. There are various other forms of blowing machines; but they are of such limited application, or have become so nearly obsolete, that they need not be described here. The modern blowers of greatest importance in mechanical operations are the bellows, the blowing engine, and rotary blowers of the fan, disk, and positive types. Consult Weisbach, *Mechanics of Air Machinery* (New York, 1905), and Kinealy, *Centrifugal Fans* (New York, 1905). See HEATING.

BLOWITZ, blô'vitz, HENRI GEORGES STEPHAN ADOLPHE OFFER DE (1825-1903). A French journalist. He was born at Blowitz, Pilsen, Bohemia, but early removed to France, where he was for many years a teacher of languages at Tours, Limoges, and Marseilles. During this time he became known as a writer on European politics, contributing to the *Gazette du Midi* and other journals. He was naturalized as a French citizen in 1870 and became a warm supporter of Thiers, and for his services in aiding in the suppression of the Commune at Marseilles in 1871 was decorated with the cross of the Legion of Honor. In July, 1871, he began his long career as Paris correspondent of the *London Times*. His services on the *Times* have been noteworthy—in particular his revelation, in 1875, of the plans of the German military party for the second invasion of France, and his publication of the entire text of the Treaty of Berlin before it was signed. He was one of the first newspaper men to see the value of the "interview." Besides having contributed over 4000 columns to the *London Times*, he published *Feuilles volantes* (1858); *Midi à quatorze heures*, a comedy; *l'Allemagne et la Provence* (1869); *Le mariage royal d'Espagne* (1878); *Une course à Constantinople* (1884). Consult his *Mémoires* (Paris, 1903; Eng. trans., New York, 1904).

BLOWPIPE. A conical tube of metal ter-

minating in a small opening and used in the arts for soldering metals and in mineralogy and analytical chemistry for determining the nature of substances. According

to Berzelius, Anton von Swab, a Swedish counselor of mines, first used the blowpipe in 1738 to test minerals and ores. Its use extended from Sweden to Germany and thence throughout the continent of Europe and to England. Cronstedt, Bergman, Gahn, and Berzelius have successively introduced valuable improvements in the form of the blowpipe. The present form, however, is due to Plattner and his successors in the Royal Saxon Mining Academy in Freiberg.

The blowpipe most commonly used in doing analytical work consists of a conical brass tube about 8 inches long, terminating at the wider end in a convenient mouthpiece made of horn or rubber, while at the lower end a small tube with a finely perforated

BLOWPIPES.

nozzle and a platinum tip is inserted at right angles to the larger tube slightly above its end, the space below being intended as a chamber for the moisture from the breath.

When the nozzle of the blowpipe is placed within an ordinary flame and a somewhat strong current of air is blown through it, the flame is projected in a lateral direction as a long pointed cone; the air thus supplied being sufficient for complete combustion, the flame is colored blue and is very hot. If the point of this flame is directed against metals, the latter are rapidly transformed into their oxides, and hence the flame is called an *oxidizing flame*. On the other hand, when the nozzle of the blowpipe is placed near but outside a flame, and a gentle current of air is blown through it, the flame retains its luminosity and, owing to the presence in it of incandescent carbon, is capable of reducing oxides to the metallic state; whence the name, *reducing flame*. See FLAME.

In certain tests the substance is heated before the blowpipe on a piece of charcoal, the formation of colored coatings often indicating the nature of the compound; thus, lead deposits on the charcoal a yellow coating of its oxide. In other tests the substance examined is mixed with reagents, usually borax, sodium carbonate, microcosmic salt, and cobalt nitrate. The first four of these form, with metallic oxides, colored glass-like beads which serve to determine the composition of the substance. With borax, a bottle-green glass bead is obtained when iron salts are present; an amethyst-colored bead indicates manganese, and a blue-colored bead, cobalt. Sodium carbonate and microcosmic salt also yield characteristic colored beads that serve to indicate the presence of certain ingredients. The solution of cobalt nitrate, when applied to a powder on a piece of charcoal, yields charac-

teristic colors for certain compounds that are distinctive, notably the blue coloration for aluminum salts.

Blowpipe analysis is generally used for qualitative determinations, and finds its greatest application in field work as an easy means for determining the composition of minerals. In certain cases, it is possible to make also a quantitative estimation of ores, especially those of silver and lead, by the use of the blowpipe. But the insignificant quantity of the material that is employed renders the result scarcely precise enough for the purpose of technical analysis.

The blowpipe is the common instrument used by goldsmiths and jewelers for soldering metals. It is also used by glass blowers in their work, but in their manipulations the form of the blowpipe is usually the Bunsen blast lamp, in which the heat of the gas flame is increased by a current of air that is supplied from a bellows.

Consult H. B. Cornwall, *Manual of Blowpipe Analysis, Qualitative and Quantitative, with a Complete System of Determinative Mineralogy* (New York, 1891), C. F. Plattner, *Manual of Qualitative and Quantitative Analysis with the Blowpipe*, trans. Cornwall (New York, 1892), Moses and Parsons, *Elements of Mineralogy, Crystallography, and Blowpipe Analysis from a Practical Standpoint* (New York, 1895), F. W. Martin, *Laboratory Guide to Quantitative Analysis with the Blowpipe* (New York, 1903). See ANALYSIS, CHEMICAL, MINERALOGY, OXY-HYDROGEN BLOWPIPE.

BLOWPIPE ANALYSIS See MINERALOGY.

BLUCHER, bluk'er, GERHARD LEBERRECHT VON, PRINCE OF WALLSTADT (1742-1819) A Prussian field marshal. He was born at Rostock, in Mecklenburg-Schwerin, Dec. 16, 1742. At the beginning of the Seven Years' War he joined a regiment of Swedish hussars and in his first action was taken prisoner by the Prussian hussars, whose colonel persuaded him to enter the Prussian service and gave him a lieutenancy. Another lieutenant having been promoted over Blucher's head, the latter immediately wrote to Frederick the Great as follows: "Von Jagersfeld, who has no merit except that of being the son of the Margrave of Schwedt, has been put over my head. I beg to request my discharge." Blucher was put under arrest, and after repeated applications for discharge he received from Frederick the curt intimation: "Captain Blucher is at liberty to go to the devil!" Blucher betook himself to his estate at Gross-Radow, in Pomerania, and devoted himself to farming, but soon tired of bucolic life and in 1787 rejoined the army. He fought as colonel of hussars against the French on the Rhine, earning great ability as a leader of cavalry. In the campaign of 1806 he took part as lieutenant general in the battle of Austerlitz. Blucher, with the greater part of the cavalry, covered the retreat of the Prince von Hohenlohe through Pomerania. He was accused of not giving the Prince due support and thus causing the capitulation at Prenzlau. Blucher marched into the territory of the free town of Lubeck, and hastily fortified the city, but the French took it by storm, and he was forced to surrender on the plain of Ratkow, near Lubeck, whither he had escaped with a few troops. A fortnight later he was exchanged for the French General Victor and immediately on his arrival in Königsberg was sent at the head of a corps to assist in the defense of Stralsund. After the Peace

of Tilsit he was employed in the War Department in Königsberg and Berlin and subsequently became commandant of Pomerania. At a later period he was placed on the retired list, together with several other men of note, at the instance, it was said, of Napoleon. He was one of the few to combat the general belief in the invincibility of Napoleon, which had grown into a sort of fatalism in high places. In common with Stein and Hardenberg, he labored to remove all weak and unpatrotic counselors from about the King. When all the leaders of the army lost courage, his constancy revived confidence and made him the centre of all hope for the future. When his countrymen at last rose against the French in 1813, Blucher was appointed to the chief command of the Prussians, reinforced by General Winzingerode's Russian corps. At the battles of Lützen, Bautzen, and Haynau he displayed heroic courage. At the Katzbach he defeated Marshal Macdonald and cleared Silesia of the enemy. In vain did Napoleon himself attempt to stop the "old captain of hussars," as he called him, in his victorious career. In the battle of Leipzig he won a great advantage over Marshal Marmont, at Mockern, Oct. 16, 1813, and on the same day pressed on to the suburbs of the city. On the 18th, in conjunction with the Crown Prince of Sweden, he had a large share in the defeat of the French, and on the 19th his troops were the first to enter Leipzig. Opposing the policy of Austria, Blucher insisted that the taking of Paris was the end to be sought. On the first day of January, 1814, he crossed the Rhine, garrisoned Nancy on the 17th of the same month, and, after winning the battle of La Rothière, pressed forward toward Paris. But his scattered corps were routed by Napoleon, and he fought his way back to Châlons with great loss. On March 9, however, he defeated Napoleon at Laon, and at the end of the month, after being joined by Schwarzenberg and his corps, he again advanced toward Paris. The day of Montmartre crowned the brilliant deeds of this campaign, and on March 31 the Allies entered the French capital. Blucher himself, who was suffering from a malady of the eyes, abstained from entering the city on that day. Frederick William III created him Prince of Wahlstadt, in remembrance of the victory at the Katzbach, and gave him an estate in Silesia. In England, whither he followed the Allied sovereigns, he was received with an enthusiasm never before excited by a German. The University of Oxford conferred on him the degree of doctor of law. After Napoleon's return from Elba, in 1815, Blucher once more assumed the general command and promptly led an army into the Netherlands. On June 16, 1815, he lost the battle of Ligny and narrowly escaped being killed by his horse falling on him. The victory of the Allies in the battle of Waterloo was decided by Blucher's timely appearance on the field. He ordered his Prussians to pursue the flying enemy, which they did the whole night. Declining the offered truce, Blucher marched against Paris, and on the second taking of that city manifested a strong desire to retaliate on Paris the spoliation that other capitals had suffered at the hands of the French, but he was held in check by the Duke of Wellington. In order to reward Blucher's services to Prussia and the common cause, Frederick William III created the Order of the Iron Cross, the badge of which consisted of an iron cross

surrounded by golden rays. On Aug. 26, 1819, a colossal bronze statue was erected in his honor in his native town. Blucher died Sept. 12, 1819, after a short illness, at his estate of Krieblowitz, in Silesia. Consult: Scherr, *Blücher, seine Zeit und sein Leben* (Leipzig, 1887); Varnhagen von Ense, "Fürst Blücher von Wahlstadt," vol. iii of the *Biographische Denkmale* (Leipzig, 1872); Von Colomb, *Blücher in Briefen aus den Feldzügen, 1813-15* (Stuttgart, 1876); Henderson, *Blücher and the Uprising of Prussia against Napoleon* (New York, 1911).

BLUDOV, блудов, DIMITRI NIKOLAYEVITCH, Count (1785-1864). A Russian statesman, born in the government of Vladimir. He studied in Moscow, entered the diplomatic service in 1800, in 1826 was appointed Secretary of State under Nicholas I, in 1832 became Secretary of the Interior, in 1839 became a member of the Imperial Council, and in 1842 received the title of Count. He worked unceasingly for the welfare of the peasants. As Minister of Justice he obtained two ukases (1842, 1847) for the amelioration of the condition of the serfs, and as President of the Imperial Council and of the Council of Ministers he set his signature to the act abolishing serfdom. For his biography, consult Kovalevsky, *Count Bludov and his Times* (St. Petersburg, 1866).

BLUE (from Fr. *bleu*, in itself borrowed from the Germanic nations; OHG. *blao*, AS. *blow*, Ger. *blau*). A primary color of the same shade as the clear sky and the turquoise, and located in the solar spectrum after the green and before the violet. This color has been conspicuously used as a badge to designate military bodies. It was the favorite color of the Scottish Covenanters in the seventeenth century, when it was called "true blue," and is the color commonly worn by the soldiers of the United States army for dress uniforms. The sailors of most navies are dressed in uniforms of a darker color, called *navy blue*. Among blue minerals the sapphire and the turquoise are highly valued as gems; the lapis lazuli has been extensively used for ornamental purposes. The coloring matter of blue flowers is due to a pigment called *anthocyanin*. Among the more important blue pigments are the following: *Antwerp blue*, a mixture of Prussian blue and alumina; *azure blue*, a cobalt oxide fused with glass and ground to powder; *Berlin blue*, another name for both Antwerp blue and Prussian blue, *bies blue*, originally native azurite powdered and washed, more commonly, however, a preparation of smalt; *Bremen blue*, chalk or whiting mixed with a solution of copper in nitric acid; *China blue*, crude cobalt oxide ground with potash and mixed with feldspar, fused, and powdered; *cobalt blue*, 10 parts of aluminum mixed with 1 part of a cobalt salt, slowly dried, and heated to a dull redness and ground to powder; *king's blue*, a cobalt carbonate; *mountain blue*, native copper carbonate or azurite; *mineral blue*, a synonym for Antwerp blue; *Paris blue*, a synonym for both cobalt blue and Prussian blue; *Prussian blue* is ferrie ferrocyanide made by adding potassium ferrocyanide to a solution of ferrous sulphate, and the resulting precipitate oxidized, washed, and dried; *queen blue*, a synonym for lump blue used in laundries (bluing); *Saunders blue*, ultramarine ashes obtained from the resinous mass in making ultramarine; *Saxon(y) blue*, Prussian blue and aluminum hydrate; *smalt*, a cobalt ore heated with flint and potash

and ground to a powder; *Thénard blue*, a synonym for cobalt blue; *ultramarine*, originally prepared from lapis lazuli, but now made synthetically by heating together kaolin, sodium sulphate, sodium carbonate, sulphur, and charcoal, then pulverizing, washing, and drying. Among the dyestuffs that yield a blue color are the following, the origin of many of which is indicated by their names: *alizarin blue*; *aniline blue*; *anthracene blue*; *chemo blue*, a solution of indigo; *Couper's blue*, derived from induline; *dahlia blue*, derived from rosaniline; *diamine blues*; *ethylene blue*, derived from diethylaniline; *indigo blue*, originally derived from the indigo plant and now made synthetically; *logwood blue*, an extract of logwood; *methylene blue*, derived from methylaniline; *night blue*, derived from rosaniline; *resorcin blue*, derived from phenol; *soluble blue*, derived from rosaniline; *sulphur blues*, and *Victoria blue*, derived from rosaniline.

BLUE, RUPERT (1857-). An American sanitarian and public official, born in Richmond Co., N. C., a brother of Victor Blue. He attended the University of Virginia in 1889-90 and studied medicine at the University of Maryland in 1892. He was promoted through the various grades in the government health service until in 1912 he became surgeon-general. In 1910 he took a course at the London School of Tropical Medicine. He served in many of the largest cities of the United States and in Genoa, Italy. In 1903-04 he was in charge of operations for the eradication of the bubonic plague in San Francisco, and in 1905 he served through the epidemic of yellow fever in New Orleans. He was director of sanitation at the Jamestown Exposition in 1907, and in that and the following years directed a second campaign against the bubonic plague in San Francisco.

BLUE, VICTOR (1865-). An American naval officer, born in North Carolina, a brother of Rupert Blue. He graduated at the United States Naval Academy at Annapolis in 1887, served on the *Suwanee* in the Spanish-American War, and attracted general attention in June, 1898, by penetrating 72 miles within the Spanish lines in the vicinity of Santiago, Cuba, and definitely determining for the first time the presence of the Spanish fleet in Santiago harbor. He commanded the *Albatross*, a gunboat captured from the Spanish, in the attack upon Manzanillo; became flag lieutenant in the Pacific Squadron, and served in the Philippines in 1900-01. From the rank of inspector of ordnance, held in 1905-07, he was promoted until he became commander in 1909 and in 1910 chief of staff in the Pacific fleet. Soon thereafter he was transferred to duty on the General Board of the Navy Department.

BLUEBACK. The name of various fishes having bluish backs; specifically, the Fraser River salmon (*Oncorhynchus nerka*), of the northwest coast of America. See SALMON.

BLUEBEARD. A fictitious hero of the familiar tale which in the eighteenth century found its way into English from the French of Charles Perrault (c.1697). In this story the Chevalier Raoul, whose surname is due to the color of his beard, had married seven wives. Six of these had mysteriously disappeared, and the seventh is represented as subjected to a singular test of obedience. Having occasion to go away, Raoul commits to Fatima the keys of his castle, and enjoins her that, though she may otherwise have free course, she must not open

a certain chamber Her curiosity is enhanced by her loneliness and proves too strong for her Opening the door, she beholds the charnel house where lie the bones of her predecessors Her lord returns, discovers her disobedience by the blood upon the key, and tells her that in five minutes she must die From the top of the castle, however, her sister Anne observes horsemen approaching in the distance, who are the brothers of the ill-fated wife, and they arrive just in time to rescue their sister by slaying Bluebeard Though Bluebeard is imaginary, there is thought to be a historic prototype in Gilles de Laval, Baron de Retz (1396-1440). He fought like the brave man he was against the English in their invasion of his country, but his intrepidity pales before his diabolical cruelties, and it is by these that he is remembered Because of some disloyalty to the Duke of Brittany, he was burned alive near Nantes in 1440 That Laval is the original of Bluebeard is conjecture at best, and from the fact that the story is found with more or less variety of detail in the folklore of different peoples, this doubt is enhanced

Besides the French version of Perrault, there are tales of a similar kind in Straparola's *Proverbi notti* (1569) and in the *Pentamerone* of Gian Alessio Abbatutis There is at Morbihan an interesting pictorial representation in some frescoes of the thirteenth century, mentioned by Violeau in his *Pelerinages de Bretagne* And it has been pointed out that the resemblance is very close to the Arabian Nights' tale of the Third Calender In his *Phantassus* Tieck has wrought the matter into a clever drama, G  try has, in his *Raoul Barbe-Bleue* (1789), given it the setting of comic opera, Offenbach produced his op  ra bouffe, *Barbe-Bleue*, in 1866, and the younger Coleman brought out *Bluebeard*, or, *Female Curiosity* (1798) Consult Wilson, *Bluebeard A Contribution to History and Folklore* (New York 1899), Hartland, "The Forbidden Chamber," in *Folklore Journal* (London, 1885), Abb   Bossard, *Gilles de Rais dit Barbe-Bleue* (Paris, 1886), Perrault, *Contes de ma m  re* *VOYE*, tr by Sombier, ed Lef  vre (Paris, 1875)

BLUE BEECH See HORNBEAM

BLUE/BELL. A name given to *Campanula rotundifolia*, a plant occurring throughout the Northern Hemisphere, on account of its blue bell-shaped flowers The specific name (*rotundifolia*) seems inappropriate, unless the root leaves are seen, the stem leaves being linear or lanceolate These flowers are often found among snow and ice The name "harebell" is often given to this species, and "bluebells of Scotland" is a name very commonly used The name "bellflower" is used for the whole genus *Campanula*, with about 250 species See CAMPANULA, CAMPANULACEAE

BLUE/BILL. A scaup duck See SCATP

BLUE/BIRD A small, widely distributed, and familiar North American bird (*Sialia sialis*), which is much the same sort of favorite in the United States that the redbreast is in England, it is, indeed, locally known as "blue robin" Except in the Southern States, it is chiefly known as a summer bird of passage, appearing very early in spring, and visiting again "the box in the garden, or the hole in the old apple-tree, the cradle of some generations of ancestors" In size the bluebird is much smaller than most of the other thrushes, being about 7 inches long The upper parts are rich sky-

blue, the throat and breast reddish chestnut, and the belly white The female is duller in color than the male The bluebird lays five or six pale-blue eggs and often has two broods in the season Its song is "a soft, agreeable warble" The male is remarkably attentive to his mate, and both exhibit extraordinary courage in driving away intruders from the vicinity of their nest, yet it is greatly disturbed, and in some places has been nearly expelled from villages, by the English sparrows See Plate of SONG BIRDS accompanying THRUSH

In the Rocky Mountains and westward its place is taken by very similar species, differing chiefly in the absence of chestnut on the throat or the entire ventral plumage, this color being replaced by blue

Several other birds prevalingly blue receive the name in other lands, such as the Oriental "fairy bluebirds" of the genus *Irena*, especially *Irena puella*, one of the East Indian bulbuls

BLUE BIRD, THE (*L'Oiseau Bleu*) A fairy play by Maurice Maeterlinck, published in 1908 Under the guise of a dream vision of two children the drama is a story of the search for happiness, typified by the Blue Bird The fairy Berylune gives the children, Tytyl and Mytyl, a jewel by which the familiar things of home, bread, sugar, water, light, the cat and dog, assume personal forms and join in the search for the Blue Bird Light, bold and fearless, Water, shrinking and timid, Bread, a fat, jolly person, the Dog, faithful and affectionate, and the Cat, fawning and treacherous, take the leading parts They visit the Land of Memory, the Palace of Night, the Palace of Happiness, and the Kingdom of the Future, thinking vainly they see the Blue Bird, only to find it at last in their own home But beneath the charming story is a deeper symbolism The Blue Bird stands not merely for happiness, but for heavenly truth, through which the former may be gained The children typify humanity, searching for truth through the past, the somber present, and the hopeful future The play was produced in London in 1910, and in New York, at the New Theatre, the same year

BLUE BOOK A term broadly applied to published reports on special topics issued by the legislature of a country, or more commonly by the various executive departments of a government Specifically the name is given to publications of this character printed by the British government for the information of Parliament They are commonly bound in blue covers In the same manner France has its Yellow Books, Italy its Green Books, and Spain its Red Books In the United States the name "Blue Book" is given to the published lists of government employees and to the manual of regulations for the navy, while the foreign diplomatic correspondence is usually published in Red Books

BLUE/BOTTLE. A plant See CENEAUREA
BLUE/BOTTLE A very large flesh fly, prevalingly blue, as, especially, *Lucilia caesar* of the northern United States For habits, see FLESH FLY

BLUE/BUCK, or BLUE/DUIKER, called by the Dutch Blaauwbok, but not to be confused with the extinct antelope of that name The pigmy antelope (*Oephalolophus monticola*), of Natal, one of the smallest of the duikerboks "These tiny creatures," says Lydekker, "which swarm in the Natal jungles, and stand only 13

inches at the shoulder, are smaller and lighter in build than a hare, and are of a blue mouse color, with the tiny straight horns scarcely showing above the tuft of hair." They feed mostly on berries and leaves and are extremely active and agile, even climbing trees of a favorable character. They feed in the densest forests during the day and rest at night. The alarm cry is a sharp, whistling shriek. For an extensive account of the habits of these and related species, consult *Proceedings of the Zoological Society of London* (1899, p. 830), and Selater, *Fauna of South Africa, Mammals*, vol. ii. See **DUIKER**.

BLUE CARDINAL. See **LOBELIA**.

BLUE-COAT SCHOOL. A nickname for Christ's Hospital, London, suggested by the long blue cotton coat worn by its students. Originally it was of russet, but after the first year (1552) it was changed to its present color. See **CHRIST'S HOSPITAL**.

BLUE EARTH. A city and the county seat of Faribault Co., Minn., 130 miles south by west of St. Paul, on the Chicago, St. Paul, Minneapolis, and Omaha Railroad, and on the Blue Earth River (Map: Minnesota, C 7). Farming, dairying, and stock raising are the principal industries, and there are cement works, flour mills, and a broom factory. The city has a public library and owns its water works and light plant. Pop., 1900, 2900; 1910, 2319.

BLUE-EYE (the bird is blue-faced). A beautiful species of honey eater (*Entomyza cyanotis*), abundant in New South Wales. It is a bold, spirited, and graceful bird, with the habits and food of the honey eaters and frequenting eucalyptus trees. It prefers, whenever it can, to deposit its eggs on the big, deserted, dome-shaped nest of a related starling-like bird (*Pomatoharus*, or *Pomatostomus, temporalis*); never within the dome, but in a neat round depression on top. Consult Gould, *Birds of Australia* (London, 1842-50); Campbell, *Nests and Eggs of Australia Birds* (Sheffield, 1910).

BLUEFIELD. A city in Mercer Co., West Va., 106 miles west of Roanoke, Va., on the Norfolk and Western Railroad (Map: West Virginia, C 4). It is the seat of a State normal school and contains two sanitariums, an opera house, and a fine Federal building. Bluefield has large railway shops, flouring mills, large wholesale houses, and important coal-mining interests, the city being the gateway of, and the distributing centre for, the vast Pocahontas coal fields. Limestone, clay, iron ore, and timber are found. Bluefield was settled in 1888 and was first incorporated in 1893. It has adopted the commission form of government. Pop., 1890, 1775; 1900, 4644; 1910, 11,118.

BLUEFIELDS. A seaport town of Nicaragua, on the Mosquito Coast, near the mouth of the Bluefields River, in the Bluefields Lagoon (Map: Central America, F 5). It is the seat of a United States consular agency, of a court of justice, and of a Moravian mission. The landlocked harbor afforded by the lagoon is connected by regular steamship lines with ports of the United States and is of considerable commercial importance, having a trade in bananas and other tropical fruits. Pop., 1906, 4706. Bluefields has been the scene of disputes between England and Nicaragua.

BLUEFIELDS, or BLEWFIELDS. A river of the Mosquito Reservation, Nicaragua, Central America. It rises on the eastern slope

of the mountains in the department of Chontales, flows generally eastward, and empties into the Bluefields Lagoon, an arm of the Caribbean Sea. It is navigable for large steamers to Rama, a distance of about 65 miles from its mouth. A town of the same name lies at the mouth of the river and is the shipping centre of an important fruit trade.

BLUE/FIN. See **BLACKFIN**.

BLUE/FISH (so called from its bluish or greenish color). A well-known food and game fish (*Pomatomus saltatrix*) of wide distribution, common in summer along the eastern coast of the United States. It is the sole representative of the family Pomatomidae and closely allied to the mackerels. It occurs in nearly all warm seas, including the Mediterranean (south shore), but is absent from British waters and from the vicinity of Bermuda and the western islands. Along the southern United States coast it is called "skipjack," or "skip mackerel," and the young are called "snappers."

Bluefish may be found more or less all the year off the eastern coast of the United States, but become abundant in May, when they pursue the schools of fishes seeking inshore spawning grounds. As to their own reproduction little is known; it is regarded as certain that they do not spawn in inshore United States waters, unless, as some believe, they do so in the Gulf of Mexico. The young fish that first appear in northerly waters in August are about 5 inches long, but they grow with great rapidity, becoming 12 or 15 inches long by the next year. They increase after that even more rapidly. It is on record that one of 25 pounds has been taken in Buzzard's Bay, Mass.; but examples of 10 pounds are heavy, and the ordinary catch is from 2 to 5 pounds. A 3-pound fish is about 21 inches long; one of 8 pounds, nearly 30 inches. The color is bluish or greenish above and silvery below, with a black blotch at the base of the pectoral fin. (For the form, see Colored Plate of AMERICAN FOOD FISHES, accompanying FISH AS FOOD.)

The bluefish is a voracious feeder upon fish—the most destructive and remorseless bandit of the northern seas. "Going in large schools, in pursuit of fish not much inferior to themselves in size," writes Prof. S. F. Baird, "they move along like a pack of hungry wolves, destroying everything before them. Their trail is marked by fragments of fish and by the stain of blood in the sea; as where the fish is too large to be swallowed entire. . . . It kills many more than it requires for its own use." The excessive voracity, which characterizes the young as well as the old, is a very serious factor in the mortality of the sea and undoubtedly diminishes in an extensive and persistent way the numbers of many other gregarious fishes, and particularly of the menhaden. They are also very fond of squid; also of certain kinds of marine annelids; and as these animals are the favorite food of several other fishes, their diminution is another indirect effect of the general destruction of fish life to be charged to the bluefish. They sometimes ascend the larger rivers; going up the Hudson, for instance, as far as the tide sets.

The bluefish is regarded in the Northern States as one of the very best table fish. The wholesale dealers of New York alone handle from 4,000,000 to 5,000,000 pounds annually, worth \$250,000 to \$300,000. Large quantities are taken in weirs or pounds from the eastern

end of Long Island to Cape Cod, and still greater quantities by gill nets. See FISHERIES

The sport of bluefishing is perhaps the foremost in American marine angling. One mode of capture is by trolling, but as in that method the boat is moving and the fish hooks itself, it gives little sport. Excitement in capture is easily obtained by "clumming," wherein the boat is anchored, and the fish are attracted to it by throwing overboard small pieces of menhaden, with which the hook is only baited. The bluefish is then handled on a rod. Another common method is by heaving a heavy jig from the shore and dragging the fish up the beach. Other anglers prefer to use a light rod and an artificial minnow from a stationary skiff, or to fish with shrimp bait from the wharves in quiet bays, where young bluefish resort.

BLUE FLAG See IIS

BLUE/GILL A local name of the blue sunfish of the Mississippi valley. See SUNFISH

BLUE/GOWNS A name commonly given to the bedesmen or beadsmen of the Scottish kings. In ancient times, a beadsman was a person employed to pray for another (See BEAD). From this practice sprang up a custom in Scotland of appointing beadsmen with a small royal bounty, who ultimately degenerated into a class of authorized mendicants. On his Majesty's birthday each beadsman received a gown of blue cloth (hence the name), a loaf of bread, a bottle of ale, and a leather purse containing a penny for every year of the King's life. Every birthday, another beadsman was added to the number. The most important part of the privilege was a large pewter badge, attached to the breast of the gown, which, besides the name of the bearer, had the inscription, *Pace et repas*. This implied the privilege of begging and bespoke the kindly consideration of all to whom the beadsman appealed. The practice of appointing beadsmen was discontinued in 1833. May, 1863, is the date of the last allowance drawn by a beadsman from the Exchequer in Edinburgh.

BLUE GRASS, KENTUCKY BLUE GRASS, JUNE GRASS, SPEAR GRASS, or MEADOW GRASS, *Poa pratensis* A species common in the cooler parts of the United States, Europe, and Asia. It grows well upon almost any soil not too sandy, but attains its best development upon clay soils overlying limestone. In the United States it grows in great perfection in the limestone regions of Kentucky and Tennessee, the famous Blue Grass Region of the former being named for that fact. Blue grass, while furnishing hay of excellent quality upon good soils, does not yield a large quantity, and on this account it is less valuable for hay than as a pasture and lawn grass. It is a perennial, attaining a height of from a few inches to 2 feet, with an abundance of long, narrow, soft root leaves. It spreads with rapidity by means of its rootstocks, soon forming a dense sod. On this account it stands pasturing well, the ordinary tramping of stock not injuring it to any extent. Blue grass should enter into every mixture for permanent pastures in the eastern and middle United States. The seed, as marketed, usually contains much chaff and is of low vitality, hence it should be sown rather thickly. To make a good firm sod, about three years are required, after which little attention is necessary. This grass does not do well in the warmer parts of the Southern States. In the South the

Texas blue grass, *Poa anachnifera*, replaces it. It is closely related to the Kentucky blue grass, differing from it principally in its more vigorous growth and having its "seed" more or less covered with wool. This grass is propagated by seed or by setting out portions of sods, the woolly seed making sowing difficult. It spreads rapidly and promises to become one of the best grasses for the regions to which it is adapted. Texas blue grass withstands drought better than the former species. Kentucky blue grass seed is often adulterated with the seed of Canada blue grass (*Poa compressa*). While this species has some good qualities, it is much inferior for lawns and pastures. Kentucky blue grass has the following percentage composition: water, 65.1, proteid matter, 4.1, f. t. l. 3, nitrogen-free extract, 17.6, crude fibre, 9.1, mineral matter, 2.8.

Its feeding value, like that of other grasses, depends chiefly on its nitrogen-free extract, crude fibre, and protein content. It is a wholesome and nutritious feed, relished by all kinds of stock. Hay made from this grass, cut when the seed is in the milk stage, contains, on an average per cent, water, 24.3, proteid matter, 6.3, fat, 3.6, nitrogen-free extract, 34.3, crude fibre, 24.6, and mineral matter, 7.0. Hay made from grass cut when the seed is ripe contains, on an average, a little less nutritive material. See Plate of Grasses.

BLUE GUM See EUCALYPTUS

BLUE-HEN STATE Delaware. See STATES, POPULAR NAMES OF

BLUE HILL OBSERVATORY (Lat 42° 13', long 71° 7', alt 635 feet) A meteorological observatory, at the summit of the Great Blue Hill, near Boston, Mass., founded in 1885 by A. Lawrence Rotch (1861-1912) of Boston and maintained by him until 1912, when, upon his death, the observatory and its grounds became the property of Harvard University. The work of Mr. Rotch and his assistants was directed mainly to the study of cloud phenomena and the exploitation of the upper atmosphere by means of kites carrying self-registering instruments. The records of the observatory and results of its investigations are published in the *Annals of the Observatory of Harvard College*. Blue Hill is one of the few stations in the world where meteorological observations of nearly every element have been continuously recorded under favorable and identical conditions for a long time. Consult an article by Waldo in *Popular Science Monthly*, vol. lxx (1901) and by Rotch in *Technology Review*, vol. xii, no. 2 (1910). Consult also Rotch, *Sounding the Ocean of Air* (1900).

BLUE ISLAND A city in Cook Co., Ill., 2½ miles south of the city limits of Chicago, on the Calumet River and on the Illinois Central, the Chicago, Rock Island, and Pacific, the Chicago and Grand Trunk, and the Baltimore and Ohio Chicago Terminal railroads (Map Illinois, E 2). It is a popular suburb of Chicago, is an important railroad and commercial centre, and has brickyards, stone quarries, breweries, wire works, smelting works, etc. Settled in 1833, Blue Island was incorporated as a village in 1872. It was the storm centre in the early phase of the great railway strikes of 1894, which tied up the traffic of half the country and led to the sending of United States troops to Chicago and elsewhere.

The government is administered under a charter of 1901, which provides for a mayor, biennially elected, and a city council. The water works are owned and operated by the municipality. Pop., 1890, 3329; 1900, 6114; 1910, 8043.

BLUE JAY, SHARK, TIT, etc. See the substantives.

BLUE KNIGHT, THE. Sir Persaunt of India, the fourth of the brothers, the Black, Red, Green, and Blue Knights. Sir Beaumains, or Gareth, conquers him in chap. 131 of Malory's *Morte d'Arthur*. He is spoken of as "The Blue Knight" in chap. 133.

BLUE LAWS. In general, any laws which impose vexatious restrictions on the freedom of members of the community and interfere with their ordinary habits or which aim to regulate their private morals; sumptuary laws. Specifically the name came to be applied to a body of regulations of this character supposed to have been in force in the Colony of New Haven, Conn., about the middle of the eighteenth century. The supposition is based upon the well-known fact that in the Puritan days the personal conduct of citizens was often subject to a close judicial supervision and that the sin of Sabbath breaking was especially odious to the magistracy. A Tory minister, the Rev. Samuel A. Peters, who had charge of the English churches in Hartford and Hebron, but who was compelled by the Revolution to flee to England, published there, in 1781, a book entitled a *General History of Connecticut*, a work whose exaggeration and spite are so obvious as to deprive it of all authority. Some years later a small book containing these supposed laws, which were really extracts from Peters's history, was published, and was until a comparatively recent date regarded as a correct statement of the early law of the Colony. When modern historical research had discredited the authority of this work, it was for a time believed that the Blue Laws were invented out of hand by Peters and had no existence in fact; but more recent investigations have shown that, although many of them are not to be found in the New Haven statute books, all except two or three out of the 45 are to be found either in the works of an earlier writer (Neal) or, with slight modifications, in the statute books of the various New England Colonies. Consult "An Examination of Peters's Blue Laws," by W. F. Prince, in the *Annual Report of the American Historical Association* for 1898, and J. H. Trumbull, *True Blue Laws of Connecticut and New Haven; and the False Blue Laws Invented by Rev. Samuel Peters* (Hartford, 1878).

Blue Laws of Hawaii, a compilation of Hawaiian statutes, largely of a paternal character, promulgated in 1840 by Kamehameha III. These laws were due to missionary influence and were obnoxious to the native population of the islands because of their interference with the ancient customs and habits of the people. They were republished in 1894 under the title of *Hawaii's Blue Laws*.

BLUE LIGHT, **BENGAL LIGHT**, or **BENGAL FIRE**. A brilliant signal light used at sea to attract attention, give warning, etc., and in ordinary pyrotechny for illuminating a district of country. It is prepared from the following materials reduced to fine powder, thoroughly dried, and intimately mixed in the following proportions by weight: nitre, 6; sulphur, 2; tersulphuret of antimony, 1. As the fumes evolved during its combustion contain a poisonous oxide

of antimony, the light cannot be used with safety in inclosed spaces.

BLUE LIGHT. The visible chemical frequencies of the spectrum have recently been successfully used in treating lupus, acne, eczema, carbuncle, and ulcer. An arc lamp of 5000 candle power is used, back of which is a reflector to throw the light on a large screen of cobalt glass, placed several feet from the lamp. The patient is seated a few inches to a foot from the screen, and the time of exposure varies up to a half hour. In neuralgia and eczema excellent results have followed exposure to dark-blue incandescent light of 50 candle power. See **PHOTOTHERAPY**.

BLUE LIGHT. In American political history, a name applied to a member of that faction of the Federalist party (q.v.) which opposed the War of 1812. It was derived from the fact, or alleged fact, that when Decatur, with two frigates, was blockaded by a superior English fleet in the harbor of New London, Conn., in 1813-14, certain Federalists warned the English commander by burning blue lights at the entrance of the harbor each time the Americans attempted to get to sea under cover of darkness.

BLUE MANTLE (from the color of his robe). The title of an English pursuivant (q.v.).

BLUE MON'DAY. A name originally referring to a custom in parts of Europe, especially in Bavaria, in the sixteenth century, of decorating churches in blue colors on the Monday preceding Lent, when the people celebrated the carnival festivities, but the excesses committed led to the legal abolition of the custom. In the United States it is the custom of some women of the poorer class to call every Monday by this name, as it is the day generally set apart for the week's laundry work.

BLUE MOUNTAINS. The name of several mountain chains in New South Wales, Australia, Jamaica, West Indies, New Jersey, Pennsylvania, and Oregon. 1. The Blue Mountains of New South Wales run nearly parallel with the coast and form a part of the complex cordillera of Australia, which extends from Cape York on the north to the Grampians on the south. They are composed of horizontal sandstone strata broken by canons and deep gullies and present a precipitous front towards the east. The highest point of the Blue Mountains, Mount Bearnang, is about 4100 feet high. They are crossed by a railway which affords communication between Sydney and the rich pasturage and mining regions of the interior (Map: New South Wales, E 4). 2. The Blue Mountains of Jamaica traverse a considerable part of the length of the island from east to west and attain an extreme altitude of 7350 feet. 3. The Kittatinny and the Shawangunk mountains forming the second ridge of the Appalachian Mountains in New York, Pennsylvania, and New Jersey are also called the Blue Mountains. These are to be distinguished from the Blue Ridge. 4. A range in northeastern Oregon extending slightly northward beyond the Washington boundary line. Its flanks are well forested with fir and pine.

BLUE NILE. See **NILE**.

BLUE NOSE. A nickname for the Nova Scotians, from the effect of the climate, or from a potato called "Blue Nose" raised in that region.

BLUE PETER (blue + *'peter*, for *repeater*). A rectangular blue flag with a white centre of similar shape, but of about one-fourth of the dimensions. It is the letter "P" of the inter-

national marine code (see SIGNALS, MARINE), when hoisted alone at the fore (i.e., at the fore truck, or top of the foremast), it signifies that the vessel will shortly sail or is ready to sail. In the United States navy a flag called the cornet takes the place of the blue peter as a sailing signal.

BLUE PILL (*Pisula hydrargyri*) The most simple form in which mercury can be administered internally. It consists of two parts of mercury with three parts of conserve of roses, to this is added powdered licorice root.

In cases of torpid condition of the liver or inflammation of that organ, blue pill is much used as a purgative, either alone or combined with some other drug, such as rhubarb. As a purgative, the usual dose of blue pill is one or two pills of five grains each, followed some hours later, by a saline draught, such as a Seidlitz powder. There is always danger of salivation, with the accompanying deterioration of gums and teeth, and the medicine should be taken only when ordered by a physician. It is recorded that a blue pill taken on each of three successive nights caused fatal salivation. Many proprietary purgative pills contain metallic mercury.

BLUE PRINT, or **CYANOTYPE** (Gk *kyanos*, *kyanos*, dark-blue + *typos*, *typos*, impression) **PROCESS** A photographic process discovered by Sir John Herschel, in which certain cyanides are used. The process is based on the reduction of a ferric salt to a ferrous salt by the action of light in the presence of organic matter. In the practical application of the process two solutions containing respectively one part of ammonium ferric citrate in four parts of water, and one part of potassium ferrioxanide in four parts of water, are mixed, filtered, and preserved in a dark room. A good quality of paper is then coated with the mixture by means of a brush or sponge or by floating the paper for two minutes on the mixture. The paper is then left in a dark place to dry. If exposed under a negative or tracing to the sun, or an intense arc light for 10 or 12 minutes, and then washed in water and dried, the paper will show the picture or drawing in white on a blue ground. To obtain prints of a similar nature of warm brown tones, the mixture employed is prepared by adding a solution of 50 grains of uranium sulphate in two ounces of water to a solution of 120 grains of potassium ferrioxanide in two ounces of water. Various modern processes have been developed whereby dark lines may be obtained on a light ground.

BLUE RACER See BLACK SNAKE

BLUE RIBBON ARMY. The name adopted in England by a society of total abstainers, from the blue badge worn by the members. Since 1883 the society has been known as the "Gospel Temperance Union." The organization originated in America in 1878, where it was known from its founder as the Murphy Movement. See TEMPERANCE.

BLUE RIDGE. The name of the most easterly range of the Appalachians in the United States (Map United States, eastern part, L 3). It forms an almost continuous chain from West Point in New York (the Highlands) down to the north of Alabama, through New Jersey (Schooley's Mountain), Pennsylvania (South Mountain), Virginia, the Carolinas, and Georgia. In New Jersey and Pennsylvania the name of Blue Ridge is sometimes, but inaccurately, ap-

plied to the "second" range, properly the Blue (or Kittatinny) Mountains, which runs parallel with this and is separated from it by a part of the Great Valley. The Blue Ridge proper refers especially to that part of the range below Pennsylvania, which separates the Great Valley from the Piedmont Region. In south Virginia the range widens into a broad plateau, which reaches its widest extent in North Carolina, where it is intersected by numerous groups known as the Black, Cowee, Nantahala, and South mountains. These groups run transverse to the main axis of the Blue Ridge, and their valleys are occupied by numerous streams with a general northwesterly course. The Black Mountains include the highest summits of the range as well as of the Appalachians. Mount Mitchell, or Black Dome, the loftiest point, is 6711 feet. Balsam Cone, Black Brothers, Mount Buckley, Mount Gibbs, and several others are over 6500 feet. Towards the north the Blue Ridge falls off in elevation, in Virginia the summits are about 4000 feet, and in Pennsylvania and New Jersey they are much less. The range is crossed by several large rivers, flowing through narrow defiles or gaps, as the Hudson in its traverse of the Highlands. See APPALACHIANS, BLACK MOUNTAINS. Consult Whitney, *United States* (Boston, 1889), Morley, *Carolina Mountains* (Boston, 1913).

BLUE RIVER, or **BIG BLUE RIVER** A river rising in Washington Co., Ind., flowing southwest and emptying into the Ohio River a few miles above Leavenworth (Map Indiana, C 4). It has a course of less than 100 miles, but it affords some water power. This name is also applied to the east fork of the White River (q.v.).

BLUE SEA See ARAL LAKE

BLUE SICKNESS See HOG CHOLERA

BLUE-STEM GRASSES See ANDROPOGON

BLUE-STOCKING CLUB A social gathering, probably an Anglicization of the *l'Hotel de Rambouillet* movement of seventeenth-century France, which extended to England in the eighteenth century. The meetings, held at the houses of Mrs. Montague, Mrs. Vesey, and other literary women, were characterized by plainness of dress. One of the members, Mr. Benjamin Stillingfleet, is said to have habitually worn blue hose, and the wits were not long in dubbing the coterie "The Bluestocking Club." An interesting account of these meetings may be found in the *Memoirs* of Elizabeth Carter (London, 1816). The name "bluestocking" has been since applied to a literary woman. Consult also, Lobban, "The Blue-Stockings," *Blackwood's Magazine*, vol. CLXXX (London, 1906).

BLUESTONE A term originally applied to a sandstone quarried in Ulster Co., N. Y., but now applied to much of the flagstone quarried in this and even other States regardless of color. See BUILDING STONE.

BLUESTONE, or **BLUE VITRIOL** The commercial name for copper sulphate. See under COPPER.

BLUE THISTLE, this? See VIREN'S BUGLOSS.

BLUETHROAT A remarkable little European bird, allied to the robin (and hence sometimes called "bluebreast" in England, where it is an infrequent visitor), assigned formerly to the genus *Cyanocitta*, but now included with the nightingale in the group *Luscinia*. It is characterized by a bright-blue throat, separated from the white below it by crescentic bands of black and rust-red. Two species are known, one hav-

ing a white spot in the centre of the blue (*Cyanocitta leucocyanica*, or *Luscinia cyanecula*), and ranging from Barbary to Holland and Germany; and the other (*Cyanocitta*, or *Luscinia, suecica*) with a brick-red fan-shaped patch in the midst of the blue. (See PLATE of SONG BIRDS accompanying THURM.) This latter species is highly migratory, spending its winters in tropical Africa and India and going each summer to breeding haunts in Scandinavia, northern Russia, Siberia, and western Alaska. One feature of this migration renders it extraordinary, viz., that the bird has almost never been seen in the countries intermediate between its summer and winter homes, so that apparently it makes the whole journey of not less than 1500 miles in a single flight, either at night or at an invisible altitude. (See MIGRATION of ANIMALS.) The Alaskan visitors also cross Bering Strait twice annually, never migrating southward.

The bluethroat is known throughout northern Europe as the Swedish nightingale on account of its fine singing; and the Laplanders style it "the bird of the hundred voices," because of its remarkable powers of mimicry. Seebohm and Brown (*Ibis*, vol. vi, p. 125, 1876) were greatly impressed by this power in Siberia, where it is exceedingly abundant in thickets and along stream courses as far north as 71°, making its nest in bushes and weeds. They mention its imitating the trilling of the sandpiper, the rich song of the redwing, and various other birds. "Sometimes he runs these together in such a way as to form a perfect medley of bird music." Consult the books on the ornithology of Europe, Siberia, and Alaska, mentioned under BIRD.

BLUE VITRIOL. See COPPER.

BLUE WHALE. See SIBBALD'S WHALE.

BLUEWING. A duck. See TEAL.

BLUFFTON. A city and the county seat of Wells Co., Ind., 25 miles south of Fort Wayne, on the Wabash River, and on the Lake Erie and Western, the Toledo, St. Louis, and Kansas City, and other railroads (Map: Indiana, D 2). It has a considerable grain and lumber trade, foundry and machine shops, a wind-pump factory, a piano factory, cement and tile works, and manufactures barrels, hoops, staves, and headings, buck handles, clay pottery, mittens, etc. Settled in 1837, Bluffton was incorporated in 1849. The government is administered by a mayor, elected every four years, and a municipal council. The city owns and operates its water works and electric light plant. Pop., 1890, 3589; 1900, 4479; 1910, 4957.

BLUHME, blow'me, CHRISTIAN ALBRECHT (1794-1866). A Danish statesman, born in Copenhagen. He studied jurisprudence from 1811 to 1816, was appointed director of the general customhouse in 1843, and in 1848 Minister of Commerce. In 1851 he became Minister of Foreign Affairs. He took measures for the maintenance of Danish neutrality during the Crimean War and, having resigned in 1854, was brought to trial with the remainder of the ministry on the ground that the expenditures for national defense had been made without appeal to the Rigsdag. He was acquitted in 1856, and again in 1864-65 took charge of the portfolio of Foreign Affairs, and at the same time acted as President of the Council of the Ministry.

BLUHME, FRIEDRICH (1797-1874). A German jurist. He was born in Hamburg, and educated in Göttingen, Berlin, and Jena. In 1833 he was appointed judge of the High Court of

Appeal at Lübeck, and was professor successively at Halle (1823), Göttingen (1831), and Bonn (1843). His works include many valuable studies in Roman and German law, among them *Grundriss des Pandektenrechts* (2d ed., 1844); *Encyklopädie der in Deutschland geltenden Rechte* (3 vols., 1847-58); *Zur Texteskritik des Westgotenrechts* (1872). The treatise "Die Ordnung der Fragmente in den Pandektenbüchern" (*Zeitschrift für geschichtliche Rechtswissenschaft*, vol. iv, 1820) explained the method of arranging the excerpts in Justinian's Pandects.

BLÜNG. A blue compound, used especially in the laundry to neutralize the yellow tinge of white clothes, but also for sugar and various other food products. Formerly blue pigments, such as indigo, ultramarines, and Prussian blue, were used, which, being insoluble, gave color by suspension in water. More recently soluble Prussian and coal-tar blues have taken their place, although ultramarine blues are still largely employed. The great objection to Prussian blue is its dissociation, in the presence of an alkali, with the formation of ferric hydroxide, which appears as iron rust on the clothes.

BLUM, Fr. pron. blēm, ERNEST (1836-1907). A French dramatist, born in Paris. He made his début as a writer at the age of 16 with *Une femme qui mord*. As a journalist he was associated with *Charivari*, *Rappel*, *Gaulois*, and other publications. Many of his dramatic works were written in collaboration with Clairville, Flan, Monnier, Brisbarre, Labiche, and others. Among the vaudevilles, librettos, and dramas of this versatile writer, the following are especially noteworthy: *Les noces de diable* (1862); *Rocambold* (1864); *La vengeance* (1868); *La folie parfumeuse* (1874); *Rose Michel* (1875); *Espion du roi* (1876); *Le petit chaperon rouge* (1885); *Les femmes nerveuses* (1888); *La rieuse* (1894); *Le carillon* (1897); *Un soir d'hiver* (1903); *Le jeu de l'amour et de la roulette* (1905).

BLUM, bloom, HANS (1841-1910). A German publicist and author, son of Robert Blum, born in Leipzig and educated at the universities of Leipzig and Bern. He was a member of the North German Reichstag from 1867 to 1870 and from 1869 to 1900 a barrister in Leipzig. During the Franco-Prussian War he was in the field as correspondent for *Daheim* and in 1871-79 edited the *Grenzboten*. His extensive and varied publications include: *Die Lügen unserer Sozialdemokratie* (1891); *Fürst Bismarck und seine Zeit* (6 vols., 1894-95); *Das erste Vierteljahrhundert des deutschen Reichs* (1896); *Persönliche Erinnerungen an den Fürsten Bismarck* (1900); *Aus dem toten Jahr* (1901), dealing with the revolutionary movement of 1848; some dramas, short stories, and novels, of which *Bernhard von Weimar* deserves a better reception than it got. Consult his *Lebenserinnerungen* (2 vols., Berlin, 1907-08).

BLUM, ROBERT (1807-48). A German patriot. He was born in very humble circumstances in Cologne, Nov. 10, 1807, and after a brief military service in 1830 became sceneshifter and afterward secretary of a theatre in Cologne and subsequently in Leipzig. In this situation he remained, devoting his leisure time to literature and politics until 1847, when he established himself as a bookseller and publisher. In 1840 he founded in Leipzig the *Schillerverein*, which celebrated the poet's anniversary, as a festival in honor of political liberty. In 1845 he acquired great reputation as a popular orator in

connection with the German Catholic movement, and particularly through his action at a turbulent meeting of armed citizens and students of Leipzig, whom he dissuaded from storming the barracks. He became the champion of the Liberal party of Saxony on the outbreak of the Revolution of February, 1848, and was elected vice president of the Preliminary Parliament at Frankfurt. In the National Assembly he became leader of the Left, and was one of the bearers of a congratulatory address from the Left to the people of Vienna when they rose in October. In Vienna he joined the Students' Corps, was arrested, and shot on November 9. Blum was a man of strong intelligence and great oratorical power. Consult Hans Blum, *Robert Blum* (Leipzig, 1878).

BLUM, blum, ROBERT FREDERICK (1857-1903). A prominent American figure painter. He was born in Cincinnati, Ohio, July 9, 1857. His artistic education began with his apprenticeship to a lithographer in his native city and attendance upon night classes of the McMicken School of Design. In 1876 he was for nine months a pupil in the Pennsylvania Academy of Fine Arts in Philadelphia, but he was to all intents and purposes self-taught. He removed to New York in 1879 and was employed as an illustrator of *Scribner's Magazine*. In 1880 he made the first of many annual European tours, continued until 1889. He was the first president of the Society of Painters in Pastel, in New York, and first exhibited work in this medium in 1882. The best known of his oil paintings of the early period is his "Venetian Lace-makers" (1885), now in the Cincinnati Museum. In 1890, through a commission to illustrate Sir Edwin Arnold's *Japonica*, he realized his great ambition of going to Japan, remaining until 1893. His delightful pastels of the open-air life and scenery of that country are his best productions in this medium. He was elected to the National Academy of Design in 1892, after exhibiting "The Ameyu," now in the Metropolitan Museum of Art. His celebrated *Letters from Japan* appeared in *Scribner's* (1893), and his best-known work, the *Friezes* in old Mendelssohn Hall, were finished in 1898. The building has since been torn down, but the paintings, which were epoch-making in their way, fortunately were preserved. At the time of his premature death he was engaged upon a decoration for the New Amsterdam Theatre.

At the outset of his career Blum was often criticised on account of the successive influence of Fortuny, Whistler, and Rico upon his work. He was, however, adaptable rather than subservient, and all of his work reveals his distinct and interesting personality—brilliant and witty, but also poetic and full of sentiment. The dominant technical note of his art is its bright and delicate color, with a predilection for sunshine effects. His artistic personality is most completely revealed in his pastels, in which medium he ranks among the very best. Most of his paintings are in private possession. An important collection of his pastels of Dutch subjects belongs to Robert Sterling Clark, of New York, another of Japanese subjects to Stephen C. Clark, who also possesses a number of his oils and water colors. An excellent memorial exhibition of his works was held in New York in 1913. Consult *The Studio*, winter number (1900-01), the *International Studio*, vol. xxi, supp. (1903).

BLUMAUER, blou'mou-er, ALOYS (1755-98). A German poet, born in Steyer. His works, which are chiefly satires on the clergy and on the Jesuit Order (of which he himself had become a member a year before its dissolution in 1773), enjoyed a wide popularity. He is remembered, however, chiefly for his *Abenteuer des frommen Helden Aeneas* (1784-88, published with introduction and commentary by E. Griesebach, 1872), a coarse travesty on Vergil's *Aeneid*, after the fashion of Scarron's *Feigle travesti*. It is still widely read in Germany. His complete works, *Sammtliche Werke*, appeared after his death (4 vols., 1801-03, republished, 4 vols., 1884). Consult Hofmann-Welnhof, *Aloys Blumauer* (Vienna, 1885).

BLUMENBACH, blou'men-bag, JOHANN FRIEDRICH (1752-1840). A German naturalist, physiologist, and anthropologist, born in Gotha. He studied in Jena and in Göttingen, where he graduated with the degree of M.D. in 1776. He began to teach in Göttingen in 1776, became a professor in 1778, and exercised the greatest influence as a teacher for more than 50 years. He founded the science of anthropology. His *Collectio Cramorum Diversarum Gentium* (1790-1828) gave the results of observations upon the skulls of different races. He advocated the theory of the unity of the human race and divided it into five types—Caucasian, Mongolian, Malay, American, and Ethiopian. His *Handbuch der Naturgeschichte* (1780) has gone through many editions. He was the first to place comparative anatomy on a thoroughly scientific basis, and in 1805 published his *Handbuch der vergleichenden Anatomie*. He speculated on the power of generation and regeneration and imagined that a *msus formativus*, or formative tendency, was possessed by all living things. Consult his *Ueber den Bildungstrieb und das Zeugungsgeschäft* (Göttingen, 1791).

BLUMENTHAL, blou'men-tal, LEONHARD, COUNT VON (1810-1900). A Prussian field marshal. He was born July 30, 1810, at Schwedt-on-the-Oder. He received a military education in the Prussian Cadet Corps and in 1827 became an officer in the Reserve Guard. From 1830 to 1833 he studied at the Berlin Military Academy. In 1848 he became a member of the Prussian General Staff. He was chief of staff of the Schleswig-Holstein army in 1849, became aid-de-camp to Prince Frederick Charles (1858), colonel of the Seventy-first Infantry (1860), and chief of staff of the Austro-Prussian army in the war against Denmark (1864). In the same year he was made a major general and in the campaign of 1866 against Austria acted as chief of staff to the Crown Prince Frederick William and distinguished himself at Königgrätz. After the war Blumenthal became a lieutenant general. During the Franco-Prussian War he again acted as chief of staff to the Crown Prince. He was afterward intrusted with the command of the Fourth Army Corps, with headquarters at Magdeburg, and given the rank of general of infantry in 1873. In 1888 he was created field marshal and given important duties as inspector general of the Fourth Division. He died Dec. 22, 1900.

BLUMENTHAL, Oskar (1852-) A German dramatist and satirist, born in Berlin. He founded there the Lessing Theatre (1888), which he managed from 1888 to 1897 and devoted chiefly to the production of contemporary comedies. He edited a critical edition of Grabbe's works (4 vols., 1874). Among his

own works first produced at the Lessing Theatre, the most popular are the comedies, *Der Probefehl* (1882); *Die grosse Glocke*; *Der schwarze Schleier* (1891); *Heute und Gestern*, with G. Kadelburg (1892); *Im weissen Rossel*, with Kadelburg (1898; Eng. trans., 1907, under the title *At the White Horse Tavern*); *Matthias Gollinger*, with M. Bernstein (1898); *Die strengen Herren*, with Kadelburg (1900); *Federkrieg* (1901), *Das Theaterdorf* and *Der blinde Passagier*, with Kadelburg (1902); *Wann wir altern* (1903); the serious dramas *Der tote Lowe* (1904), dealing under a thin disguise with Bismarck's dismissal by William II; *Der Schieur der Treue* (1905); *Die Tur ins Freie* (1908); *Der Schlechte Ruf* (1909); *Die Kunst zu lacheln* (1910); *Wellenringe* (1912). He also published epigrams (*Klingende Pfeile*, 1904) and sketches. Blumenthal at first wrote plays with some regard for the canons of art, but soon dropped lower and lower in the scale till he reached the rapid manufacture of empty farces.

BLUMER, GEORGE ALDER (1857-). An Anglo-American physician, born in Sunderland, England. He studied at the University of Edinburgh, graduated in 1879 at the medical department of the University of Pennsylvania, and in 1879-80 was resident physician at the German Hospital, Philadelphia, Pa. From 1880 to 1886 he was assistant physician at the Utica State Hospital, of which he was superintendent in 1886-89. In 1889 he was appointed superintendent of the Butler Hospital for the Insane, Providence, R. I. He also became an associate editor of the *American Journal of Insanity*. He became president of the American Medico-Psychological Association in 1903.

BLUMER, blum'ər, JOHANN JAKOB (1810-75). A Swiss jurist and statesman, born in Glarus, Switzerland. He studied at the universities of Zürich, Bonn, and Berlin. In 1843 he was elected to the Swiss Landrat and in 1861 became president of the Court of Appeals. Between 1861 and 1874 he completed his revision of the civil and criminal law of Switzerland, a work of lasting value, and subsequently he was chosen president of the Permanent Court of the Swiss Federation. His books include *Staats und Rechtsgeschichten der schweizerischen Demokratien* (3 vols., 1850-59) and *Handbuch des schweizerischen Bundesstaatsrechts* (2 vols., 1877-87). Consult his life and works (2d ed., Glarus, 1877).

BLÜMNER, blum'nər, HUGO (1844-). A German classical scholar, born in Bernh., Aug. 9, 1844. He taught in the universities of Breslau and Königsberg and has been since 1877 professor in the University of Zürich. He is author and editor of many philological and archaeological works, of which the most important are: *Die gewerbliche Thätigkeit der Völker des klassischen Altertums* (1869); *Technologie und Terminologie der Gewerbe und Künste bei Griechen und Römern* (4 vols., 1874-88); *Leben und Sitten der Griechen* (1887); *Maximaltarif des Dioletianus*, with Theodor Mommsen (1893); *Pausanias Graecia Descriptio*, a text, with commentary, written in conjunction with Hitzig (Leipzig, 1896 et seq.); *Die Römischen Privataltertümer*, part of vol. iv of Müller's *Handbuch* (Munich, 1911). He revised also Hermann, *Griechische Privataltertümer* (1881), etc. In 1912 he published the first volume of a thoroughgoing revision of his *Technologie und Terminologie*, etc.

BLUNDELL'S SCHOOL. One of the best of the smaller English public schools, especially noted in the west of England. It was founded in 1604 under the will of Peter Blundell, in Tiverton, Devonshire. Beginning life as a poor boy, he amassed a considerable fortune, most of which was left to charities, the greatest of which was this school. There were founded in connection with it scholarships at Balliol College, Oxford, and at Sidney Sussex College, Cambridge. Although its pupils have never been very numerous—the present number is 230—this school has sent forth many distinguished men, including Bishops Bull, Hayter, and Conybeare, Abraham Hayward, the essayist, and R. D. Blackmore, the novelist. John Ridd, the hero of *Lorna Doone*, was also a member of the school.

BLUNDERBUSS (either corruption of Dutch *donderbus*, thunder box, i.e., musket, or from *blunder* + Dutch *bns*, Ger. *Buchse*, box, barrel of a gun). An old-fashioned short musket with a wide, smooth bore sufficient to take in several shots or bullets at one charge. A number of the English and German troopers in the seventeenth century were armed with this weapon, which had a limited range and was more particularly effective at close quarters or in the defense of narrow passages. It has long been obsolete. See SMALL ARMS.

BLUNT, JAMES G. (1826-81). An American soldier. He was born in Trenton, Me., and in 1849 graduated at the Starling Medical College, Columbus, Ohio. In 1856 he settled in Kansas, where he strenuously opposed the introduction of slavery and was a member of the convention that framed the State Constitution. He entered the Federal army as lieutenant colonel at the outbreak of the Civil War, and in 1862 was made brigadier general and placed in command of the Department of Kansas. On December 7, at Prairie Grove, he defeated a force under General Hindman and thus checked the advance of the Confederates into Missouri. He was raised to the rank of major general in November, 1862, but in 1863 was relieved of the command of the department, and assigned to the Army of the Frontier.

BLUNT, JOHN HENRY (1823-84). An English High-Church theologian and writer on ecclesiastical history. He was born in Chelsea, studied at University College, Durham, and was ordained a priest of the Established church in 1846. He was appointed a vicar of Kennington in 1848 and in 1873 rector of Beverton. He contributed much to reviews and periodicals, and his publications include *The Atonement* (1855); *A Cyclopedia of Religion* (1884); and an important *History of the Reformation of the Church of England* (1862-82), written from the High-Church standpoint.

BLUNT, JOHN JAMES (1794-1855). An English clergyman and author, born in Newcastle-under-Lyme, Staffordshire. He graduated in 1816 at St. John's College, Cambridge, was curate at Hodnet, Shropshire, to Reginald Fleber, whom he succeeded; and subsequently was curate also at Chetwynd. In 1834 he became rector of Great Oakley, Essex, and in 1839 professor of divinity at Cambridge. He wrote a considerable number of works on ecclesiastical history and biblical criticism, besides several volumes of sermons. The best known of his publications is *Undesigned Coincidences in the Writings both of the Old and New Testament, an Argument of their Veracity* (1847). Con-

sult Selwyn, "Memoir," in Blunt's *Two Introductory Lectures* (1856)

BLUNT, WILFRED SCAWEN (1840-). An English traveler and poet. He was born near Crawley, England, Aug. 17, 1840. His mother being a Catholic convert, he was educated at Stonyhurst and at St. Mary's, Oscott. He served for some years as attaché to various British embassies in Europe, and in 1869 married Anne, daughter of the Earl of Lovelace, and granddaughter of Lord Byron, with whom he traveled through Spain, Algeria, Egypt, and the Syrian Desert. In 1882 he championed the cause of Arabi Pasha (qv) and later took up the Nationalist cause in Ireland. In 1887-88 he was imprisoned for two months for taking part in a prohibited meeting at Woodford, in county Galway. Blunt won attention by the *Love Sonnets of Proteus* (1880), containing a fine sonnet on Gibraltar. This volume has been followed by *Esther* (1892), *Griseida* (1893), the *Quatrains of Youth* (1898), *Satan Absolved. A Mystery* (1899), and *Seven Golden Odes of Pagan Arabia* (1903). His poems are human and realistic. He is also the author of *Secret History of the English Occupation of Egypt* (1907), *India under Ryon* (1909), *Gordon at Khartoum* (1911), and *The Land War in Ireland* (1912).

BLUNT'HEAD. A curious colubrine innocuous snake (*Amblycephalus* *boa*) of Java and the East Indies, the type of the family *Amblycephalidae*, and allied to the night tree snakes (*Dipsadidae*). It is slender, about 3 feet long, and purplish in color, densely mottled and marked with brown, with rosy spots and cheeks, and lips carmine-red. Its large head is shaped like that of a mastiff, "which animal it further resembles by snapping at whatever disturbs it." Having a prehensile tail, it climbs with great ease and at night creeps about the thatch of houses in Java and Borneo, in search of insects, the natives welcoming it as a vermin destroyer.

BLUNTSCHLI, blunt'shlé, JOHANN KASPAR (1808-81). A famous German jurist, born in Zurich, Switzerland. He studied jurisprudence first at the University of Zurich, then under Savigny in Berlin, and finally at Bonn, where he took his degree in 1829. Returning to his native country, he became professor of law in the University of Zurich in 1833, and shortly thereafter a member of the grand council of the local government. He distinguished himself by his vigorous opposition to the civil war of 1847-48. In 1848 he became professor of German and international law at Munich, and in 1861 professor of political science and jurisprudence at Heidelberg. In 1864, with Baumgarten and others, he founded the Protestant Union and subsequently presided over several Protestant conventions and over the General Synod at Baden in 1867. He also presided, in 1861, over the International Congress of Jurists in Dresden. Bluntschli was one of the founders and (1875-77) president of the Institute of International Law at Ghent and was generally considered one of the highest European authorities on international law. He was always active in politics and in 1867 was elected to the *Zollparlament* (customs parliament). His valuable library, mainly historical, is now owned by the Johns Hopkins University of Baltimore. His legal writings include *Geschichte des allgemeinen Rechts* (1864), *Des moderne Kriegerrecht* (1866), and *Das moderne Völkerrecht* (1868). He was also the author of a highly esteemed

work on political science, *Die Lehre vom Staat* (1875), and of several books on Swiss history.

BLUSHING (AS *blýscan*, to glow, *blýsa*, a torch). A sudden reddening of the face, neck, and breast, owing to some mental shock, most commonly of the character of shyness, shame, or modesty. It is produced by an increased flow of blood into the capillary vessels over the parts where the blush extends, resulting from a temporary vasomotor paralysis. Besides reddening the complexion, it creates a sensible augmentation of heat in those parts. The feeling that accompanies a blush is one of distress—of heat and general discomfort. Children rarely blush. Darwin is authority for the statement that people of races that habitually are nearly naked blush down to the waist. There is a nerve filament, from the sympathetic system, lying within the sheath of and parallel with each artery and capillary, controlling the expansion and contraction of the muscular coat of the vessel. This is called a vasomotor nerve. During the mental stress that accompanies blushing the action of the vasomotor nerve is suspended and the arteries and capillaries dilate, producing the phenomenon, the heart's action being unaffected. Mental stress of a nature to moderate or control the heart's action is more likely to cause pallor of the surface, owing to the decreased amount of blood passing through the arteries, and the correspondingly greater contraction of their coats. Consult Darwin, *Expression of Emotions in Man and Animals* (London, 1872), Mitchell, *About Dreaming and Blushing* (Edinburgh, 1905).

BLUTHGEN, blut'gen, VICTOR (1844-). A German author. He was born in Zorbig, near Halle, studied theology at the university of the latter city, assisted in the preparation of a theological dictionary and was for a short time a journalist. His best-known works are his *Gedichte* (1881, new ed, 1901), a number of books for the young, including his text to Flinzer's *Schelmenspiegel* (1876), *Froschmaus-Krieg* (1878), *Hesperiden* (1879), a volume of tales, which was translated into Danish, the novelettes in the collection called *Bunte Novellen* (2 vols, 1880), *Der Friedensstörer* (1883), *Pavet-house* (1884), *Die Stiefschwester* (1887), and the novels *Aus garenden Zeit* (2 vols, 1884), *Frau Grafen* (2 vols, 1892), *Die Spiritisten* (1903). He also wrote *Das Peterle von Nurnberg* (1907) and *Mama kommt* (1911).

BLYDEN, EDWARD WILMOT (1832-1912). A negro scholar and author, born at St. Thomas, West Indies. He came to the United States in 1845, seeking entrance in some American college, but a hostile reception caused him to change his plans, he went to Liberia and there graduated from the Alexander High School. Later he became principal of this school, then professor and president (1880) of Liberia College. Having been ordained a Presbyterian minister, he was commissioner to the general assembly of the American Presbyterian church in 1861 and in 1880. In Liberia he held the offices of Secretary of State and of the Interior, and in 1892 he was appointed Minister to the court of St. James's. Dr. Blyden was an accomplished linguist. Spanish he learned at the age of 10 during a short stay in Venezuela, and Arabic during a visit to the Orient. In addition he was master of Latin, Greek, Hebrew, Italian, and French. His publications include *Liberia's Past, Present, and Future* (1869); *Liberia's*

Offering (1873); *From West Africa to Palestine* (1873); *Christianity, Islam, and the Negro Race* (1887; 2d ed., 1888); *West Africa before Europe* (1905); *The Three Needs of Liberia* (1908); *African Life and Customs* (1908); *The Problems before Liberia* (1909).

BLYTHEVILLE. A city and the county seat of Mississippi Co., Ark., 65 miles north of Memphis, Tenn., on the Frisco Lines, the Jonesboro, Lake City, and Eastern, the Paragould, Southeastern, and the Blytheville, Leachville, and Arkansas Southern railroads (Map: Arkansas, F 2). It is in a fertile cotton and corn region and has a large cotton compress and hardwood and lumber interests. Pop., 1900, 302; 1910, 3849.

B'NAI B'RITH, b'nî b'rêth, INDEPENDENT ORDER OF. An organization of Israelites of German extraction, founded in America in 1843 and since extended through Germany and in the East. It somewhat resembles the Masonic organization without its secrecy and ceremonial. Its object is the moral elevation of its members, who numbered in 1913 over 35,000 in over 600 lodges.

BOA, bô'â (Lat. *boa*, *bova*, a large serpent; perhaps akin to *bos*, ox, owing to its size). Any of the large nonvenomous snakes of tropical America of the family Boidæ. These are closely related to the pythons; and popularly the name is applied to any large snake that entwines its prey, crushes it, and swallows it whole—a "boa constrictor." These great serpents feed upon living animals of all sorts, for which they lie in wait, often hanging for hours together from trees. The weight of the body is borne under such conditions partly by the prehensile tail, aided perhaps by two opposing hooks on each side of the vent. These hooks are held by muscles attached to several bones, all below the skin, which are the rudiments of the hind limbs of the higher vertebrates. The boa seizes its prey with a swift dart of the head and forward part of the body, and the numerous long backward-leaning teeth hold the struggling animal until the snake throws one or more folds about it and compresses it to death. It may also seize an animal by knotting a fold of its tail or some part of its body around it; and thus boas have been seen to capture, crush, and hold two or three victims at once. The swallowing is a slow and laborious process, aided by a copious flow of saliva, which serves both to lubricate and to digest the mass of food. Boas are able to swallow creatures considerably larger than their own heads, because the loose and elastic articulation of the jaws (see SNAKE) enables the mouth to be opened both vertically and horizontally. While the process of digestion is going on, for which weeks may be necessary, the boa remains in a state of torpidity and then is easily killed. The boas are afflicted with many and at times fatal intestinal worms, received from the bodies of their victims. Excepting such adversaries, the larger of these powerful serpents have almost nothing to fear.

The name *Boa constrictor* properly belongs to one of the smaller of the boas, 12 feet long, which is most abundant in Guiana and Brazil. It is an exceedingly handsome serpent, brownish, changing to brick-red on the tail, while along the back is a row of tan-colored saddle-shaped spots, becoming pale cream on the tail in sharp contrast to the red of that region. (See accompanying Plate.) The emperor (*Boa*

imperator) of Central America and Mexico resembles it, but has the markings separated by light lines along the sides. A third allied species is the lamanda, to which a sort of worship was paid by the ancient Central Americans, named *Boa divinitiqua*, of which the Mexican boa (var. *meviana*) is a northerly form. A fourth, and probably the best-known, species, is the rainbow, or ringed boa (*Epiorates cenchris*), which is found all over Brazil, but nowhere numerously, and northward to Costa Rica; it is about 5 feet long and is marked with circular or 8-shaped spots, having a dark border. In the sunlight it glows with a wonderful iridescence. This is one of the species called *aboma* and *jiboya*—Brazilian terms, which, like "boiguacu" and some others that have found currency in books, are very indefinite. The genus *Epiorates* embraces the "tree boas," most of which are slender snakes of moderate length, having distinct necks and somewhat triangular heads, which obtain their food in trees and bushes, or by hanging from branches and striking passing prey; they have the singular faculty of clinging firmly to the upper surface of a leafy branch without curling any part of the body around it, and no amount of wind waving or other agitation will loosen the hold of their looped length short of complete overturning. The swiftness of their stroke is too great to follow with the eyes. Another genus is often represented in menageries by the dog-headed boa (*Xiphosoma caninum*) of the Amazon region. It often exceeds 5 feet in length and is green above and bright yellow beneath, ornamented with clustered white spots edged with purplish black. The sand snakes (*Eryx*), the Californian *Ilichanuras*, and various other generic forms also belong to the Boa family.

The greatest of all the boas is the water boa (*Eunectes murinus*), best known as the anaconda. Although the home of this huge serpent is wholly within the valleys of the Amazon and Orinoco, the name was borrowed from the Portuguese name of a Ceylonese python, and fixed by Cuvier in 1817; its most widespread Brazilian name is "sucuriuba," or simply "sucuria." It is far more aquatic in its habits than any other big American snake, spending a large part of the time in the water, to which its structure is adapted, the nostrils being very small, placed vertically in the top of the heavily scaled nose, and closable by valves. Thus it can swim safely under water and need only push the merest point of its head above the surface in order to take breath. Its eyes, also, are elevated, prominent, and so placed that it can see both ahead and downward (into the water), which most snakes cannot do. Although, like the others, it hangs from trees or lies coiled on the bank waiting to seize anything manageable that may come in its way, it also sinks its body in the water and waits at chosen places near the bank until some animal comes down to drink, when it seizes it by the nose with a grip from which beasts rarely escape before they are dragged down, enfolded, and drowned in its crushing embrace. One of the Brazilian names is "deer swallower," and stories are told of its killing and eating cattle, horses, and jaguars; but these must be regarded as fanciful tales, inspired by the same imagination which says it reaches a length of from 50 to 80 feet. The largest specimen actually measured is that (a

stuffed skin) in the British Museum, which is 29 feet long, it is not probable that this is often much exceeded, while the average maximum length is, no doubt, nearer 20 than 30 feet. A snake of the largest size could certainly kill, and might swallow, one of the small Brazilian deer, at any rate a hornless doe or fawn, but the more ordinary food consists of rodents, from the capybara down, peccaries, birds and their eggs, and fishes and reptiles, including their own kind. This serpent is rich green in color and marked with round blackish blotches, which often run together, as shown in the accompanying illustration.

The boas are viviparous, and in captivity the anaconda has been known to give birth to 34, while a brood of young boa constrictors has numbered 64. All the boas are hardy and long-lived, and those mentioned above are to be seen in various zoological gardens, where they usually thrive well if protected from cold and intelligently treated, and often come to know their keepers and be very friendly with them. Certain species are constantly tamed and kept as pets among the villagers of Brazil and Central America, and occasionally completely tamed specimens have been known in other parts of the world, not only among performers in animal shows, but in private, of which the most famous recent example is the boa "Cleo," kept by Mr and Mrs Mann in London, and described by Frank Buckland in *Land and Water* and elsewhere about 1877. For special information, consult Moles and Ulrich, "Serpents of Trinidad," in *Proc Zool Soc of London*, 1894, pp 499 et seq.; Hopley, *Snakes* (London, 1882); Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851); Ditmars, *Reptiles of the World* (New York, 1910).

BOABDIL, bō'ab-dēl' (corrupted from Abu-Abdallah). The last Moorish King of Granada, surnamed *El Chico*, 'The Little', and *El Zogorby*, 'The Unlucky'. He expelled his father, Abu'l Nassan, in 1432, but the next year was defeated by the army of Castile near Lucena, and taken prisoner, but on agreeing to pay tribute was set free and returned to Granada to struggle for the throne against his father and his uncle, Abdallah-el Zaghali. The power of the Moors was greatly shaken by this civil conflict, and the dispute was finally settled by Ferdinand of Aragon, who in 1492 captured Granada, in spite of the reckless courage of the Moors and of Boabdil. The story goes that Boabdil, having handed over to Ferdinand the keys of the city, was riding on towards the mountains, when he turned, at Padul, on a spur of the Alpuzarras, to take a last look at the towers of Granada. "Allhu Akbar!" ('God is great'), he exclaimed, bursting into tears. His mother, standing beside him, exclaimed, "You may well weep like a woman for what you could not defend like a man." The spot still bears the name of *El Último Suspiro del Moro*, 'The Last Sigh of the Moor'. Boabdil soon crossed to Africa and lost his life in battle. Consult Lane-Poole, *The Moors in Spain* (New York, 1886); Dozy, *Spanish Islam* (London, 1913). See GRANADA.

BOAC, bō-ak'. The capital of the island of Marinduque, Philippines, situated about 48 miles from Calapan (Map Philippine Islands, C 4). It is about 160 miles by water from Manila and carries on a brisk coast trade. Pop., 1903, 15,823.

BO'ADICE'A, or, more correctly, **BOUDICCA**

(?-62 AD) Queen of the Iceni, a tribe inhabiting the territory now included in Norfolk and a part of Suffolk. Prasutagus, her husband, who died about 60 AD, left his wealth jointly to his two daughters and to the Roman Emperor Nero, hoping that by this artifice his kingdom would be protected from oppression, but the Roman soldiery, taking advantage of the defenseless condition of the country, began to plunder unscrupulously. Boadicea herself was scourged, her daughters were violated, and the nobles among the Iceni were plundered and ill-treated. These outrages drove them into a revolt, in which they were joined by the Tinobantes. Boadicea gathered round her a large army, attacked and captured the Roman colony of Camulodunum (Colchester), took Londinium and Verulamium, and destroyed, according to Tacitus, 70,000 Romans and British partisans of Rome. Suetonius Paulinus, the Roman Governor of Britain, with about 10,000 legionaries, took up his position in a narrow valley, where he could not be surrounded from the rear or outflanked. Boadicea, who, it is said, had under her command over 200,000 men, attempted to destroy his army. A dreadful battle ensued (62), in which 80,000 Britons were said to have perished, and only 400 Romans. These figures, of course, cannot be trusted, but the victory must have been decisive, as it established the authority of the Romans in Britain. Boadicea, overwhelmed with despair, committed suicide. Consult Tacitus, *Agriicola*, xvi, and *Annales*, xiv, 31-35, with the notes in the edition of the *Annals* by F. E. B. (Oxford, 1891); Elton, *Origins of English History* (London, 1882); Rhye, *Celtic Britain* (London, 1882); Haverfield, *The Romanization of Roman Britain* (Oxford, 1912).

BOANERGES (Gk *Boanerpēs*, *Boanērgēs*, of uncertain etymology). The surname given by Jesus to James and John, which Mark (iii. 17) interprets as meaning 'sons of thunder,' doubtless under the influence of the narrative of Luke ix 54. It describes possibly the fiery zeal of these two disciples displayed in such incidents as Luke ix 51-56 and Mark ix. 37-39. Like "Peter" it was not necessarily given at the time of the choosing of the Twelve, where Mark records it, but, unlike "Peter," it apparently did not persist in use.

It has been explained as an application of the folklore name connected with the cult of the *Dioscuri*, the Twin Brothers, given to these Sons of Zebedee because they were twins or of twin likeness in character and action (J Rendel Harris, *Boanerges*, 1913), and has been accounted for, along with Dalmanutha (Mark viii. 10), as the result of an imperfect attempt to copy an illegible text (Burkitt, *Earliest Sources for the Life of Jesus*, pp 32 f.).

BOAR (AS *bār*, OHG *bēr*, Ger. *Bai*, in hood boai, cf. Russ *borovā*, boai), WILD. The common and most typical species (*Sus scrofa*) of wild swine, which exceeds the largest domestic swine in size and is far superior to them in strength and swiftness. It is grayish black in color, covered with short, woolly hair, thickly interspersed with stiff, coarse bristles, which assume the form of a mane along the spine. The ears are always black. Its great tusks are formidable weapons, but when old the tusks curve over the snout and are no longer serviceable for goring, then, however, the teeth of the upper jaw protrude and curve outward, serving

BOAS

2. IMPERIAL BOA (*Boa imperator*).
3. MEXICAN BOA (*Boa mexicana*).

4. COMMON BOA (*Boa constrictor*).
5. DOG-HEADED BOA (*Xiphosoma caninum*).
6. ABOMA or RINGED BOA (*Epicrates cenchris*).

the same purpose as the tusks had done. The animal is native in Europe, Asia Minor, and North Africa, inhabiting the deep recesses of marshy forest grounds. Boars were common in England until the time of Henry II, and then not found until, in the reign of Charles I, an unsuccessful attempt was made to raise them in the New Forest. In the time of the Conqueror any one killing a wild boar was liable to have his eyes put out. Consult Harting, *British Animals Extinct within Historic Times* (London, 1880), and Johnston, *British Mammals* (London, 1903).

It was for centuries a favorite beast of chase with the nobles of Europe and was hunted chiefly on foot with the spear, aided by a breed of great dogs now nearly extinct, its strength and ferocity rendering the sport alike exhilarating and dangerous. There is little of boar hunting now, except upon certain great estates in eastern Europe, where the animals are bred for the purpose of sport. In India, however, the wild boars of that country are pursued and speared by mounted men, who regard "pig-sticking" as the most exciting sport the Orient affords. The courage and tenacity of life exhibited by pursued and wounded animals are surprising. The animal seeks its food at night and feeds chiefly on roots and grain, though it will eat smaller animals, birds' eggs, etc. The bristles of the boar are much used for brushes. Besides this one, several other species of boar have been described, of which three at least seem to be valid—*Sus vittatus* of Asia and Africa, *Sus verrucosus* from Java and Celebes, and *Sus barbatus* from Borneo. No species of the genus *Sus* are natives of America or Australia. See PEGGARY; SWINE.

BOARD (AS, *bord*, Ger. *Bord* and *Brett*). In nautical language, a term which has numerous significations. The terms *plank* and *board* were formerly used without much discrimination; hence the application of the word *board* to express in a figurative manner the deck or side of a vessel. From this use are derived the expressions *aboard*, *on board*, *boarding* (i.e., the act of going on board for a friendly or inimical purpose), *inboard* (inside the rail or bulwarks), *outboard*, etc. Before the days of keels and centreboards and for small boats until comparatively recent times, a broad board called a leeboard was secured to the side and projected into the water in a manner to prevent *leeway* (q.v.), when under sail. From this resulted the expressions a *good board*, which meant to lose nothing to leeward on a single stretch while tacking (q.v.), a *half board*, *storn board*, etc. The operation of *boarding* a vessel of the enemy meant a forcible entry for the purpose of capturing it; in the days of sailing vessels, slow steamers, and slow-firing guns it was an operation of importance, but it would not now be attempted except in unusual circumstances.

BOARD (from the *board*, or table, at which the officers sit). The general name applied to persons who in their collective capacity have the management of some public office or department, bank, railway, charity, or, indeed, of any other trust.

BOARDING HOUSE (from *board* or table for food). A house, not an inn or hotel, in which persons are furnished with board and (usually) lodging at an agreed price. Under an agreement for lodging, the boarder is entitled to all the usual and necessary conveniences of

a dwelling house, and the keeper of a boarding house impliedly undertakes that the lodgings are reasonably fit for the purposes of the intended occupation. The legal liability of a boarding-house keeper differs from that of an innkeeper (q.v.) in three important respects. The first difference is due to the fact that he does not hold himself out as engaged in a common public employment. Consequently he is at liberty to reject any person who may apply for accommodations, whether his house is full or not. No person has a right to insist upon boarding with him until a special agreement has been made between them. In the second place, a boarding-house keeper is not subject to the extraordinary liability for the property of the boarder which rests upon an innkeeper for the chattels of his guests. He is bound to exercise only such care as an ordinarily prudent man would take of his own property in similar circumstances. In the third place, the keeper of a boarding house has, at common law, no lien on his boarders' property for bills owing by them, although such a lien has in most of the United States been accorded him by statute. See INN; INNKEEPER; LODGING HOUSE; and the authorities referred to under those titles.

BOARDMAN, GEORGE DANA (1801-31). An American missionary. He was born in Livermore, Me., graduated at Waterville College (now Colby University) in 1822, and studied at Andover Theological Seminary. He was ordained as a Baptist minister in 1825 and in the same year sailed for Calcutta as a missionary. In 1827 he established a mission at Burma and was especially zealous in his work among the Karen villages. His widow married the Rev. Adoniram Judson. Consult A. King, *Memoir of George Dana Boardman* (Boston, 1856).

BOARDMAN, GEORGE DANA (1828-1903). An American Baptist clergyman. He was born at Tavoy, Burma, and was educated at Brown University (1852) and at the Newton Theological Institution. He was pastor of the First Church, Philadelphia, from 1864 to 1894. In June, 1899, he established at the University of Pennsylvania the permanent lectureship known as the "Boardman Foundation in Christian Ethics." He was president of the Christian Arbitration and Peace Society and of the American Baptist Missionary Union. His most important production is a monograph, *Titles of Wednesday Evening Lectures*. It embraces 981 of his lectures, delivered between 1865 and 1880, and comprises a complete exegesis of the Bible. His other writings include *The Prophecies of the Risen Lord* (New York, 1879); *Disarmament of Nations* (1880); *The Kingdom* (1899); *The Church* (1901); *The Golden Rule* (1901); *Our Risen King's Forty Days* (1902); *The Problems of Jesus* (new ed., 1913).

BOARD OF TRADE. See TRADE, BOARD OF.
BOAR/FISH. A southern European fish (*Capros aper*) of the family Caproidae, having a much protracted hog-like snout. The body is oval, compressed, and carmine in color, with seven transverse orange bands on the back. The flesh is little esteemed.

BOAR'S HEAD, THE. The haunt of Shakespeare's Falstaff and his crew. It was a tavern in Eastcheap, London. It fell in the great fire of 1666. It was rebuilt, but had to give way for an approach to London Bridge. The site is now occupied by a statue of William IV.

BOAS, bô'as, EDUARD (1815-53). A German

author, born at Landsberg. He is remembered chiefly for his works on Goethe and Schiller, including *Nachtrage zu Schillers semmtlichen Werken* (3 vols, 1838-40), *Nachtrage zu Goethes sammtlichen Werken* (1841), *Schiller und Goethe im Xenienkampf* (1851). His *Schillers Jugendjahre* (1856) and *Schillers und Goethes Xenienmanuskript* (1856) were published posthumously by W von Maltzahn. His other works include *In Skandinavien, Nordlichter* (1844), the humorous novel *Des Kriegshommissar Papius Reise nach Italien* (1841), and the idyllic poem *Peputa* (1844). He published selections from his prose and poetical works in his *Schriften* (5 vols, 1846-48).

BOAS, FRANZ (1858-) A German-American anthropologist. He was born in Minden, Westphalia, studied at Heidelberg, Bonn, and Kiel, and in 1883-84 made a scientific journey through the Baffin's Land region. He was assistant in the Royal Ethnographical Museum in Berlin from 1885 to 1886. From 1886 to 1888 he was an associate editor of *Science*, from 1888 to 1892 instructor in anthropology at Clark University, and in 1899 was appointed professor of anthropology at Columbia University. He was curator of ethnology in the American Museum of Natural History in 1901-05, president of the American Anthropological Society in 1907-08, and of the New York Academy of Sciences in 1910. While connected with the American Museum, he planned and took part himself in the Jesup North Pacific Expedition, which disclosed interesting relations between the North Asiatic and Northwest American cultures, the *Reports*, which continue to appear, have been prepared under his editorship. In 1912 Oxford University conferred upon him the degree D.Sc. He wrote *Baffin's Land* (1885), "The Central Eskimo," *Sixth Annual Report, United States Bureau of Ethnology* (1888), *Tsimshian Texts* (1902), *The Growth of Children* (1904), *Changes in the Form of Body of the Descendants of Immigrants* (1911), *The Mind of Primitive Man* (1911), editor of *Handbook of American Indian Languages* (1911), *An Anthropologist's View of War* (1912).

BOAST (origin uncertain) A term used in sculpture to define the first contour of a roughly hewn block before the working out of ornament and details. Portions of buildings that are designed for ornamentation, if in obscure places, are often left in this rude state.

BOAT (AS *bāt*, Ger *Boot*, cf Fr *bateau*, boat, from LL *batellus*, dimin of *battus*, *batus*, boat.) A small vessel propelled by oars, sail, or some form of engine or motor. The name is also applied to large vessels built to navigate rivers and interior waters and sometimes to large sea-going vessels, but in such cases it is ordinarily used as part of a compound word or expression, e.g., steamboat, ferryboat, canal boat, packet boat, etc. Boats are of numerous types and forms, representing the various developments of the raft and dugout principles, which may be said to meet in the framed open boat, as it embodies the hollow form of the dugout and the framing of the raft. The simplest form of boat is called a *punt* or *bateau*, and it is much used in shallow interior waters, where it is often propelled by pushing with a pole instead of using oars, it has a flat bottom and sides made of single boards. The *dory* is a variety of punt, but, being intended for use in rough water, it is deeper and more shapely

Dories are used in great numbers by fishing vessels. Small, shallow, framed boats are called wherries, or Whitehall boats. In the United States navy boats are of four types—*cutter*, *whaleboat*, *steamer*, and *motor boat*. The cutter type includes the dingies and launches, the former being smaller than the cutter, and the latter being larger, all are square-sterned. The whaleboat is sharp at both ends. Steamers resemble cutters in build, but are heavier, are partly decked and some have rounded or pointed sterns, the smaller steamers are frequently called steam-cutters, motor boats are of various types. *Gigs* and *barges*, now little used, are commonly of cutter build, but are longer, narrower, and of less depth, some gigs are of whaleboat form. Dingies usually have 4 oars, cutters and whaleboats from 6 to 14, gigs 5 or 6, barges 12 to 14, and launches 12 to 16. All are supplied with masts and sails to be used when desired. In modern men-of-war boats are stowed on skid-frames amidships in order to keep them out of the way of the guns, a certain number of davits are fitted, however, as a matter of convenience during ordinary service. The boats of merchant ships are of various types, and their number depends upon the size of the vessel and the character of the service, dories are much used in the United States coasting vessels, but large boats are usually carried; most deep-sea sailing ships have one large boat, called the *launch* or *longboat*, in addition to smaller ones.

Boats are usually built of wood, they are liable to receive many minor injuries, and the repair of an iron hull is a much more difficult matter than that of a wooden one, moreover, an iron boat is much more likely to punch a hole in her bottom or side in striking a sharp object than is a wooden one. There are three different methods of building wooden boats: the *carvel*, with fore-and-aft planks, the edges meeting but not overlapping, the *clinker*, also with fore-and-aft planks, but with the edges overlapping each other like shingles, and the *diagonal*, the planking of which runs diagonally, the inside planks running in a contrary direction to the outside ones and their edges meeting. On some steamers the number of passengers carried is so great that sufficient room cannot be found for boats of the ordinary type, and these vessels often carry a number of collapsible boats with wooden frames and covered with canvas. Boats are *single* or *double banked*, as they have one or two oars to a thwart. The seats for the crew of a boat are called *thwarts*, the strip on which the thwarts rest is called the *rising*, the space abaft the after thwart the *stern sheets*, that forward of the foremost thwart the *fore sheets*, the spaces for the oars the *rowlocks*, and where the coxswain of a man-of-war boat sits or stands, the *coxswain's box*.

Boat Davit When not resting inboard on chocks or skid frames, boats are carried at the davits. These are secured to the ship's side, the end resting in a socket or saucer (if the davits revolve), with a collar around the davit higher up and near the ship's rail. Davits are sometimes straight, but are usually curved somewhat in the shape of an inverted letter J (thus *J*). The upper blocks of the *boat falls* (see *Block*, also *Tackle*) are secured to the curved arms of the davits, and the lower blocks hook into rings in the boat. Boat davits are usually made of round iron bars, but stronger and lighter davits are made of T-rail iron or of box bidders. Me-

chanical davits of one form or other are provided on many ocean steamships to facilitate the launching of lifeboats.

Boat-Handling Apparatus. The size and weight of many boats now carried by ships preclude their being hoisted by davits, and all boats carried inboard on men-of-war require special apparatus. In the United States navy boats stowed on skid beams are usually handled by a *boat crane*, which is shaped somewhat like a boat davit, but is many times larger. The power to operate it is either steam or electric. The boats, when about to be hoisted, have wire-rope or chain contrivances called *slings* fitted to them, and the tackle of the boat-crane hooks in the rings of the slings. In the British navy large boats and those on the skid beams are handled with *boat derricks*, consisting of strong booms hinged at the heel in heavy sockets on the mast. *Lifeboats* are carried at davits of the usual pattern, but they have special apparatus for lowering them and for detaching them after they are lowered. There are many types of such devices in use; the general feature which is common to all is an arrangement whereby the boat is instantaneously released from the hoisting gear, and it is customary to detach the boat two or three feet above the water and let it fall the rest of the distance. In a rough sea it is very difficult to unhook the ordinary falls, and a failure to do so promptly might cause the boat to swamp or be crushed against the ship's side.

BOATBILL. A South American night heron (*Cancroma*, or *Cochlearia*, *cochlearia*), differing from the true herons mainly in the form of the bill, which is comparatively short and very broad, as shown in the accompanying illustration. It is about the size of a domestic fowl, has shorter limbs than most of the herons, but

HEAD OF A BOATBILL.

resembles them in plumage, and is abundantly provided with elongated feathers on the back of the head and neck, which it erects when irritated. The skin beneath the lower jaw is bare and distensible in a large gular pouch. Its general color is rusty red, the forehead and breast whitish. It inhabits Guiana, Brazil, etc., and stands in shallow water waiting for a favorable opportunity to engulf its prey in its capacious beak. Small fish and amphibians form its principal food. The note is a harsh croak. Another species (*Cancroma*, or *Cochlearia*, *zelendoni*) inhabits Central America. These are considered by some to form a subfamily, characterized by having four powder-down tracts, but it is probable that generic rank is sufficient to indicate their peculiarities. See HERON.

BOAT FLY. See WATER BUG.

BOATSWAIN, *naut. pron. bō's'n* (boat + swain, servant). An officer of the navy of warrant rank. On board ship he has, under the executive officer, charge of the rigging, anchors, cables, cordage, etc. He summons the crew at all general evolutions and acts as assistant to the executive in carrying on the business of the ship; on old-type ships his station was on the fore-

castle. A boatswain's *call* or *whistle*, which he uses in summoning the crew or to call attention as a preliminary to passing orders, etc., is his badge of office. Examinations for appointments to the grade of boatswain are held annually or oftener for those who are eligible. When a boatswain has served six years as such, he is, if he passes the prescribed examination, advanced to the grade of *chief boatswain* and commissioned with the rank of ensign. In 1913 there were 99 chief boatswains and 72 boatswains on the active list of the United States navy. The pay of a boatswain when at sea is \$1200 per annum, with an increase of \$200 for each three years of service until the maximum of \$2250 is reached. Chief boatswains receive the same pay as ensigns.

BOATSWAIN, or BOATSWAIN-BIRD. A sailor's name for two sorts of sea-wandering birds: (1) a jaeger, especially the parasitic jaeger (*Stercorarius parasiticus*); (2) a tropic bird (q.v.). The reference in each case seems to be to the long, pointed feathers in the tail, which suggest a marlin'spike, the boatswain's badge of office; in fact, skuas and jaegers are also known locally in New England as "marlin'spikes."

BO'AZ. See JACHIN.

BOBAC, bō'bác (Pol. *bobak*, Russ. *babakū*). A gregarious marmot or woodchuck (*Arctomys bobac*) of eastern Europe and Central Asia, which resembles the American prairie dog in appearance and habits.

BOBADILLA, bō'bá-dē'lyá, FRANCISCO (?-1502). A Spanish commander of the Order of Calatrava, appointed in 1499 to supersede Columbus as Viceroy of the Indies. He was fully empowered to conduct an investigation of the affairs of the colony of Hispaniola and set sail with two caravels from Cadiz in June, 1500. He was both insolent and inefficient, and he had no sooner landed in the island than he proceeded to high-handed and stupid demonstrations of authority. By his orders Columbus was seized, placed in chains, and sent back to Spain. The Admiral was, however, received with great consideration by the nation and court. In 1502 Columbus set out on his fourth and final voyage and arrived at Hispaniola on June 29. On the first of July Bobadilla, who, after his utter mismanagement had been recalled under arrest, left San Domingo in one of the vessels of a large fleet commanded by Torres and was drowned in a hurricane.

BOB'BIN (Fr. *bobine*, of uncertain origin). A small wooden or metal roller, flanged at one or both ends, on which thread or yarn is wound for sewing, weaving, etc. Bobbins for weaving are commonly made with a flange at one end only, but most other forms of bobbins are flanged at both ends. The ordinary "spool" on which sewing thread is wound is a familiar example of a wooden bobbin, and the metal implement for holding the thread in a sewing machine shuttle is a good example of a metal bobbin. The manufacture of bobbins, which are used in enormous numbers, is usually carried on by means of automatic machinery. In the manufacture of bobbins or spools for sewing thread the wooden blocks, cut to the proper length, are thrown into the hopper of the machine, whence they are taken automatically, turned, flanged, bored, and discharged complete and ready for use. See LOOM.

BOBBIN-BOY, THE. The nickname of Gen.

Nathaniel P. Banks, and the title of a boy's book founded on his life

BOBBINET (*bobbín + net*) A machine imitation of pillow lace (See LACE) A cotton or linen fabric of hexagonal meshes, formed by a series of threads crossing and partially twisting around each other See BRUSSELS LACE

BOBBIO, bób'be-ó An episcopal city in Lombardy, province of Pavia, north Italy, near the confluence of the Bobbio and the Trebbia, 37 miles northeast of Genoa (Map Italy, D 3) In 612 St Columbanus founded an abbey here, whose famous library, consisting of 700 manuscripts, made known to the world by Niebuhr and others, is now partly in the Vatican, partly in the Ambrosian Library at Milan Pop., 1881 (commune), 4500, 1901, 4848, 1911, 4910

BOBIZATION In music, a general term denoting the various systems proposed by the theorists of the sixteenth and seventeenth centuries for naming the tones of the scale by syllables instead of letters Especially the semitone before the octave, B, was designated by a large variety of syllables (si, bi, ci, di, ni, ba, za) Consult II Riemann, *Geschichte der Musik-theorie* (Leipzig, 1898)

BOBOLI (bó'bó-le) **GARDENS** Magnificent gardens near the Pitti Palace, in Florence, Italy, planned in 1550, under the patronage of Eleanor of Toledo and the direction of the sculptor Tribolo

BOBOLINK (earlier *boblink*, *Bob o' Lincoln*, *bob-o-lincoln*, in imitation of the sounds produced by the bird) One of the most conspicuous and interesting song birds of North America, found wherever plains, prairie meadows, or cultivated fields offer it a suitable home It is a member of the Icteridae, but stands apart from the orioles and blackbirds by reason of its pointed tail feather and long middle toe, as *Dolichonyx oryzivorus* The length is about 7 inches, of which 2¾ inches go to the tail, the

HEAD AND FOOT OF BOBOLINK
Male in summer plumage

spring or breeding plumage of the adult male is black, with the hind head and nape, scapulars, rump, and upper tail coverts buff, inclining to ochraceous on the neck and ash toward the tail, in this plumage a popular local name is skunk blackbird The female is protectively denied this gay suit and is clothed in neutral yellowish brown, much streaked, and the young of both sexes wear a similar dress until the males mature (See Plate of BLACKBIRDS) For their nests they choose open grassy spaces or fields of cultivated grass and grain, and as the spreading cultivation of the country has multiplied these conditions they have dispersed much more widely, especially in the East, than they originally extended, and for a long time vastly increased in numbers Arriving from the South in May, a pair take possession of a field The female constructs on the ground a nest of grasses skillfully entwined and often ingeniously hidden among the stems of the growing plants, in which are laid four or five eggs (for description of birds' eggs, see EGG), dull white, flecked and marbled with vandyke brown, upon which she sits very closely for about a fortnight

During this nuptial season—from their first arrival until mid July—the male is driving from the vicinity every intruder he can frighten away, especially rivals of his own kind, by his gay activity upon the wing, and his loud, sprightly, and unceasing song, which has a peculiar ringing or *chinking* quality adapted to a rattling melody, seemingly uttered in an ecstasy too vivid to permit of any tune or modulation The bobolink goes through a complete midwinter molt in South America, when its plumage is chiefly black, but with almost all the feathers veiled with long buffy-yellow tips These gradually wear away (see MOLTING) until at the season of courtship the bird is clad in strong contrasting colors of black, buff, and white After the breeding months an autumn molt brings the male into rich ochre or yellow colors similar to those of the female This it wears until midwinter Then brilliant song dwindles to the call note, *Chink!* and in August the males gather upon marshy meadows in vast flocks, where they are gradually joined and followed by their families, and the southward migration begins By the end of September all the bobolinks have left the northerly parts of the country and are gathered upon southerly seacoasts or inland marshes At this time they are fat and along Chesapeake Bay and the Southern "sounds" are shot in immense numbers under the name *reedbirds* as an autumn delicacy Such as escape move on southward, and fall in enormous flocks upon the ripening rice fields of Carolina and the Gulf coast, where they are called *reebuds* Here they do very serious damage by eating the rice grains and more by slaking down a vast quantity So systematic and severe has been the destruction of these birds of late years that the species has been seriously diminished, and bobolinks are becoming rare in many parts of the northeastern United States and Ontario, to the sorrow of the people

BO'BRIKOV, NIKOLAI IVANOVITCH (1830-1904) A Russian general and official born at St Petersburg Having been thoroughly trained in military academies, he at once entered military life He rose rapidly in the government's favor, and in 1898 was appointed governor-general and commander in chief of the military district of Finland He ruthlessly carried out the policy of Russification aimed at the suppression of Finland's constitutional liberties He was endowed with dictatorial powers in 1903 and entered on a vigorous course of repression, including the expulsion of the most prominent Finnish leaders He was assassinated, June 16, 1904, by Eugene Schiaumann, the son of a former senator See FINLAND

BOBRINETTS, bób'brí-nyéts' A thriving town in the government of Kherson, south Russia, 120 miles north of the city of Kherson, on the high, rocky banks of the Bobrinets River, an affluent of the Bug (Map Russia, F 5) Flour milling, the manufacture of tobacco, and retail trading are its principal industries In the neighborhood of Bobrinets are interesting mounds Pop., 1890, 10,050, 1897, 14,350

BOBRUISK, bób-bró'y'sk A fortress of the first class and the capital of a district in the government of Minsk, Russia, 108 miles southeast of the city of Minsk (Map Russia, C 4) It is situated on the high right bank of the Bérésa, at the mouth of whose tributary, the Bobruisk, is a station for the steam packets navigating the Dnieper and Bérésa It con-

tains a departmental college and a military hospital. Manufactures include iron and flour, but are less important than its commerce, which consists principally of exports of grain and timber. During the reign of Alexander I it was fortified, and in 1812 it was ineffectually besieged by the French. Czar Nicholas I converted it into a fortress of the first class. In 1902 it was almost totally destroyed by a conflagration. Pop., 1897, 25,100.

BOBRZYNSKI, bób-zhin'skě, MICHAEL (1849-). A notable Polish historian, born at Cracow, in Galicia. He was educated at the place of his birth, graduating at both its gymnasium and its university. In 1872 he received the degree of LL.D. and the following year became assistant professor in the history of Polish jurisprudence, assuming similar duties with regard to German law in 1876. In 1877 he was made professor of law in the University of Cracow. From 1885 to 1891 he was a member of the Reichsrat and held many other honorary and responsible positions, and from 1890 to 1901 he was president of the Galician board of education. He became Governor of Galicia in 1908. His most important publications are his *Geschichte Polens* (1879), which aroused much criticism on account of its bitter attacks on Poland's past, and his contributions to Lenel's *Polnische Rechtsdenkmäler* (1874-82).

BOBS. A nickname given by his soldiers and by the English people to Field Marshal Earl Roberts.

BOB'STAY. See Plate of a full-rigged ship with article SHIP.

BOBWHITE. An American quail. See QUAIL.

BO'CA (Sp. *boca*, mouth, from Lat. *bucca*, cheek). A term applied to the entrance of various straits and rivers, chiefly in South and Central America. 1. *Boca Chica*, the deep channel, 28 miles in length, which leads to Cartagena, in Colombia. 2. *Boca de Nariños*, the largest and most southerly outlet of the Orinoco. 3. *Boca Grande*, a bay of the Caribbean Sea, at the mouth of the Zuenir, in Costa Rica. 4. *Boca del Toro*, in the Caribbean Sea, in Costa Rica, in lat. 9° 20' N. and long. 82° W. 5. *Boca Grande* and *Boca Chica* are the two channels connecting Darien harbor with San Miguel Bay, Panama. The bays of Almirante and Chiriqui, in Panama, are connected with the Atlantic by the bocas del Drago, del Toro, and del Tigre. 6. A village on the Southern Pacific Railroad in Nevada Co., Cal., is known by this name.

BOCAGE, bô'kážh, HENRI (1835-). A French dramatist, son of Pierre-Martin Toussiez Bocage, and younger brother of Paul Bocage. He is the author, alone or with collaboration, of several pieces which were successful on the Paris stage. Among them are the comedies *L'architecte de ces dames* (1869); *La comète de Damocles* (1871); *Le cadeau du beau-père* (1874); *Une fille d'Ève* (1875); *Les trois bougies* (1880); *En partie fine* (1884); *La vie à deux* (1890); and the comic operas *La girouette* (1880) and *Les poupées de l'enfance* (1881).

BOCAGE, MANOEL. See BOCCAGE.

BOCCAGE, PIERRE-MARTIN Toussez (1797-1863). A well-known French actor of the romantic period. He was born in Rouen. In 1826 he secured an engagement at the Odéon. There he had some success, but later at the Gaîté and Porte Saint-Martin theatres he found a more congenial opportunity in plays of a more melo-

dramatic character, such as *Alice, ou les fosses écossoises* and *Neugate, ou les voleurs de Londres*. Among his greatest successes were those in *Angèle*, *Antony*, *La tour de Nesle* and other pieces by Alexandre Dumas. From 1845 to 1848 he was director of the Odéon and later (1860) of the Théâtre Saint-Marcel. His final achievement was in the production, at the Ambigu, of *Les beaux messieurs de Bois Doré* (1862).

BOCAS DEL TORO, bô'čas del tó'ro. A port in the republic of Panama, on an island of the same name, in one of the entrances to the Chiriqui Lagoon or Bay (Map: Central America F 6). Pop., about 5250. The most important article of trade is the banana, which is exported in great quantities. Other exports are coco nuts, sarsaparilla, india-rubber, hides, and turtle shells.

BOCA TIGRIS, bôk'a tē'grīs (Portug. trans of Chinese *Hu-Men*, the tiger's mouth or gate) or **THE BOGUE**. A passage in the Canton River China, between the island of Tycoektow on the west and the islands of An-ung-hoi and Chuen-pi on the east. It is about 2½ miles wide, and below it the Canton River expands into a broad estuary. The Boca Tigris contains a number of small islands, with remnants of old forts, which were repeatedly taken by the British. At present the entrance is guarded by modern fortifications.

The "Bogue Forts," so called after the Bocas Tigris, are forts of granite masonry, erected by the Chinese on the rocky islands in the channel of the Boca Tigris, to defend the approach to the city of Canton. One remarkable island mass of rounded granite with precipitous sides rising to a height of about 400 feet, seemed to the Chinese as a tiger's head, though Europeans imagine that of an elephant. These forts were captured by the British in 1841 and again in 1850; but they were rebuilt, and are now supplied with heavy armament of the latest style of Krupp and Armstrong factories.

BOCAUE, bô-kou'ă. A town of Luzon, Philip pines, in the province of Bulacan. It is situated about 4½ miles northeast of Bulacan, a short distance from the railway line (Map: Luzon E 7). Pop., 1903, 8438.

BOCCACCINO, bôk'kât-chē'nô, BOCCACCIO (c 1467-c.1525). An Italian painter of the early Renaissance, belonging to the Emilian school. He was born in Ferrara and studied in his native town, probably under Domenico Panetti. Few facts of his life are known. He passed some time in Venice, where he was strongly influenced by Venetian painting. His principal artistic activity was in Venice, Ferrara, and especially in Cremona, where he founded a school in which Garofalo was a pupil. His most celebrated achievement is the frescoes in the cathedral of Cremona, (1506-19) representing the "Birth of the Virgin" and some subjects from her life. His remaining works, which include the "Marriage of St. Catharine" (Venice Academy), the "Virgin and Child with Four Saints" (Venice San Giuliano), the "Virgin and Two Saints" (Cremona, San Quirilo), and the "Holy Family" (Paris, Louvre), are considered by Lanzi remarkable for richness of drapery, variety of color, spirit and grace of attitude, and harmony of landscape. Several works formerly attributed to Perugino, Pinturicchio, and Garofalo are now ascribed to Boccaccino. His son and pupil CAMILLO (1501-46) was a painter at Cremona.

BOCCACCIO, bók-kat'éhó, GIOVANNI (1313-75). Author of the *Decameron*, the third of the *Three Crowns* of Italian literature, the great master and model of classic Italian prose, and the greatest of modern story-tellers. He was born (probably in 1313, and surely not later than July 20, 1314) in Paris, the illegitimate son of Boccaccio di Chellino, a Florentine merchant, and a French noblewoman, whose first name was Giovanna (Jeanne). Reared in Florence, Boccaccio was sent about 1323 to study accounting in Naples. Finding this un congenial, he turned to canon law, which also he left for classical and scientific studies and the gay life of the court of King Robert of Naples, a brilliant centre of culture and learning. Here he made powerful and stimulating friendships, his mind was enriched in cultivated surroundings, his sensibilities were sharpened to the natural beauty of Naples, and his emotional nature expanded in a sympathetic, sensuous luxury. The great episode in his life at this time was his love for Maria de' Conti d'Aquino—for "Fiammetta," as she is called in some of his writings—a love which touched all the chords of emotion in Boccaccio, from exquisite happiness while she was faithful to him, to bitterest jealousy and despair after she left him for others. For her he wrote his earliest Italian romances, and his experiences with her brought him a deep insight into human nature and feeling. Financial difficulties recalled Boccaccio to Florence in 1340, and during the next years he is almost lost to view. In 1346 he was living with Ostasio da Polenta at Ravenna, in 1348, with Francesco Ordelaffi at Forlì. He settled, after a short trip to Naples, in Florence, where he was living in 1351. For his native city he performed various diplomatic services in Bologna (1351), the Tirol (1351), Avignon (1354 and later in 1365), and Rome (1367). In 1351 also he had earned to Petrarch in Padua a nomination to a professorship in Florence. Boccaccio had met Petrarch, in 1350, in Florence. His acquaintance with the great poet ripened into a sincere affection, which sustained Boccaccio in the difficult years to follow, encouraging him in his studies and writing, steadying his mental and moral poise. Their correspondence was uninterrupted till Petrarch's death, in 1374. In 1362 Boccaccio was invited to Naples by his friend Nicola Acciaiuoli, who promised him the patronage of Queen Joanne. His cold reception led him to seek the consolation of his friend Petrarch in Venice (1363). Rejecting Petrarch's offer of a home, he returned to the poverty of his Certaldo estate. His last years were brightened by his appointment as lecturer on Dante in Florence in 1373, but the course was interrupted by illness in 1374. Since 1354 a great change had come over Boccaccio's view of life. The bitterness of his emotional experiences had inclined him to disgust with the world and to religious meditation. These tendencies became very definite after a visit to him in 1362 of a monk, Gioacchino Ciani, who brought him the dying message of a certain Fra Pietro Petroni, urging him to repent. Boccaccio regarded the poverty of his last years as a direct judgment of God on his youth. His retirement to Certaldo in 1374 was a definite renunciation of the world. He died there, Dec. 21, 1375.

Aside from the *Decameron*, Boccaccio's writings include (1) The *Filosofo* (1331-38), his first and longest work of fiction, which was writ-

ten for Maria d'Aquino. It deals with the fundamental theme of Fleur and Blanchefleur, two youthful lovers, separated by adversity, and reunited after many adventures. The naive tale of mediæval France is adorned by Boccaccio with a curious conglomeration of pagan and chivalric legends, of classic mythology and mediæval Christianity. A certain importance attaches to the discussions of love on the background of Neapolitan society of the day, and to the personal revelations concerning himself and Maria, which Boccaccio has woven into the story. Greater psychological acumen appears in (2) the *Filosofo* (the story of Troilus and Criseis, written c1338) and (3) the *Teseide* (the story of Palemon and Arcite, written c1341), both poems in the octave stanza, inspired by Boccaccio's own love affairs and interesting as sources of Chaucer's *Knights Tale* and *Troilus*. A third poem in octaves (4), the *Ninfale Fiesolano* (the love of Adonis for a nymph of Diana, and the founding of Florence through their son Prunco), shows a great advance in artistry, in the delicacy and sincerity of its sentiment and pathos, and in the simplicity of its form, whereas in (5) the *Ameto* and in (6) the *Amorosa visione* the warmth of biographical motivation is smothered under a cold and perfunctory allegory of love. Just as the *Ameto* is the first great pastoral romance, so (7) the *Fiammetta* is the first great psychological novel. Here, under the names of Panfilo and Fiammetta, Boccaccio relates, with inverted rôles, the story of his abandonment by Maria. Even though the analysis of sentiments, especially of jealousy, is hampered by an excess of classical illustration, it is profound, acute, and sincere, and there is much of the same rich objectivity in setting that we find in the *Decameron*. In (8) the *Comaccio* (written c1354-55) he vents in a satirical allegory on the wiles of women his resentment at his disillusion in love, and hints at that weariness with worldly things which characterizes the later years of his life. In fact, the *Decameron*, finished in 1353, seems to have exhausted one phase of Boccaccio's nature, his gaiety and mundanity. Between 1351 and 1360 we have (9) a work of ponderous erudition, the treatise *De genealogia deorum gentium*, followed (1356-64) by (10) the *De casibus virorum illustrium* and the *De claris mulieribus* and (1366) by the scientific *De montibus*, all works of distinctly mediæval type, without the historical perspective so notable in Petrarch's humanism. (11) The *Vita di Dante* and the *Commentary* on the *Comedy* also belong to this later period. The notable (12) *Ecolgues* in Latin and (13) his Italian verses retrace in part the ground covered in his romances.

If Boccaccio had died in 1348, the minor works already produced would have made him an important figure among the lesser contemporaries of Petrarch and Dante. It was the *Decameron*, written between that year and 1353, which gave him a place among the greatest writers of all time. Purely extrinsic considerations make the *Decameron* a work of the first importance. In it Boccaccio gathers together from all sources—from the French *fabliaux*, from the classics, from current folklore and contemporary life—all those fundamental human situations, tragic, comic, practical, ethical, which confront human existence in its most universal aspects. In this respect the *Decameron* has been a storehouse

for all writers of fiction from his own time to the present. His imitators include hundreds of writers, from masters like Shakespeare to geniuses like D'Annunzio. The perfection of his art has likewise made him a universal model for story-telling: he isolates with absolute clearness the "point" of his situation, develops it with characters visualized in their most living and essential features, and his exposition proceeds with the greatest expedition and economy to the climax and conclusion. In a narrower field, that of Italian prose, his influence, like that of Petrarch, has been tremendous; for the Renaissance, with its doctrine of *imitation*, set up the *Decameron* as the criterion of prose excellence, choosing, however, with typical perversity the occasional involution of his periods as the essence of his art. So that here its influence was mostly bad. The *Decameron* finally offers an encyclopædic panorama of contemporary life and manners, representing people from every walk of life, but especially from the middle classes, in their objective reality, living, moving, feeling, revealing themselves in their inmost souls. All this makes the *Decameron* interesting. But the vital principle which makes it immortal is Boccaccio's own æsthetic vision. In the representation of the tragic, the heroic, the virtuous, Boccaccio is out of his natural field; he becomes rhetorical, abstract, and inclined to exaggeration. His creations move as though out of touch with reality. If his patient Griselda has survived, it is not for her virtue but for her pathos as a suffering, neglected wife. It is rather when Boccaccio comes to his characters with the pure delight of concrete portrayal that he attains perfection. And his own best insight was for the uglier sides of human nature in their more venial manifestations. Here we have the true field of the comic. Boccaccio's laugh is the quintessence of laughter. He penetrates behind every pose, every self-deception of his people, and brings them face to face with reality, and this reality and this pose are visualized by him in their completeness and essence. There is no phase of life that escapes his comic vein. He riots in lechituousness and at least skims the surface of sacrilege, not because his genius was more perverse, but because his available materials were more plentiful. In the comic field he attains the heights reached by Dante in his treatment of human aspiration. He has the same grasp of human nature, the same power of objectifying his vision.

Consult E. Hutton, *Giovanni Boccaccio: A Biographical Study* (New York, 1910; trans. by T. Wright, London, 1874; complete ed. of all works, by Moutier (Florence, 1827-34); expurgated ed. of *Decameron* by Fornaciari (Florence, 1900).

BOCCAGE, bók-kázh', or **BOCAGE**, MANOEL MARIA BARBOSA DU (1765-1805). A popular Portuguese poet, born at Setúbal. He was admitted to the army at the age of 14 and served in the East Indies, in 1786 in the navy, and three years later as lieutenant of cavalry. Subsequently he deserted, and returned to Lisbon (1790), where he soon became the most distinguished member of the circle of young poets known as the *Nova Arcádia*. His eager advocacy of the cause of the French Revolution found an organ in certain poems, notably "Verdades Duras," but activity in this direction was short-lived. The revolutionary and atheistic tone of his writing gave the

authorities offense; in 1797 he was arrested and imprisoned, and eight years later he died, without having recovered his old leadership. The quality of Boccage's poems is extremely uneven. He had an unusual gift for improvisation and wasted himself to a large extent upon verse of that sort, often upon the most frivolous subjects. Yet among his poems there are some of high order—sonnets that are little masterpieces of polished verse and amply justify the admiration of his contemporaries; while the popular and national spirit that animates them is the new note which he introduced into Portuguese literature and which later found further expression in the younger national school led by Almeida-Garrett and Castilho. An excellent biography of Boccage, by Braga, forms the introduction to the latest edition of his poems (Oporto, 1876). The most complete edition of his works is entitled *Rimas* (5 vols., Lisbon, 1806-14).

BOCCAGE, bók-kázh', MARIE ANNE FIQUET DU (LEPAGE) (1710-1802). A French poetess, remarkable chiefly for the praises she inspired as "Venus in form, Minerva in art." She was a member of the academies of Rome, Bologna, Padua, Lyons, and Rouen. She imitated Milton in 'An Earthly Paradise' (*Paradis terrestre*) (1748) and wrote also miscellaneous *Poems* (1746) and *La Colombade* (1756). Her letters to her sister while traveling in England, Holland, and Italy have still an interest that is not inherent in her verses.

BOCCALINI, bók'ká-lé'né, TRAJANO (1556-1613). An Italian satirist, born at Loreto. Under Gregory XIII he held several offices, the most important being that of Governor of Benevento. In an age of conventionality, hypocrisy, moral apathy, and routine thought Boccacini stands out as an exponent of free intelligence, disinterested citizenship, political and economic justice, sane literature, and aggressive humanity. His principal work, 'Dispatches from Parnassus' (*Ragguagli di Parnaso*), is a satire of perennial interest for its solid mentality and cogent humor. It exerted considerable influence on Swift and Addison. In his *Pietra del paragone politico* he assailed Spanish domination in Italy with a view to national independence. His *Commentaries on Tacitus* attack political absolutism and favor modified democracy. Consult G. Rua, *La letteratura civile* (Milano, 1910). The best edition of the *Ragguagli* is that of Rua (Bari, 1910); Eng. trans., anonymous (1704) and by Hughes (London, 1706).

BOCCE DI CATTARO, bók'ká dè kát'tá-rò. See CATTARO, GULF OF.

BOCCHERINI, bók'ká-ré'né, LUIGI (1743-1805). An Italian composer and violoncello virtuoso. He was born in Lucca, Feb. 10, 1743. He was the son of a contrabassist, who instructed him on the violoncello. Afterward he studied in Rome and traveled through Italy and Germany, playing in concerts with success. He went to Paris (1768) and to Madrid (1769) and became composer and violoncellist in the Chapel of the Infante Don Luis, which post he held until 1785. Owing to impaired health, he fell into poverty, and was aided by friends. He is the greatest Italian representative of the new style of instrumental music originated by Stamitz (q.v.) and the composers of the Mannheim school. Even in his very earliest works Boccherini exhibits a remarkable mastery of form and a surprising originality in figuration

and dynamic expression far superior to the early works of Haydn, who, before the rediscovery of Stamitz, had been regarded as the 'father' of instrumental music. A leaning towards sentimentality and mere virtuosity has caused Boccherini's works to fall into rather undeserved neglect. His works (many of them of striking beauty) consist of 91 string quartets, 125 string quintets, 18 quintets for strings and flute, 54 string trios, 16 sextets, 2 octets, 4 concertos for 'cello, 20 symphonies, 2 oratorios, 1 opera, 1 mass, 1 Stabat Mater, and numerous violin sonatas. Consult L. Picquot, *Boccherini* (Paris, 1851). D. M. Ceiu, *Cenni intorno alla vita e le opere di Luigi Boccherini* (Lucca, 1864). H. M. Schletterer, *Boccherini* (Leipzig, 1882).

BOCCUS, bōk'kūs (Gk. Βόκκος, *Bokchos*). 1 King of Mauretania and father-in-law of Jugurtha. With Jugurtha he made war against the Romans, but afterward (106 B.C.) delivered him up to Sulla, the questor of Marius (Sallust, *Jugurtha*, 80-120, Plutarch, *Marius*, 8-32). 2 A son of the preceding (?-33 B.C.). In the early part of his career he reigned over Mauretania with his brother, Bogudes. After assisting Caesar in his war against the Pompeians in Africa, he was rewarded with a part of the Kingdom of Masimissa. After the murder of Caesar, Bocchus sided with Octavianus and Bogudes with Antony, and during his brother's absence in Spain Bocchus usurped the sole government of Mauretania, in which he was confirmed by Octavianus. After his death his kingdom became a Roman province.

BOCHART, bō'shā', SAMUEL (1599-1667). A noted French Orientalist and Protestant divine. He was born in Rouen, studied in Paris, Sedan, Saumur, Oxford, and Leyden, and then became pastor of the Protestant church in Caen, where he remained for 42 years. In 1629 he gained great reputation by his victory, in a public discussion of several days' duration, over the famous Jesuit Père Veron. From 1646 to 1651 appeared his *Geographia Sacra*, and in 1663 his *Hæresicon* (2 vols.), or Scripture zoology, to which he devoted many years of his life. In 1652 he was invited to Stockholm by Queen Christina and went thither, accompanied by his friend Huet. Court life, however, did not suit him, and his visit was short. The fourth edition of his complete works was published in three volumes (1712).

BÖCHER, bō'shā', MAXIME (1867-) An American mathematician, born in Boston, and educated at Harvard and Gottingen. At Harvard he became instructor in mathematics in 1891, assistant professor in 1894, and professor in 1904. He was one of the editors of the *Annals of Mathematics* in 1896-1900, 1901-07, and again in 1911, and (with L. E. Dickson) editor of the *Transactions of the American Mathematical Society* in 1907-09 and after 1910. In 1908-10 he was president of the American Mathematical Society. His publications include *Ueber die Reihenentwicklung der Potentialtheorie* (1894), *Introduction to Higher Algebra* (1907, Ger. trans. by Hans Beck, 1910), *Introduction to the Study of Integral Equations* (1909).

BOCHNIA, bōk'nī-a. A town of Galicia, Austria-Hungary, situated about 24 miles by rail from Cracow (Map Austria, G 2). It has in its vicinity extensive salt and gypsum mines and is the seat of thriving industries and trade.

Pop. of judicial district in 1910, 47,987, including 3000 Jews.

BOCHOLT, bōk'olt. A town in the Prussian province of Westphalia, on the Aa, 35 miles west by south of Münster. It is the seat of the cotton industry of Westphalia, and manufactures hearths, leather, iron, and trimmed lumber. Pop., 1890, 13,000, 1900, 21,200, 1910, 26,404.

BOCHUM, bōk'um. A town in the Prussian province of Westphalia, about 9 miles east of Essen (Map Prussia, B 3). It is a centre of the iron, steel, and coal industry of Westphalia, which gives employment to thousands of men. Bochum possesses five churches, a gymnasium, a school of mining and metallurgy, and a theatre. There are cast-steel works, foundries, and coalpits, and manufacturing of tin and zinc ware, carpets, calcium carbide, and paper roofing. The town owns its water supply, a modern sewage system, and a slaughterhouse, and is governed by a municipal council of 24 members, electing an executive board of 7. (See PRUSSIA, *Local Government*.) Pop., 1890, 47,601, 1900, 65,600, 1910, 136,916.

BOCK, KARL ERNST (1809-74). A German anatomist and medical writer. He was born in Leipzig, studied at the University of Leipzig, and was appointed professor there in 1839. He wrote, in popular style, a number of successful and frequently translated works, such as *Handbuch der Anatomie des Menschen* (2 vols., 1838, 4th ed., 1849), *Anatomisches Taschenbuch* (1839, 5th ed., 1864), *Hand-Atlas der Anatomie des Menschen* (1843, 7th ed., 1890), *Lehrbuch der pathologischen Anatomie und Diagnostik* (1848), *Das Buch vom gesunden und kranken Menschen* (1855, 16th ed. by Camerer, 1897), *Vollst. Gesundheitslehre* (1865, 7th ed., 1890), *Bau, Leben und Pflege des menschlichen Körpers* (1868, 17th ed., 1900).

BOCK BEER. See BEER.

BOCKELSON, JAN. See JOHN OF LEYDEN.

BOCKING, bō'king, EDUARD (1802-70). A German jurist of note. He was born in Tiarsbach, studied in Heidelberg, Bonn, Berlin, and Gottingen, and in 1829 was appointed professor of law in Bonn. He was deeply learned in historical jurisprudence and prepared a number of valuable critical editions of legal classics. These include *Corpus Legum sive Brachylogus* (1829), (with Kleuze) the *Institutiones* of Gaius and Justinian (1829), and *Notitia Dignitatum Utriusque Imperii* (1839-50). His other works include *Römisches Privatrecht*, *Institutiones des römischen Civilrechts* (2d ed., 1862), and editions of the works of Ulrich von Hutten and A. W. von Schlegel.

BOCKLIN, bōk'lin, ARNOLD (1827-1901). A Swiss landscape painter. He was born in Basel and studied in Düsseldorf (under Schümel), in Brussels, Paris, and Rome. He returned to Germany in 1856 and lived in Hanover and then in Munich, where Count Schack, afterward his chief patron, was first attracted by his talent. In 1860 he was appointed professor at the newly founded art school in Weimar, but resigned in 1862 to revisit Italy, whence in 1866 he returned to his native Basel. In 1871-74 he was again in Munich, then made Florence his home until 1885, and returned there in 1892, having in the meanwhile resided in Zürich. Although an artist of the highest rank, he was understood by only a few, was often ridiculed even by his fellow artists, and never became popular. Endowed with wonderful creative

power and a grandly picturesque imagination, he painted only what poetically interested and inspired him, caring little for the public, and, while fantastic and sensational in the choice of his subjects, was always original in his design and fascinating in his manner of painting. Notable for his fine color tones and poetic apprehension, he was an exceptionally fine delineator of southern nature, but in his figures only too often seemed to be impelled by the wish to represent the eternal contrast between beauty and ugliness. Hence the most perfect and enjoyable of his creations are those in which the landscape portion preponderates and his landscapes pure and simple. Some of his most noteworthy pictures are: "Castle by the Sea Surprised by Corsairs," "Chase of Diana," both in Basel Museum; "Venus Reposing," "Pan in the Rushes" (Munich Gallery); "Villa by the Sea," "Centaur Struggle," "Pan's Terror," "Anacreontic Shepherd Boy," "The Isle of the Blessed" (National Gallery, Berlin). Many of his finest paintings are in private collections in Germany and Switzerland. In public collections the largest number is in the Schack Gallery, Munich, among which is the "Sea Idyl," one of his most original compositions, and a great masterpiece from the coloristic point of view. Next in importance are the collections of the Museum of Basel and of Freiherr von Heyl, Darmstadt. His drawings are most numerous in the museums of Darmstadt and Basel and the Royal Graphic and Maillinger collections of Munich. Consult: Lehrs, *Arnold Böcklin, ein Leitfaden zum Verständnis seiner Kunst* (Munich, 1897); Heinrich Brockhaus, *Arnold Böcklin* (Leipzig, 1901); Württemberger, *Arnold Böcklin* (Berlin, 1912); Ostini, in *Künstler Monographien* (Bielefeld, 1904). The most complete series of reproductions of his works was published in 4 vols. (Berlin, 1892-1901), with bibliography by H. A. Schmid.

BOCLAND (AS. *bōcland*, bookland, charterland, from *bōc*, book, charter), or **BOOKLAND**. In Anglo-Saxon law, land held in free tenure by grant (i.e., deed or charter) from the crown made with the consent of the Witan (q.v.). It is contrasted with *folcland* (q.v.), or land held, without written title, by customary law. The term does not describe a particular form of tenure, feudal or non-feudal, nor was bocland necessarily allodial in the sense of being held absolutely and independently of any superior. It seems that the distinguishing characteristic of such a title was that it derived all its qualities and incidents from the deed or charter creating it. Folcland, being governed by the customary or common law, must have presented uniform qualities, as of heritability, alienability, etc. But every tenure of bocland might be different from every other. It might be inheritable or not, or inheritable only by a certain class of heirs. It might be alienable or not, or alienable only to a limited class of persons. It might be allodial, in the later meaning of that term, as free from the claims of any superior lord, or it might be held by a feudal tenure of the most restricted and burdensome sort. Originally grants of bocland were made only to religious corporations, but they came in time to be available to laymen also. Consult: Digby, *Introduction to the History of the Law of Real Property* (4th ed., Oxford, 1892); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899); Lee, *Historical Jurisprudence* (New York,

1900); Pollock, *The Land Laws* (London, 1887); Kemble, *Anglo-Saxons*; Stubbs, *Constitutional History of England*. See **ANGLO-SAXON LAW**.

BOCQUILLON-WILHELM, bō'kē'yōn' vē-lān', GUILLAUME LOUIS (1781-1842). A French musician. He was born in Paris, studied at the Paris Conservatory, was instructor in music at the College of Saint-Cyr, and from 1810 professor of vocal music at the Lycée Napoléon (afterward the College of Henry IV). In 1835 he was appointed superintendent of vocal music in the public schools, in 1838 in the universities. The classes he thus organized, combined with the workingmen's evening classes later established, formed the basis of the Orphéon, whence was developed the French system of choral societies. He set to music Béranger's songs and published a number of valuable pedagogical works on singing.

BÓCSKAY, bōch'kō-ē, STEPHEN (1557-1606). A Hungarian national leader. He was brought up at the court of the Bathorys and in 1604 headed the Hungarians in their revolt against Rudolph II of Austria, who was aiming at the overthrow of Protestantism. After defeating the Imperial troops in several battles, he was proclaimed Prince of Transylvania (1605), was recognized as such by Sultan Ahmed I and was also invested with the supreme power by the Estates of Upper Hungary. In 1606 he concluded the Peace of Vienna with Rudolph II and thereby secured religious freedom to the Protestants of Hungary. Bocskay was supposed to have been poisoned by his chancellor when he died soon after becoming Prince of Transylvania. Consult Szilágyi, *Monumenta Comitatus Regni Transylvanie* (Budapest, 1879).

BOD, or **BOD-PA**. The name of the Tibetans proper, inhabiting the southern part of the country, the fertile, settled, and more or less civilized regions. See **TIBET**.

BODE, BOYD HENRY (1873-). An American professor of philosophy. He was born at Ridott, Ill., graduated from the Yankton (S.D.) College, and received a Ph.D. from Cornell in 1900. After serving for several years as assistant professor of philosophy at the University of Wisconsin, he was appointed (1909) professor at the University of Illinois. He was elected a member of the American Philosophical Association and served as vice president of the Western Philosophical Association in 1911-12. He published *An Outline of Logic* in 1910.

BODE, bō'dē, JOHANN ELEERT (1747-1826). A German astronomer. When a boy, he made astronomical observations from the garret of his father's house, with a telescope constructed by himself, and at the age of 18 calculated an eclipse of the sun. The next year he wrote on the solar eclipse of August 5, and in 1772 became astronomer of the Academy of Sciences at Berlin. He also wrote several popular works on astronomy, one of which, *Anleitung zur Kenntniss des gestirnten Himmels* (1st ed., 1768; 11th ed., 1858), was especially successful. He was appointed director of the Berlin Observatory in 1786 and held the post until the year before his death. In 1774 he founded the *Astronomisches Jahrbuch*, which is still continued, he himself editing no fewer than 54 volumes. His *Repräsentation des Astres*, in 34 sheets, containing all the stars visible to the naked eye above the horizon at Berlin, together with the most important telescopic stars, appeared in 1782. But his fame rests chiefly on the *Uranographia*,

published in 1801, in which he included 17,240 stars, or 12,000 more than can be found in any previous charts. Bode reproduced the statement of the relations of the planetary distances, previously made known by Titius of Wittenberg, but afterward called "Bode's Law" (q v).

BODE, JOHANN JOACHIM CHRISTOPH (1730-93) A German musician and translator, born in Brunswick. He was at various times an oboist, instructor in music and languages, composer, editor, printer, and translator. His translations, including Burney's *Present State of Music in Germany*, Tristram Shandy (1774), the *Vicar of Wakefield* (1776), and the *Essays of Montaigne* (1793-97), had decided influence on German literature. Consult Bottiger, *Bodes literarisches Leben* (Berlin, 1796).

BODE, WILHELM (1845-) A German art critic. He was born at Calvorde, Brunswick, and began his career as a jurist, in 1869, however, changing to the study of art and archeology in Berlin. In 1872 he was appointed assistant in the Berlin Museum, in 1883 director of the Department of Christian Sculpture, and in 1890 director of the Gallery of Paintings. The remarkable development of the Berlin Museum into one of the foremost collections of the world is due chiefly to his able management. In 1905 he was named General Director of all the Royal Museums in Prussia, and in 1909 actual Privy Councillor with the title "Excellency." He became a member of the academies of Berlin, Munich, and Amsterdam, and received the Prussian Order of the Red Eagle, etc., and in 1914 hereditary nobility was conferred upon him. His astonishingly wide knowledge of art includes every branch since the Middle Ages. It is most profound in Dutch and Flemish paintings and in Italian and German sculpture. In America, especially, his attributions are considered final. Of his many works, the principal are *Studien zur Geschichte der holländischen Malerei* (1883), *Geschichte der deutschen Plastik* (vol 1 of the *Geschichte der deutschen Kunst*, 1885), *Italienische Bildhauer der Renaissance* (1887), *Rembrandt, Beschreibendes Verzeichniss seiner Gemälde, Geschichte seines Lebens und seiner Kunst*, with Hofstede de Groot (8 vols, fol, also in French and English, 1897-1900), and *Kunst und Kunstgewerbe am Ende des 19 Jahrhunderts* (1901). He also edited the *Denkmale der Renaissance-sculptur Toscanas*, published by Bruckmann (Munich, 1892-1903), *Florentiner Bildhauer der Renaissance* (1902, Eng trans, 1908), *Rembrandt und seine Zeitgenossen* (1906), Eng trans, *Great Dutch and Flemish Masters of the Seventeenth Century* (1909), *Italian Bronze Statuettes of the Renaissance* (3 vols, 1908-12).

BODEN-SEE, bô'den-zâ' See CONSTANCE, LAKE OF.

BODENSTEDT, FRIEDRICH MARTIN VON (1819-02). A German poet and journalist. He was born in Peme, April 22, 1819, and educated for commerce, but forced his way to the university, studying in Göttingen, Munich, and Berlin, after which he lived three years as tutor in Moscow, making excellent translations of poems by Pushkin, Kazloff, and Lermontoff (1843). In 1843 he became instructor in the gymnasium in Tiflis and in 1845 published a translation of Russian folk songs under the title of *Poetische Ukraine*. In Tiflis he prosecuted Oriental studies under a Tatar teacher (Mirza Schaffy),

and began those imitations of Persian thought which under the name of this teacher suggest FitzGerald's *Omar Khayyam*. Later he traveled widely in the Caucasus and the East, and as a result wrote *Die Völker des Caucasus und ihre Freiheitskämpfe gegen die Russen* (1848) and *Tausend und ein Tag im Orient* (1850). Poems from this book, with others, were collected as *Lieder des Mirza Schaffy* (1851). Their warm imagery, their sensuous joyousness, and their melodious charm claimed general applause. The book has passed through 150 editions and has been translated into nearly all European languages. A continuation, *Aus dem Nachlass des Mirza Schaffy* (1874), was more serious and less successful. Bodenstedt was for a time a very efficient director of the noted theatre in Meiningen. In 1881 he lectured in the United States *Vom Atlantischen zum Stillen Ocean* (1882) is an account of this journey. His part in the translation of Shakespeare's works, undertaken by the German Shakespeare Society, is also noteworthy, as are his autobiographical *Erinnerungen aus meinem Leben*. He wrote many tales and some dramas, but his talent showed to greatest advantage in his translations and adaptations. He made himself a permanent place in German literature as the poet of Mirza Schaffy. Consult Stern, *Studien zur Literatur der Gegenwart* (Dresden, 1895), and Baker, *Literary and Biographical Studies* (London, 1903).

BODENSTEIN, bô'den-stên See CARLSTADT. **BODE'S (bô'dez) LAW** An arithmetical relation which is supposed to establish a connection between the distances of the planets from the sun. It may be thus stated. Write, in the first instance, a row of fours, and under these place a geometrical series beginning with 3, and increasing by the ratio 2, putting the 3 under the second 4, and by addition we have the series 4, 7, 10, etc., which gives nearly the relative distances of the planets from the sun.

4	4	4	4	4	4	4	4	4	4
4	7	10	16	24	48	96	192	384	

Thus, if 10 be taken as the distance of the earth from the sun, 4 will give that of Mercury, 7 that of Venus, and so forth. The actual relative distances are as follows, making 10 the distance of the earth.

Mercury	Venus	Earth	Mars	Asteroids
39	72	10	152	265
Jupiter	Saturn	Uranus	Neptune	
520	954	1918	3005	

Close as is the correspondence between the law and the actual distances, except in case of Neptune, no physical reason has been given to account for it, and there is little probability that such exists. Bode's law, therefore, in the present state of science, is purely empirical. Titius was the first to perceive the law, and Bode argued from it that a planet might be found between Mars and Jupiter, to fill up the gap that existed at the time in the series. The discovery of the asteroids has proved the correctness of this prediction.

BODIE, or BOD-Y'S ISLAND. A sand strip in Dare Co., N C, between Albemarle and Roanoke sounds and the Atlantic Ocean (Map North Carolina, G 2). The sand is shifting in character, inlets from the ocean appearing and disappearing from time to time. Naghead, a

popular seaside resort, is built upon the site of a former inlet of that name. There is a first-order light in lat. 35° 40' N. and long. 75° 33' W., at a height of 156 feet above sea level.

BODIERON, bö'di-ēr'ōn (origin obscure). The green rock trout (*Hewagrammos lagocephalus*) of Puget Sound and northward, known to the Cape Flattery Indians as teebarquā. It resembles other rock trout, especially the boregat, but its flesh is greenish. See ROCK TROUT.

BODIN, bö'dän', JEAN (1530-96). A French writer on politics, born in Angers. He was a lecturer on law in Toulouse, and subsequently practiced as an advocate of the Parlement of Paris, before he devoted himself to the study of political theory. His exceptional talents, and the positive attitude he assumed in support of the doctrine of absolute monarchy, gained him the good will and protection of Henry III and of his brother, the Duc d'Alençon. With all his leanings toward conformity in politics and religion, Bodin was an enemy of persecution, and his antagonism to the course adopted by the ultra-Catholics cost him the favor of his royal patrons. At the States-general of Blois in 1576 Bodin, as a representative of the Third Estate from Vermandois, succeeded in securing an interim of peace and toleration for the adherents of the Reformed religion. After the assassination of the Duke of Guise in 1588, Bodin joined the League, but was expelled not long after for his lukewarm Catholicity and spent the rest of his life in retirement. He died in Laon in 1596. In his *Methodus ad Facilem Historiarum Cognitionem*, published in 1566, Bodin already gave evidence of a philosophical spirit and a deep store of learning; the appearance, 10 years later, of his *Six livres de la république* assured him almost from the first the leading place among the political writers of the Renaissance not even excepting Machiavelli. By his vast erudition and bold grasp on the principles underlying historical fact, Bodin, in the estimation of modern authorities, deserves a place with Aristotle and Montesquieu as one of the three greatest political philosophers in history. His most valuable contribution to the science of society and statecraft is the conception of sovereignty which he was the first clearly to formulate and to develop. Starting with the family as the unit of society, Bodin defines the state as a collection of families united by common interests and common possessions living under the right authority of a sovereign. This sovereign is described as power "supreme and perpetual, absolute, and subject to no law." The kinds of government are three: democracy, aristocracy, and monarchy or despotism, according as the sovereign power reposes in the mass of the people, in a few, or in one; mixed governments there can be none, since in the nature of things the sovereign is one and indivisible. Of the three forms of government Bodin much prefers monarchy, and inasmuch as he endows his ruler with all the gifts of Plato's philosopher-king, he finds it easy to bestow on him the full attributes of sovereignty. Custom, law, the will of the people as expressed through their parliaments and magistrates, are undoubtedly of great importance; but in the last instance the King is subject to no restraint save that of his own conscience. Equally celebrated with his theory of sovereignty is Bodin's analysis of the effect of climate on society and government. In general he finds that the nations of the north are characterized by the

predominance of physical strength, those of the south by mental power, those of the temperate zones by a happy mixture of the two. In the north the dominant force is brute will; in the south, superstition; in the central regions, reason. The ideal commonwealth would embrace the entire world, in which the northern peoples should supply the workers and fighters, the southern peoples the priests, poets, and artists, and the inhabitants of milder climates the legislators, magistrates, and judges. The

Colloquium Heptaplomeres, published only in 1847, is a plea for toleration. Seven men—a Roman Catholic, a Lutheran, a Zwinglian, a Jew, a Mohammedan, an Epicurean, and a Theist—debate on the subject of what is the true religion and arrive at the conclusion that it is best for each man to live in accordance with his own belief, provided his creed be not opposed to public morality and the welfare of the state. In political economy he demonstrated the fact of a general rise in prices in his controversy with the Sieur de Malesroit who, but for Bodin, would be entirely unknown at the present time. He was a critic of the contemporary policy of interfering with the exportation of bullion. His contributions to the theory of public revenues entitle him to an important place in the history of finance. He was opposed to slavery. Despite his breadth of view, Bodin was unable to free himself from the common mediæval superstitions. He devotes an entire book of the *Republio* to an erudite discussion of the influences of the planets on the affairs of men, and in his *Démonomanie* (1580) advocates the burning of wizards and witches. Consult: Baudrillard, *Jean Bodin et son temps* (Paris, 1876); Barthélemy, *Étude sur Jean Bodin* (Paris, 1876); Dunning, *Political Theories from Luther to Montesquieu* (New York, 1905).

BODIO, bö'dyō, LUIGI (1840-). An Italian political economist and statistician. He was born in Milan and studied in Pavia and Pisa. In 1864 he was appointed professor of political economy at the Technical Institute, Leghorn; in 1867 professor in Milan, and in 1868 professor of statistics and commercial geography at the Venice Commercial School. In 1872 he became director of the National Statistical Bureau. He published a considerable number of important statistical works, among which is *Sui documenti statistici del regno d'Italia* (1867). He was editor of the quarterly review entitled *Archivio di Statistica* (1877-82), and became editor of the *Bollettino dell'Istituto Internazionale di Statistica* in 1886.

BODKIN, böd'kin (origin obscure). An instrument used by women of antiquity to fasten up the hair at the back of the head. It was the method commonly adopted by the priests of Cybele as well as by the female characters in Greek tragedy, the bodkin being highly ornamented. Silver bodkins are still worn in a similar way by the peasant girls of Naples. The term "bodkin" is also applied to a sharp-pointed instrument for piercing holes in cloth as well as to a tape needle. It was also at one time a very common name for a dagger.

BOD'LE, or **BOD'DLE**. An ancient copper coin in Scotland, in value the sixth of a penny sterling. The bodle, first issued under Charles II, is said to have been so called from a mint-master of the name of Bothwell. "Not to care a bodle" is a phrase still used.

BODLEIAN (bôd'le-an) **LIBRARY** The great library of the University of Oxford, England. The first library, the foundation of Humphrey, Duke of Gloucester, was destroyed by the fanaticism of Edward VI's Commissioners for the Reform of the University. Sir Thomas Bodley's was a restoration (1602), and his active quest of valuable publications was equalled by his munificence. Formally opened with great ceremony, Nov. 8, 1603, it was the next year granted letters patent by James I, who himself gave it the name of its founder. One of Bodley's first acts was the presentation of a large collection of valuable books, purchased on the Continent at an expense of £10,000. Through his influence and noble example, the library was speedily enriched by numerous other important contributions. Among the earliest subsequent benefactors were the Earl of Pembroke, who presented it with 250 volumes of valuable Greek manuscripts, Sir Thomas Roe, Sir Kenelm Digby, and Archbishop Laud, who made a magnificent donation of 1300 manuscripts in more than 20 different languages. About 8000 volumes of the library of the famous John Selden also went to the Bodleian Library. General Fairfax presented it with many manuscripts, among which was Roger Dodsworth's collection of 160 volumes on English history. The first catalogue of printed books was published by the first librarian, Dr. James (1605). Among some of the important bequests of the nineteenth century were the collections of Richard Gough, on British topography and Saxon and Northern literature, of Edmund Malone, the editor of Shakespeare, and of Francis Douce, also, the sum of £40,000, by the Rev. Robert Mason, the interest to be expended on books. By purchase the library acquired some fine collections of Oriental, Greek, Latin, and Hebrew books and manuscripts. The Bodleian Library is particularly rich in biblical codices, rabbinical literature, and materials for British history. Along with the British Museum, it enjoys the right of receiving a copy of every book appearing in England. There are more than a million bound volumes, 30,000 volumes of manuscripts, besides valuable pictures and relics. The buildings contain also many art treasures, as the Pomfret and Arundel marbles, and the Hope collection of portraits. One of its most interesting paintings is that of Sir Thomas Bodley, full length. There is also a marble bust of him. Members of the university who have taken a degree are admitted to the use of the library, a small addition to the matriculation fees and an annual payment being charged for the privilege. Literary men, properly recommended, are allowed to make extracts from the works in the library, which is usually open from 9 o'clock in the morning to 5 in the afternoon. Connected with the main library is now a circular structure called the Camera Bodleiana, the gift of Dr. Radcliffe, which is kept open from 10 A.M. to 10 P.M. It contains the more common books and is used as a reading room. The tercentenary of the foundation was celebrated with great splendor in the autumn of 1902. Consult Macray, *Annals of the Bodleian Library* (Oxford, 1888); Garnett, *Essays in Librarianship* (London, 1899); Clark, *A Bodleian Guide for Visitors* (Oxford, 1906). See **BODLEY**, **SIR THOMAS**, **LIBRARIES**.

BODLEY, JOHN EDWARD COURTENAY (1853-

) An English historian. He was educated at Balliol College, Oxford, receiving the bachelor's degree in 1877, three years after he had become a barrister of the Inner Temple. He held important official posts, being private secretary to the President of the Local Government Board (1882-85) and secretary to the Royal Commission on Housing of the Working Classes. But he became better known as a writer on French history, being made (1902) a corresponding member of the Académie des Sciences Morales et Politiques. He translated into French (1901-04) his own excellent work on France—vol. 1, *The Revolution and Modern France*, vol. 11, *The Parliamentary System* (1898, 7th ed., 1907), and wrote *L'Anglomanie et les traditions françaises* (1899) and *The Church in France* (1906). He also published an official account of Edward VII's coronation (1903, 2d ed., 1911) and *Cardinal Manning, and other Essays*, mostly on French subjects (1912).

BODLEY, SIR THOMAS (1545-1612). An English scholar and diplomatist, now best known through the Bodleian Library (q.v.). During the reign of Mary his parents were for a time in Geneva, where Thomas studied Greek, Hebrew, and divinity, the last with Calvin. The family returned on the accession of Elizabeth, and the son, entering Magdalen College, Oxford, was duly graduated B.A. in 1563, and was made a probationer fellow of Merton College. The following year he was made actual fellow and in 1566 received M.A. For a while he delivered a Greek lecture, was in 1569 elected proctor, and on one occasion was public orator. Employed by the Queen in diplomatic missions, he was sent to the courts of Denmark, France, and Holland. He was proficient in the continental tongues, and his diplomatic career was so distinguished that he was solicited to become Secretary of State, but the scholarly quiet of the Oxford life appealed to him more strongly, and he returned thither in 1590. Now relieved of public cares, he considered how he might "do the true part of a profitable member of the state," and the restoration of the library seemed to him a rare opportunity. He was fortunate in securing the hearty cooperation of his countrymen. Himself indefatigable, he had an agent go to the Continent and buy largely. He also permanently endowed the library, and in his will he made the university his chief beneficiary. Knighted by James I, he desired that he might be buried in keeping with his knightly rank, and accordingly directed that £666 13s. 4d. be expended for great ceremony. His remains were laid in the chapel of Merton College. There, too, a monument was erected in 1615. Bodley's autobiography up to 1609, with his letters, was published under the title of *Reliquiæ Bodleianæ* (London, 1703). See **BODLEIAN LIBRARY**, **LIBRARIES** with the bibliographies there appended. Consult Sandys, *A History of Classical Scholarship*, vol. 11 (Cambridge, 1903), *Teicentale Bodleianum* (Oxford, 1913).

BODMER, GEORG (1766-1864). A noted Swiss mechanic, born in Zurich. He was apprenticed to a mechanic in Hauptwil and made valuable improvements in wool-spinning machinery in 1805. In 1808 he invented a cannon for firing bombs which exploded upon striking. He continued to manufacture and improve industrial machinery and firearms and in 1824 established large works in Manchester, England.

Subsequently he turned his attention to railway construction in Austria.

BODMER, JOHANN JAKOB (1698-1783). A German-Swiss critic and poet. He was born in Greifensee, became professor of Swiss history and politics in Zurich, and was one of the chief movers in the emancipation of German literature from French classic tradition. He published, with Breitinger, a critical periodical (after the style of Addison's *Spectator*), *Diskurse der Mäler* (1721-23), which attacked the then popular poets with an enthusiastic assertion of Simonides' principle that poetry is word painting, and of the doctrine that its foundation is feeling rather than reason. His æsthetic writings, beginning with *Vom Wunderbaren in der Poesie*, precipitated in 1740 a literary war between him and the powerful Leipzig critic Gottsched (q.v.), who rapidly declined in influence. The viewpoints of the two schools were, however, not so different as one might suppose. The quarrel turned chiefly on the merits of Homer and Milton. As Bodmer and Breitinger championed the cause of beauty and feeling against dogmatism, they won. While Bodmer at first hailed Klopstock (q.v.) as a worthy successor to Milton, he later on became involved in a personal quarrel with him. He totally failed to appreciate the new movement in German literature. He first called attention to the beauties of the Minnesingers and of the Nibelungenlied, translated Milton's *Paradise Lost* (1732) and Homer, and did much to awaken in Germany an interest in English literature. He was not a great poet. His numerous works, to which he continued to add even up to the time of his death, lie in various fields—critical and æsthetic, epic, dramatic, historical, pedagogical, political, and satirical. Consult Breitmaier, *Geschichte der poetischen Theorie und Kritik von den Diskursen der Mäler bis auf Lessing* (2 vols., Frauenfeld, 1888-89); Bächtold, *Geschichte der deutschen Literatur in der Schweiz* (Frauenfeld, 1892); E. Meissner, *Bodmer als Parodist* (Leipzig, 1904).

BOD'MIN (from Cymr., Celt. *bod*, dwelling + *min*, high rock; or possibly *bod-manach*, dwelling of monks). The county town of Cornwall, England, 30½ miles west-northwest of Plymouth (Map: England, B 6). It consists principally of one street a mile long. Its ancient church (St. Petrock's) is one of the largest in Cornwall. It has an ancient grammar school, founded by Queen Elizabeth, a hospital, and the county lunatic asylum. Its chief trade is in cattle, horses, and sheep. Pop., 1891, 5100; 1901, 5400; 1911, 5734. Bodmin was long an important place, having a priory, a cathedral, and 13 churches. Consult *Guide to Bodmin and Neighborhood* (Truro, 1872).

BODONI, bô-dô'nê, GIAMBATTISTA (1740-1813). An Italian type cutter and printer. The son of a printer, he was born in Saluzzo, Piedmont, and was successively a compositor in Rome and the superintendent of the Duke of Parma's private press. He was distinguished rather for his elegance than for his accuracy and is best known by his editions of the *Iliad*, Vergil, and the Lord's Prayer, the last in 155 languages. Worthy of mention, too, is his *Manuale tipografico* (1818). His biography has been written by Bernardi (Saluzzo, 1873).

BOD PA. See TIBET.

BOD'Y, CHARLES WILLIAM EDMUND (1851-

). An Anglo-American theologian. He was born at Clapham, London, and was educated at St. John's College, Cambridge. He was provost and vice chancellor of Trinity University, Toronto, Canada, from 1881 to 1894, when he became professor of Old Testament literature and interpretation of the General Theological Seminary, New York. His principal publication is *The Permanent Value of Genesis* (one of the Paddock Lectures for 1894).

BODY AND MIND. The question of the relation of body to mind, together with the deeper question whether we have a right to separate these two terms and to speak at all of a "relation" between them, is subject-matter for metaphysical inquiry. We refer to the articles DUALISM; EPISTEMOLOGY; MATERIALISM; MONISM; SPIRITUALISM. Here we are concerned simply to discuss the views which have been adopted by psychologists as working hypotheses upon the scientific level, without regard to their ultimate metaphysical validity. Just as physics may postulate, for its own purposes, the existence of a matter which certain philosophical systems repudiate, so may psychology accept a theory of the relation of mind to body which some or all systems of philosophy would pronounce erroneous or inadequate. Every science must assume its data as realities and has a right to its working hypotheses. And some sort of theory of the relation of mind to body has become a necessity for psychology, since Fechner (q.v.) has shown that the presupposition of an exact science of mind is the uniformity of mental response to physical stimulus.

Psychologists are, at the present day, sharply divided into two groups—the one holding a theory of the interaction of mind and body, the other a theory of psychophysical parallelism. The former theory, which has all the weight of common opinion on its side, avers that mental processes are able to act causally upon bodily; that an idea may "make" us act—i.e., condition bodily movements—just as truly as a blow may make us feel pain. The chain of events is made up of two kinds of links—material processes and mental processes; and the links are interchangeable and equally effective. The latter theory maintains that the two series, the material and the mental, are disparate; that they never pass into or interfere with each other. The mental series is conditioned upon the material, runs parallel with it, term for term; but there neither is nor can be any transition from the one to the other. It should be said, emphatically, that there is no necessary connection between the theory of interaction and a metaphysical monism or idealism, and none between parallelism and metaphysical dualism and materialism. Either theory, held as a scientific working hypothesis, is compatible with any one of these ultimate metaphysical beliefs.

The main arguments for interaction are as follows: 1. "The particulars of the distribution of consciousness point to its being effacious" (James). Consciousness can apparently "load the dice" of the brain—i.e., can bring "pressure to bear in favor of those of its performances which make for the most permanent interests of the brain's owner." "Consciousness is only intense when nerve processes are hesitant."

Where indecision is great consciousness is agonizingly intense." This argument squares with the doctrine of biological evolution, in that it gives to mind, which is a highly complex de-

velopment, a survival value in the organism's struggle for existence. 2 A damaged brain may recover and work normally, the parts remaining take on the duties of the parts lost, by the principle of "vicarious function." The restoration is intelligible if consciousness direct it, unintelligible, if the brain machine be subject to no such direction. 3 Pleasures are associated with beneficial stimulation, pains with detriment to the organism. This correlation seems to imply that pleasures and pains exert a direct influence upon the bodily processes. 4 The assumption of the interaction of mind and body assures the universality of the causal connection and the uniformity of natural law throughout the known universe.

To the first argument there is the reply that it offers no proof of the actual interference of consciousness in the struggle for existence. Mind may be a mere concomitant of brain—a concomitant that varies in complexity as its physical substrate varies, and that is thus an index or symptom of brain efficacy, but that is not itself a factor in survival. An animal may surpass its fellows, not because it has a better mind, but because (as its better mind shows) it has a better brain. The presence of an intense consciousness during deliberation and doubt offers no difficulty. (See ACTION.) As for vicarious function, the developed brain is, by hypothesis, an exceedingly complex and plastic structure, not a machine definitely shaped for a few particular ends. Hence there is no need for the intervention of consciousness. The correlation of pleasure with stimuli that further life, and of pain with stimuli that thwart it, is readily explicable as a coincidence due to the continued operation of natural selection (Spencer). An animal that, from the biological point of view, "liked" to be hurt would not exercise any considerable influence upon the further development of its species. Finally, the demand for a universal causality is rather a metaphysical than a scientific postulate.

The arguments in favor of parallelism may be summed up as follows. 1 The hypothesis is a necessity for scientific psychology. If our psychological experiments, in which we submit the mind to various forms of physical stimulation and observe the results, were liable to interruption by the reaction of mind itself upon the stimuli employed, there could be no hope of erecting "laws" of mind, of discovering mental "uniformities." Our most laborious and careful researches might be upset at any moment by the interjection of some mental influence. The fact that laws and uniformities have been established indicates that the mental is conditioned, unequivocally, by the physical, and that there is no reciprocal conditioning. 2 The categories of mind and body are most diverse of all that are recognized by science. They are entirely heterogeneous. But it is a rule of logic that one may not argue from category to category, reasoning is valid only within the limits of a single "kind" or "genus." Hence we may not interpolate mental links in the chain of physical causation, and vice versa. 3 Reflex and secondary reflex movements show that the organism can act "teleologically," i.e., as if with set purpose and with a view to a determinate end, without the aid of consciousness. 4 The law of the conservation of energy requires that motion produce and be produced by motion, it forbids any arbitrary increase of the energy of

the organism, such as must follow from the direct action of mind upon brain cell.

The first of these arguments is difficult to meet. It rests upon a basis of positive fact, whatever our theoretical belief, we can but grant the utility of the parallelistic principle in the practice of experimental psychology. We might, however, urge that the heuristic value of a working hypothesis is no evidence that the hypothesis will endure. A proposition that appears self-evident at one stage of the history of a science may be utterly overthrown by later discovery. It may be, then, that as our experimental methods grow in refinement, and we attack the higher and more complex processes of mind, we shall gain evidence of the very mental action which now seems to be precluded by the results of experiment. The second argument is less strong. No formal considerations can limit the province of cause and effect: experience must decide in each case, irrespective of homogeneity or heterogeneity of the terms. The purposiveness of the reflex movements "proves only that the same effect can proceed from different combinations of conditions" (Stumpf). Moreover, it is probable that these movements are, one and all, degenerate impulsive actions (See ACTION), so that their teleology may, after all, be consciously conditioned. Lastly, there is no good reason why we should not rank "mental energy" alongside of chemical, thermal, electrical, etc., energy, and assume that it, like these, has its precise mechanical equivalent.

We shall incline to one side of the other, then, as our interests and experience prompt. The descriptive psychologist, keenly alive to the manifestations of mental life about him and influenced by the traditions of psychological thought, will tend toward an acceptance of interaction, the experimental psychologist, revolutionary in temperament and dominated by the methods of the laboratory, will tend toward a parallelistic theory. The impossibility of present decision may mean that we have not as yet sufficient facts at our disposal for a solution of the problem, or it may mean that the problem is now wrongly formulated, and will be transcended by a true philosophy. In either case we must put our trust in time and further work.

Bibliography. James, *Psychology* (New York, 1890), Stumpf, "President's Address," *Bericht III Internationaler Congress für Psychologie* (1897), Ebbinghaus, *Psychologie* (Hamburg, 1905), Kuelpe, *Outlines of Psychology* (London, 1909), Titchener, *Text-Book of Psychology* (New York, 1910), Wundt, *Human and Animal Psychology* (Eng. trans., London, 1901), Wundt, *Outlines of Psychology* (Eng. trans., 1897), T. H. Huxley, *Science and Culture* (New York, 1882), A. Binet, *L'Âme et le corps* (Paris, 1905), L. Busse, *Geist und Körper, Seele und Leib* (Leipzig, 1903), C. A. Strong, *Why the Mind Has a Body* (New York, 1903), Wm. McDougall, *Body and Mind* (London, 1911).

BODY COLOR. A pigment possessing substance, consistency, and covering power, which contributes substance to other pigments. The term is applied particularly to the solid white known as Chinese White, used in water colors, which by rendering them opaque distinguishes them from the transparent and fluid washes which mark the water-color method pure and simple.

BODY ISLAND. See **BODIE ISLAND**.
BODY SNATCHING. The common law of-

fense of unlawfully taking and carrying away a dead human body. When the body is taken from a grave, the offense is commonly called *body lifting*. The taking is ordinarily for the purpose of dissecting the body or selling it for dissection or of secreting and holding it for ransom. By statute in many of the United States a person has the right to direct the manner in which his body shall be disposed of after his death, unless he is a convicted felon. In the latter case his body may be turned over to medical authorities for dissection. Statutes frequently provide also for the exhumation and dissection of buried bodies, under the direction of proper officers, for the purpose of discovering the cause of death. But the removal of a dead human body after burial, or while awaiting burial, if made without authority of law, with intent to sell or use it for dissection, is in nearly every jurisdiction a statutory or a common-law offense, punishable by imprisonment or a fine, or by both. See CORPSE, and the authorities referred to under CRIMINAL LAW.

BOECE, bois, or **BOËTHIUS**, HECTOR (1465–1536). A distinguished Scottish historian. He was born in Dundee, and belonged to the family of Bois or Boys, modern Boice or Boyce. He was educated in Dundee, and studied at the University of Paris, where he took the degree of B.D. He was appointed professor of philosophy at the Collège Montaigu, and acquired there the friendship of Erasmus, who has praised him in his writings. He left Paris reluctantly to preside over the new University of Aberdeen, the prosperity of which he greatly promoted. He also became canon of Aberdeen and rector of Tyrie. In 1522 he published his lives of the bishops of Mortlach and Aberdeen. His fame rests chiefly on his *History of Scotland*, published 1527, for which he received the degree of D.D. from the university and a royal pension. This work contains a large amount of fiction, but is worthy of the commendation it has received on the score of style. It is supposed that Boece died in 1536, for on November 22 of that year the King presented the rectory of Tyrie, vacant by the death of Mr. Hector Boiss, to John Garden. Consult: Irving, *Lives of Scottish Writers* (Edinburgh, 1839); and Burton, *History of Scotland* (Edinburgh, 1873).

BOECKH, bek, PHILIPP AUGUST (1785–1867). A German classical scholar. He was born in Karlsruhe, Nov. 24, 1785, and was enrolled in the University of Halle in 1803 as a student of theology, philosophy, and philology, but the lectures of F. A. Wolf (q.v.) induced him to devote himself exclusively to philology; the influence of Schleiermacher (q.v.) led him to the special study of Plato. In 1809 he became professor at Heidelberg and in 1811 was called to the newly established University of Berlin, which owed much of its early fame to him, in company with Hegel and Schleiermacher. Boeckh lectured in Berlin with great success for 56 years to a total of many thousand students. The range of his studies was very wide, and he was the first to develop philology on a philosophic basis. He conceived of that science as an organically constructed whole, which aims at nothing short of a complete intellectual reproduction of antiquity. His lectures therefore included both formal and historical grammar, exegesis, archaeology, history of ancient literature, philosophy, politics, religion, and society. (Consult Freund-Deiter, *Wie studirt man klas-*

sische Philologie, Stuttgart, 1903). Boeckh's concept of philology excited much opposition at first, but gradually won adherents, and unquestionably gave a great stimulus to classical scholarship; at the present time, after many of the subjects which Boeckh regarded as subdivisions of philology have been exalted to the position of independent sciences, there are significant signs of a return to his general view of the unity of philology. His earliest publication, dedicated to Wolf, was *Commentatio in Platonis qui vulgo fertur Minoem* (1806); in his *Græcæ Tragicæ Principum Æschyli, Sophoclis, Euripidis, Num Ea Quæ Supersunt Genuina Sunt*, etc., published in 1808, he discussed the possible revisions due to repeated productions and the interpolations of actors in the extant tragedies. He also produced some monographs on Plato while professor at Heidelberg.

His great works are the following: an edition of Pindar in 4 vols. (1811–22), the completion of which he entrusted to his friend G. L. Dissen (q.v.), professor in Göttingen. This marked an epoch in Pindaric studies by its criticism of the text and the scholia, and especially by Boeckh's investigations of the metre. The introductory essay on the criticism of Pindar is still of great value. His work *Die Staatshaltung der Athener*, 'The Public Economy of Athens' (2 vols., 1817; 3d ed., by Fränkel, 1886) applied the methods of his master, Wolf, and of his older contemporary, Niebuhr, to questions of the commercial and state economy of the Athenians in a masterly manner; by it Boeckh established the science of public antiquities, in which he was followed by K. F. Hermann, G. F. Schoemann, and M. H. B. Meier (q.v.); and the work remains a permanent monument of thorough research, analysis, and vast learning. It gave a full and systematic statement of the economic side of the Athenian constitution in its actual working; it contained an *Appendix of Inscriptions on the Athenian Navy*. The work was translated into English in 1828 by Sir George Cornwall Lewis. In his investigations Boeckh had been led to a careful study of Attic inscriptions; he was practically the founder of the scientific study of inscriptions. He now planned a comprehensive collection of Greek inscriptions, the cost of which was undertaken by the Berlin Academy. With Boeckh were associated Ph. Buttmann, Schleiermacher, Immanuel Bekker (q.v.), and later many others; the result of their work was the *Corpus Inscriptionum Græcarum* (4 vols., 1825–62). Among his other important works are *Philolaos' des Pythagoreers Lehre* (1819); *Metrolologische Untersuchungen über Gewicht, Münzfüsse und Masse des Altertums* (1838); *Urkunden über das Seewesen des attischen Staates* (1840); *Sophokles Antigone* (2d ed., 1884); *Encyclopædie und Methodologie der philologischen Wissenschaften*, never published by himself, but edited from his lectures on the subject by Bratuschek (1877; 2d ed., by Klusmann, 1886). This is still the most important work in its field. Boeckh won a great name also for investigations in ancient chronology, by his *Zur Geschichte der Mondsystem der Hellenen* (1855); *Epigraphisch-chronologische Studien* (1856), etc. His *Opuscula* fill 7 vols. (1858–74). He died in Berlin, Aug. 3, 1867. Consult Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

BOËDROMIA. See BOËDROMOS.

BOËDROMIOS (Help-giver). An epithet

of Apollo, the origin of which is assigned to various events of Greek history (consult Plutarch, *Theseus*, 27). From this epithet was derived the name of the third Attic month, Boedromion, corresponding to portions of September and October, on the 7th day of which the festival Boedromia was celebrated in honor of Apollo.

BOEHLE, bē'le, ERNST (1880-) A German composer. He was born in Munich, Dec. 27, 1880, and received his musical education under Ludwig Thuille (composition) and Heinrich Schwartz (piano). Since 1907 he has been conductor of the concerts of the *Vollsymphonie* in Munich. As a composer he immediately attracted attention with large orchestral works that show not only excellent workmanship but inventive power of an unusual order. His works are *Odysseus' Ausfahrt und Schiffbruch*, *Die Insel der Kulte*, *Die Klage des Nausiklaos*, *Odysseus' Heimkehr*, *Troisma*, *Eine tragische Overtüre*, and vocal works with orchestra *Stille der Nacht*, *Landung*.

BOEHLER, bē'ler, PETER (1712-75). A Moravian Bishop. He was born at Frankfurt-on-the-Main, Germany, studied at Jena and in 1737 was ordained as a Moravian minister by Count Zinzendorf (qv). On his way to America, where he had been sent as a missionary to Carolina and Georgia, he stopped in England and there became acquainted with John and Charles Wesley, over whom he had a powerful influence. He worked among the negroes in Georgia and among the Germans in South Carolina, some of whom he ultimately transferred to Bethlehem, Pa. For a year Boehler labored as missionary to the Indians. He then went to Europe and returned with a large number of Moravian colonists. This addition to the growing community at Bethlehem caused the founding of Nazareth, near the original town. In 1742 Boehler was appointed Bishop of the Moravian churches in America, England, Ireland, and Wales. While on a parochial visit to his new charge he died in London. Consult T. P. Lockwood, *The Memorials of the Life of Peter Boehler* (London, 1868).

BOEHM, bēm, HENRY (1775-1875). An American Methodist minister. He was born in Lancaster Co., Pa., and became a preacher in 1800. He was an intimate friend and associate of Bishop Asbury and greatly contributed to the extension of Methodism, particularly among the German-speaking people of Pennsylvania. Consult his *Reminiscences of Sixty-Four Years in the Ministry* (1865).

BOEHM, SIR JOSEPH EDGAR (1834-90). An English sculptor. He was born in Vienna, the son of the director of the Imperial Mint, and from his father received his earliest instruction. In 1840-51 he studied in England, chiefly the Elgin marbles and other sculptures in the British Museum, and afterwards in Italy, Paris, and Vienna. He was then active as a medalist in Vienna, but, encouraged by the success of his works exhibited in the Royal Academy in 1862, he removed to London and soon became the most representative sculptor of the Victorian period. In 1881 he was named sculptor in ordinary to the Queen, and in the following year was elected to the Royal Academy. Among his best-known productions are the colossal bronze statue of Queen Victoria at Windsor, and statues of John Bunyan at Bedford, of Lord John Russell in Westminster Hall, London, of the Duke of Wel-

lington at Hyde Park Corner, and of Thomas Carlyle on the Thames Embankment, and the fine recumbent figure of Dean Wellesley in Westminster Abbey. Boehm's art represents the transition from the cold classicism then prevalent in England to the more realistic productions of the present day. Without being work of the highest rank, it is often well characterized and able.

BOEHMERIA (after the German naturalist Bohmer). A genus of plants of the family Urticaceae. The fibres of a number of species are used for making ropes, twine, nets, sewing thread, and cloth, and some of them appear likely to acquire much economical and commercial importance. The commercially important species now known are *Boehmeria nivea* and *Boehmeria tenacissima*, also known as *Boehmeria undulata*, the latter being often considered as merely a variety of the former differing mainly in having green leaves, instead of those which are white beneath. *Boehmeria nivea* grows in temperate and subtropical regions, while the variety flourishes in subtropical and tropical countries. It yields a great part of the fibre employed in China in the manufacture of the beautiful fabric known as China-grass cloth (qv). It is a perennial herbaceous plant, with broad ovate leaves, which are white and downy beneath, and is of the general habit though destitute of the stinging powers of the nettles. It is carefully cultivated by the Chinese, by whom it is called *tekou ma*. It is propagated either by seeds or by parting the roots. It loves shade and moisture. Three crops are obtained in the season, new shoots springing up after it has been cut. Great attention is bestowed upon the preparation of the fibre. This is extracted by hand stripping, by boiling the stalks in water, or some chemical solution, or by machinery. Machine methods have so far not met with unqualified success. On the other hand, the first-named two ways of extracting the fibre are more or less intricate and involve a large amount of hand labor. As a consequence, the bulk of the fibre is produced in China and India, where cheap labor is plentiful. Some writers claim to *Boehmeria nivea* properly belongs the name China grass, while ramie or ihea should be retained for the plant which Dr Roxburgh strongly recommended to attention about the beginning of the nineteenth century, now known as *Boehmeria tenacissima* (see RAMIE). It is now believed that most of the commercial fibre comes from *Boehmeria nivea*. An allied species, *Vilbunnea integrifolia*, is common in Nepal, Sikkim, and other parts of the Himalaya, to an elevation of 3000 feet above the sea. It is not cultivated, but often overruns abandoned fields. It grows to a height of 6 or 8 feet and varies from the thickness of a quill to that of the thumb. The plant is cut down for use when the seed is formed, the bark is then peeled off, dried in the sun for a few days, boiled with wood ashes for four or five hours, and beaten with a mallet to separate the fibres, which are called *poash* or *poce*, and also *kenka* or *yenka*. When properly prepared, the fibre is quite equal to the best European flax. The fibres of a number of coarser species are employed in different parts of the East Indies for making ropes. *Macoutia puya*, a plant belonging to the same family, is also an important source of fibre in the East Indies. The cultivation of *Boehmeria nivea* has been introduced into the southern part of the United States

and in California, and with the invention of satisfactory methods of decortication and degumming it will doubtless prove an important industry. *Boehmeria cylindrica* is indigenous to the United States, occurring as an annual in waste places from Canada to Florida, and westward. Consult Royle, *Fibrous Plants of India* (London, 1865); Dodge, *Descriptive Catalogue of Useful Fibre Plants* (Washington, 1897). See Plate of FIBRE PLANTS.

BOEHMERT, bö'mért, KARL VIKTOR (1829-). A German writer on political economy. He was born in Quesitz, Saxony, and studied in Leipzig. In 1857-60 he edited the *Bremer Handelsblatt*, from 1886 to 1875 he was professor of political economy at the University of Zürich, and from 1875 to 1895 director of the bureau of statistics of Saxony. He was appointed in 1875 professor of political economy and statistics at the Technological Institute in Dresden, retiring in 1903. He sought steadfastly to promote free trade and to liberate German industry from its medieval restrictions. He wrote *Briefe zweier Handwerker* (1854); *Freiheit der Arbeit* (1858); *Der Sozialismus und die Arbeiterfrage* (1872); *Die Gewinnbeteiligung der Arbeitnehmer in Deutschland, Oesterreich und der Schweiz* (1902; French trans., 1908); *Das Alkoholverbot* (1904 and 1909).

BOEHM VON BAWERK, bëm fön ba'vërk, EUGEN (1851-). An Austrian political economist. He was born in Brünn, Moravia, Feb. 12, 1851, was educated at the University of Vienna, and from 1872 to 1879 continued his study of political economy in Heidelberg, Leipzig, and Jena, under Knies, Roscher, and Hildebrand. He held for a short time a place in the Austrian Ministry of Finance, lectured in 1880 at the University of Vienna, but was called thence to the University of Innsbruck, where he remained till 1889. He then entered once more the government service, in the department of finance, and was Minister of Finance from June 13 to Oct. 2, 1895. He was then appointed professor in the University of Vienna and became president of one of the superior courts of administration. In 1897-98 he was again Minister of Finance; in 1899 he was called to the House of Peers, and January, 1900, until October, 1904, he was in charge of the Ministry of Finance. Boehm von Bawerk is one of the leading economists of the so-called Austrian school. With Menger, Wieser, Sax, and other economists he worked out a system of value based upon the final utility concept. His principal contribution, however, is to the theory of capital and interest. In his *Geschichte und Kritik der Kapitalismus Theorien*, (1884; trans. by William Smart in 1890 under the title *Capital and Interest*) Boehm von Bawerk subjects all earlier theories to a searching criticism and finds them essentially defective. In his *Positive Theorie des Kapitals* (1889; enlarged ed., 1909-12, trans. by William Smart in 1891), Prof. Boehm von Bawerk contends that interest arises from the undervaluation of future goods, to which class all instruments of production belong. This undervaluation is due to (1) inferior provision for present wants; (2) the technical superiority of present goods; and (3) men's incapacity to make full allowance for future needs. This theory, in somewhat modified form, has found wide acceptance among American economists. Boehm von Bawerk also wrote *Zum Abschluss des Marxschen Systems* (1896), trans. by Alice M. MacDonald under

the title *Karl Marx and the Close of his System* (1898), and *Einige strittige Fragen der Kapitalstheorie* (Vienna, 1900).

BOECKELMANN, bö'kel-män, BERNARDUS (1838-). A Dutch pianist. He was born in Utrecht, June 9, 1838, and received his first musical education from his father. From 1857 to 1860 he was a pupil of the Leipzig Conservatory, where he studied under Richter, Hauptmann, and Moscheles. In 1862 he became a teacher in Stern's Conservatory in Berlin, but at the same time he continued his studies under Bulow, Kiel, and Weitzmann. In 1864 he made a tour of Mexico and also visited the United States. He settled permanently in New York in 1866 and soon was recognized as one of the foremost teachers of America. His analytical edition of selected fugues from Bach's Well-Tempered Clavichord attracted considerable attention. In order to make the structure and development of these fugues clear to amateurs he printed the themes, counterthemes, etc., in different colors. His Trio Club, which he directed from 1867 to 1884, was an important factor in the musical life of New York, and greatly aided and advanced the appreciation of chamber music.

BOËLLMANN, bö'el'män', LÉON (1862-97). French organist and composer. He was born at Ensisheim (Alsace), Sept. 25, 1862. He was educated at Niedermeyer's Music School in Paris, and after graduation he continued his studies as a private pupil of E. Gigout. In a very short time he won a reputation as one of the foremost organists, and from 1880 to his early death, Oct. 11, 1897, he presided at the magnificent organ of St. Vincent de Paul in Paris. His compositions, which show remarkable talent, are a Symphony in F, Symphonic Variations for 'cello and orchestra, a piano quartet, a piano trio, a sonata for 'cello, *Suite Gothique* for organ, *Fantassie dialoguée* for organ and orchestra, *Rhapsodie carnavalesque* for piano (four hands), and a collection of 100 organ pieces published under the title *Heures mystiques*. Consult P. Locard, *Léon Boëllmann* (Paris, 1901); Locard, *Biographie de Léon Boëllmann* (Strassburg, 1903).

BOËO. See CAPE BOËO.

BCEOTARCH, BCEOTARCHES. See BCEOTIA.

BCEOTIA (Gk. *Bœotia*, *Boiōtia*). In ancient geography, next to Attica, the most important political division of central Greece, bounded on the north by Locris and the Eubœan Gulf, on the east by the narrow strait of the Euripus, on the south by Attica, Megaris, and the Corinthian Gulf, and on the west by Phocis. Bœotia had a surface estimated at 1000 to 1100 square miles. The plains inclosed on the south by Mounts Cithæron and Parnes, on the west by Mount Helicon, on the north by the slopes of Mount Parnassus and the Opuntian Mountains, fall naturally into two divisions—the basin of Lake Copais, now called Topolias, and that of the Asopus, together with the coast district on the Corinthian Gulf. The principal stream was anciently called the Cephissus. It entered the country from Phocis at Cheronea; and in the spring, when it was swollen by innumerable torrents, converted the Copaic plain into a shallow lake. There were underground channels for the outlet of the waters that congregated in this plain, but only four were active at the time the French engineers, in 1833, began extensive drainage works to recover this valuable

region to agriculture and remove the malarial marshes. The successful draining of the bed of the lake showed that similar works had been carried out by the Minyæ of Orchomenus (q.v.) in the Mycenaean period, a large dike ran along the north shore, collecting the waters of the Cephissus and the Melas, and emptying them through a great natural subterranean passage. Another dike kept back the waters from the south shore and brought them to the same outlet. A dike near the centre seems to have been connected with a system of irrigation. Forts secured the outlets against hostile attack. With the fall of the Mycenaean Kingdom at Orchomenus, the works seem to have been neglected, and a change in the sea level seems to have rendered the outlets useless, so that the became again flooded. An attempt to cut the old passages and open new ones was made during the reign of Alexander the Great, but there are traces of similar attempts in the time of the Romans. Boetia in antiquity was a productive region, abounding in fruits, and well fitted for pastoral pursuits, potters' clay, and iron were found there, and it was also celebrated for flute-making. The inhabitants in the legendary age were the Minyæ of Orchomenus and the Cadmeians, both Greek races and hostile to each other. Later the country was occupied by the Boeotians, an Aëolic people, who were more numerous than the Thespians. The Boeotians were hostile to the Athenians. From 457 to 447 all Boetia, except Thebes, was subject to Athens, the country regained its freedom, however, by the battle of Plataea (q.v.). In the Peloponnesian War the Boeotians sided with Sparta. In 424 they defeated the Athenians decisively at Delium. The Boeotians excelled as cultivators of the soil and were gallant soldiers, both on foot and on horseback, but they were rude and unsocial, and took little part in the gradual refinement of manners and intellectual development of the rest of Greece, so that their name became proverbial for illiterate dullness. This was usually ascribed to their thick damp atmosphere. Yet there were not wanting among them eminent generals, as Epaminondas and Pelopidas, and poets and historians, as Hesiod, Pindar, Corinna, and Plutarch. The greater cities, of which the number was about 14, Thebes, Haliartus, Thespia, etc., with their territories, formed the Boeotian League. At the head of this were seven Boeotarchs, who held office for one year, commanded the army of the league and conducted its diplomacy, though the final decision in matters of policy seems to have rested with the four councils, concerning whose composition we are not informed. The internal history of Boetia is largely concerned with the efforts of Thebes to maintain her leadership through this league against the efforts of Thespia, Orchomenus, and other cities for autonomy. The power of Thebes and the league was at its height in the years succeeding the battle of Leuctra, 371 B.C., when Epaminondas (q.v.) placed Thebes at the head of Greece. After the battle of Chæronea, in which Philip established the Macedonian throne on the ruins of Grecian liberty, the political importance of Boetia declined so rapidly that about 30 B.C. only two cities, Tanagra and Thespia, had any prominence. Boetia now forms one of the nomes of the Kingdom of Greece. The capital is Livadia. Its area is about 1550 square miles, and

its population in 1907 was 65,816. Consult W. M. Leake, *Travels in Northern Greece* (London, 1835); W. Rhys Roberts, *The Ancient Boeotians* (Cambridge, 1895), for the works in Lake Copais; E. Curtius, *Die Deichbauten der Minyer* (Berlin, 1892), and for topography, Ulrichs, *Reisen und Forschungen in Griechenland* (Bremen, 1840); Bonne, "The Boeotian Federal Constitution," in *Classical Philology*, vol. v (Chicago, 1910).

BOER, böm (Dutch *boer*, farmer, Ger. *Bauer*, peasant, Eng. *boor*, husbandman, rustic). The name given to the Dutch inhabitants of South Africa who are descended from the original settlers of Cape Colony. Separated for centuries from the rest of the world, these people, in their rude pioneer life, preserved their belief in the stern tenets of early Calvinism, a belief which colored their whole life. When, in 1814, Cape Colony was ceded by Holland to England, the English administrators failed entirely to understand the people with whom they had to deal, and they increased the hostility which the Dutch naturally felt for the English by their drastic legislation against practices which were a part of the religion as well as the life of these simple people, possessing many of the faults as well as many of the virtues of a primitive state of society. As a result, there was a series of *treks* or emigrations, by which the more determined Boers sought to free themselves from British control. The first considerable movement of this kind was the "great trek" of 1836. The Boers at first attempted to establish themselves in Natal, but they came into collision with the native Kaffirs, who were under British protection, and when Natal became an English colony they removed beyond the Drakenberg Mountains, taking possession of an extensive region on both sides of the Vaal, the principal affluent of the Orange River. Here they founded two states, the Transvaal or South African Republic, in the north, and the Orange Free State in the south. The Boers believed in their right to enslave the natives, and the abolition of slavery under English rule was one of the grievances that led to the *trek*. This attitude of the Boers won them the hatred of the native peoples. The Sand River Convention of 1852 between commissioners for the Cape government and for the Boers gave autonomy to the Transvaal, with a reservation against the practice of slavery. The convention of Bloemfontein two years later brought the Orange Free State into being. The Boers continued to be, for the most part, farmers clinging with the utmost conservatism to their antiquated religious ideas and their primitive mode of life. Their tenacity of purpose and stubborn independence in opposition to the British power in South Africa, although it won respect for the rugged virtues of their character, brought into being a constant state of friction between Boer and British settlers which resulted in the absorption of all South Africa in the British Empire. For the later and more detailed history of the Boers, see **UNION OF SOUTH AFRICA**. Consult also Theal, *History of the Boers in South Africa* (London, 1888); David Livingstone, *The Transvaal Boers* (Edinburgh, 1881); F. W. Chesson, *The Dutch Boers and Slavery in the Transvaal* (London, 1869); Lucas, *The History of South Africa to the Jameson Raid* (Oxford, 1899); Cana, *South Africa from the Great Trek to the Union* (1909).

BOERHAAVE, böör'hä've, HERMANN (1668-

1738). A Dutch physician, born at Voorhout, near Leyden. In 1682 he went to Leyden to become a clergyman, and studied Greek, Latin, Hebrew, Chaldee, ecclesiastical and secular history, and mathematics. In 1689 he was made doctor of philosophy and in 1690 began the study of medicine. Though mainly self-educated in medicine—as in chemistry and botany—he gained his doctor's degree at Harderwyck, 1693, and returned to Leyden, where, in 1701, he was appointed lecturer on the theory of medicine. In his inaugural lecture he recommended to the students the ancient method of Hippocrates in medicine; but in 1703 his views had widened, and he elaborated various mechanical and chemical hypotheses to explain the diseases of the body, especially in the case of the fluids. In 1709 he was elected professor of medicine and botany in the place of Hottot. About this time he published the two works on which his great fame chiefly rests: *Institutiones Medicæ in Usus Annuæ Exercitationis Domesticæ* (1708), and *Aphorismi de Cognoscendis et Curandis Morbis, in Usum Doctrinæ Medicæ* (1709) which were translated into various European languages and into Arabic. In the first work—a model of comprehensive and methodical learning—he gives a complete outline of his system, including a history of the art of medicine, an account of the preliminary knowledge necessary to a physician, and a description of the parts and functions of the body, the signs of health and disease, etc.; in the second he gives a classification of diseases, with their causes, modes of treatment, etc. Boerhaave also rendered important services to botany. Among his best lectures are those delivered on his resignation of the office of rector of the university, *De Comparando Certo in Physicis* (Leyden, 1714), and *De Honore Medici, Scrivite* (1736). To combine practice with theory, he caused a hospital to be opened, where he gave clinical instruction to his pupils. Though so industrious in his own profession, he undertook, in 1718, after Lemort's death, the professorship of chemistry and published in 1724 his *Elementa Chemicæ*, a work which did much to render this science clear and intelligible, and one that will always occupy a high place in the history of chemistry. His fame had meanwhile rapidly increased. Patients from all parts of Europe came to consult him. Peter the Great of Russia visited him; and it is even said that a Chinese mandarin sent him a letter, addressed "Boerhaave, celebrated physician, Europe." Consult Burton, *Account of the Life and Writings of Boerhaave* (London, 1743), and Johnson, *Life of Boerhaave* (London, 1834).

ROESWILLWALD, bës'vil-vält, EMILE (1815-96). A French architect, born in Strassburg. He felt very early the reaction in favor of a return to the old French architecture and joined Viollet-le-Duc and Lassus in their endeavor to restore the mediæval styles. So strong was the prejudice against anything Gothic that his drawings were refused at the Salon of 1840, but his talent was too evident to be long ignored. Three years afterward he became one of the commission for the care of historic monuments, and as inspector general of the commission was in charge of the excavations in Algeria and Tunis. His principal works are the restoration of the cathedral of Lugon and, with Duban and Lassus, the restoration of the Sainte Chapelle at Paris. He was, in company with Viollet-le-Duc

and Lassus, one of the inspectors of Notre Dame. Among his designs are those for a number of churches and public buildings in France and Spain. He was preëminently a scholar and archeologist, and received honors from various French and foreign societies.

BOËTHIUS, bô-ë'thi-üs, or **BOËTIUS**, bô-ë'shi-üs. See BOSCE.

BOËTHIUS, or (more correctly) **BOËTIUS**, ANICIUS MANLIUS TORQUATUS SEVERINUS (480-524). A Roman statesman and philosopher. The family to which he belonged had been distinguished for both wealth and dignity for two centuries. His father, who held the office of consul, died when Anicius was still a boy, and consequently the latter was brought up under the care of Symmachus (q.v.), whose daughter, Rusticana, became his wife. It is known that he studied philosophy, mathematics, and poetry, translated and elucidated with laborious care the writings of Aristotle, and of the old mathematicians, Euclid, Archimedes, Ptolemy, and others; but the story of his 18 years' stay in Athens is entirely unhistorical. Boëthius soon attracted notice; he became a patrician before the usual age, a consul in 510, and also *princeps senatus*. Having, moreover, gained the esteem and the confidence of Theodoric (q.v.), King of the Ostrogoths, who had fixed the seat of his government at Rome in the year 500, he was appointed by that monarch *magistor officiorum* in his court. His influence was invariably exercised for the good of Italy, and his countrymen owed it to him that the Gothic rule was so little oppressive. His good fortune culminated in the prosperity of his two sons, who were made consuls in 522. But his bold uprightness of conduct, springing from what seem to have been the essential characteristics of the man—viz., strong faith in the truth of his philosophic ethics, and courage to regulate his official conduct by them—at last brought down upon his head the unscrupulous vengeance of those whom he had checked in their oppressions and provoked by his virtues. He was accused of treasonable designs against Theodoric; and the King, having become despondent and distrustful in his old age, was induced to listen to the charges. Boëthius was stripped of his dignities, his property was confiscated, and, after imprisonment at Pavia, he was executed about 524, according to one account under circumstances of horrible cruelty. During his imprisonment Boëthius wrote his famous *De Consolatione Philosophiæ*, divided into five books, and composed in the form of a dialogue, partly in prose, partly in verse, in which Boëthius himself holds a conversation with Philosophy, who shows him the mutability of all earthly fortune and the insecurity of everything save virtue. The *Consolatio* is piously theistic in its language, but affords no indication that Boëthius was a Christian; and if the doctrinal treatises ascribed to him are, as the acutest criticism maintains, not genuine, we must class him in religion rather with Marcus Aurelius than with his alleged friend St. Benedict. He was the last Roman writer of any mark who understood the Greek language and literature. He translated into Latin parts of Aristotle's writings and wrote commentaries on some of them; from these works the Middle Ages largely derived their knowledge of Aristotle. During the Middle Ages he was regarded with profound reverence, as the

Augustine of philosophy, but on the introduction of the Aristotelian metaphysics in the thirteenth century his reputation gradually sank. The first edition of Boethius' entire works appeared at Venice, 1491-92, the standard edition of the entire works is to be found in Migne, *Patrologia Latina*, vols. lxxii-lxiv (Paris, 1860). The oldest edition of the *Consolatio* is that published at Nuremberg, 1473, but many manuscript translations into various languages had appeared long before the invention of printing. Among these may be mentioned that by King Alfred into Anglo-Saxon and by Chaucer and Queen Elizabeth into English. The best edition is by Peiper, Leipzig (Teubner), 1873, a new translation was published by James (London, 1897). Consult also Stewart, *Boethius An Essay* (Edinburgh, 1891). The most interesting question in connection with Boethius' mathematical works relates to his knowledge of Hindu numerals, characters evidently derived from them appearing on the apices of small cones used on the abacus. A discussion of this question may be found in Cantor's *Geschichte der Mathematik*. Consult also A. Hildebrand, *Boetius und seine Stellung zum Christenthum* (Regensburg, 1885), Teuffel, *Geschichte der römischen Literatur*, vol. 3, sec. 478 (6th ed., Leipzig, 1913).

BOETHIUS, bō-ē-thūs (Gk. Βοέθιος). A native of Chalcedon, a worker in silver and a sculptor. According to Pliny (*N. H.* xiv, 84), he was better in working in silver than in sculpture, and was especially successful in portraying children. Pausanias (*v.* 17, 4) speaks of a seated gilded (bronze?) statue of a boy at Olympia, and Pliny (*loc. cit.*) mentions a boy struggling with a goose. It is probable that the boy and the goose, which exist in several copies (*John Bell Stud.*, vi, p. 7), is a work of Boethius, and that these various replicas go back to the original cited by Pliny. His date has been recently settled by a discovery in Rhodes (*Jahrb. d. Inst.*, 1904, p. 212) as being in the first half of the second century B.C.

BOETIUS, See BOECE, BOETIUS.

BOETTI, bō-ē-tē, GIOVANNI BATTISTA (1743-98). An Italian adventurer whose place of birth is unknown. After a series of remarkable adventures Boetti, under the title of an emissary of Mohammed, put himself at the head of a small army and within a year subdued Kurdistan. He afterward engaged in war with the Russians, by whom he was finally taken prisoner. He died in captivity on the island of Solovelsk, in the White Sea.

BOETTICHER, bō-tīk-ēr, P. A. DE LAGARDE. See LAGARDE.

BOEUF BAYOU, bōf bā-yō. An overflow stream in Arkansas and Louisiana, fed in time of inundation by the Mississippi. It unites with the Ouachita or Washita River and at high water affords 100 miles of steamboat navigation.

BOEYER, ADOLPH VON. See VON BOEYER, ADOLPH.

BOG (Gael. *bogán*, quagmire, *fi* and Gael. *bog*, soft, moist). Wet land covered with moss and often underlain by it to a variable depth. Owing to the spongy character of the material, bogs are often saturated with water and converted into a kind of quagmire. The term "peat bog" is especially applied to those swamps or bogs which are underlain by an accumulation of peat, a vegetable gathering caused by the growth and decay of sphagnum, rushes, and various aquatic plants. Peat bogs are especially abundant in

the north temperate regions, much of Ireland and portions of England, as well as northern Germany, Nova Scotia, and Canada being covered by them. Various archaeological objects and the bones of many extinct animals like the mastodon and mammoth are found in such bogs, since any organic material decays very slowly in these surroundings.

Bogs often originate by a process of lake filling, ponds or even estuaries being partly filled by the inwash of sediment and partly by the spread of bog mosses from the shore into the ever-shallowing water. As soon as one layer of bog moss decays another growth springs up. The term "climbing bogs" is applied to those formed on hillsides, the supply of moisture being kept up by mountain springs. In many regions the peat is dug and utilized for fuel. When properly treated, bogs also yield arable land of much value. The reclamation of bogs for farming purposes involves the proper drainage of the area, and the plowing up of the soil in order to aerate it and bring about the necessary oxidation processes. In some cases clay is plowed in, although this requires time and expense. Oats are usually the best first crops. Once reclaimed, the soil is exceptionally fertile, containing an inexhaustible supply of humus, and is specially adapted for the growth of vegetables like celery, onions, and the various root crops.

The bog oak is a tree favoring peat bogs, the wood of the tree is black and dense and is used for carvings. The word "bog" is of Irish origin, being from a Gaelic root that signifies "a hobbling, quaking notion." See BENT GRASS, WASTE LANDS, PEAT, SPHAGNUM.

BOGAARD, MARTIN VAN DEN. See DESJARDINS, MARTIN VAN DEN BOGAARD.

BOGAERS, bō-gā-ers, ADRIAAN (1795-1870). A Dutch poet, born at The Hague and educated in law at Leyden. He practiced law in Haarlem and was on the bench at Rotterdam from 1830 to 1851. He began his literary career in 1832 with the poem *Volharder* in which he encouraged his fellow-countrymen to war with Belgium. His best-known works are his poems *De Tocht van Heemskerk naar Gibraltar* ('The Voyage of Heemskerk to Gibraltar,' 1860) and *Jorkebed* (1861). There were published two posthumous volumes of his, entitled, respectively, *Taalkundigeopstellen* (Philological Papers, 1872) and *Wooftenboek op de dichtreken van Bilderdijk* ('Lexicon of Bilderdijk's Poetical Works,' 1878). His collected poems have been edited by N. Beets (2 vols., Haarlem, 1871). Consult his biography by J. G. Gleichmann (Amsterdam, 1875).

BOGAN, or NEW-YEAR RIVER. The Allan Water of Oxley, an interior stream of east Australia, joins the Darling after a generally northwesterly course of more than 300 miles about lat. 30° S and long. 146° E. Its source is in the Harvey Range, about lat. 33° S and long. 148° 30' E.

BOGAR'DUS, ANNEKE. See JANS, ANNEKE.

BOGARDUS, EYERARDUS (1-1647). A minister of the early Dutch Reformed church in New Amsterdam, the second minister in the colony. In 1638 he married Anneke Jans, a widow, who owned 60 acres of land in what is now an important business part of New York. The farm subsequently came into possession of Trinity Church and up to 1847 was the occasion of many lawsuits for recovery by the descend-

ants of one of the heirs of Anneke Jans and Bogardus. In 1647 Bogardus sailed for Holland to answer certain charges made by his ecclesiastical superiors, but lost his life by shipwreck in Bristol Channel. See JANS, ANNEKE.

BOGARDUS, JAMES (1800-74). An American inventor. He was born in Catskill, N. Y., and became a watchmaker and engraver. His inventions include the eight-day, three-wheeled chronometer clock, and other improvements in timepieces; the ring flyer for spinning cotton; the eccentric mill, in which both stones run the same way, but with different speed; an engraving machine; a transfer machine for producing bank-note plates from separate dies; the first dry gas meter; the first pencil case without a slot; a medallion engraving machine, a machine for engine turning, an improved method for making postage stamps, etc.; a machine for pressing glass; several machines for cutting and working india-rubber; a new pyrometer; a dynamometer; and other contrivances of less importance. In 1847 he erected in New York for his factory a cast-iron building, the first one of that material ever erected. Soon afterward he introduced wrought-iron beams.

BOGART, b'g'art, JOHN (1836-). An American municipal engineer, born at Albany, N. Y. After graduating from Rutgers College he worked in the engineering corps of the New York Central Railroad, on the State canals of New York, and as United States engineer at Fort Monroe, Va., during the Civil War. He served for some time as chief engineer of the Brooklyn park commission and after 1877 engaged in a multitude of engineering operations, both public and private. His services were especially sought for municipal works at Albany, New Orleans, Chicago, Baltimore, Rochester, and New York. In the latter city he was chief engineer of the public parks and also constructing engineer of Washington Bridge. Besides his work on the harbors of Venezuela he served as hydraulic and electrical engineer for the development of power at Niagara Falls, and at many points along the St. Lawrence River, in British Columbia, and in the Southern States. He represented the United States government at the International Congress of Navigation at Dusseldorf, Germany, in 1902; at Milan, Italy, in 1905, and at St. Petersburg in 1908.

BOG ASPHODEL. See ASPHODEL.

BOG BUMPER, BOG JUMPER, or BOG PUMPER. Names for the bittern.

BOG BUTTER. An organic compound which has been found in the bogs of Ireland and is known mineralogically as *Butyrolite*. Its properties and chemical composition led to the supposition that it was of vegetable origin and had been formed by the decomposition of the peat in which it was found, especially so in consequence of its general resemblance to mineral resins, such as asphalt and bitumen. However, a thorough examination by McAdam in 1885 seemed to demonstrate its animal origin, as all of the samples analyzed showed the presence of hairs that were microscopically identical with those of a cow. It is probably safe to say that it is a variety of adipocere—i.e., that it was formed by the decomposition of animal matter out of contact with the air. (See ADIPOCERE.) It resembles butter in color and consistency and becomes liquid at 51° C. (123.8° F.).

BOGDANOVITCH, b'g'dā-n'v'ch, I'POLIT

FEODOROVITCH (1744-1802). A Russian poet, born at Perevolotchna, Little Russia. His fame rests entirely upon his poem *Dushenka* ('Dear Little Soul') published in 1773. Apuleius' story of Psyche, borrowed from Lafontaine's version in *Les amours de Psyche*, forms the groundwork of the poem, which is characterized by a refined and graceful style and vivacious playfulness of language. Its publication in 1783 made him famous as well as obtained for him the high favor of the court; but there can be no doubt that the popularity of the work was due as much to the adventitious circumstances in which it was produced—nothing of the kind having been previously attempted in Russia—as to its intrinsic merits. Though he wrote much afterward, he never equaled his earlier works. Indeed later criticism did not sustain the contemporary enthusiastic estimates made of this writer.

BO'GERMAN, JAN (1576-1637). A Dutch theologian, born at Oplowert, East Friesland. He actively participated in the Armenian controversy, was in 1618 president of the Synod of Dort, and in 1633 became professor of divinity at the University of Franeker. In addition to his translation of *De la punition des hérétiques* of Beza as *Van het ketter straffen* (1601), he published the polemical *Annotationes contra H. Grotium*. He prepared, in collaboration with four others, a vernacular translation of the Bible. This rendering, of which the Old Testament was for the most part by him, continues to be the common Dutch version.

BO'GERT, GEORGE H. (1864-). An American landscape painter. He was born in New York City and studied at the National Academy of Design, and afterward under Puvis de Chavannes, Aimé Morot, and Raphaël Collin in Paris. His talent is exceedingly versatile, and this has prevented his forming a pronounced style. His views of foreign cities and marines are especially popular. He has won a number of important prizes and medals and is an associate of the National Academy of Design. He is well represented by several landscapes in the Hearn Collection, Metropolitan Museum, New York City.

BOGERT, MARSTON TAYLOR (1868-). An American chemist, born at Flushing, N. Y. He graduated from Columbia College in 1890, and after four years of specialization became a member of the faculty of his Alma Mater. At first an assistant in organic chemistry, within 10 years he had reached a full professorship and finally became head of the department. Of the American Chemical Society he was president in 1907-09, and of the Chemists' Club a founder and, in 1912-13, president. He was chosen to membership in numerous other learned societies, foreign as well as American. By invitation of President Roosevelt he became a member of two important conferences on the conservation of national resources, held in Washington in 1908; and he addressed each of the four sections on land, water, forest, and minerals. He is author of more than 50 scientific papers and of numerous reviews and popular articles. Clark University conferred upon him the degree LL.D. in 1909.

BOGGS, CHARLES STUART (1811-88). An American naval officer, born in New Brunswick, N. J. He entered the United States navy as a midshipman in 1826, became a lieutenant in 1837, served in Commodore Conner's squadron

during the Mexican War, distinguished himself under Farragut at New Orleans, in April, 1862, and the same year was raised to the rank of captain. In 1870 he became a rear admiral, and three years later was retired.

BOGGS, FRANK MYERS (1855-) An American landscape and marine painter. He was born in Springfield, Ohio, and studied at the Ecole des Beaux-Arts in Paris, principally under Gérôme. In 1885 he was awarded a prize of \$2500 at a competition in New York City for his "Rough Day at Honfleur," purchased by the Boston Museum of Fine Arts. After 1881 he resided in Paris, but retained a studio in New York, which he frequently visited. Mr. Boggs is represented in the Luxembourg Museum by "La Place de la Bastille" (1882), in the Museum of Niort by "Isigny," and in several other provincial museums and private collections of France. He belongs rather to the French than to the American school.

BOGH, BËG, ERIK (1822-99) A Danish writer. He was born in Copenhagen, was schoolmaster, actor, playwright, theatre director, and journalist. He first won a considerable reputation with his comedies and farces, exceeding 100 in number, and published collectively as *Dramatiske Arbejder* (7 vols., 1858-71). He also published a volume of *Digte* (1855) and several prose works, including *Huldsbakken* (1852), *Kalisen paa Bøvnstyr* (1857), *Hundredde Viser* (1862), and *Mester Oles Prædiken* (1877). His style is in general characterized by finish rather than originality. Consult his autobiographical works, *Erindringer fra mine unge Dage* (1894) and *Min første Forfatterliv* (1897).

BOGHAZ-KIEUL, or KEUI', bô gâz' kâ'ê, or KOI' A village of Asia Minor in the vilayet of Angora, about 17 miles from the town of Yozgad, in lat 40° 1' N and long 34° 35' E. The modern village is insignificant, but the heights near by contain many ancient ruins and a number of remarkable sculptures. The place was an important seat of Illytic civilization, and fragments of pottery seem to show intercourse with the Mycenaean lands. For a description of the remains and drawings of the sculptures, consult Van Lennep, *Travels in Asia Minor* (London, 1870), and for the recent excavations, E. Chantre, *Mission en Cappadoce* (Paris, 1898), whose statements as to a Babylonian colony must be received with caution. Consult also Hall, *Oldest Civilization of Greece* (London and New York, 1901). The remains mentioned above are commonly regarded as those of the town of Pteria (q.v.), but the identification is not yet completely proven. Consult Puchstein, *Boghazkoï, die Bauwerke* (Leipzig, 1912).

BOG HEAD MINERAL See TORBANTITE.

BOG-IRON ORE A name applied to deposits of limonite (hydrous ferric oxide) that are often found in alluvial soils, bogs, meadows, lakes, etc. It is abundant in some of the northern and western islands of Scotland and in the northern countries of Europe generally, also in North America. Sometimes the ore accumulates with great rapidity, thus, in some Swedish lakes a layer half a meter (20 inches) thick accumulates every 15 to 30 years. Its constituent iron is dissolved out from the rocks by spring water, from which it is precipitated in an insoluble form when exposed to the air. The amount of iron oxide in the ore commonly

ranges from 40 to 50 per cent, phosphoric acid is usually present in quantities varying from 2 to 11 per cent, silica, alumina, oxide of manganese, and other substances make up the rest. The color of the ore is brown—either yellowish brown or blackish brown. Some varieties are earthy and friable and are formed of dull, dusty particles, others are in masses with an earthy fracture, often vesicular, still others are more compact and have a conchoidal fracture. The ore is often mixed with so much clay and sand that these have to be separated by washing before the ore can be used. Owing to the low percentage of iron, the commercial value of bog-iron ore is rarely very high, although the quality of the iron yielded is good. This type of ore is worked in Quebec, but not in the United States. See IRON, LIMONITE.

BOGISH, bô'gâ-shih, BALTHASAR (1840-1908) A Slavic jurist. He was born in Ragusa-Vecchia (Dalmatia) and studied in Vienna, Berlin, and Paris. In 1869 he was appointed professor of the history of Slavic law at Odessa and was then charged with the task of elaborating a code of civil laws for Montenegro. In 1893-99 he was Minister of Justice in Montenegro. He published several important studies, such as *Compilation of Legal Usages among the Southern Slavs* (1874) and *Aperçu des travaux sur le droit coutumier en Russie* (1879).

BOGLIPOOR See BHAGALPUR.

BOG MOSS See SPHAGNUM.

BOGNOR, bôg'nêr A popular seaside resort in Sussex, England, on the English Channel, 5½ miles southeast of Chichester (Map England, F 6). It has a fine pier and esplanade. Pop., 1891, 4600; 1901, 6200; 1911, 8142.

BO'GO A seaport town of Cebu, Philippines, situated 56 miles north of Cebu. It has an excellent harbor and is connected by canal with the opposite shore of the island. Pop., 1903, 14,915.

BOGODUKHOV, bô'gô-dû'kôf, or BOHO-DUKHOV A fortified town of Russia, capital of a district in the government of Kharkov, 40 miles northwest of the city of that name (Map Russia, E 4). A town of some commercial significance until 1820, it has now lost all of its importance owing to new railways which have transferred its trade to other towns. The manufacture of leather, flax, and fur goods are the leading industries. Pop., 1897, 12,000.

BOG'OMILES. A religious sect which came into notice in the twelfth century, whose chief seat was in Bulgaria. They spread especially among the Slavic races. Their name, if derived from the Slav *Bog*, 'God,' and *miluy*, 'have mercy,' may perhaps refer to the frequency of their prayers, but more likely it comes from Bogomil, the name of their founder. The basis of their creed was as follows: God's first-born son was Satanael, at first good, he afterward rebelled and created in opposition to the original spiritual universe a world of matter and human beings. These human beings, however, received from the Supreme Father a life spirit, but this was kept in slavery by Satanael until a second son of God, the Logos or Christ, came down from heaven, and, assuming a phantom body, broke the power of the evil spirit, who was henceforth called only Satan, the divine name, *El*, being dropped. The Bogomiles, like all similar sects, practiced a severe asceticism, despised images, and rejected the sacraments. Instead of baptism they placed their hands and the

Gospel of St. John on the head of the neophyte, singing at the same time the Lord's Prayer, which they repeated seven times during the day and five times during the night. They accepted the whole of the New Testament, but of the Old Testament only the Psalms and Prophets, which they interpreted allegorically. Their morality was high, and their ideals of life seem to have been much above the average of their time. In 1118 that vehement hater of heretics, Alexius Comnenus, burned their leader Basilus. Persecution, however, did not put an end to the Bogomiles, and at the time of the Mohammedan conquest of Bosnia (fifteenth century), it is said that the greatest number of the Christians who embraced the religion of the conquerors belonged to this sect. There are some Bogomiles even at the present day. Consult Heard, *The Russian Church and Russian Dissent* (New York, 1887).

BOGORODSK, bō'gō-rōtsk'. The chief town of a district in the government of Moscow, Russia, 52 miles east-northeast of the city of Moscow, on the Klyazma, and on a branch of the Moscow and Nizhni-Novgorod Railway (Map: Russia, E 3). It carries on a prosperous trade in silk and cotton fabrics, produced in the mills of the district, and in woollens, brandies, and liquors manufactured in the town. Pop., 1888, 2470; 1897, 11,200.

BOGOS, bō'gōz. An Abyssinian tribe inhabiting the highlands north of Abyssinia, about Keren. They speak a Hamitic language called Bilin, which is akin to the Agau, though Tigré is very generally understood among them. Their name, Bogos, means 'robber.' They are slightly above the medium stature, rather robust, and in color reddish brown, betraying an admixture of negro and other blood. Primarily they belong to the Hamitic group. They are largely nomadic and pastoral. Nominally the Bogos are Christians, but the Christian religion has no very strong hold upon them. Their territory was for a long time an object of dispute between Egypt and the Abyssinian kings. It now forms a part of the Italian colony of Eritrea. Consult: Munzinger, *Ostafrikanische Studien* (Schaffhausen, 1864); Brinton, *Races and Peoples* (New York, 1890); Littman, *Bibliotheca abyssinica* (Leiden, 1904-11).

BOGOSLOV, bō'gō-slov'. A volcanic islet off the northwest coast of Unalaska in the Aleutian Islands, Alaska, U. S. A. (Map: Alaska, D 8). It was formed by a volcanic upheaval in the year 1706. It is a haunt of sea lions.

BOGOTÁ, bō'gō-tá' (under Spanish rule Santa Fé de Bogotá). The capital of Colombia and of the department of Cundinamarca, an archiepiscopal city situated on a plateau, 8675 feet above sea level, at the western base of the Guadalupe and Monserrate mountains, in the eastern Cordillera of the Andes, 4° 35' 3" north of the equator (Map: Colombia, C 8). The plateau is surrounded by high mountains on all sides, except to the west, where the river Bogotá, or Funza, cuts a narrow channel through a rocky precipice, on its way to the Magdalena, and 14 miles from the city leaps from a height of over 475 feet, forming what is called the fall of Tequendama. The climate of Bogotá is moist and moderate, the temperature varying between 57° and 61° F., with two rainy seasons each year. The city is regularly laid out, is rhomboidal in shape, and occupies an area of 6 square miles, measuring 3½ miles from north

to south and half that length from east to west. The city is divided into four parts by the San Francisco and San Agustín rivers, which are crossed by 20 bridges. The streets cross at right angles; for the most part they are narrow but well paved. Around the principal square, la Plaza de la Constitución, or de Bolívar, are the government buildings and the cathedral, a magnificent edifice in the Corinthian style. In the middle is the bronze statue of Bolívar by Pietro Tenerani. The city has two theatres. With educational institutions Bogotá is well provided, these including a national university, three endowed colleges, a national academy, a school of chemistry and mineralogy, a library of some 50,000 volumes, a national observatory, a military school, a museum of natural history and antiquities, and a botanic garden. The museum and library are situated in a former Jesuit monastery. The museum contains many interesting specimens of Inca civilization, and the library has a rich collection of plants and national literature. Bogotá is one of the principal centres of mediæval clericalism in South America, and it has many churches and convents. In some of the churches are paintings by Murillo, Spagnoletto, and Vasques. Besides the national university there are colleges and schools giving instruction to more than 10,000 children of both sexes. There are about 40 periodicals of all sorts, and the city ranks among the foremost in South America for culture and education. The city is governed by a municipal council that elects the mayor and also the police inspectors of the wards (barrios), while one of the President's secretaries is the governor of the department. There is rail connection with Facatativá (25 miles), Zipaquirá (37 miles), Soacha (7 miles), and by way of Facatativá, with Girardot on the Magdalena River. The geographical situation is unfavorable to any great commercial or industrial development. The industries include the manufacture of cloth, carpets, matches, glass, cordage, and porcelain. The district north and east of Bogotá is rich in coal, iron, limestone, sand, manganese, and fire clay. At Zipaquirá, north of Bogotá, are large salt mines, worked by the government, which supply nearly all of Colombia with salt and are a great source of revenue.

BOG SPAVIN. See SPAVIN.

BOG-TROTTER. An appellation sometimes contemptuously given to the lower class of the Irish peasantry. It owes its point to the ability acquired by many of them of traversing the extensive bogs of their native country, where a stranger would find no secure footing, and in the frequent use which they have made of this means of escape from soldiers, officers of police, or other pursuers.

BOGUE, bōg, DAVID (1750-1825). A Scottish preacher, and the organizer of the London Missionary Society. He was born at Hallydun, parish of Coldingham, Berwickshire, and was educated at Edinburgh University and in 1771 went to London, where he was for some time employed as a teacher. He afterward accepted the charge of an Independent church at Gosport, where he established a seminary for the education of students who purposed to become Independent ministers, and in 1795, he and others organized the London Missionary Society. He also took an active part in the establishment of the British and Foreign Bible Society and of the Religious Tract Society. He

was the author of *An Essay on the Divine Authority of the New Testament* (1801), which was translated into German, French, Spanish, and Italian, *Discourses on the Millennium* (1813-16), and in conjunction with Dr James Bennet, a *History of Dissenters, from 1688 to 1808* (1812). Consult Moirson, *Fathers and Founders of the London Missionary Society* (London, 1840), McLean, *Epoch Makers of Modern Missions* (Chicago, 1912).

BOGUE, LILLIAN BELL. See BELL, LILLIAN
BOGUE, VIRGIL GAY (1846-) An American engineer, born in Norfolk, N. Y. He graduated (C.E.) from the Rensselaer Polytechnic Institute, was assistant engineer of Prospect Park, Brooklyn, in 1868, and for the next decade was engaged in railway work in Peru. For 12 years he was employed by the Northern and Union Pacific companies, discovering in 1881 "Stampee Pass" across the Rocky Mountains. Establishing himself as a consulting engineer in New York City, he added to his other duties after 1905 those of chief engineer and vice president of the Western Pacific Railroad. His services were sought in improving the navigation of the Columbia River, in making plans for the harbor of Tacoma, Wash., and in projecting a new railway across South Island, New Zealand.

BOGUE FORTS See BOCA TIGRIS
BOGUSLAV, bö'gu-slav' A town of the government of Kiev, Russia, situated on the river Rossoa, about 100 miles from the city of Kiev. It has trade in woollens, leather, and sheepskins. The town was annexed to Russia in 1793.

BOGUSLAWSKI, bö'gu-slaw'ski, ADALBERT (1750-1820) A Polish actor and playwright, born in Ghino. In 1790 he was appointed director of the Royal Theatre in Warsaw, where he established a school of dramatic instruction. He is to be regarded as the real founder of a Polish national drama, to whose repertory he contributed a large number of translations and original works. He also introduced opera into Poland. A complete edition of his dramas, in 9 vols., appeared in Warsaw in 1820-25.

BOHADDIN, bö'ha-dén', or **BAHA-AL-DIN** (ABU'L MAHASIN YUSUF IBN RAPT IBN SHADDAN) (1145-1234) An Arabian historian and statesman. He was born in Mosul, and after concluding his studies there settled first as a tutor in the Nizamiya at Bagdad, but in 1173 he returned to his native place and became professor at the high school of Mosul. In 1187 he went on a pilgrimage to Mecca and Medina and later to Jerusalem and Damascus. By a work on the *Laus and Discipline of Sacred War* he attracted the attention of Saladin, and until the death of that prince he was in his employ as cadí of Jerusalem and of the army. After the death of Saladin he remained in the service of Saladin's successors, Malik al Zahir and Malik al Aziz, as cadí of Aleppo, where with his own means he established two schools. His most important work was a *Life of Saladin*, which was published with a Latin translation by Schultens (Leyden, 1732). Consult C. R. Conder, *The Life of Saladin by Beha ad Din*, compared with the original Arabic and annotated with a preface by Ch. Wilson (London, 1897). There are manuscripts of *A History of Aleppo, The Foundations of Jurisprudence, and Lectures on the Hadith* (or Tradition) by Baha-al-din. Consult, also, Brockelmann, *Geschichte der arabischen Literatur*, vol. 1, pp. 316 f (1898).

BOHEMIA (ML from Lat *Boiohamum*, from Boii, a Celtic tribe + OHG, *heim*, Old Sax *hēm*, home, called by its Slavic inhabitants, the Czechs, Cechy) A former kingdom of Europe and now a crownland of the Cisletian (Austrian) half of the Austro-Hungarian Monarchy (Map Austria, D 2). It occupies the northwestern end of Austria and is bounded by Saxony on the northwest, Prussian Silesia on the northeast, Moravia and Lower Austria on the southeast, Upper Austria on the south, and Bavaria on the southwest. Extending from lat 48° 34' to 51° 3' N and from long 12° 7' to 16° 50' E, it comprises an area of 20,064 square miles, peopled by 6,769,548 inhabitants, according to the census of 1910.

Bohemia is separated from Germany by mountain barriers, which cover all the three sides on which it touches that Empire. The Bohemian Forest forms the boundary line on the southwest, the Erzgebirge, or Ore Mountains, on the northwest, and the Riesengebirge, or Giant Mountains, on the northeast. These mountain ranges, together with the Bohemian-Moravian highlands, in the southeast, form a great basin, in the shape of a lozenge. In the interior are some minor elevations. The rivers of Bohemia, with a few exceptions, flow from south to north. The Elbe, which rises on the northeastern frontier, with its numerous tributaries, drains the larger part of the area. After the Elbe, the chief rivers of Bohemia are the Moldau and the Eger, both tributaries of the Elbe. In the northwestern part of the country are famous mineral springs, including those of Karlsbad, Marienbad, Franzensbad, and Teplitz.

The climate of Bohemia is continental in its character. The average annual temperature of Prague, in the centre of the region, is 48.6°. The maximum reached at Prague, for a period of 30 years, is 97.5° F., and the minimum is 13.24° F. The climate is healthy throughout, mild in the valleys and cold in the mountains, the higher peaks being covered with snow during a considerable part of the year. The country is peopled mainly by Czechs or Bohemians who are Slavs. About two-fifths of the population consists of Germans. Keen rivalry exists between these elements.

Bohemia is still an agricultural country, although some of its manufactures have attained a very high degree of development. The soil is generally fertile, especially in the districts along the upper Elbe, in the vicinity of Königgrätz, in the valley of the Elger, in the lands called the "Paradise," near Teplitz, and in a tract in the midland mountains. Of the total area, 5,104,810 hectares, 2,623,105 hectares in 1910 were in arable land, 60,363 garden, 778,874 meadow and pasture, 1,507,327 forest, and 38,705 lake, swamp, etc. Of the arable land in 1910 rye was planted to 560,560 hectares; wheat, 234,152; barley, 300,593; oats, 407,997; pulse, 40,011; potatoes, 295,772; sugar beets, 143,878; hops, 14,715. A great part of the land is divided into small holdings. In 60 per cent of it are about 600,000 holdings, half of which embraces less than half a hectare each. The remainder is divided into about 1800 holdings. Cattle raising forms an important adjunct to agriculture. Horned cattle, goats, and swine are reared extensively in some districts, and in the south geese form an important item in the resources of the country. At the end of 1910 there were 250,000 horses, 2,201,000 horned

cattle, and 1,013,000 sheep. Silk culture and bee keeping receive considerable attention.

The forests of Bohemia, in which various kinds of game are found, are very extensive, and the lumber industry gives occupation to a considerable part of the population. Next to agriculture, mining occupies the first rank. In regard to its mineral deposits, Bohemia stands first among the crownlands of Austria, the annual value of its mineral products exceeding \$35,000,000. The value in kronen in 1909 was 166,908,595, of which the value of lignite was 104,524,589, coal 46,715,917, iron ore 10,784,178, silver ore 3,385,723, and gold ore 593,980. Bohemia is famous for its manufactures of glass, and its textile industries are on a vast scale. The manufacturing of beet sugar is also very important, as well as the distilling of spirits. There are large iron and steel works, and the manufacture of chemicals is extensively carried on. Among other important industries are the manufacture of agricultural implements, paper making, and milling. The beer of Pilsen and the china of Karlsbad are celebrated. The tobacco factories employ about 10,000 hands, mainly women. In general Bohemia is not only the most important manufacturing crownland of Austria, but also one of the most advanced among the manufacturing countries of Europe. Most of the manufacturing is on a large scale, and the tendency towards concentration is very pronounced. There are still, however, a number of industries carried on almost exclusively in the houses of the workmen, such as lace knitting, the manufacture of toys, musical instruments, etc.

The commerce of Bohemia is naturally very extensive and is greatly facilitated by the numerous financial institutions, as well as by the excellent transportation facilities. In 1909 Bohemia had 66.52 kilometers (41.33 miles) of railway, or 29.73 per cent of the total for Austria. The chief navigable river is the Elbe, and there is also a considerable mileage of artificial waterways.

The Diet of Bohemia consists of 242 members, including the Archbishop of Prague, the heads of the three sees of Leitmeritz, Königgrätz, and Budweis, two rectors of universities, 70 representatives of the large landholders, 87 representatives of towns and chambers of commerce and industries, and 79 representatives of the rural communities. The representatives of the landed aristocracy, as well as those of the towns and industrial centres, are elected directly on a property qualification, while the delegates from the rural communities are elected by a board of electors returned by voters paying a certain amount of taxes. Bohemia is represented in the Lower House of the Austrian Reichsrat by 130 members.

Public education in Bohemia is well advanced, and the line of demarcation between the two elements of the population, Czech and German, is sharply drawn. At Prague there is a Czech university (1065 students in 1912) and a German university, founded in 1348 (4414 students). In 1912 there were 77 gymnasia and realgymnasia (18,770 students) and 46 realschulen (15,872), besides several technological institutes, middle schools, and commercial and other special schools. The public elementary schools in 1909 numbered 8153 (of which 2548 were German), with 1,129,811 pupils; private elementary schools, 228, with 22,112 pupils.

About 98 per cent of the school population is in attendance.

The population of Bohemia in 1890 was 5,843,049; in 1900, 6,318,697, and in 1910, 6,769,598, or 337 per square mile, making Bohemia one of the best-populated crownlands of Austria-Hungary. The increase for the decade 1900-10 was 7 per cent, against 8.10 per cent for the period of 1890-1900. In regard to nationality, the population is 63 per cent Czech (see division on *History*) and 37 German. The Catholic religion is professed by 96 per cent of the population, while somewhat more than 2 per cent belong to the different Protestant denominations and 1.6 per cent profess the Jewish religion. The capital city, Prague, had a population of 223,741 in 1910.

History. In the first century B.C. the Celtic people, called Boii, who had settled in Bohemia and who gave it its name, were compelled by the advance of the Germans to emigrate from the country. Bohemia was then occupied by the warlike tribe of the Marcomanni. At the time of the great migration of nations the Marcomanni moved westward, and in the sixth century we find the region peopled by Slavic immigrants, who soon appear under the common name of Czechs. By the close of the ninth century the petty chiefs who ruled the Czechs had been converted to Christianity, which in the main was introduced by the Germans, while the conversion of the adjoining Moravians was undertaken by the great missionaries of the Eastern church. For a brief period Bohemia formed part of the great Moravian realm of Svatopluk, which fell before the onslaught of the Magyars at the beginning of the tenth century. From about that time Bohemia was united under the sway of a line of dukes of the house of Přemysl, who acknowledged the overlordship of the kings of Germany. In the latter part of the tenth century the bishopric of Prague was constituted. The princes of the house of Přemysl sought to elevate themselves to the rank of kings, and from the close of the twelfth century they were permanently recognized as such by the German sovereigns, their state forming part of the Holy Roman Empire of the Germans. Under Ottokar II (1253-78) Bohemia was for a brief period one of the most powerful realms in Europe. His sway extended from the region of the Elbe to the shores of the Adriatic. Ottokar succumbed to the arms of the Emperor Rudolf of Hapsburg, and his realm was dismembered. His son, Wenceslas II (1278-1305), who succeeded him in Bohemia and Moravia, was also King of Poland. Ottokar II and Wenceslas II did much for the civilization and economic development of Bohemia by encouraging the immigration of German artisans and colonists. With the death of Wenceslas III, in 1306, the dynasty of Přemysl became extinct. From 1310 to 1347 Bohemia was ruled by a line of kings of the house of Luxembourg—John (1310-46), Charles (1346-78), Wenceslas IV (1378-1419), Sigismund (1419-37). The last three were emperors of Germany. Charles of Luxembourg, who was German Emperor as Charles IV, exerted himself in every way to promote the welfare and greatness of Bohemia. In 1348 he founded the University of Prague, the first established within the bounds of the old German Empire. The good work of Charles was to a great extent undone by the incompetence of his son, Wenceslas. His reign witnessed the great religious movement inaugu-

rated by John Huss and Jerome of Prague. This was one of the most significant anticipations of the Reformation of the sixteenth century. The Hussite Wars broke out in the year in which Wenceslas died and lasted almost to the end of the reign of his successor, Sigismund, who, in addition to being German Emperor, was King of Hungary, but up to 1434 was unable to make his power recognized in Bohemia. The Bohemians heroically repulsed the crusading forces of the Catholic church and then engaged in a bloody internecine religious strife.

The Hussite movement quickened the spirit of nationality among the Czechs and arrested the process of Germanization which had made such progress under Charles of Luxemburg. Endless internal dissensions and the extraordinary complexity of the political fabric, with its name of jurisdiction, stood, however, in the way of the election of a permanent Slavic monarchy. From 1458 to 1471 the throne of Bohemia was occupied by the shrewd and able George Podiebrad. His successor, Ladislas II, of the Polish house of Jagellon (1471-1516), was chosen to succeed Matthias Corvinus on the throne of Hungary. Louis, the son and successor of Ladislas II, was likewise King of Hungary. He lost his life in 1526 on the field of Mohács, where Sultan Solyman the Magnificent overwhelmed the Hungarians. The Estates of Bohemia now bestowed the crown upon Louis' brother-in-law, Ferdinand of Hapsburg, the brother of the Emperor Charles V. Ferdinand ruled over the old hereditary dominions of the house of Austria and simultaneously with his election in Bohemia was chosen King by a portion of the Hungarians. Thus were laid the foundations of the Slav-German-Magyar state of Austria-Hungary. The Bohemian realm, or the lands belonging to the crown of St. Wenceslas, at this time included Bohemia, Moravia, Silesia, and Lusatia. The crown of Bohemia soon became virtually hereditary in the house of Hapsburg. The Hussite movement had paved the way for the introduction of the Reformation into Bohemia. The Hapsburgs directed their energies towards the suppression of Protestantism, and in the struggle that ensued Bohemia lost alike her political freedom and her religious liberties. Ferdinand I was unable to stem the progress of the Reformation, which continued to spread rapidly under his successors. Bohemia had arrived at a high state of culture at this time. The University of Prague was one of the greatest seats of learning in Europe. The national literature of the Czechs witnessed its Golden Age in the first century after the Reformation. In 1618 the Protestants of Bohemia rose against the Hapsburgs and by the *defenestration* of Prague precipitated the struggle of the Thirty Years' War. In 1619, on the death of King Matthias, the Bohemian estates placed the crown upon the head of the Elector Palatine, Frederick V, the so-called "Winter King," (son-in-law of James I of England) who had to take up the struggle against the Catholic League of Germany, in arms for the newly elected Emperor of Germany, the bigoted Ferdinand II of Austria. The Catholic forces triumphed at Prague (battle of the White Mountain) in November, 1620. Bohemia lay prostrate at the feet of Ferdinand, who wreaked his vengeance in a merciless way, crushed out Protestantism, and turned the country over to the Jesuits.

Bohemia was a bloody battle ground in the Thirty Years' War, which ended where it had

begun, at Prague. It is estimated that the population of about 2,000,000 was reduced to 700,000, and the civilization of the country suffered a blow from which it never recovered. The people bore meekly the rule of the Hapsburgs, no considerable portion of the population being any longer estranged from them by differences of religion. After the accession of Maria Theresa Bohemia became a chief battle ground for the attacks of Frederick the Great of Prussia who succeeded in despoiling the kingdom of much of its dependent territory. Under her son the Emperor Joseph II Bohemia was deprived for a time of her National Diet. In the latter part of the eighteenth century, however, there was a vigorous reawakening of the national feeling among the Czechs, which, under the stimulus of patriotic writers, gradually developed into an active yearning for national independence. An emphatic utterance was given to this sentiment in 1848, when a Pan-Slavic Congress was convened in Prague. At this time the capital was the scene of an insurrection, which was suppressed by the guns of Windischgrätz. Since then the efforts of the Czechs to regain their autonomy have played an important part in the history of the Empire. The reorganization of Austria-Hungary on the present dualistic basis only intensified the antagonism between the Germans and the Slavs of Bohemia. The Czechs refused to enter the Vienna Reichsrat of 1867, then leaders, Palacky and Rieger, ostensibly attended the Pan-Slavic Congress at Moscow in 1868, and the demands for national autonomy grew more emphatic with each concession, made by the Taaffe and Badeni ministries, as to the establishment of a Czech university at Prague and the status of the Czech language in the courts and the administration. United as the Czechs are against the Germans on national issues, they are sharply divided within themselves on other points, the Old Czechs representing the feudal and clerical party, and the Young Czechs the radical and irreconcilable element. It is the latter that has within recent years placed itself into such violent antagonism to German pretensions in the Vienna Reichsrat. The apparent impossibility of reconciling the Czechs to the existing order of things in Austria-Hungary constitutes the chief danger that threatens the stability of the Empire. Nor does there seem to be any lessening of the tension. In 1897 a cabinet crisis was caused by the introduction by the government of a bill which made a knowledge of the Czech language compulsory for all officials. In 1910 another bitter struggle ensued which ended by a compromise, each self-governing community in Bohemia being permitted to choose whatever language it pleased. But this compromise did not last long. In fact, so serious had the situation become in 1913 that in that year the autonomy of Bohemia was suspended, the diet dissolved, and a concession of administration appointed.

BOHEMIAN BRETHREN. See BRETHREN, BOHEMIAN.

BOHEMIAN FOREST, or **BOHMERWALD**. The old Sylva Gabreta of the Romans. A mountainous region of central Europe, separating the Austrian crownland of Bohemia from the German Kingdom of Bavaria, and extending from the Fichtelgebirge on the northwest to the Danube, below Passau, on the southeast. It forms part of the watershed between the basins of the Elbe and the Danube (Map: Germany, E 4). The region is about 125 miles long and from 20 to 40 miles wide and covers an area of about 4400 square miles, of which a considerable portion in the southwest belongs to Bavaria and forms what is known as the Bavarian Forest, or *Bayrischer Wald*. The region is thickly covered with forests, which grow to an altitude of 4000 feet, and abounds in picturesque scenery. The highest summits, which are found in the Bavarian section, in the group of the Arber (Great Arber, Raschel), exceed 4700 feet. The rock formation is chiefly granite, schist, and gneiss. The rainfall is very heavy, and there is an abundance of pasture. The chief product is grain. The inhabitants of the region are chiefly Germans and Czechs.

BOHEMIAN MUSIC. See SLAVONIC MUSIC.

BOHEMUND I (Lat. *Bohemundus*) (c.1055-1111). The eldest son of Robert Guiscard, the Norman Duke of Apulia and Calabria, born some time between 1052 and 1060. He distinguished himself in the war carried on by his father against Alexius Comnenus (1081-85). Robert Guiscard died in 1085, leaving his property to his younger son, Roger, but Bohemund fought with the latter until 1089, when a peace was made by which Bohemund received a part of Apulia. When the First Crusade was preached, Bohemund saw in it an opportunity for extending his possessions. He was the ablest of all the Crusaders, and as long as he remained with them was really their leader, although not officially recognized as such. In June, 1098, when Antioch was captured, he received it as a principality and remained there, taking no further part in the expedition against Jerusalem. In August, 1100, he was captured by the Mussulmans and held a prisoner until May, 1103. During his absence his cousin, Tancred, ruled over Antioch. In 1104, after suffering a great defeat, he returned to the west to seek aid, and (1106) while in France married Constance, the daughter of Philip I. In 1107 he found himself at the head of a large army of adventurers, who had been attracted by his renown. Instead of returning to Antioch he led his forces against the Greek Empire, with which he had been at enmity since 1098. He failed, and after a year's fighting a peace was made by which Bohemund became the vassal of the Emperor for his principality of Antioch. He never returned to Syria, going instead to Apulia, where he died in 1111. Consult Hagenmeyer's *Gesta Francorum* (Heidelberg, 1890), which, in the notes, gives full reference to all facts.—**BOHEMUND II**, son of Bohemund I was a minor at the death of his father, and became Prince of Antioch only in 1126. He was killed in battle in 1130. The later rulers of this name are **BOHE-**

MUND III (1163-1199); **BOHEMUND IV** (1200-33); **BOHEMUND V** (1233-50); **BOHEMUND VI** (1251-63); **BOHEMUND VII** (1268-87), the last Prince of Antioch. Consult Röhrich, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898); Kugler, *Boemund und Tancred* (Tübingen, 1862).

BOHIO, LAKE. See MAP OF PANAMA CANAL.

BÖHLAU, ULOU, HELENE (1850-). A German novelist, born at Weimar. She traveled extensively in the East and at Constantinople married Omar al-Rashid Bey, with whom she settled in Munich. She became known in 1888 for her *Ratsmädchengeschichten*, a series of delightful genre pictures of the Weimar of classic days. The best of these is the last story, *Das Gometchen*. Her works include: *Novellen* (1882); *Es hat nicht Sein Sollen* (1891); *Das Recht der Mutter* (1896; new ed., 1903); *Neue Ratsmadel- und Weimarische Geschichten* (1897); *Halbblut* (1899); *Sommerbuch* (1902); *Die Krustallkugel* (1903); *Iselies* (1911).

BOHLEN, BÖHLEN, PETER VON (1796-1840). A well-known German Oriental scholar. He was born at Wüppels in Oldenburg, studied at Halle and Bonn, and after 1826 was professor of Oriental languages at Königsberg. Among his publications are *Das alte Indien* (2 vols., 1830-31), *Die Genesis historisch-kritisch erläutert* (1835), and editions of the *Sententia* of Bhartihari (1833) and the *Ritasandhara*, of Kalidasa (1840). Consult his *Autobiographie*, edited by Voigt (Königsberg, 1841).

BÖHM, BEM, RICHARD (1854-84). An African explorer. He was born in Berlin, studied zoölogy, and in 1880 went with Paul Richard to Zanzibar. In the following year he made an expedition to the interior of the Continent and visited Lake Tanganyika. He died of fever in the Urma district. He published numerous zoölogical, especially ornithological, observations. His letters from East Africa were published with a biographical sketch by H. Schalow under the title *Von Sansibar zum Tanganika* (Leipzig, 1888).

BÖHM, BEM, THEOBALD (1794-1881). A Bavarian flute player and manufacturer of wind instruments. For many years he was first flutist of the Royal Orchestra of Munich. His improvements in the construction of the flute not only revolutionized flute building, but led to important improvements in the construction of all the wind instruments. After he had become convinced that the size and relative distance of the sound holes must be determined solely in accordance with the laws of acoustics, he associated himself with the eminent scientist Karl von Schaffliuti. He thus established the proportions of the various parts and secured not only a maximum volume, but also a wonderfully soft quality of sound. He wrote *Ueber den Flötenbau und die neuesten Verbesserungen desselben* (1847), and *Die Flöte und das Flötenspiel*, and also had some reputation as a composer. Consult Christopher Welch, *History of the Boehm Flute* (London, 1883).

BÖHME, BEME, or BÖHM, BEM, JAKOB (1875-1924). A German theosophist and mystic. He was born of peasant parents at Altsiedenberg, near Gërlitz, in Upper Lusatia, and spent his boyhood in tending cattle. He learned the trade of a shoemaker. About 1612 he composed his first book, called *Aurora, oder die Morgenröte im Aufgang*. The manuscript fell

into the hands of the authorities, got him into trouble, and was condemned as heretical. It was not published till 1634. Bohme's fundamental doctrine is that everything exists and is intelligible only through its opposite. Thus, in the very nature of goodness evil is necessary as an element in its perfection. Without evil the will would rest content with its present state and progress would be impossible. God himself contains conflicting elements in His nature, the whole sensible universe being a constituent in His divine holiness. Bohme stated his doctrine in technical theosophic language which makes it quite unintelligible to the uninitiated. Numerous attacks from theologians disturbed Bohme's last years, but he bore them all with great meekness. They were probably occasioned by a tract on repentance, *Der Weg zu Christo*, which his friends had printed without his knowledge. In addition to the two works already mentioned, perhaps his *Mysterium Magnum* should be noted as a characteristic production. The best collection of his writings was published (1832-60), by Scheibel, at Leipzig. Next to Germany, Holland and England are the countries in which Bohme's works have been received with most favor. In England, where Bohme was generally called Boehmen, a translation of his works was published (1644-62). In 1697 Jane Lead, a disciple of Bohme, founded a sect called the Philadelphians. In some respects Bohme anticipated the views of such absolutists as Spinoza, Schelling, and Hegel. The intellectual contemplation of the absolute, out of which the contradictions in the world of phenomena proceed and into which they return, is common to these absolutistic systems and to Bohme. Hegel, indeed, expressly represents Bohme's negativity, the active principle of development, as an obscure foreshadowing of his own intuitions, and on that account places him at the head of modern philosophy. Consult Hamberger, *Die Lehre des deutschen Philosophen Jacob Bohme* (Munich, 1844), Fechner, *Jacob Bohme, sein Leben und seine Schriften* (Gotha, 1857), Peip, *Jacob Bohme, der deutsche Philosoph* (Leipzig, 1860), Carrere, *Die philosophischen Anschauungen des Reformationszeit* (Leipzig, 1887), Hartmann, *Life and Doctrines of Bohme* (London, 1893).

BOHMER, bē'mēr, JOHANN FRIEDRICH (1795-1863). A German historian. He was born in Frankfurt-on-the-Main, studied in Heidelberg and Göttingen, and from 1830 to 1862 was librarian of Frankfurt. In various libraries and archives of the Continent he made valuable researches for the sources of German history during the Middle Ages, and the results are embodied in his works, especially the following: *Urkundenbuch der Reichsstadt Frankfurt* (1836, new ed., 1901), a series of *Regesta Imperii* (1833, 1839, 1844, 1849, new eds of various dates), *Fontes Rerum Germanicarum* (4 vols., 1843-68). Consult Janssen, *J. F. Böhmers Leben, Briefe, und Kleinere Schriften* (Freiburg, 1868).

BOHMERWALD, bē'mēr-wā'lt. See BOHEMIAN FOREST.

BOHMISCH-LEIPA, bē'mish lē'pā. See LEIPA.

BOHN, bōn, HENRY GEORGE (1796-1884). An English author, translator, and publisher, of German parentage, born in London. He rendered a valuable service to the English-speaking

world by republishing at a cheap rate a vast number of the most valuable works in literature, science, philosophy, and theology. He obtained distinction as the editor of the *Bibliotheca Parnassica*, of Lowndes's *Bibliographer's Manual* (1857-58), and as a translator of Schiller, Goethe, and Humboldt. He also compiled a *Polyglot of Foreign Proverbs* (new ed., 1884), a *Practical Handbook of Modern Geography* (1847), a *Handbook of Pottery and Porcelain* (1849), and a *Dictionary of Quotations* (1887). He acquired great wealth and made valuable collections of china, paintings, ivories, etc.

BOHNENBERGER, bō'nōn-bēn'k'ēr, JOHANN GOTTLIEB FRIEDRICH VON (1765-1831). A German astronomer and mathematician, born at Simmozheim, Württemberg. He studied at the University of Tübingen, in 1796 became connected with the observatory of the university, and in 1798 was appointed professor of mathematics and astronomy. He was an assistant editor of several scientific periodicals and published *Anleitung zur geographischen Ortsbestimmung* (1795), *Astronomie* (1811), *Anfangsgründe der höheren Analysis* (1812).

BOHOL, bō-hōl'. One of the Visayas group of the Philippine Islands, in about lat 9° 50' N and long 124° 15' E, situated between the islands of Cebu, Leyte, and Mindanao (Map Philippine Islands, J 10). It is about 47 miles long and 34 miles wide. Its surface, covering 1411 square miles, is generally mountainous, and the north and west coasts are bordered by reefs. The island is not very fertile, but produces cacao, tobacco, coffee, cotton, hemp, rice, sugar, and corn. Deposits of gold, copper, phosphate, coal, and iron exist, and there are numerous mineral springs. The inhabitants are engaged chiefly in weaving silk and cotton fabrics and blankets. Pop., 1903, 243,148. Together with Siquijor, Panglao, and other neighboring islands, Bohol forms the province of Bohol, with an area of 1511 square miles, and a population (1903) of 269,223. Tagbilaran (pop., 12,108) is the capital.

BOHOR. An antelope (*Cervicapra bohor*), one of the larger reitbucks. It ranges in East Africa from Abyssinia to Rhodesia. See REITBUCK.

BOHOT. See BORS.

BOHTLINGK, bōt'lingk, OTTO VON (1815-1904). A Russian-German Orientalist and Sanskrit scholar. He was born in St. Petersburg, studied there and in Berlin and Bonn, and in 1842 returned to St. Petersburg. He became a member of the Academy of Science in 1842 and a Privy Councillor in 1875. In 1868 he left Russia and moved to Jena. In 1885 he moved again to Leipzig, where he passed the remainder of his life. In collaboration with Prof. Rudolph Roth, of Tübingen, he published his most important work, the great *Sanskrit Wörterbuch* (St. Petersburg, 1853-75). An abridgment and supplement of this appeared in 1870-80. His edition of the Sanskrit grammarian Panini (1840, 2d ed., Leipzig, 1878), and of a series of Sanskrit apothegms and proverbial verses, *Indische Sprüche* (1863-65, 2d ed., 3 vols., St. Petersburg, 1870-73), are standard works; and among his other publications are *A Sanskrit Chrestomathy* (St. Petersburg, 1845; 2d ed., ib., 1877-87), and an edition with translation of a treatise on Hindu poetics by Dandin, *Kāvya-darsa* (Leipzig, 1890). In 1888 a "Festschrift" containing contributions of many famous schol-

ars, was presented to him in honor of the 50th anniversary of his doctorate.

BOHUN. The name of an English family prominent in the thirteenth and fourteenth centuries. HUMPHREY V, de Bohun, second Earl of Hereford and first Earl of Essex (?-1274 or 1275), went on the Crusades in 1250, in 1257 was in charge of a portion of the Welsh marches, was one of the commissioners appointed in accordance with the Provisions of Oxford (q.v.), but by 1263 had gone over to the King's side and was taken prisoner at Lewes (May 14, 1264).—HUMPHREY VII (?-1298), grandson of Humphrey V, succeeded him and was prominent with Roger Bigod in opposition to the measures of arbitrary taxation resorted to by Edward I. During Edward's absence in Flanders he and Bigod obtained from the regent a confirmation of the charters, with supplementary articles whereby the King was to surrender the right to taxation without national consent. This confirmation was subsequently ratified by the King.—HUMPHREY VIII (1276-1322) married, in 1302, Elizabeth, the daughter of Edward I. He held high offices under Edward II, but joined the barons in their armed protest against Piers Gaveston, the King's favorite. After Gaveston's death Hereford (as Humphrey VIII was generally called) was again prominent in the King's service until the rise of new foreign favorites of the King. After several years of opposition, in 1321 he appeared with troops in London in revolt against the Despensers, who were forthwith banished. In October of that year, however, Edward took the field in attack upon Bohun and other rebellious lords, and Bohun was killed at Boroughbridge (Yorkshire) March 16, 1322.

BOIARDO, bô-yâr'dô, MATTEO MARIA, COUNT OF SCANDIANO (1434-94). A celebrated Italian poet, born at Scandiano. Educated at the University of Ferrara, he long resided at the Court of Borso and Ercole d'Este, Dukes of Ferrara, who were his steadfast friends and patrons. He was made Governor of Reggio in 1478, Captain of Modena in 1480, and was in 1487 reappointed Governor of Reggio, continuing in this office until his death. He began his literary work by some Latin poems in praise of the Estensi, and imitating Vergil; a dramatization of Lucian's *Timone*; verses in Italian of biographical inspiration, and translations of Apuleius and Herodotus. Encouraged in his literary ambitions by his masters, he produced his *Orlando Innamorato* (1482, pub. 1487). This poem, in octave stanzas, is interesting as forming the point of departure for Ariosto's *Orlando Furioso*. It deals with the fundamental matter of the epic of Charlemagne, already treated with genius by L. Pulci in the *Morganza maggiore*; but Boiardo's distinctive contribution is the introduction of the romantic chivalrous spirit of the Arthurian legends and the search for classic elegance in poetic dress. Aside from its historical importance, the *Innamorato* has intrinsic merit, in its richness of color in description, grace and reality of characterization, and the urbanity of its comic vein. Many completions, remodelings, and imitations of the *Innamorato* appeared after Boiardo's death. For the most important, see ARIOSTO, and BERNI. Consult: G. Bertoni, *Nuovi studi su M. M. B.* (Bologna, 1904); Solerti, *Le poesie volgari e latine di M. M. B.* (Bologna, 1894); ed. of *Innamorato* of Sonzogno (Milan, 1894), Eng. trans. by Toft (1598) and Rose (London, 1823).

BOIELDIEU, bôwîl'dyê', FRANÇOIS-ADRIEN (1775-1834). An eminent composer of French *opéra comique*. He was born Dec. 15, 1775, in Rouen, son of an archbishop's secretary. He ran away from his teacher, the organist Broche, to Paris (1787), whence he was ignominiously brought back; and Broche's lessons seem to have been all the formal instruction that Boieldieu received. The local success of his operas *La fille coupable* (1793) and *Rosalie et Myrta* (1795) induced him to go again to Paris, where he had to earn a living by tuning pianos for the Erards. Here he made the acquaintance of Méhul, Cherubini, and the tenor Garat, who made Boieldieu famous by singing his songs in public. *Les deux lettres* (1796) and *La famille suisse* (1797) had an enormous success at the Opéra Comique. He published various instrumental pieces and then triumphed again with *Le Calife de Bagdad* (1800). Some caustic remarks of Cherubini about "undeserved success" made Boieldieu apply himself to serious study of counterpoint, the results of which were noticeable in *Ma tante Aurèle* (1802). About this time his home life became so unbearable that he removed to St. Petersburg (1803) to become *maître de chapelle* to the court. In the eight years of his sojourn there he produced no work of merit, though bound by contract to write three operas annually in addition to other specified duties. Lung trouble hastened his return to Paris, where *Jean de Paris* (1812) was hailed with delight. He succeeded Méhul (q.v.) as professor of composition in 1817; *Le chaperon rouge* was given in 1818, and after a seven-year silence *La dame blanche*, generally conceded to be his masterpiece, created a veritable sensation. The next work, *Les deux nuits* (1820), had only a *succès d'estime*, and Boieldieu did not try his hand again. He retired from the Conservatory on a pension, but this was revoked by the government in 1830. Boieldieu died near Gisors, Oct. 8, 1834, of laryngeal phthisis, his sufferings somewhat relieved by the care and love of his second wife. His operas—of which *La dame blanche*, *Jean de Paris*, and *Le Calife de Bagdad* are still heard occasionally—are the finest examples of *opéra comique* in its earlier stage of development. Genuine comedy, intermingled with romanticism, seductive melody, orchestration that fairly glows with color yet never obscures the voice, grace, delicacy, and unflagging interest—such are the characteristics of Boieldieu's music. The list of works written in collaboration with Cherubini, Méhul, Isouard, Berton, Kreutzer, and others runs into dozens. Among his pupils the most famous were Adam, Fétis, Zimmermann, and Labarre. Consult A. Pougin, *Boieldieu, sa vie et ses œuvres* (Paris, 1875), Ferris, *Great Musical Composers* (New York, 1887), and Augé, *Boieldieu, biographie critique* (Paris, 1908).

BOIES, boiz, HORACE (1827-). An American politician. He was born in New York and in 1858 was a member of the New York Assembly, but removed to Iowa in 1867. In 1883 his opposition to the tariff and protection policy of the Republican party, which he had joined in early life, led him to identify himself with the Democrats, by whom in 1889 and again in 1891 he was elected Governor of Iowa. He was the leading candidate for the Democratic nomination for the presidency up to the time of the national convention of the party in 1896.

BOII, bô'î. A Celtic people, who early mi-

grated eastward from Transalpine Gaul into northern Italy, Bohemia, and the region of the eastern Alps. In Italy they stubbornly resisted the Romans, sometimes victors, often vanquished. They united with both Hannibal and Hamilcar against the common enemy, but in 191 B.C. they were definitely defeated by Scipio Nasica, and about half their Italian lands were taken from them by the Romans. According to Strabo, some of the Boii went back across the Alps at this time and settled in the domain of their kinsmen, the Taurisci, along the Danube, near Vindelicia and Retia, there may, however, have been a settlement of the Boii on the Danube, in the country now called Bohemia, long before. About 130 years later the Germanic peoples pressed into these northern abodes of the Boii, who were unable to resist them. A fragment of the tribe joined the Helvetians in their migration into Gaul and were met and defeated by Cæsar, who settled them in the land of the Ædui. The country of the Boii, to the north of the Danube, after it had been overrun by the Marcomanni (q.v.), was still called Boiohemum, the land of the Boii, the modern Bohemia. Another survival of the name is Bavaria. Consult T. R. Holmes, *Cæsar's Conquest of Gaul* (2d ed., Oxford, 1911).

BOIL (allied to Lat. *bullā*, a bubble), or **FURUNCLE** (Lat. *furunculus*). An acute circumscribed suppurative inflammation of the skin and subcutaneous tissue. It begins as a small hard point of a dusky-red color, which is hot, painful, and throbbing. This point extends, and during several days these symptoms increase in severity until finally the boil ceases to enlarge. It is then of a conical form, with a broad, firm base, and presents on the apex a whitish blister, which contains a little pus. This opens, and after a few days more there is discharged a core or slough of cellular tissue, and the small cavity left heals rapidly, leaving a white depressed scar. Boils are common in the spring and in young and plethoric persons, and their appearance is not inconsistent with robust health. Men somewhat overtrained for athletic contests, and others who have suddenly changed their diet and daily habits, are subject to them. In some, boils continue to succeed each other for a length of time. In the treatment of boils the intestinal canal should be cleared out by laxative medicines, and one of the so-called "alteratives," of which calomel is reputed best, given for a few weeks. Of late years staphylococcus vaccines have been used with excellent effects. The skin should be kept healthy by frequent washing, while the inflamed spots should be poulticed with flaxseed combined with an antiseptic, to avoid infection of neighboring parts. Deep incision after pus appears is the best and most satisfactory treatment. The cause of boils is infection with a pus germ, generally the staphylococcus, which enters a hair follicle or a sweat gland. See **ABSCESS**.

Aleppo Button or Aleppo Boil.—An endemic disease of hot countries, consisting of a scab or an ulcer which attacks the face chiefly. It is also called *Bishia button*, *Gafsa button*, *Kandahar sore*, *Natal sore*, *Dellin boil*, and *Oriental boil*. It is found in the countries bordering the southern and eastern shores of the Mediterranean Sea, in Crete, Cyprus, the Crimea, and Persia. It was first described by Russell in

1756. Duclaux claimed that it is caused by a diplococcus. Wright, in 1904, found protozoa 1μ or 2μ in diameter, in the blood. He suggests the name *Helcosoma tropicum*.

In the course of the disease a red spot appears, which soon becomes a papule (pimple), then a nodule, which breaks down into an ulcer, over which a scab forms. The period of incubation is from three days to several months. The disease is not constitutional. Usually there is but one boil, but there may be as many as 90 on the face and body (Crocker). The disease runs a course of 6 to 12 months, and hence the Persians call it "the one-year boil." Distorting cicatrices result. It is most common in young children. The best treatment is to scrape the surface with a sharp spoon and cauterize with nitric or carbolic acid.

BOIL, *Span. pron* bó-il', **BOYLE**, or **BULL**, **BERNARDO** (?-1520). A Spanish Benedictine friar of the monastery of Montserrat, Catalonia, and the first priest to visit the New World. Under papal appointment (1493) as apostolic vicar of the Indies, he accompanied Columbus on the admiral's second voyage (1493-94). He was attended by three other friars, and on Epiphany Sunday (Jan. 6), 1494, said the first mass celebrated in America. He was one of the four commissioners selected to govern the colony of Isabella during the absence of Columbus on a voyage of further discovery (April 24 to Sept. 20, 1494). Already, it would appear, jealous of the admiral, he now turned traitor, and with Margarit and others similarly disloyal sailed for Spain, there to spread every sort of misstatement against his commander.

BOILEAU-DESPRÉAUX, bwd/dô/dâ/'piô/ô', **NICHOLAS** (1636-1711). The most distinguished of French critics in the age of Louis XIV, known as the "legislator of Parnassus." He was in criticism an incarnation of correct, commonplace common sense, a schoolmaster in careful workmanship, sworn enemy of all false sentiment and preciosity, such as marred the poetry and fiction of his immediate predecessors. He was born in Paris, Nov. 1, 1636, studied first for the priesthood, then for the law, but found his place instinctively in the rather Bohemian literary company of Molière, La Fontaine, Racine, the philologist and realistic novelist Furetière, and the witty Ninon de l'Enclos. Of the Hôtel Rambouillet and its literary coterie he made one trial and never another. Louis XIV liked his rare honesty and gave him a pension, but he shunned the court, save when he could serve a friend there (e.g., Corneille), for he was a bourgeois and not at ease with the aristocracy. Feeble, asthmatic, in later life a little deaf, poetry was his aspiration, and criticism, justly weighed and carefully balanced, his delight. His life was uneventful. He never left Paris and its environs save at the command of the King, who made him a royal historiographer, and he died at Auteuil, March 13, 1711. His satire on the vices of Paris was his first success and by its date gave a name to the "school of 1680." Seven other satires appeared in 1669, and five more complete the list. They are in rhymed couplets, polished, harmonious, witty, with the maliciousness of merciless personalities. This was destructive criticism with a vengeance.

In the *Art poétique* (1674) he was constructive, and, following Horace's *Ars Poetica*, gave

a theory of poetic composition in four cantos, of which the first lays down general rules, the second applies these to lyric poetry, the third to the epic and the drama, while the fourth contains general reflections, advice, and cautions, all spiced with brilliant wit and barbed with personal allusion. He preached a reign of literary law, truth in subject, conscientious workmanship in form, unity, clearness, proportion. He sought to establish literature on an unchanging foundation and to give canons of classicism for the ages. And indeed his work has a perennial reasonableness, though it allows scant scope for "the heat and height of sane emotion" and the unchartered play of genius. For Boileau's mind was material, logical, lacking in imagination. He has been studied by generations because his is the art that can be learned, as Pope, his best pupil, learned it, though his own Horace might have taught him that the true poet could not be made. Boileau repeated and enforced his critical views in the prose *Dialogue des héros de roman*, whose authorship he at first concealed, and in *Réflexions critiques sur Longin* (1693). His own best verses are 12 *Épîtres* and a mock-heroic epic, *Le Lutrin*, which was his most popular work. It was published in part in 1673, but not in full till after his death. This and all the poems are filled with cleverly turned lines that remain as familiar quotations, but Boileau should be most gratefully remembered as the first systematic critic of France, the first to make criticism an art. See CRITICISM.

He was narrow and sometimes unjust, he never fully grasped the fundamental principles of the classic art he admired; but his honest, loyal, stubborn, rough good sense did much to direct the talent of Molière, Racine, and La Fontaine to its most fruitful channels and to guide the next generation to a true, though partial, naturalism. On the lyric poetry of succeeding generations its effect was to cultivate a formal technique and so to check inspiration that first fully revives in the Romantic school. The best edition of Boileau's *Works* is by Gidel (4 vols., 1870-73); the *Œuvres de Boileau* (Strassburg and New York, 1909-) may also be mentioned. Consult: Deschanel, *Le romantisme des classiques* (4th series, Paris, 1888); Lanson, *Boileau* (Paris, 1892); Morillot, *Boileau* (Paris, 1892); Faguet, *XVII siècle, études littéraires* (Paris, 1887); Liénon, *Cours de littérature* (Paris, 1889-95); Dreyfus-Brisac, *Un fauve classique: Boileau* (Paris, 1901), and Walter, *Boileau's Wirkung auf seine englischen Zeitgenossen* (Strassburg, 1911).

BOILER. In steam engineering, a vessel in which steam is generated for heating or power purposes. In its simplest form, it consists of a closed vessel made of sheet metal, having apertures for the admission of water and egress of steam, with gauges for showing the level of the water and the pressure of the steam, and set or mounted in combination with a furnace, either internal or external, according to the type of boiler. When water is boiled in an open vessel, the temperature of the water and of the steam rising from it remains at, or very near, 212° F., and the tension or pressure of the steam is no more than sufficient for it to make its way into the atmosphere, being equal to that exerted in all directions by the atmosphere itself, viz., 14.7 pounds per square inch. In a closed vessel, on the other hand, the temperature and pressure

to which steam can be raised are limited only by the strength of the vessel or boiler. The form of a boiler is determined by two considerations—viz., strength to withstand internal pressure, and efficiency in producing steam; and the object of the designer is to combine in one apparatus sufficient strength to work at the proposed pressure with a large margin or factor of safety, and to occupy the least possible space, with such a form and arrangement as shall abstract the maximum of heat from the gases of combustion and at the same time be in all respects suitable to the special circumstances of the case. The spherical form is that best adapted for strength and was the earliest to be used, being employed by Hero of Alexandria about 150 B.C. in his reaction engine, which was known as an *æolipile*. The boiler was hemispherical and was mounted on a stand and heated by a wood fire below. The spherical form of boiler presents to the fire, however, the

HORIZONTAL RETURN TUBULAR BOILER.

This type of boiler is in very general use for low pressure in manufacturing purposes.

minimum heating surface in proportion to its contents and therefore has a minimum efficiency. After spherical boilers came rectangular steam generators with rectangular fire boxes of so many types and forms that it is impossible to allude to them in detail. These square boilers were not suitable for carrying a greater pressure than three or four pounds to the square inch, but were used in the early days of steam vessels. Their defects led to cylindrical boilers, at first set vertically and afterward horizontally, and later on these were furnished with internal furnaces. Watt's "wagon-top boiler" (so called from its shape) was used for many years, but, being unfit for any but the lowest pressures, it was discarded; and the "egg-end" boiler, or plain cylinder with hemispherical ends, also much used at one time, has now disappeared on account of its small evaporative efficiency, it being used only where large quantities of waste fuel material, such as sawdust, can be had cheaply.

Modern steam boilers, speaking broadly, may be classified according to their form and construction or according to the character of their employment. Under the first division we have horizontal and vertical boilers, internally and externally fired boilers, shell and sectional boilers, fire-tube and water-tube boilers, or boilers combining two or more of these several features. Under the second division are included stationary boilers, locomotive boilers, marine boilers, and various forms of portable or semiportable boilers. The variety of forms and methods of construction of stationary boilers is very great, but the locomotive boiler is practically limited

to a single form, and marine boilers are usually of the type known as the Scotch boiler, although water-tube boilers of various forms are being more and more used. Recently considerable attention was devoted to the development of a boiler for motor vehicles. For this purpose use is made of one of the oldest types of steam generators, the "flash boiler," so called from the fact that no body of water is carried in it, but the water needed to make steam is injected by a pump, and thrown directly against highly heated tubes or coils, when it at once flashes into steam, it is a very light generator, but has the disadvantage in its unimproved form of requiring renewal of the heated surfaces frequently, because, by constant exposure to high temperatures, the metal oxidizes rapidly and scales off, reducing the tubes so much that they must be replaced. The White Company's semi-flash boiler had a coil construction with a mechanical feed or circulation of water, so designed that the cooler water entered the coil at the top, and the hot (and superheated) steam left at the bottom, where the coil was practically red hot over the fire. Hence rapid changes of temperature in the heating coil were eliminated, and a long life secured for the coil.

The most familiar form of boiler is, perhaps, the return tubular boiler. It has a cylindrical shell closed at the ends by flat circular plates, and tubes extending lengthwise of the boiler and terminating in the end plates. These tubes are open at both ends, and through them pass the gases of combustion. The furnace is placed underneath the front end of the boiler shell, and from it the gases pass back under the shell to its rear end, thence up and forward through the tubes to the front end, and thence out of the chimney. In this passage the hot gases give up a large portion of their heat to the water surrounding the tubes inside of the shell. Technically classified, this boiler is a horizontal, externally fired, fire-tube shell boiler. Another form of horizontal shell boiler formerly much used has the numerous fire tubes replaced by two large cylindrical flues. This type of boiler is less efficient than the tubular boiler, but its greater simplicity and its accessibility for cleaning give it advantages, especially where the feed water is bad. The two-flue or Lancashire boiler has several modifications which are known by special names. The Galloway boiler has two flues which are crossed at intervals by conical-shaped tubes whose purpose is to provide an internal bracing for the flues and to add to the heating surface. In this boiler the grates are placed inside the flues at the front. The double Cornish boiler has two furnaces, internal and side by side. These flues are usually corrugated to give them strength against collapse from external pressure. Older forms were stiffened by rings of angle or tee iron, as in the Adamson construction. The Cornish boiler has one large instead of two smaller flues. Both the Galloway and Cornish boilers are internally fired.

Vertical boilers consist of a cylindrical shell set on end, with the grate at the bottom and fire tubes running vertically. In large stationary boilers of this type the boiler is mounted on a masonry foundation, but in small portable boilers, such as are commonly used for hoisting engines, the boiler is set on a cast-iron base which contains the grate and ash pit complete. Some of the larger stationary vertical boilers

built at present are from 20 feet to 30 feet high. Fire-engine boilers are always of the vertical type. See FIRE ENGINES.

The Scotch marine boiler has a cylindrical shell resembling a large drum in shape. It is set horizontally. In the lower half of the boiler there are from one to four flues containing furnaces, which terminate in a combustion chamber at the rear, and in the upper part there are a large number of fire tubes terminating in the combustion chamber and in the uptake to the smokestack at the front. Double-ended boilers of

SCOTCH MARINE BOILER, FRONT END

this type have furnaces at each end, and resemble two single-ended boilers placed back to back. Sometimes a common combustion chamber is used for both sets of furnaces in a double-ended Scotch boiler, but it is considered better practice to have a separate combustion chamber for each set of furnaces. The locomotive boiler consists essentially of a rectangular fire box and a cylindrical barrel through which numerous fire tubes extend from the fire box to the smoke box. The latter forms a continuation of the shell from which the products of combustion pass up the smokestack. Although this form of boiler is universally used for locomotives, it has many disadvantages, chief among which are the necessity for numerous stays to hold the flat plates around the fire box in shape against the external pressure which tends to collapse them, and the troubles from unequal expansion of the hotter and cooler parts of the inner and outer plates. (See illustration under LOCOMOTIVE.) Newer constructions corrugate these formerly flat surfaces, and thus give strength without the same troubles from failure of stay bolts.

All the boilers so far described have been of the fire-tube type—i. e., the tubes and flues pass-

BOILERS

5. MANNING VERTICAL FIRE-TUBE BOILER.

ing through the boiler shell have been for the conveyance of hot gases from the furnace. The idea of using tubes and flues is to provide a greater heating surface and generate steam more rapidly. To economize heat and increase the rapidity of raising steam still further, the water-tube boiler has been developed and is now being extensively used. In water-tube boilers there are one or more drums or water legs connected by tubes of relatively small diameter.

SCOTCH MARINE BOILER, LONGITUDINAL SECTION.

These are filled with water, and the gases from the furnace pass around and between the tubes and so heat the water contained within them. The tubes connecting these drums vary from straight tubes to tubes bent to various degrees of curvature and vary in diameter from 1 inch to 4 inches. Water-tube boilers are made light, powerful, and compact, and well adapted for forced draught, steam can be raised rapidly from cold water or a sudden demand for increased pressure quickly met. They have the most effective and definite circulation of the water within them. They are the safest of all types against rupture and explosion, as the failure of one unit releases the excess of pressure gradually and without concussion. For these reasons they are largely used on war vessels, especially torpedo boats, though many vessels in the merchant marine continue to employ the Scotch boiler. Injury may be done by the hot water which escapes at high velocity and temperature, scalding and making steam as it expands. The water-tube boiler is also extensively employed in large power-generating plants on land. See STEAM NAVIGATION.

Boiler settings are the supports of masonry or metal upon which the boiler rests and by which it is oftentimes wholly or partly inclosed. Large stationary boilers usually have masonry settings, while portable and semiportable boilers have settings of cast iron. Marine boilers are seated on plates and saddles, which are built into the bottom of the ship. In externally fired boilers the setting usually contains the furnace. (See FURNACE.) Boiler fittings or accessories comprise steam pipes and blow-off pipes, safety, check, and gate valves for various purposes (see VALVE); dampers and regulators; feed pumps and feed-water heaters; steam traps and steam separators, and steam gauges and water gauges, besides a number of minor attachments for one purpose or another in the operation of the boiler.

The water supplied to a boiler to be made into steam gives trouble within it when it carries mineral matter in a soluble form which is precipitated or concentrated on the boiling process. The steam goes off without such mineral contents; and these are precipitated or left behind and by their accumulation retard the making of steam and endanger an overheating of the plates.

The material chiefly employed in the manufacture of boilers is steel. In order to make certain that the material used has the proper strength and toughness, it is required that the plates be tested by cutting off small pieces and breaking them in a testing machine (see TESTING MACHINE) previous to use. After passing the tests the plates, which are shipped to the boiler shop flat and of various sizes, are sheared to the proper dimensions, the edges are planed, flanged, drilled for riveting, and bent by means of heavy rolls to the proper curve. The next step is to assemble the different parts and bolt them together. They are then riveted and the seams caulked. Finally, when the boiler is complete, it is tested by filling it with water under pressure, which determines whether it has the proper strength to carry the steam pressure and whether there are any leaks. Very often a boiler is tested, after it has been installed ready for operation, to determine its economy and efficiency in generating steam. Rules for such tests can be found in vol. xxi, *Trans. of American Society of Mechanical Engineers*. It is the usual practice to rate and sell boilers by the horse power, this custom having originated early in the days of the steam engine. The term "horse power," as applied to a steam boiler, has a purely arbitrary significance, since the power from the steam is developed in the engine, and hence the economy in the use of the steam depends on the engine to some extent. The rule established by the American Society of Mechanical Engineers is to consider 30 pounds of water evaporated per hour from a temperature of 100° F. under a pressure of 70 pounds by the gauge as equivalent to one horse power. This rule may be otherwise stated as a capacity for "the evaporation of 34.5 pounds of water per hour from feed-water temperature of 212° F. into dry steam of the same temperature." See HORSE POWER.

Boiler explosions may occur from various causes, but the most frequent is that the boiler is too weak to endure the regular working pressure. A new boiler may be weak through defective design or workmanship, and an old boiler is liable to be weak through rust and general deterioration. Sometimes, but rarely, the sheets which resist pressure fail by a pressure above the working pressure. Low water is often an indirect cause of an explosion, when the sudden injection of water upon an overheated area of the heating surface entails such a sudden contraction of the metal locally as to cause an overstrain, under which the sheet fails. The spectacular and destructive features of a boiler explosion follow when the hot water confined at high pressure and temperature is released by an adequate rupture. The lowered pressure permits the highly heated water to pass into gas with a suddenness and a disruptive energy which tears the remaining structure apart and may propel parts of it to a distance through walls and structures surrounding it. The water gasifies in a manner analogous to an explosion of powder. The safety of a boiler from explosion is insured only

by careful and correct design, honest and thorough workmanship, intelligent care in service, and incessant vigilance by expert inspection. Boilers are usually insured against failure in companies making a specialty of such inspection, and their underwriting. See STEAM ENGINE.

Bibliography. The literature on boilers is very extensive, and students have the choice of a number of standard books treating of the history, design, and construction of such apparatus. The following works will be found to cover the subject thoroughly: Thurston, *A Manual of the Steam Boiler* (New York, 1896), Bair, *Boilers and Furnaces* (Philadelphia, 1899), Bertin, *Marine Boilers* (London, 1898), Parsons, *Steam Boilers* (New York, 1904), Kent, *Steam Boiler Economy* (New York, 1901), Hutton, *Mechanical Engineering of Power Plants* (New York, 1908), Kent, *Steam-boiler Economy* (New York, 1910), Gray, *Practical Design of Marine Single-Ended and Double-Ended Boilers* (London, 1912), Shealy, *Steam Boilers* (New York, 1912). American and European technical journals should also be consulted for the more recent developments in boiler construction.

BOILING See COOKERY

BOILING POINT. The temperature at which a liquid substance boils. Evaporation of water takes place, more or less rapidly, at all temperatures (even at temperatures at which it rapidly freezes), no matter how great the pressure of air or other gases on its surface. When some water is placed in an empty closed vessel, evaporation will go on until the escaping vapor has attained a certain definite pressure of its own, whose magnitude is dependent on nothing but the temperature of the water, this is the *vapor pressure* of water at the given temperature. If the vessel in which the water is placed contains air, the latter exerts a certain *mechanical pressure* upon the water, and the resulting compression of the liquid into a smaller volume causes some rise in its vapor pressure. However, the compressibility of liquids being generally slight, the rise in the vapor pressure of, say, water due to mechanical compression by atmospheric air is practically negligible. In other words, the presence or absence of air in the containing vessel will be found to have practically no influence upon the limit to which a liquid will vaporize within it. Not so, however, as regards the speed with which that limit is attained. The presence of air checks the rate of evaporation, though it cannot prevent the latter from going on until the vapor pressure has finally attained its limit determined by the temperature.

While the presence of air thus diminishes the rate of evaporation, an elevation of temperature causes, on the contrary, a corresponding increase of that rate. As the temperature of the water rises, its vapor pressure continuously increases, and with it increases the rate of evaporation. Finally, when the temperature has risen to the point at which the vapor tension is equal to the external pressure of the air, evaporation becomes very rapid indeed, and bubbles of water form in brisk succession throughout the volume of the liquid, throwing it into more or less violent commotion, the water is then said to be *boiling*. If the steam is now allowed to escape, boiling will go on until all the water has been evaporated, and if, while the liquid is boiling, the bulb of a mercury thermometer be kept just below the surface of the

water, the thermometer will register a constant temperature (provided the water is pure). This constant temperature, the lowest at which, under a given pressure, water will continue to boil, is called the boiling point of water at that pressure.

The so-called normal boiling point of water is 100° Centigrade (212° F). This is the temperature at which water boils under normal atmospheric pressure, i.e., when the height of the mercury barometer is exactly 760 millimeters (30 inches). A change of pressure will at once result in a corresponding change of the boiling temperature. In elevated positions, where the atmosphere is rare and the barometric pressure comparatively low, the boiling point is lower than at the level of the sea. At the city of Mexico, 7000 feet above the sea, water boils at 93.3° C (200° F), at certain points in the Himalayas it boils at 82.2° C (180° F). Boiling water is thus not always equally hot, and in elevated places many substances cannot be cooked by boiling. Once the boiling temperatures of water corresponding to different heights have been ascertained, we can, conversely, determine the height of a mountain by observing the boiling point of water at its summit. See HYPSOMETER.

The above statements as to the boiling point of water are true only of water which is chemically pure and contains no admixture of any sort. If, instead, we take a solution, say, of ordinary salt, we shall find (1) that when heated under normal atmospheric pressure, the solution will begin to boil at some temperature higher than 100° C, and (2) that, whatever the temperature at which boiling will begin, if the steam is allowed to escape, the temperature of the boiling solution will continuously rise, in other words, the solution will not continue boiling at a constant temperature. When the "boiling point of a solution" is spoken of, it should be understood to mean the degree of heat at which boiling just commences. The only reason that a solution will not boil at constant temperature lies in the fact that, during the process of boiling, its composition changes, for when a solution boils, water escapes in the form of steam, while the solid substance remains behind and its proportionate amount in the solution consequently increases. If, however, the steam is continually condensed by means of a suitable cooler, and thus made to return to the solution, the composition of the latter will remain unchanged, and no matter how long boiling is kept up, the temperature will remain constant, this temperature is evidently the point at which otherwise, if the steam were allowed to escape, boiling would just commence.

From what has been said of boiling solutions, it may be seen that the boiling point of a liquid is the higher, the greater the amount of non-volatile foreign substance contained in it.

This is, however, not the only factor on which the temperature of a boiling solution depends. The molecular weight of the dissolved substance is another factor. If we were to take two equal quantities, say, of water, heat them to boiling, and then add to them, respectively, equal weights of two different substances, we should find that the elevation of temperature is greater in the case of the sample to which we have added the substance of smaller *molecular weight*. Experiments carried out in this manner with

many different substances permit us to induce the law, that the difference of the boiling temperatures of a solution and of the pure solvent is inversely proportional to the molecular weight of the substance dissolved. It must, however, be borne in mind that in this simple form the law is limited to solutions which do not conduct electricity, in solutions of electrolytes relations are not quite so simple. (See SOLUTION, DISSOCIATION.) In the case of solutions of nonelectrolytes, such as many of the carbon compounds, the law holds with considerable precision; and it has proved especially useful in this, that it permits us to determine the unknown molecular weights of newly discovered substances. To ascertain, by this method, the molecular weight of a new substance, all the

BECKMANN'S APPARATUS.

chemist has to do is first to observe the rise of temperature produced in a boiling solvent, when a certain quantity of his substance is added to it, and then to compare the rise of boiling point to the rise produced by the same quantity of some other substance, of known molecular weight. These important determinations are carried out with considerable precision by the use of Beckmann's apparatus (see figure).

The apparatus consists essentially of two parts: an inner tube, *a*, containing the solution, and an outer vessel, *b*, containing the pure solvent and separated from *a* near the bottom by a sheet of asbestos. The coolers *c* and *d* serve to condense the escaping vapors. To determine the rise of boiling point caused by a given substance, the operator introduces into *a* first a known amount of the pure solvent, observes the boiling point, then introduces also a known small amount of his substance, and again observes the boiling point. In the case of most solvents the inner tube need not be heated directly, and heating only the outer vessel is sufficient to keep the liquid in the inner tube boiling.

What has been said above of pure boiling water applies equally well to any other compound in the liquid state; any liquid consisting of one single chemical compound has a definite boiling point depending on nothing but the external pressure. Thus, under normal atmospheric pressure, the boiling point of ether is 35° C.; the normal boiling point of pure alcohol is 78.3°; aniline boils at 183°, and the hydrocarbon piceine at 520°. The boiling temperature is, of course, very easy to determine, and since it is one of the highly characteristic properties of a liquid, a chemist determines that point usually before inquiring into other properties when called upon to identify a liquid compound. Further, since in the case of a pure chemical

compound, if the vapors are allowed to escape, the boiling temperature remains constant, while in the case of a solution (or any other homogeneous liquid mixture) it continuously rises; whenever a chemist wants to ascertain whether he is dealing with a single and pure chemical compound, he subjects his liquid to distillation, to see whether the boiling point will remain constant. If it does not remain constant he knows that he is dealing with a mixture or that some chemical change is taking place in the liquid. See CHEMISTRY.

From the fact that every compound has a characteristic boiling point of its own, chemists were naturally led to think. (1) that some definite relation must surely exist between the chemical nature of compounds and their boiling points, and hence (2) that, in comparing compounds of similar constitution, definite numerical relations should be expected to exist between the boiling points of such compounds. As a matter of fact, in the homologous series of organic chemistry, the boiling point is generally found to increase with the complexity of the molecule (see, for example, the article HYDROCARBONS); which shows that the boiling point of compounds is really dependent on their nature and structure. The numerical relations hitherto discovered are, however, far from being definite and general. Probably we do not know as yet how to search for the more definite relations. Consult Jones, *The Freezing-Point, Boiling-Point, and Conductivity Methods* (Easton, Pa., 1912).

BOILLY, bwā'yē, LOUIS LÉOPOLD (1761-1845). A French genre and portrait painter. He was born at La Bassée (Nord), the son of a sculptor. Excepting his father, none of his teachers are known; but he was much influenced by the Dutch genre painters. He is known as the "Little Master of the Revolution"—not however of its stirring military, but its peaceful, domestic scenes. His pictures are small in size, firm and accurate in design, even in color, and sparkling with wit and grace. Possessed of amazing facility, he has been credited with no less than 5000 pictures. Many of them were engraved, and he himself did creditable lithographing. Most of his paintings are in private possession, the Chaix d'Est Ange Collection (Paris) being the richest. Many are in French provincial museums, and the Louvre has "The Arrival of the Diligence" (1803). The authoritative monograph on Boilly is by Harisse (Paris, 1898).

BOIS D'ARC, bwā'dark'. See OSAGE ORANGE. **BOIS DE BOULOGNE**, bwā de bwō'lō'ny'. A famous and beautiful park of Paris covering about 2250 acres (Map: Paris). It derives its name from the town of Boulogne-sur-Seine on its south. The park was formed under Napoleon I out of the old Forêt de Rouvray, and remained in the possession of the state until transferred to the city by Napoleon III in 1852, since which time it has been the favorite drive of Parisians. The Bois was greatly injured by bombardment during the siege of Paris in 1870-71, but was soon restored. It contains the great Auteuil and Longchamps race courses. The Parisian season closes the races for the *Grand Prix* of Longchamps (100,000 francs), held in the early part of June. The Bois also contains the Jardin d'Acclimatation. See PARIS.

BOIS DE CHYPRE, bwā de shē'pr'. See ELM.

BOISDEFRE, bwa/défr', RAOUL FRANÇOIS CHARLES LE MOUTON DE (1839-) A French soldier, born at Alençon (Orne). He studied at the College of Saint-Cyr and at the Staff-College. During the Franco-Prussian War he was a major of cavalry and aid-de-camp of General Chanzy and in 1882 was promoted to be colonel. In 1890 he became assistant chief of staff and in 1893 chief of staff. At the trial of Emile Zola (1898), during the Dreyfus agitation, he appeared full-uniformed in court, and in a much-applauded address to the jury affirmed the existence of a third secret document incriminating the accused officer. When subsequently it transpired, through the confession of Lieutenant Colonel Henry, that the document to which he had referred in good faith was a forgery, he tendered his resignation.

BOIS DE VINCENNES, vā'n'sen' A park of 2250 acres east of Paris, formerly a hunting forest of Louis IX. A large part of the park is taken up by the Champ de Manœuvres, an infantry drill ground, a race course, and the polygone d'artillerie. It is equal to the Bois de Boulogne in beauty, but is not so fashionable.

BOISE, boy'se A city and the county seat of Ada County, and the capital of the State of Idaho, 435 miles northwest of Salt Lake City, Utah, on the Boise River, and on the Oregon Short Line Railway (Map Idaho, B 6). It is the centre of an agricultural and mining district and has important lumber, dairying, meat packing, stone quarrying, bottling, and stock raising interests. It also manufactures cigars, cement pipe, ice, brooms, trunks, candy, doors and sashes, harness, etc., and is one of the most important inland wool markets in the United States. Water derived from the Boise River—on which, 26 miles above the city, is situated the celebrated Arrow Rock Dam, one of the highest in the world (354 feet)—is utilized for irrigation and also for power in the manufacturing industries. Natural hot water exists here in abundance and is extensively used in heating the buildings of the city. Among the prominent features are the largest enclosed natatorium in the United States, fed by natural hot water, a Carnegie library, a number of fine schools and academies, business colleges, United States assay office, land office, surveyor general's office, reclamation and forestry service headquarters, and military post, the State capitol, the penitentiary, and a Soldiers' Home. The city also contains two hospitals, several good hotels, three theatres, and a popular amusement park called "The White City." Boise was settled in 1863 by Major Lugabill, U. S. A., who established here a military post known as Fort Boise. In 1864 it was organized as a city and became the capital of the Territory. Boise has adopted the commission form of government. Pop., 1900, 5957, 1910, 17,358.

BOISE, boyz, JAMES ROBINSON (1815-95). An American educator. He was born at Blandford, Mass., and in 1840 graduated at Brown University, where he was professor of Greek from 1843 to 1850. From 1852 to 1868 he was professor of Greek language and literature at the University of Michigan and from 1868 until his death filled a similar chair at the University of Chicago. During the latter period he was also professor of New Testament interpretation at the Baptist Union Theological Seminary (1877-95), and professor emeritus of New Testament Greek at the University of Chicago. He pub-

lished notes on the Epistles to the Galatians, Romans, Ephesians, Colossians, and Philippians and also the classical text-books, *Exercises in Greek Prose Composition* (1850), *First Lessons in Greek* (1870, 8th ed., 1876), *Selections from Various Greek Authors* (7th ed., 1889).

BOISE, OTIS BARDWELL (1844-1912). An American musician and composer. He was born at Oberlin, Ohio, studied music in Leipzig and Berlin, and for some time was instructor in composition at the New York Conservatory and organist of the Fifth Avenue Presbyterian Church. From 1881 to 1888 he was in business in New York. In 1890 he took up his residence in Berlin, where he was in great demand as a teacher of composition. He returned to America in 1908 as professor of composition at the Peabody Conservatory in Baltimore. His compositions include a *Concertstück* for piano and orchestra, a G minor piano concerto, a symphony, and two concert overtures. He has also written *Harmony Made Practical* (1900) and *Music and its Masters* (1901).

BOISGOBEY, bwō'gā-bā', FORTUNÉ CASTILLE DU (1821-91). A French writer of detective stories whose work may be compared, not unfavorably, with that of Emile Gaboriau. He traveled extensively and not unprofitably, for he appears to have made his experience serve his writing. He was born at Granville (Manche) Sept. 11, 1824. He was paymaster in the French army in Africa from 1844 to 1848. Later he traveled in the Orient and collected his memoirs of the voyage under the title *Du Rhin au Nil* (1876). He made his first literary appearance in the *Petit Journal* with a novel entitled *Deux Comédiens* (1868). He then became a popular feuilleton writer. *Le Colonel Forçat* (1872) and other police stories, many of which have been translated into English, later afforded some suggestions to Sir A. Conan Doyle. Other works of his are: *Les gendres* (1873), *Chevalier Casse Cou* (1873), *La tresse blonde* (1874), *L'as de cœur* (1875), *Les collets noirs*, *Le coup de ponce*, *Les mystères du nouveau Paris* (3 vols., 1876), *Le demi-monde sous la Terreur* (1877), *Qui était-ce?*, *L'homme au masque de fer*, reprinted as *Les deux Mèdes de M. de Saint-Mars* (1878), *L'Épingle Rose* (1879), *Les coquelottes de Marie Rose*, *Où est Zénobie?* (1880), *Le pape de Paris*, *Les mœurs de Constantinople* (1882), *Le collier d'acier*, *Bouche cousue* (1883), *Le billet rouge* (1884), *Le cri du sang* (1885), *Le ponce croché* (1885), *La violette bleue* (1885), *La bande rouge* (1886), and *La main froide* (1889).

BOISGUILLEBERT, bwa'gā'ye-bēr', PIERRE LE PESANT, SIEUR DE (1646-1714). A French political economist, born in Rouen. In 1690 he was appointed lieutenant general (civil) of his bailiwick. He published in 1695 *Le détail de la France sous le règne de Louis XIV.*, and by a work entitled *Faustum de la France* (1706) brought upon himself the wrath of the ministry and exile to Auvergne. He republished the two essays, somewhat amplified, under the title *Détail de la France*, in 1712. Boisguillebert was the first economist to criticize the prevailing mercantile system of economic policy on the ground that it confused gold and silver with national wealth. In his view the real national wealth consists in commodities that supply the necessary wants of life. He attacked the system of Colbert on the ground that it exaggerated the importance of industry and permitted agriculture, the sound

basis of national life, to fall into decay. In his emphasis upon the importance of fair prices for the products of agriculture, and of unrestricted trade in such products, Boisguillebert anticipated the chief doctrines of the physiocrats (q.v.).

BOIS-LE-DUC, bwā'le-duk' (Dutch *s' Hertogenbosch*, Duke's Forest). The capital of the Dutch province of North Brabant, and seat of a Catholic bishop, situated at the junction of the Dommel and the Aa (Map: Netherlands, D 3). Its fortifications were destroyed in 1876, but the natural situation of the town is very strong, as the surrounding country can be flooded, leaving only two roads passable. It is clean and well built, is about 5 miles in circumference, is intersected by canals, and has a citadel called Papenbril. The cathedral of St. John, dating from the eleventh century, is noteworthy, and the town contains the museum of the province with a collection of Roman and mediæval remains, an academy of arts, a grammar school, several hospitals, etc. Manufactures consist of gold and silver articles, shoes, woodenware, cigars, and mirrors. Its trade with the interior and its shipping are considerable. Its population in 1905 numbered 34,093; in 1910, 35,214. Bois-le-Duc is a place of considerable antiquity, having been founded in 1184 by Godfrey III, Duke of Brabant. The surrounding forest was cut down by his son and successor, Henry, who strengthened the town with walls. In the sixteenth century Bois-le-Duc separated from the Dutch states, and was ineffectually besieged in 1601 and 1603 by Prince Maurice of Nassau, but had to surrender to a Dutch force in 1620. In 1794 the town was taken by the French and in 1814 retaken by the Prussians. Consult Fremant, "The Siege of Bois-le-Duc," in *The Military Engineer* (London, 1759).

BOISSERÉE, bwā'srā', SULPIS (1783-1854) and MELCHIOR (1786-1851). German art critics and antiquaries. They were born at Cologne, Aug. 2, 1783, and April 23, 1786, respectively. A visit which the brothers, along with their friend Bertram, paid to Paris in 1803 inspired the trio with the idea of collecting and preserving the scattered specimens of early German painting. The realization of this idea became the single object of their lives. After years of research they had gathered at Heidelberg in 1810 a collection of nearly 200 pictures. In 1818 it was taken to Stuttgart, where the collection was arranged chronologically in a spacious building. This disclosed the fact that in the fourteenth century Germany possessed an original school of panel painting, and that it was strongly modified by the Flemish masters, especially the Van Eycks, in the fifteenth century. In 1827 the collection was sold to the King of Bavaria for 12,000 thalers and, except for about 40 which were taken to Nuremberg (now in the Germanic Museum), they were incorporated into the Royal Pinakothek in Munich, to which place the brothers Boisserée followed it. In 1845 the two brothers removed to Bonn and devoted all their energies to the study of the Cologne Cathedral, pleading for its completion. Sulpiz died May 2, 1854; Melchior, May 14, 1851. They published lithographic plates of the gallery, and Sulpiz, who widened his studies to include all German mediæval art, wrote several valuable works on Cologne Cathedral, on the architecture of the Rhineland, etc. Their collection became a valu-

able source for the study of primitive German painting. Sulpiz Boisserée had considerable influence on Goethe's studies of German art. His widow published a biography of her husband under the title *Sulpis Boisserée* (Stuttgart, 1802).

BOISSIER, bwā'gyā', MARIE LOUIS GASTON (1823-1908). A French historian and archaeologist, born in Nîmes. He studied at the Ecole Normale, and was an instructor in rhetoric from 1847 to 1857 in Nîmes, and subsequently at the Lycée Charlemagne of Paris. In 1861 he was appointed to the chair of Latin eloquence at the Collège de France, where he later was transferred to that of the history of Latin literature. In 1865 he became lecturer in Latin language and literature at the Ecole Normale. He was elected in 1876 to the French Academy, in 1886 to the Academy of Inscriptions and Belles-Lettres. In addition to extensive contributions to the reviews, he published a number of scholarly works, written in a style at once clear and distinctive, and including *Le poète Attius* (1857); *Étude sur la vie et les ouvrages de Terentius Varron* (1861); *L'Opposition sous les Césars* (1875), a picture of political degeneracy at Rome under the successors of Augustus, *La religion romaine, d'Auguste aux Antonins* (1883); *La fin du paganisme* (1891); *Cicéron et ses amis* (1892); *Promenades archéologiques: Rome et Pompéi* (1880, 1896), two reconstructions of antiquity remarkable for vividness and minute accuracy, *L'Afrique Romaine* (1901); *Tacite* (1905; Eng. trans., 1906). He resigned his chair at the Collège de France in 1906. The charm of his style, and the clearness, vividness, and accuracy of his pictures of Roman life led to the translation of several of his books into English, in which form they have been deservedly popular.

BOISSIEU, bwā'syē', JEAN JACQUES DE (1736-1810). A French etcher and painter. He was born in Lyons, where he studied painting under Lombard and Charles Frontier. The years 1761-64 he passed in Paris, associating with the engraver Wille and with Greuze, Vernet, and other painters, chiefly occupied with landscape painting. In 1764-65 he was in Italy. He then returned to Lyons and devoted himself to etching. In 1761 he was appointed a *trésorier* in the bureau of general finance. The Revolution destroyed his fortune, but through the protection of the painter Jacques Louis David he was enabled to maintain a very influential artistic activity. In an age of classic convention he never ceased to be a sincere naturalist. His paintings are careful in execution, but somewhat monotonous in color. Examples, both in landscape and genre, are in the museums of Lyons, Nantes, the Louvre, Breslau, and Berlin. His numerous drawings are scattered throughout various collections, the Louvre alone possessing 20. He practiced all mediums, but was unrivaled in wash drawings. His etchings, 140 in number, and mostly after original designs, are among the very best of his day. They excel especially in beauty of tone. Consult the historical notice on Boissieu's life and works by Dechazelle (Lyons, 1810) and A. de Boissieu (Paris, 1878).

BOISSONADE, bwā'sō'nād', GUSTAVE-ÉMILE (1825-). A French jurist, the son of Jean François Boissonade, the famous Hellenist. He was born in Vincennes. He is best known through his important mission to Japan, whither he went in 1873 to draw up the principal

codes of the modernized legal system of Japan M Boissonade is also the author of the following valuable books *Histoire des droits de l'empire* (1852), *Histoire de la réserve héréditaire* (1873)—both crowned by the Académie des Sciences Morales, *Projet révisé de code de procédure criminelle* (1882), *Projet révisé de code pénal* (1886). He was decorated with the Legion of Honor in 1881.

BOISSONADE, JEAN FRANÇOIS (1774-1857) A French classical scholar, born in Paris, Aug 12, 1774, of a noble Gascon family. He was originally intended for an administrative career and from 1792 to 1795 held public offices, but after that date devoted himself to philology. He soon made himself known to the learned world by his contributions to the philological journals and was appointed professor of Greek in the University of Paris in 1812. In 1813 he was admitted to the Academy of Inscriptions, and in 1828 he succeeded Gail as professor of Greek literature in the Collège de France. His most important works are *Philostati Heroica* (1806), *Marini Vita Procli* (1814), *Tibullus Rhetor de Figuris* (1815), *Sylloge Poetarum Graecorum* (24 vols, 1823-26), *Philostati Epistulae* (1842), *Tzetzes, Allegoriae Iliados* (1851), *Babri Fabulae* (1844). Two other works, *Anecdota Graeca* (1829-33) and *Anecdota Nova* (1844), throw much light on Byzantine history and on the Greek grammarians.

He contributed in his earlier years numerous papers on philological subjects to Parisian, English, and German journals, and gave the cause of classical study in France a powerful and still perceptible impulse by his eloquent and attractive lectures from his chair. In addition to his many and laborious works in classical philology, he also signalized himself as a French lexicographer and belle-lettrist and was one of the most copious and valued contributors to the *Biographie Universelle*. He died Sept 8, 1857.

BOISSY D'ANGLAS, bwa'sē' dan'glas', FRANÇOIS ANTOINE, COUNT (1756-1826) A French statesman, born at Saint-Jean-le-Chambre, in the department of Ardèche. In 1789 he was elected a deputy of the States-General. While a member of the Constituent Assembly, he was accused of plotting to change the French monarchy into a Protestant republic. After the execution of Robespierre, whom he helped to overthrow, he became a member of the Committee of Public Safety (1794) and proved himself a man of marked ability. He was director of the supply of provisions for Paris during the riotous and sanguinary proceedings of the 13th Germinal and 1st Prairial in the year III of the Republic and in this capacity met the popular menaces with singular firmness. Subsequently he became President of the Council of Five Hundred, was a Senator under Napoleon, and a peer under Louis XVIII. He wrote *Recherches sur la vie, les écrits et les opinions de Malesherbes* (1819) and *Études littéraires et poétiques d'un vieillard* (1825).

BOITO, bō-ē'tō, ARRIGO (1842-) An Italian composer and librettist. He was born in Padua, Feb 24, 1842. It is an anomalous fact that Boito owes his musical fame to an opera, *Mefistofele*, which has been a comparative failure, and that this work despite its apparent lack of lasting popularity, should be considered epoch-making—one of the most important Italian musical products of the nineteenth century—because it forms the pivotal point on which Ital-

ian opera turned from mere tunelessness to the new dramatic school exemplified in the later Verdi and in Ponchielli, Mascagni, Puccini, and Leoncavallo. The writing of the libretto, the composition and remodeling of this "remarkable failure" occupied Boito for nearly 20 years. The son of cultured parents—his father was an Italian painter, his mother a Polish woman, a parentage which is supposed to account for the blending of southern and northern temperament in his artistic nature—he entered the Milan Conservatory in 1856. While studying there, he composed the garden scene in *Mefistofele* and other portions of the work. But the score was not finished and rearranged for stage production until 1868. Meanwhile, Boito had done much literary work and had lived in France, Germany and Poland. *Mefistofele* was produced on March 5, 1868, at La Scala, Milan. The performance lasted six hours, and though it had several repetitions (amid scenes of disorder, due to hissing and applause, which caused the work to be withdrawn by order of the public authorities), its failure was undoubted. Boito again remodelled the opera, among other changes making Faust a tenor, instead of a barytone, role. In 1875 the revised version was produced in Bologna with great success, which was repeated in other European cities. Nevertheless, it has not maintained itself as a popular opera in the repertoire. In this country *Mefistofele* was produced at the Metropolitan Opera House, New York, in 1883, 1896, and 1901. Boito's other operas, *Ero e Leandro*, *Nerone*, and *Orestade*, have never been performed. The libretto of the first named he afterward gave to Bottesini (qv) and to Mancinelli (qv). He also wrote the libretti for Faccio's *Amleto*, Ponchielli's *Gioconda*, and for Verdi's *Otello* and *Falstaff*, and translated several of Wagner's works into Italian. Under the anagrammatic pen name of Tobio Gorria he published several novels.

BOIVIN, bwa'vin', MARIE ANNE VICTOIRE GILLAIN (1773-1841) A French midwife. She was educated in a convent and studied anatomy and midwifery at Etampes with a relative, the superior of the Hospitalières, and afterward at the Hôtel Dieu of the same place. She received the degree of M D from the University of Marburg. After the death of her husband she took the place of midwife in the Maternity Hospital and in 1801 became chief overseer. She caused the establishment by Chaptal of a special school of accouchement. Her *Mémorial de l'art des accouchements* (1812) is a well-known work. She is also author of *Mémorial sur les hémorrhagies internes de l'utérus* (1818), *Recherches sur une des causes les plus fréquentes et les moins connues de l'avortement* (1828), *Traité pratique des maladies de l'utérus et de ses annexes* (2 vols, 1832-33).

BOJADOR (Portug pron bō'zha-dō'r'), CAPE (Portug one that juts or bulges) A headland on the west coast of Africa, in lat 26° 7' N, long 14° 30' W, at the northern coast boundary of the Spanish possessions (Map Africa, C 2). In consequence of its extreme flatness, and the shoreward tendency of the currents, the coast, extending northward to Cape Nun, abreast of the Canary Islands, is very dangerous for navigation. The Portuguese doubled this cape in 1483, and from them it received its name "Bojador Cape," signifying 'a round cape'.

BOJANO, bō-ya'nō (anciently, Samnite *Boevanum*, Gk. *Bolavor*, *Boananon*) A city in the

province of Campobasso, in the province of Abruzzi e Molise, south Italy, on the Biferno, 18 miles southwest of Campobasso (Map: Italy, J 6). It lies in a deep valley on the northeast slope of the Matese Mountains, which for four months of the year shut off the light of the sun. It is the seat of a suffragan bishop and has a cathedral, five churches, and a seminary. There are ruins of a Roman theatre and a temple and of the walls of the ancient Bovianum, which during the Samnite wars was often besieged. During the Second Punic War it was several times the headquarters of the Roman army, and in the great Social War the Confederates, on the fall of Corfinium, made it their capital. It has suffered greatly from earthquakes, especially in 1805. Pop. of commune, 1901, 6337; 1911, 6439.

BOJAR, bô-yâr'. See BOJAR.

BOJER, bô'yér, JOHAN (1872-). A Norwegian author, born in Drontheim and reared there as an orphan by a laborer's family. While working for a merchant he got time to attend the Latin school. His first drama, *A Mother*, secured him a scholarship, which enabled him to continue his education. His works include the historical drama *Olaf den Hellige* (1897), and the stories *Helga* (1896), *Den evige Krug* (1899), *Moder Lea* (1900), *Troens Magt* (1903). He also wrote *Vortrige* (1908); *Kjærlighetens oie* (1910); and the novel, *Luv* (1911).

BOK, bok, EDWARD W. (1863-). An American journalist. Born in Helder, Holland, he came to the United States in 1869, had a public-school education, and was for a time in the employ of Henry Holt and Company and Charles Scribner's Sons, publishers. In 1886 he formed the Bok Syndicate Press, which handled Beecher's sermons and did a large business. He edited *The Beecher Memorial*, 1887. In 1889 he became editor of *The Ladies' Home Journal* of Philadelphia, which, under his editorial supervision and the ownership of Cyrus H. K. Curtis (q.v.) reached an enormous circulation and gained a position of great influence. Bok published *Successward* (1895) and *Keys to Success* (1900).

BOKELMANN, bô'kel-mân, CHRISTIAN LUDWIG (1844-94). A German genre and portrait painter. He was born at St. Jürgen near Bremen, and studied under Wilhelm Sohn at the Düsseldorf Academy. His earlier pictures depend for their effect chiefly upon the literary anecdote; but in his later works he rises to an impressive and characteristic delineation of the life of the people, with good plain-air effects. The best of his works are "House of Sorrow" (1873); "Pawnbroker's Shop" (1876, Museum, Stuttgart); "Opening of the Will" (1879); "A Village Fire"; "Strike of Laborers"; "North Frisian Peasant House" (1888), and "Alone" (1892), perhaps his masterpiece, the last two in the National Gallery, Berlin. His portraits are conceived in a pictorial sense and are well characterized.

BO'KER, GEORGE HENRY (1823-90). An American poet, dramatist, and diplomatist, born in Philadelphia. He was the son of a banker, graduated at Princeton in 1842, studied law, but did not practice, and after a tour in Europe published a volume of poems, *The Lesson of Life* (1847). His tragedy *Calagnos* (1848) was staged with success, and he produced many others: *Anne Boleyn*, *Leonor de Guzman*, *Francesca da Rimini*, *The Betrothed*, and *The Widow's Marriage*. Of these, *Francesca da Rimini*

is considered the best. It has been revived several times by Barrett and other actors. Boker collected his *Plays and Poems* in two volumes in 1856. The Civil War inspired him to much patriotic poetry, which made up his *Poems of the War* (1864). Later volumes of verse were *Street Lyrics* (1869), *Königsmark and Other Poems* (1869), *The Book of the Dead* (1882), and *Sonnets* (1886). The interval between these last volumes he spent largely in diplomatic service. He was appointed Minister to Turkey in 1871 and was transferred to Russia in 1875, where he remained till 1879. Boker's poems and dramas are much above the average in style and power, but have never achieved real popularity. His last book was a volume of *Sonnets* published in 1886.

BOKHARA, bô-khârâ, or BUKHARA. A Russian protectorate in Central Asia, bounded by Russian Turkestan on the north, the Pamir region on the east, Afghanistan on the south, and the Russian Transcasian Territory and Khiva on the west (Map: Asia, Central, J 2). It lies approximately between lat. 37° and 42° N. and long. 62° and 72° E. The extent of its area cannot be ascertained with accuracy, owing to the unsettled state of some of the boundary lines. General estimates vary from 80,000 to 93,000 square miles.

A considerable extent of the country consists of desert land and steppes interspersed with fruitful oases. The eastern part is very mountainous. The most fertile and cultivated regions are found along the rivers. The chief river is the Amu Darya, which forms the southern boundary and flows close to the western boundary and with its tributaries drains a large part of the country. The Zarafshan flows through the northwestern part, losing itself in the sands a short distance from the Amu Darya. The climate is warm and generally healthful. The summers are hot, and the winters very cold, with considerable snowfall. The rainfall is very scant, and occurs mostly in the spring.

The dry climate of Bokhara makes it necessary to utilize almost all the smaller rivers for irrigation. The oases and valleys are exceedingly fertile, and agriculture is a flourishing industry. The chief agricultural products are wheat, rice, barley, tobacco, lucerne, flax, cotton, and dye plants. There are also produced large quantities of fruit, including several varieties of grapes, peaches, apricots, and nuts. Sericulture is carried on. Sheep raising is also an important industry, the skins of the native lambs being exported to Russia for making coats. Horses, cattle, goats, and camels are also raised. The manufacturing industries of Bokhara are chiefly confined to the production of textiles and are carried on on a very small scale and by the most primitive methods. The chief products are cotton and woolen fabrics, silk, coarse cloth, and a kind of felt called *koshma*, leather goods, including footwear and saddles, and small metal products, such as knives, locks, etc. The mineral industry is as yet undeveloped. Salt and gold are mined, the latter by the Russians in Safet-Darya; iron and copper are found.

The foreign commerce of Bokhara is quite important, owing to its central location, and Bokhara, the capital, although it has lost a considerable portion of its commercial importance and splendor, is still considered an im-

portant seat of commerce in Central Asia. The trade is chiefly with Russia, India, and Persia, and is carried on mostly by means of caravan routes and the Transcaspian Railway, as the wagon roads are very few and in poor condition. The main imports are manufactured goods, sugar, tea, indigo, drugs, etc. Exports are lambskins, cotton, silk, and agricultural products. The Transcaspian Railway, which runs through Bokhara for about 186 miles, has had a very good effect on the commerce of the country, which has considerably advanced under the protection of Russia. The capital is connected by telegraph with Tashkent.

Bokhara is an absolute monarchy, the ameer being invested with unlimited powers. The immediate administration is in the hands of several high officials, each at the head of a separate department. For purposes of administration Bokhara is divided into districts, administered by beks, who are obliged to turn a certain sum of money every year into the treasury of the ameer, in addition to suitable gifts, consisting mostly of cattle, etc. The beks are not paid by the government, but are expected to get their share out of the taxes collected by them. The army consists of a regular force and a militia, and is recruited chiefly from volunteers, but in case of a holy war every Mussulman capable of bearing arms is liable to military service. The standing army numbers 11,000 men, only a small portion being armed and drilled according to Russian methods. It is practically fit only for police duty. There are about 20 guns, mostly made of copper, served by 600 artillerymen.

The population is estimated at about 1,500,000 (10,508 Russians). It consists mainly of Uzbeks, Kirghiz, who are largely nomadic, Tadzhiks, Turkomans, Arabs, Afghans, Sarts, Persians, and some Jews and Russians. The prevailing religion is Mohammedanism. With the exception of Bokhara (qv), the capital, and Karshi (pop. about 25,000), there are few towns of any importance.

History. Bokhara was in ancient times called Sogdiana, and sometimes Transoxiana, and was inhabited in antiquity by Iranian tribes professing Zoroastrianism. At a very early period the country was invaded by Iranian newcomers, who were Buddhists, and a long struggle ensued between the two, in which the difference in religion played no less important part than that of race. It was conquered 640-642 by the Arabs, who brought with them the faith of Islam, and Bokhara was a field of incessant contests and fighting, until, with the rise of the Samanid dynasty, in the latter part of the ninth century, it became a mighty monarchy, the bulwark of Islam, and a great centre of learning. The dominions of Bokhara at that time reached down into Afghanistan and Khurasan. At the end of the eleventh century the country, together with much of the Mohammedan world, was conquered by the Seljukian Turks. Under the rulers of that period (1004-1133) Iranian and Arabic continued as the languages of culture, Turkish being employed by the court for conversation only. After that Bokhara was a bone of contention between competing rulers, until conquered by Genghis Khan in 1220, when the capital was burned to the ground, the kingdom devastated, and most of the inhabitants slain. For a century and a half these invaders ruled over Bokhara. Having

embraced Mohammedanism, they favored their kindred, the Turks, so that the latter soon gained the ascendancy. Under Timur, or Tamerlane (died 1405), Bokhara became of great political and commercial importance, its capital, Samarkand, being full of gorgeous palaces, splendid mosques, and very extensive gardens. After his reign, however, it became the arena of bloodshed and was for nearly 100 years, until conquered by the Turko-Mongolian Uzbeks, about the year 1500, which marks the beginning of Bokhara's decline. With the single exception of the scholarly Abdullah-Khan (in the sixteenth century), her monarchs have been typical Oriental rulers, cruel and steeped in fanaticism. Nasrulla-Khan (1827-60) was perhaps the most infamous in a long series of infamous potentates. It was he who caused, in 1842, the death of Colonel Stoddart and Captain Conolly, who went on a mission to Bokhara. Dr. Wolff, who visited the country in 1844, with a view to ascertain their fate, narrowly escaped with his life, after a detention of some months. By the middle of the nineteenth century the steady, aggressive expansion of Russia in Central Asia cast a shadow on the Khanate of Bokhara, and a clash of arms became imminent, unless the Khan were to submit to the rule of the Czar without resistance. In 1865 the Russians occupied Tashkent, and Khan Mozaffaredin, son of Nasrulla, accepted this as a challenge to open hostilities. He took the field in person, but his army was badly defeated at Ijaj, on May 20, 1866. The Russians pushed farther and after many successful battles entered Samarkand, in May, 1868. The fortress of Katti-Kurghan was then stormed and taken, and on June 14 the Ameer was completely defeated on the Zerabulak Heights. By the terms of the peace concluded in July, 1868, Samarkand, and the Katti-Kurghan, Penjekent, and Urgut districts—the best portions of the Zerashan valley—were ceded to Russia. Besides paying 500,000 rubles (about \$250,000) indemnity the Ameer granted special privileges to Russian trade. This final blow brought Bokhara into Russian vassalage. In return for complete obedience, the Russians gave the Ameer active assistance in suppressing revolt within his possessions. Thus, in 1868, the Russians dispersed the hordes of rebels who wanted to enthrone the Ameer's eldest son, Abdul-Malik-Mirza. After the Russian expedition against Khiva (1873) Bokhara was given a large strip of Khivan territory for supplying the Russian army of invasion with camels and provisions. In 1877 the territory of Bokhara was expanded eastward by the conquest of Darwaz and Karategin. During the intervening years the Russian government pushed forward its imperialistic policy, putting down rebellions here and there and at times with great loss. In 1885 the present Ameer, Sayyid-Abdul-Ahad, came to the throne. In 1886 he abolished slavery. He visited St. Petersburg in 1893 and left there the heir to the throne to be given a Russian education. The Ameer, though tractable to the Russian government, continues to symbolize to a certain measure that national particularism which is so characteristic of the people of the Khanate.

Consult Vámbéry, *History of Bokhara from the Earliest Period to the Present Time* (London, 1873), Cuzon, *Russia in Central Asia* (1889) and *The Pamirs and the Source of the*

Oxus (London, 1897); Le Messurier, *From London to Bokhara* (London, 1899); O'Donovan, *The Merv Oasis* (2 vols., London, 1880); Reclus, "Asiatic Russia and the Middle Asiatic Khanates," in *Universal Geography* (Paris, 1876-94); Capus, *A travers le royaume de Tamerlan* (Paris, 1892); Rickmers, "Travels in Bokhara," *Geographical Journal*, vol. xiv (London, 1899); Skrine and Ross, *The Heart of Asia* (London, 1899); Olafsen, *The Emir of Bokhara and his Country* (London, 1911).

BOKHARA (Mongol. *bulhar*, church). The capital of the khanate of the same name, and one of the most important commercial centres of Central Asia, situated in a valley near the river Zerashan, and only a few miles from the Transcasian Railway (Map: Asia, Central, J 2). It is irregularly built and surrounded by a high wall. The streets are narrow and crooked and mostly unpaved. The houses, built, as a rule, of unburned brick, are low and without windows on the streets. Bazaars, both covered and open, are numerous and well stocked with Oriental wares as well as with European manufactures. Bokhara has as many mosques as streets, a few of them noteworthy. The chief is the Mirgharab, surmounted by a cupola 100 feet high, covered with blue tiles. Adjoining it is the high minaret which was used until 1871 for the execution of state criminals by hurling them from its top. The citadel is situated on an artificial elevation and contains the palace of the ameer, the houses of the higher officials, the jail, and the water cisterns. The city is intersected in several directions by a canal, which is spanned by numerous bridges. Bokhara is a centre of culture and Islamicist erudition, and contains about 60 high madrasahs as well as a large number of minor ones. There are a considerable number of manufacturing establishments, producing silk fibres, coarse cloth, blades, and metal articles. The commerce is carried on to a large extent in articles of Russian manufacture, textiles, leather goods, etc. A few miles distant from the capital, on the railway line, is situated a small Russian settlement named New Bokhara, or Kagan, containing about 2000 inhabitants. The population of the capital is estimated at about 70,000.

BOKHARI. See BUKHARI.

BOL, bōl, FERDINAND (1616-80). A Dutch portrait and religious painter. He was born in Dordrecht and studied with Rembrandt soon after the latter came to Amsterdam (1631). He was one of the master's cleverest pupils, and his earliest works, both paintings and etchings, are sufficiently good to have been confused with Rembrandt's. His later style is more elegant and less virile. For a time he was the most popular portrait painter in Amsterdam; he made two wealthy marriages and occupied an honored position. Of his portrait groups the best are the "Regents of the Leper Hospital" (1649), in the Town Hall, and the "Regents of the Poor House" (1657), in the Rijks Museum, Amsterdam. The best known of his portraits are those of Admiral de Ruyter (1699, Rijks Museum, Amsterdam, and Copenhagen), and of his son Engel de Ruyter (The Hague). Among his best religious subjects are "Repose on the Flight to Egypt" (1644, Dresden), "Joseph Interpreting his Dream" (Schwerin), and "The Women at the Sepulchre" (Copenhagen). Bol is well represented in practically all German and

Dutch museums, especially in those of Amsterdam, Berlin, Cassel, Frankfurt, and Munich, as well as in Paris, London, Stockholm, Copenhagen, and St. Petersburg.

BOLA BO'LA, or **BO'RA BO'RA**. One of the Society Islands (q.v.), about 200 miles to the northwest of Tahiti, in lat. 16° 30' S. and long. 152° E. (Map: World, L 6). It rises to a height of nearly 2400 feet, is fertile, and has a population of about 1800 inhabitants.

BOLAK. See UNIVERSAL LANGUAGE.

BOLANDEN, KONRAD VON. See BISCHOFF, JOSEPH EDUARD KONRAD.

BOLAN (bō-lan) **PASS.** A defile in the mountains of British Baluchistan on the great highway leading up from the Indus via Shikarpur, Dadar, and Quetta to Kandahar (Map: Asia, F 5). It extends northward from the neighborhood of Dadar, for a distance of about 55 miles, until it reaches a plateau nearly 5800 feet above the sea. The average ascent is about 90 feet to the mile. It is bounded throughout by eminences 500 feet in height. A military railroad has been constructed by the British through the Bolan Pass to connect Sindh with Kandahar. It is now completed as far as the border of Afghanistan.

BOLAS, bō'lās (Sp. *bola*, ball, from Lat. *bullo*, bubble, round object). A hunting weapon used by various tribes of Mexico and South America, particularly those of the Pampas. It consists of three leather-covered balls of clay or stone, radiating from a central knot and attached to the end of a stout rawhide rope. It is thrown from horseback in such a way as to entangle the legs of the animal and hold it until the hunter comes up.

BOLBEC, bōl'bēk'. A town of France in the department of Seine-Inférieure, about 18 miles from Havre (Map: France, N., F 3). The Bolbec, on which it stands, supplies water power for its mills, where cotton, woolen, and linen goods are manufactured. It has also considerable trade in grain, horned cattle, and horses. Pop., 1901, 11,663; 1911, 11,080. Consult "Cités Ouvrières de Bolbec," in *Nouvelles Annales de la Constitution* (Paris, 1878).

BOLDINI, bōl-dē'nē, GIOVANNI (1845-). An Italian genre and portrait painter, belonging to the Parisian school. He was born in Ferrara, the son of a painter of religious subjects, and studied at the Academy of Florence. He attained great success as a portrait painter in London, but in 1872 he removed to Paris, where he has been identified with the progressive element in French painting. He is a member of the Société Nationale des Beaux-Arts, has received numerous medals, and is Chevalier of the Legion of Honor. His art is essentially Parisian—chic, piquant, and sparkling with esprit, and he is master of a brilliant and highly modern technique. Among his principal paintings are "The Connoisseur," "Gossip," "Delivering the Despatch," "Kitchen Garden," "Repose in the Atelier," and the delightful "Spanish Dancer," often reproduced in prints. He is represented in the Luxembourg by the "Portrait of a Lady" and "Au Luxembourg," and in the National Gallery, Berlin, by a portrait of Menzel. The Vanderbilt collection (Metropolitan Museum, New York City) possesses two fine examples, "Ladies of the First Empire" and "Des Parisiennes"; the Brooklyn Institute Museum the remarkable portrait of his friend Whistler.

BOLDREWOOD, bôl'dër-wud, ROLF (Thomas Alexander Browne) See AUSTRALIAN LITERATURE

BOLE (Gk βῶλος, *bôlos*, lump of earth, clod, nugget) A hydrous aluminum silicate that is found massive, and constitutes a variety of halloysite. It is a clay-like body, containing more or less iron oxide, which gives it a yellowish to red-brown or dark color. It has a conchoidal fracture, and when thrown into water falls to pieces. It is unctuous to the touch, and some varieties adhere to the tongue. It is found in Armenia, Italy, France, Germany, Iceland, Scotland, and South America. Bole is used as food by the natives of certain parts of South America, and by the Japanese it is favorably regarded as a means for producing leanness. *Armenian bole* is of a bright-red color, due to the oxide of iron that it contains, and has been used as a dentifrice. It has also been prescribed as a tonic and as an astringent medicine, finding in recent years its most important use in veterinary practice. *Lemnian bole* is of similar character and is obtained from the island of Lemnos. When calcined, washed, and ground, it is applied as a pigment and is known variously as *Blois bole*, which is yellow in color, *Bohemian bole*, which is yellowish red, *French bole*, which is pale red, and *Silesian bole*, which is pale yellow.

BOLERO, bô-lä'rô (Sp) A Spanish national dance, mostly in the time of a minuet, with a sharp, marked, and peculiar rhythm. It is accompanied with the castanets and the cithern and frequently also with the voice. The dancer in the movements seeks to represent the different degrees of feeling from coyness to the highest ecstasies of love. The term has, by extension, come to be applied also to the air to which it is danced, and some composers (notably Moszkowsky) have named their dance music "boleros."

BOLETUS (Lat *boletus*, from Gk βῶλην, *bôlêta*, a kind of fungus) A genus of Basidiomycetous fungi of the family Boletaceæ. The older botanists included it in the numerous species now forming the genus *Polyporus* (see AMADOU, DRY ROT) and other genera, but even as now restricted, it is a very extensive genus. Many of the species resemble the common mushroom and other species of *Agaricus* in form, but instead of gills, the under side of the cap (*pileus*) is occupied by a layer quite distinct from it in substance, and pierced by pores so as to be composed of a multitude of small tubes on the inside of which the spore cases or seed vessels are produced. Some of the species are edible. *Boletus edulis* is much used in France, also in Germany, Hungary, Russia, etc. It is the *ceps ordinaire* of the French markets. It grows on the ground in woods, in places covered with moss, heath, or grass. In moist, warm summers it sometimes appears in immense quantities, attaining a size of 6 inches or more across. The tubes are removed with the skin and stem, and only the flesh of the cap is eaten, which is firm, white, delicate, of agreeable smell, and is prepared like the common mushroom. For illustrations, see Colored Plate under FUNGI, EMBLE.

BOLEYN, bôl'en, ANNE (1507-36) Queen of England as second wife of Henry VIII. She was the mother of Queen Elizabeth. The date of her birth is given as 1501 or 1507, the latter being the more probable. The family name is frequently found in contemporary writings as Bullen, Bouleyn, Boullan, or Boulain. She was

the daughter of Sir Thomas Boleyn, afterwards Earl of Wiltshire and Ormond. In her twelfth year Anne went to France, where her elder sister, Mary, had previously accompanied. Mary Tudor, the affianced bride of Louis XII of France, and sister of Henry VIII. She remained at the French court three years, and soon after her return to England was wooed by Lord Henry Percy, the heir to the earldom of Northumberland, and by King Henry himself, who, in April, 1522, began to shower wealth and honors on her father, and before this had dishonored her sister Mary Henry's "religious scruples" regarding the lawfulness of his marriage with Catharine became too urgent for the slow decision of the court of Rome, but not till the King's divorce was set afoot (in May, 1527) did Anne favor his addresses. However, long before Cranmer pronounced the divorce (May 23, 1533), she was Henry's mistress, and in the preceding January they had been secretly married. She was crowned with great splendor in Westminster Hall on Whitsunday, but within a few months Henry bade her "shut her eyes to his unfaithfulness, as her betters had done, for he could abase yet more than he had raised her." His cooling passion was not revived by the birth (September, 1533) of the Princess—afterwards Queen—Elizabeth. The new Queen, naturally light and gay of heart, and educated at the French court, where these qualities were likely to be developed to the utmost, conducted herself toward the courtiers with an easy familiarity not customary in England for one in her position. Concerning the first two years of her married life we have little information. It is said that she was favorable to the Reformation, and promoted a translation of the Bible. In January, 1536, the Queen gave premature birth to a son. The mishap is said to have been caused by learning of the King's newly developed passion for Jane Seymour, her successor. The King became more and more estranged, and her freedom of manners had given but too good grounds for her enemies to speak evil of her. On May 1 the annual tournament was held at Greenwich, in the presence of the King and Queen. The tilting had commenced, the challengers being Viscount Rochford, brother to the Queen, and Sir Henry Norris, one of the gentlemen of the King's Privy Chamber. Suddenly the King rose, his outward bearing manifesting inward disturbance, left the tourney, and with a small party rode up to London, leaving the Queen at Greenwich. The popular account is that the King had seen her drop a handkerchief into the lists in order that one of her presumed lovers might wipe his face, but the necessity for any such romantic and sudden pretense of jealousy is annulled by the fact that in the previous week a commission composed of members of the Privy Council had been secretly engaged in examining charges of adultery against Anne, indeed, two of her alleged accomplices, Sir William Brereton, a gentleman of the King's household, and Mark Smeton, a musician at court, had already been arrested. The Queen remained at Greenwich that night. On the following morning she was examined before the Privy Council, and protested her innocence. In the afternoon she was sent up the river to the Tower. Sir Henry Norris and Sir Francis Weston, another courtier, along with Smeton, were also examined, and all at first declared their innocence of the charge imputed to them, but under torture, the musician con-

fessed to the crime. In the Tower, the Queen's every action and word were watched and reported; but anything she said while a prisoner seems quite as compatible with innocence as with guilt. Her letter to Henry, written on May 6, speaks decidedly in her favor, but this letter is now supposed to be a fabrication of the time of Elizabeth. On the 10th of May the Grand Jury of Middlesex found a "true bill" on the indictment which charged the Queen with committing adultery with no less than five persons, including her own brother, Lord Rochford, and of conspiring with them, jointly and severally, against the life of the King, the adultery being alleged to extend over a period of nearly three years. On the 11th the Grand Jury of Kent also found a true bill. On the 12th the four commoners, Brereton, Weston, Norris, and Smeton, were found guilty, the last confessing to the charge of adultery only, the other three pleading not guilty to both charges. With her case thus prejudged, on the 15th the Queen and her brother were tried before 27 peers. Their uncle, the Duke of Norfolk, was president, and their own father was one of the judges. The accused affirmed their innocence, but were found guilty and condemned, the Queen to be burned or beheaded on the Tower Green. On the 17th Smeton was hanged, and the other four beheaded; general protestations of unworthiness by them at the hour of death being regarded by some historians as evidence of guilt. On the 19th, the Queen was beheaded, with her last words, praying a blessing on Henry, who, she said, had ever been to her a good and gentle lord, but making no confession of guilt. Henry was betrothed to Jane Seymour the next day.

It is difficult to form anything like a just and satisfactory estimate of the character of Anne Boleyn—historians, for the most part, having made her but a lay figure upon which to hang the drapery of religious partisanship, or to display the colors of individual sympathy. That she was guilty of adultery with Henry is certain; but that she was guilty of the other heinous offenses laid to her charge remains at least not proved, and it is a suspicious fact that every trace of evidence has vanished. The character of this "mother of the English Reformation" was not saintly; but she was not the Jezebel that Saunders, the Jesuit, would have us believe. According to him, she was even in person ugly, misshapen, monstrous; but although Holbein's portraits do not confirm the statements of others that she was "comely," we know that she had beautiful eyes and hair, and that her only positive defect was a supplemental nail. Consult: "Letters and Papers of Henry VIII.," "Love Letters of Henry VIII to Anne Boleyn" in *Harleian Miscellany*, vol. iii (London, 1744). The best biography, Catholic in general tone, is Friedmann, *Anne Boleyn* (London, 1885). For Henry's side consult Froude, *History of England* (New York, 1871). The best account of the period is Pollard, *Henry VIII* (London, 1905).

BOLGARY, bôl-gá'ri (Russ. the Bulgarians). Also called **USPENSKOYE**. A village in the government of Kazan, Russia, about 16 miles from Kazan, and 4 miles from the Volga. It is well known for the historical remains it contains in the form of buildings, walls, minarets, etc. It occupies the site of Bolgar, called by the Russian chroniclers Veliki Gorod (the 'Great Town'), capital of the old Bulgarian Kingdom. The time of its foundation is unknown. But in

the writings of Ibn-Khankal, in the latter half of the tenth century, it is stated that after the town had been ravaged by two victorious Russian armies it still had a population of about 10,000. At a much later period, when Bolgary was conquered by the Mongols, the old capital declined considerably. Sacked and almost destroyed by Timur ('Tamerlane') in the fourteenth century, it was completely ruined at the time of the fall of the "Golden Horde."

BOLGRAD, bôl-grád' (for *Byelgrad*; see *BELOGRADE* for derivation). A town in the government of Bessarabia, Russia, on Lake Yalpukh, situated about 75 miles southwest of Akerman (Map: Russia, C 5). It trades in grain and produces brick and tallow. Pop., 1897, 12,388, mostly Bulgarians.

BOLI, bô'le, or **BOLY** (corrupted in popular speech from Gk. πόλις, *polis*, the city, from Hadrianopolis; cf. Turk, *Stambul*, Constantinople, for *eis tîn pólin*, *eis tîn polin*, to the city). A town of Asiatic Turkey, in the vilayet of Kastamuni, on the left bank of the river Boli, and 136 miles east of Constantinople (Map: Turkey in Asia, D 2). The town occupies an eminence at the extremity of a fertile plain. It has several mosques, and in the vicinity are the historic ruins of the birthplace of Antinous. There are manufactories of leather, cotton, and wool, and a lively trade in timber is carried on. Boli is on the caravan route from Constantinople to Erzerum. Pop., estimated at 11,000.

BOLIDE. See *METEORS*.

BOLIN, bô'len, **ANDREAS WILHELM** (1835-). A Finnish scholar, philosopher, and author. He was born in St. Petersburg, studied in Helsingfors, and was appointed professor of philosophy in 1865, and in 1872 university librarian. In philosophy he is a disciple of Ludwig Feuerbach. His principal works are: *The Family* (1864); *European Public Life and the Political Doctrines of Philosophy* (2 vols., 1868-71); *Doctrine of the Freedom of the Will* (1868); *Ludwig Feuerbach, His Influence and Contemporaries* (1891); *The Beginnings and Development of Religion* (1909); and an edition of Shakespeare's works in Hagerberg's translation with the Gilbert illustrations (2d ed., 1899).

BOLINGBROKE, bôl'ing-bruk, formerly bul'ing-bruk, **VISCOUNT HENRY ST. JOHN** (1678-1751). An English statesman, orator, and author. He was born at Battersea, Oct. 1, 1678. He was educated at Eton, and, it is said, at Oxford; but the only ground for this assertion is that of the honorary degree conferred upon him by the university in 1702. During 1698-99 he resided on the Continent, and acquired a knowledge of the French language, which was afterwards of service to him. His early manhood was notorious for extreme licentiousness, but having entered Parliament in 1701, he devoted himself to politics and, joining the Tory party, soon made himself prominent as an orator. In 1704 he was made Secretary of State for War. This office he retained till 1708, when the Whigs came into power, after which he retired from politics, and gave himself up to study, but still retained great influence as the Queen's favorite counselor. On the fall of the Whig party in 1710, he was made Secretary of State for Foreign Affairs. In 1712 he was called to the House of Lords with the title of Viscount Bolingbroke, and in 1713, against the wish of nearly the entire nation, concluded the Peace of Utrecht. Having previously quarreled with his old friend

Harley—now Earl of Oxford, and his most powerful rival—he contrived his dismissal in July, 1714, and immediately proceeded to form a strong Jacobite ministry, in accordance with the well-known predilections of his royal mistress. Her death, however, three days later, disconcerted his schemes, and the accession of George I proved a deathblow to his prospects. On the 28th of August he was deposed from office, in March, 1715, he fled to France, and in August of the same year was attainted. For some time he held the office of Secretary of State to the Pretender, but his restless and ambitious spirit yearned for the 'large excitement' of English politics. His efforts to obtain a pardon not proving in the meantime successful, he retired to a small estate which he had purchased near Orleans. In 1718 his first wife died, and in 1720 he married the rich widow of the Marquis de Vilette. A judicious use of this lady's wealth enabled him to return to England in May, 1725. His property was restored to him, but he was never permitted to take his seat in Parliament. He therefore betook himself to his villa at Dawley, near Uxbridge, where he occasionally enjoyed the society of Swift, Pope, and others of his old friends, with whom he had corresponded in his exile, and where he diversified his moral and metaphysical studies by his attacks on the ministry in his periodical, *The Craftsman*, in which the letters forming his *Dissertation on Parties* first appeared. In 1735, finding his political hopes clouded forever, he went back to France in chagrin, and continued there till 1742. During his second residence abroad he wrote his *Letters on the Study of History*, in which, as a Deist, he violently attacked the Christian religion. He is believed to have influenced the thought of Voltaire. It was also during this period that he wrote his famous *Patriot King*, an attempt to create in England the idea of "benevolent despotism" then so prevalent on the Continent. He died, after a long illness, in 1751. Bolingbroke has been styled the Alcibiades of his time, and was admired by his contemporaries for his graceful person and charming manners. His talents were brilliant and versatile, his style of writing was polished and eloquent, and repays study to the present day, but the lack of sincerity and honest purpose which characterized him, and the unscrupulous ambition which made him aim for power, hindered him from looking wisely and deeply into any question. His philosophical theories are not profound, nor are his conclusions solid, while his criticism of passing history is worthless. His collected writings were published by Mallet (London, 1753-54).

Bibliography. Goldsmith, *Life of Lord Bolingbroke* (London, 1770), Collins, *Bolingbroke A Historical Study* (London, 1886), Sichel, *Bolingbroke and his Times* (2 vols., London, 1901, 1902), Stephen, *Religious Thought in the Eighteenth Century* (New York, 1876), Lecky, *England in the Eighteenth Century* (7 vols., London, 1892).

BOLINTINEANU, bô-lân-tâ-nê-an', DIMITRI (1826-72) A Rumanian poet and journalist, born at Bolintina, Wallachia. He was a member of the civil service, but lost his post through the publication of political articles and poems. Subsequently, at the time of the revolutionary outbreak against the Russian protectorate, in which he took a prominent part in his journal, *Poporul Suceran*, which he founded (1848), he was proscribed and fled the country (1849).

After his return he was appointed Minister of Public Instruction (1859). He was the representative poet of the Rumanian Renaissance. In addition to his *Rumanian Melodies* (1858) and other verse, he wrote diamas, satires, and works of fiction. Selections from his poetry were translated into French under the title *Bruses d'orient* (1866), and other selections into German by Carmen Sylva under the heading *Rumanischen Dichtungen* (3d ed., 1889). His poems were collected and published in 2 vols. (Bucharest, 1877).

BOLÍVAR, bô-lí-vêr A city and the county seat of Polk Co., Mo., situated 1071 feet above sea level, 39 miles north-northwest of Springfield, on the St. Louis and San Francisco Railroad (Map Missouri, C 4). It has a considerable trade in apples, poultry, eggs, cattle, horses, and mules. The city is the seat of the Southwest Baptist College, opened in 1878. Settled about 1835, Bolivar was incorporated in 1855 and is now governed under a charter of 1881, which provides for a mayor elected biennially and a city council. The water works and electric light plant are owned and operated by the municipality. Pop., 1890, 1485, 1900, 1869, 1910, 1975.

BOLÍVAR, bô-lê-var A northern department of the Republic of Colombia, bounded by the Magdalena River on the east, the department of Antioquia on the south, Cauca on the west, and the Caribbean Sea on the west and north. It covers an area of 24,880 square miles (Map Colombia, B 2). It has a low surface, mostly still overgrown with thick forests and very little cultivated. Its chief rivers are the Magdalena with its tributary, the Cauca, and the Sinú, all navigable. The climate is hot and extremely unhealthy, especially for those accustomed to the temperate zone. Pop., about 227,000. Capital, Cartagena (q v).

BOLÍVAR The largest state of Venezuela, bounded by the Orinoco on the north, Colombia on the west, the territory of Alto Orinoco and Brazil on the south, and the territory of Yuruay on the east (Map Venezuela, E 2). Some cartographers include Yuruay as part of the state of Bolívar, which thus is made to extend to British Guiana. It covers an area estimated at 88,700 square miles and has a population (1904) of 55,217. Capital, Ciudad Bolívar (q v).

BOLÍVAR, Sp. pron bô-lê-var, SIMÓN, or BOLÍVAR Y PONTE, ã pôn'tá (1783-1830) A South American patriot, called the "Liberator." He was born in Caracas, July 2, 1783, of a noble and wealthy family. After studying law in Madrid, he traveled extensively on the Continent, married, and returned to his native country, where his wife died. He then revisited Europe and in 1809 returned by way of the United States, where he became an enthusiastic admirer of republican institutions and resolved to free his own country from foreign despotism. Arriving at Venezuela, he at once associated himself with a secret organization of the patriots there, and after the insurrection of Caracas, April 10, 1810, he was sent to London to gain the interest of the British Cabinet. The British government, however, declared its neutrality, and Bolívar speedily returned. He fought under General Miranda in several successful engagements. In 1812 the Spaniards recovered possession of Venezuela, and Bolívar fled to Curaçao. He did not, however, remain long inactive, but won the sym-

pathy of the republican President of New Granada, raised a force of volunteers, defeated the Spaniards several times, his army increasing with each victory; and on Aug. 4, 1813, entered Caracas as a conqueror. He was hailed as the liberator of Venezuela and made absolute dictator in civil and military affairs. After defeating the Spaniards in several engagements, he was himself beaten in the battles of La Puerta and Aragua. He now went to Cartagena and afterward to Kingston, in Jamaica. In Haiti he assembled the insurgent refugees, landed (December, 1816) on the island of Margarita, where he convoked a congress, instituted a government, and proclaimed the abolition of slavery. The following two years were marked by successes over the Spanish general, Morillo. In February, 1819, a congress was opened at Angostura, and Bolívar, chosen President, was armed with the power of dictator. He conducted his forces over the almost impassable Cordilleras to New Granada, and achieved the victories of Tunja and Sojaca. Soon afterward (in 1819) New Granada united with Venezuela as the Republic of Colombia, of which he became the first President. By 1822 the new republic was completely cleared of royalist troops. Bolívar was summoned the same year to help the Peruvians, and in February, 1824, was named Dictator of Peru. By 1825 the Spaniards were driven from Peru also; and Bolívar, calling a congress at Lima, formally resigned the dictatorship. The southern part of the country, which had detached itself from the government of Buenos Aires, was erected into a separate state and named Bolivia (q.v.), of which he was chosen perpetual protector. A form of government suggested by him was adopted by Bolivia in 1826. Widespread dissatisfaction in Colombia, where, in spite of considerable opposition, he was confirmed in the presidency in 1826 and 1828, led to a conspiracy against his life, which was suppressed by the execution of the leaders and banishment of 70 accomplices. In 1829 Venezuela separated itself from the Republic of Colombia, which was generally disturbed by factions. Bolívar's ambition was loudly denounced, and, virtually forced to resign, he retired to Cartagena. He died at San Pedro, Dec. 10, 1830, having shortly before his death written a farewell address to the people of Colombia, in which he vindicated his character from the aspersions that had been cast on it and complained bitterly of ingratitude. The war of liberation and the peculiar elements with which he had to deal compelled him to assume dictatorial power; but there is no proof that he was ever insincere in his devotion to liberty. He spent 90 per cent of his fine patrimony in the service of his country, and although for a long time he had absolute control of the resources of Colombia, Peru, and Bolivia, he never made any private use of public moneys. He has been described as the Washington of South America. By a resolution of the Congress of Colombia in 1842, his ashes were removed with great pomp from Santa Marta to Caracas, where a monument was erected to his memory. In 1846 Bogotá built a statue in his honor; and the Peruvians followed suit with an equestrian statue erected in Lima in 1858. A statue of Bolívar was erected in Central Park, New York, 1884. Twenty-two volumes of official documents connected with the career of Bolívar were published by the government at Caracas in 1826-33, and his correspondence, in two volumes, at New York

in 1865. Consult Ducondrey-Holstein, *Mémoires de S. Bolívar* (London, 1830); Carlos A. Villanueva, *Bolívar y el general San Martín* (Paris, 1911); Jules Manin, *Bolívar et l'émancipation des colonies espagnoles des origines à 1815* (Paris, 1912), and *Cartas de Bolívar* (1700-1822), with prologue by José Enrique Rodó and notes by R. Blanco-Pombona (Paris, 1913).

BOLÍVAR (bo-lé'vár) CITY. See CIUDAD BOLÍVAR.

BOLIVIA, *Sp. pron.* bó-lé'vya (in honor of Simón Bolívar). An inland South American republic, situated in the western part of the continent, and extending from about lat. 10° S. to 22° 50' S., and from long. 58° W. to 69° 30' W. It is bounded by Brazil on the north and east, by Paraguay and Argentina on the south, and by Chili and Peru on the west. Its area is about 556,000 square miles.

Topography. Topographically Bolivia may be divided into two provinces: (1) a western highland and (2) an eastern lowland. The former province is a part of the mountain system of the Andes. In 18° S. lat., in Bolivian territory, this system changes from a northwest-southeast to a north-south trend; here it attains its greatest width, about 450 miles. On each side the Bolivian highland is bordered by a high range. The eastern chain, or Cordillera Real, contains some of the highest peaks of the two American continents: Illampu, or the Nevado de Sorata, and the Illimani, both over 21,000 feet high; Todos Santos, 19,500 feet; Choroque, 18,500 feet; and the Cerro de Potosí, 15,500 feet. In the western range the peaks are generally much less lofty, but they include the giant volcano Sajama, 21,000 feet in height. Between the two ranges lies the region known as the Bolivian Plateau, or *Altiplano*, with an elevation of 12,000 to 13,000 feet. It contains Lake Titicaca (q.v.), which lies at an elevation of 12,500 feet—only the southeastern half is Bolivian—Lake Poopó and other lakes which are believed to be remnants of an inland sea. The mountain chains of Bolivia include many volcanoes, some of which are active at the present time. Cretaceous formations are found in the western range, while in the Cordillera Real Paleozoic rocks seem to predominate; but the geology of the region is only imperfectly known. The second province, the eastern lowland, extends northeast and east from the base of the Andes. The higher land which forms the divide between the Amazon and Paraná drainage basins and which extends in a general northeast direction from the angle of the Andes in 18° S., subdivides this region into two parts. The northern part is occupied by an extensive plain, which is traversed by numerous navigable rivers, and covered with dense tropical forests. The surface is generally level, and its decline from about 3000 feet near the Andes to about 300 feet at the eastern boundary is so gradual as to be almost imperceptible. The chief rivers of the country flow through this section, which belongs to the basin of the Madeira. The chief tributaries of the Madeira are the Madre de Dios, the Beni, the Mamoré and the Guaporé, which forms part of the boundary with Brazil. The southern part of the Bolivian lowland consists of the northern end of the Gran Chaco (q.v.), a level plain characterized by subtropical open forests. Its only drainage artery of importance in Bolivia is the Pilcomayo River. In the region of the Bolivian Plateau the only stream of importance is the

Desaguadero, which connects the lakes of Titicaca and Poopó, the latter also connected by a short river with the salt lake of Copasa.

Climate In regard to climate, Bolivia may be divided into three regions: the eastern lowland, or *tierras calientes*, where the climate is hot and damp, the highland region, or *tierras templadas*, with a more or less temperate climate, and the mountain regions, or *tierras frías*, where the climate is comparatively cold. At La Paz, situated at an altitude of 12,100 feet, the temperature ranges from 44° to 73°, with an average of about 50°. The coldest months are June, July, and August, when the temperature is marked by extreme fluctuations. During December, January, and February, which constitute the wet season, rains and hailstorms are frequent, and the rivers are subject to overflow. In the eastern lowland the wet season lasts from November to April, but rains occur also during other parts of the year, and inundations are frequent. This portion of the country is the most unhealthful, owing to the exhalations from partly submerged plains and the poor circulation of the air. The most salubrious and temperate climate prevails in the Yungas, the transitional region between mountain and plain on the eastern slope of the Andes, varying between 5000 and 9000 feet in elevation. For Europeans the climate is rather trying. Dysentery is the usual affliction of newcomers, and fevers and smallpox are not infrequent, even among the natives.

Flora The flora of Bolivia is most luxuriant in the region below 6500 feet, where the vegetation is essentially tropical, and where coffee, cacao, pineapples, bananas, cotton, sugar cane, rice, cinnamon, and vanilla, besides numerous medicinal plants, such as cinchona, sarsaparilla, etc., are cultivated. The forests, which are especially abundant in this region, are composed largely of ebony, mahogany, rosewood, cedar, cork, rubber, and numerous species of palm. The temperate zone includes all the territory lying between 6500 and 12,000 feet, and embraces the southeastern and a portion of the western departments. Here are found lemons, grapes, figs, peaches, and other European and southern fruits and vegetables, as well as the common cereals, wheat, corn, barley, etc. In the frigid zone, or puna, which comprises, in the territory lying above 12,000 feet, the mountains of the Andes and the high table-land around Lake Titicaca, the Bolivian Plateau, trees are entirely wanting and the cereals are cultivated only in the more favored regions. It affords, however, extensive grazing lands, and is inhabited chiefly by Indians engaged in pastoral pursuits.

Fauna The fauna of Bolivia is also characterized by great variety, but the difference between the zones is not so well marked as in the case of the flora. The jaguar, puma, tapir, armadillo, several varieties of monkeys, alligators, and many other South American species are well represented. In the higher regions are found the vicuña, guanaco, and llama. Birds also are numerous, and include a variety of parrots, pigeons, toucans, chatters, and humming birds, a few of which fly to altitudes above 14,000 feet.

Agriculture, Mineral Production, and Industry. Owing to climatic conditions agriculture has only a restricted development. Neither the raw climate of the highland nor the humid climate of the northern part of the lowland, with

its unbroken tropical forest, are conducive to agriculture. Those parts of the Gran Chaco where precipitation is sufficient may be potential agricultural areas, but as yet they are undeveloped, even almost unknown. Under present conditions agriculture is chiefly carried on in the Yungas region on the eastern slope of the Andes. Sugar cane, cinchona, cacao, bananas, pineapples, cotton, rice, pepper, and coffee are grown. The scant crops of the plateau include oca, a native tuber similar to the potato, corn, barley, and wheat. Of vegetable products rubber is of prime importance, the tropical forest of the lowland region furnishing an abundant supply. In 1911 rubber stood second in the list of Bolivian exports, with a value of \$7,800,000. The chief importance of Bolivia, however, lies in its vast mineral resources. The profusion of gold decoration found in the royal palaces and temples of the Incas at the Spanish conquest, as well as the numerous instruments belonging to the period preceding that event which are found in the mines worked at present, indicate that the gold deposits of Bolivia were exploited by the Incas. After the Spanish conquest the natives discontinued the mining of the metal, which was the chief cause of their downfall, and the work was subsequently taken up by the conquerors. The most important centre of gold mining was the Tipuani River, in the Andes not far from La Paz. After Bolivia became independent gold mining began to decline, and at present very few mines are worked by modern methods. Gold is supposed to exist in all the mountain streams of the northwestern as well as the southwestern parts of the country. At present silver, in the amount produced, ranks first among the minerals of Bolivia. This metal is worked chiefly in the department of Potosí, though it is believed that deposits exist in many other parts of the Bolivian Andes. The total production of silver, as reported by the chief mining companies, averages annually over 11,000,000 troy ounces. Tin is next in importance to silver. The tin mines are situated principally in the departments of Oruro, Potosí, La Paz, and Cochabamba, at an altitude of 14,000 feet, the most productive being in the departments of Oruro and Potosí. The output of tin has increased very rapidly, the methods employed being comparatively modern, and amounts at present to about 40,000 tons yearly. Rich copper deposits are located in the mountains near the Desaguadero River, in the department of La Paz. The average annual production of copper aggregates about 2000 tons. There are also deposits of bismuth, antimony, borax, salt, lead, zinc, etc. In Bolivia, as in other South American countries, inadequate transportation facilities and the lack of modern machinery—obstacles removable only by the aid of foreign capital—are factors which militate against the development possible to the valuable mineral resources. That the government is fully aware of this fact is evidenced by its liberality in the granting of concessions and in the matter of appropriations for the surveying of new railroad lines. Manufacturing industries are practically of no importance.

Commerce, Transportation, etc. Bolivia is greatly hampered in the development of commercial interests by its inland situation. It exports chiefly metals, rubber, wool, hides, and skins, and other raw products, the trade being carried on principally through the Chilean ports of Anto-

fagasta and Arica, the Peruvian port of Mollendo and the river ports of Vila Bella and Puerto Suarez, on the eastern frontier. The imports for 1911 amounted to \$23,000,000 and the exports for the same year to \$32,000,000. Seventy-two per cent of the exports consisted of mineral products, 23 per cent of rubber. The import trade is mainly with Great Britain, Germany, and the United States. Manufactures of iron, cotton cloths, and refined sugar are the chief articles of import. On account of the small total value of the imports, a single large item, such as the importation of locomotives, may markedly affect the relative share of the three countries mentioned, so that the percentages of a single year are not necessarily typical. In 1911, Great Britain imported 21 per cent, Germany 18, and the United States 17 per cent of the total imports of Bolivia. The opening of the Panama Canal will undoubtedly increase the imports from the United States.

The surface formation of the country is not favorable to the development of a good system of communication. Most of the roads in the mountainous regions are intended only for pack animals, by which the internal commerce is principally carried on, and wagon roads are found only in the vicinity of the capitals of the provinces and other large cities. The cart roads of the country have a length of about 1430 miles. Of railways Bolivia had, in 1912, about 1500 miles, and quite a number of new lines are projected for the immediate future. The three principal lines have the Pacific for their objective: One leads from La Paz to Guayaquil on Lake Titicaca, where transshipment is made by boat to Puno at the other end of the lake, whence there is rail communication to the Peruvian port of Mollendo. The second, built in 1912, leads directly from La Paz to Arica. The third leads from La Paz via Oruro (branch to Cochabamba), Rio Mulatos (branch to Potosí) and Uyuni (branch under construction to connect with the Argentine system at La Quiaca) to Antofagasta. In the north the Brazilian line from Guayara-Mirim to San Antonio, completed in 1912, has given Bolivian rubber a direct outlet to the Amazon by avoiding the rapids of the Madeira River. Bolivia is connected by telegraph lines with Peru, Chile, and Argentina, and by cable with the United States and Europe. There are about 4000 miles of telegraph.

Government, Finance, etc. The government of Bolivia is a representative democracy, in which the executive power is vested in a president, elected directly for four years, who is assisted by a responsible ministry of six members. There are two vice presidents. Neither the president nor the vice presidents are eligible for two successive terms. The legislative authority is intrusted to a Congress consisting of a Senate of 18 members, elected for six years, and a Chamber of Deputies of 75 members, elected for four years. For administrative purposes Bolivia is divided into nine departments, which are subdivided into provinces and cantons, and a territory. The governors of the departments and the prefects of provinces are appointed by the president, and they, in turn, appoint the administrative officers of the cantons. Municipalities in each department are subject to supervision by the municipal council of the capital of the department. The Supreme Court, which sits at Sucre, consists of judges nominated by the Senate and elected by the Chamber of

Deputies. The republic has seven judicial districts, each containing a number of superior courts and inferior tribunals. Since 1892 military service has been compulsory for every able-bodied citizen between the ages of 21 and 50 years. The total strength of the Bolivian army is over 80,000 men, of whom only about 3150 belong to the standing army, the remainder being composed of reserves and territorial guards. The monetary standard is gold (since 1906); monetary unit, the boliviano, par value 38.932 cents (12.5 to the pound sterling). Revenue is derived chiefly from import and export duties, imports on mining, and stamps. Estimated ordinary revenue and expenditure for 1909, 13,300,000 and 16,454,625 bolivianos; for 1912, 17,237,100 and 17,350,552. Foreign debt in 1912, 21,937,805; internal debt, 4,208,069 bolivianos; floating debt, 2,034,959 bolivianos. For national coat of arms, see Colored Plate accompanying HERALDRY.

Education. Primary instruction is nominally free and compulsory, but the public schools, though increasing in number, are inadequate to the needs of the country, and illiteracy is prevalent. As reported for 1912, there were 990 primary schools (public and private), with 3960 teachers and 81,336 pupils; for secondary instruction, 21 colleges, 5 clerical institutions, and 5 private lyceums, with a total of 2177 students; for higher education, 19 establishments (including the universities at La Paz and Sucre), with 780 students.

Population. No census was taken in Bolivia from 1854, when the population was 2,326,126, of whom the whites and mestizos numbered only 634,000, until 1900, when it numbered 1,744,568. In 1910 it was estimated at 2,500,000. Indians make up 50 per cent of the whole, mestizos 20 per cent, whites 12 per cent, and unclassified 9 per cent. The Indians belong mostly to the Aymara and Quichua tribes, which have been partly converted to Christianity and are engaged in agricultural pursuits. In the southeast, in the Chaco, are found Indians of the Chiriguano and other tribes who are still uncivilized. Although the highland constitutes but three-tenths of the total area of the country it contains 86 per cent of its population. Here is the nucleus of the country's life; here is the seat of government and here lie the larger cities. La Paz, the capital, has 95,000 inhabitants; Cochabamba, 28,000; Potosí, 25,000; Oruro, 24,000; and Sucre, 22,500. Santa Cruz de la Sierra, which lies at the foot of the Andes, with 18,000 inhabitants, is the only city of consequence not on the highland.

History. The territory of Bolivia, which was subdued by Hernando Pizarro in 1538, constituted, under the name of the Audiencia of Charcas, a part of the viceroyalty of Peru till 1776, when it was annexed to the government of La Plata. Within 40 years after the conquest Spanish settlements were formed at Chuquisaca (Sucre), Potosí, La Paz, and Cochabamba, and numerous silver mines were opened, in which the Indian population was compelled to labor. So thoroughly were the natives subjugated that no important rising occurred till 1780, when Tupac Amari, a descendant of the ancient Incas, headed a formidable insurrection, which for a time threatened the destruction of the Spanish power in the region. The first revolutionary outbreak against the authority of Spain occurred at Chuquisaca (Sucre) in May, 1809, and was followed

in August by a rising of the inhabitants of La Paz. In 1810 an army from Buenos Aires came to the assistance of the patriots, but it was defeated at Huaqui by General Goyoneche, who put down the insurrection with great cruelty. For 15 years the country was devastated by a sanguinary guerrilla warfare, with several pitched battles, in which victory changed from side to side. More than once fresh Argentinian armies invaded Upper Peru, but no definite result was attained till 1824, when the Spanish army in Peru was crushed by the Colombian force under General Sucre. On Aug. 6, 1825, a Congress at Chuquisaca declared the independence of Upper Peru, and five days later the Republic of Bolivia was organized, embracing the provinces of Potosí, La Paz, Cochabamba, and Santa Cruz. A constitution drafted by Bolívar, the Código Boliviano, was adopted in 1826, and the presidency for life was offered to General Sucre, who held office for two years only. From the beginning, almost, of its national existence, Bolivia was plunged into a state of chronic revolution and civil war, from which it was relieved only at intervals by the absolute rule of some military leader. Of those presidents who succeeded in giving Bolivia breathing space for the development of its resources, mention may be made of Santa Cruz (1829-39), who in 1836 usurped the chief power in Peru and constituted it, together with Bolivia, a federal republic under himself as protector; Generals Belzu and Córdova, who were in power from 1848 to 1857, and José María de Acha (1861-64), in whose time treaties were concluded with the United States and Belgium, and some attempts made to foster the foreign trade of the country. By arrangements made in 1866 and 1874, the joint possession of Chile and Bolivia had been established over the rich nitrate fields of the desert coast of Atacama, but in 1879 Chile seized the Bolivian port of Antofagasta, and declared war against Bolivia and its ally, Peru (q.v.). In the Treaty of Nov. 29, 1884, Bolivia gave its assent to the retention by Chile of its seaboard with the rich mineral fields. In the fall of 1898 a revolution broke out, which after a half-year's fighting resulted in the overthrow of President Severo Fernando Alonzo and the elevation of José Manuel Pando to the presidency. During his administration a dispute arose with Brazil concerning the possession of the Acre region (See ACRE). It was settled in November, 1903, by the cession of about 70,000 square miles to Brazil in return for a money indemnity and small territorial compensations elsewhere. There was a long-standing dispute with Chile over the interpretation of the Treaty of 1884, Bolivia claiming that her cession of the littoral territory in that year was only provisional. A treaty ratified in December, 1904, recognized the perpetual dominion of Chile over the disputed territory, but granted Bolivia free access to the sea, with the right of erecting customhouses at designated ports. The treaty provided for the immediate construction of a railway from the port of Arica to La Paz at the expense of the Chilean government, the Bolivian section to be transferred to Bolivia after 15 years. Ismael Montes was elected President in 1904 for the term 1904-08. He was succeeded by Elhodoro Villazón.

BOLKHOV, bol'-kof'. The capital of a district in the government of Orel, Russia, about 36 miles north of the city of Orel, and 200 miles from Moscow (Map Russia, E 4). It is an active, thriving town, trading to the amount of 1,500,000 rubles (\$150,000) annually, in hemp, grain, rapeseed oil, etc. It has several mills and factories, the annual produce of its tanneries is estimated at 530,000 rubles (\$270,000). A peculiar feature of the town is the location of its harbor, which is 12 miles distant in the village of Krutogorye, on the Oka River. Pop., 1897, 20,700.

BOLLAN, WILLIAM (?-1776). An English-American lawyer and political pamphleteer, born in England. He emigrated to Massachusetts about 1740, married a daughter of Governor Shirley, and through this connection obtained an appointment to the position of Advocate General. As the agent of Massachusetts in England (1745-48), he secured from the British government the repayment of the money advanced by that Colony to defray the expenses of the Cape Breton Expedition. In 1769 he obtained and sent to Massachusetts a collection of letters written by Governor Bernard and General Gage, strongly criticising and abusing the colonists. On the approach of the Revolutionary War he exerted himself with zeal and energy to effect a conciliation between the British ministry and the American Colonies. Among the numerous pamphlets written by him are *The Ancient Right of the English Nation to the American Fishery Examined and Stated* (1764), *The Mutual Interests of Great Britain and the American Colonies Considered* (1765), *Freedom of Speech and Writing upon Public Affairs Considered* (1760), *A Free Britan's Memorial in Defense of the Right of Election* (1769), and *A Petition to the King, with Illustrations Intended to Promote the Harmony of Great Britain and her Colonies* (1774).

BOLLANDISTS. An association or succession of Jesuits by whom the *Acta Sanctorum* (q.v.) are collected and published. They derive their name from their head, Jean Bolland, who was born at Tirlmont, Belgium, Aug. 13, 1596, joined the Jesuits in 1612, and was called to Antwerp in 1630 to edit and publish the materials for the lives of the saints which had been collected by the Jesuit Hubert Rosweyde, who had died the year before. Bolland chose as his collaborators Godfried Henschen and Daniel van Papenbroeck. The days of the saints, usually their days of death, were arranged chronologically, and so the lives follow this order, and several volumes are given to one month. The first volume appeared in 1643. Bolland died in Antwerp, Sept. 12, 1665. The work was carried on by those associated with the original company. Some of them are C. Janning (died 1723), P. Bosch (died 1736), C. Suyken (died 1771), I. Hubens (died 1782), A. Berthod (died

1788), and J. Ghesquière (died 1802). In 1773 the Jesuit order was suspended, and in 1775 the convent in which the Bollandists had lived was turned into a military school. It seemed as if their task must be abandoned; but in 1776 the Empress Maria Theresa came to their assistance and secured for them the Caudenberg Monastery in Brussels, and also for each Bollandist a modest pension. Her successor, the Emperor Joseph II, ordered that they should produce a volume yearly, and as it was impossible for them to do so, expressed such great dissatisfaction that in 1788 he forbade them to bring out another volume. In 1789 their library and all their materials were sold to the Premonstratensian Abbey of Tongerlo, not far from Antwerp, for 25,000 francs, and there the work was continued for a time. But in 1796, the French having invaded the country, the abbey was dissolved. The materials were not scattered, however. In 1825 they were removed to Brussels. In 1836 it was reported in Brussels that the work was to be continued in Paris. This so stirred the interest of the Belgians that the government passed a yearly subsidy of 6000 francs to insure the continuance of the work on Belgian soil; a new company of Bollandists was formed, and ever since the volumes have been coming out.

In 1882 a supplement to the volumes already published, and preparatory studies for those not yet in press, began to appear under the title *Analecta Bollandiana*. The principal collaborators on this series are De Smedt, Van Hooff, and De Backer. In addition, catalogues of the Latin manuscripts before 1500, and of the Greek manuscripts, in the National Library of Paris, have appeared. The extensive library of the Bollandists is now housed in the College of Saint-Michel, Brussels.

BOLLER, ALFRED PANCOAST (1840-1912). An American engineer, born at Philadelphia. Graduating from the University of Pennsylvania and from the Rensselaer Polytechnic Institute, he practiced as a consulting engineer in New York City almost continuously for more than 50 years. Bridges were his specialty. Among the works which he planned are the Albany and Greenbush bridge over the Hudson, the Thames River Shore Line bridge at New London, Conn., the Central bridge and viaducts over the Harlem River, and the Duluth and Superior Interstate bridge. He also served in an advisory capacity for New York City, the Wabash Railroad, and the Brooklyn Rapid Transit Company. His writings include *A Practical Treatise on the Construction of Iron Highway Bridges* (3d ed., 1876), and *The Thames River Bridge* (1890).

BOLLES, bōlz, ALBERT S. (1846-). An American lawyer, educator, and author. He was born in Montville, Conn. He studied law and was admitted to the Connecticut bar and in 1870 was elected judge of the Probate Court. He afterward edited successively the *Norwich Bulletin* and the *Bankers' Magazine* and for several years was professor of mercantile law and banking in the University of Pennsylvania. He was then, for eight years, chief of the Pennsylvania Bureau of Industrial Statistics and subsequently became lecturer at the University of Pennsylvania and at Haverford College. Among his publications are: *Financial History of the United States from 1774 to 1789* (1879); *Financial History of the United States from 1789 to 1860* (1883); *Financial History of*

the United States from 1860 to 1865 (1886); *Practical Banking* (1884); *Industrial History of the United States* (1878); *The Conflict between Labor and Capital* (1876); *The History of Pennsylvania* (1890); *American Finance* (1901).

BOLLES, FRANK (1856-94). An American author, born in Winchester, Mass. He received his law education in Washington, D. C., and at Harvard; gave himself up to literary work, became an editor of the *Boston Advertiser*, and finally secretary to Harvard University, where he labored successfully to aid poor students. He was also conspicuous as a writer of nature studies, somewhat in the manner of Thoreau (q.v.). In prose he produced the following works: *The Land of the Lingering Snow* (1891); *At the North of Bear Camp Water* (1893); *From Blomidon to Smoky* (1894); and, in verse, *Chocorua Tenants* (1898).

BOLLEY, HENRY LUKE (1865-). An American plant pathologist, born at Manchester, Ind. He was educated at Purdue University, there became instructor and assistant in biology, and also served as assistant botanist of the Indiana Agricultural Experiment Station in 1888-90. In the latter year he became professor of botany and zoölogy at the North Dakota Agricultural College and also botanist and plant pathologist of the government Experiment Station for North Dakota. He is known as the discoverer of the parasitic nature of potato scab and as originator of the methods used for its prevention, and is credited with the first use of formaldehyde upon seed grain to prevent smut of oats, wheat, and other cereal grain (1892-93). Besides having worked out the causes of "flax-sick" soil, and flax-wilt disease, and having originated disease-resistant varieties of this plant, he also developed a method of spraying grain fields in 1896 to destroy the weeds without injury to the growing crop. He is author of the *North Dakota Pure Seed Law of 1908*, and in 1909 he became seed commissioner for that State.

BOLL WEEVIL. See WEEVIL.

BOLLWORM, bōlwŭrm (*bōlz*, the round pod or capsule of cotton + *worm*). The widely destructive caterpillar of a noctuid moth (*Heliothis obsoleta* [arnigera]). "Of popular names," says C. V. Riley, who studied and wrote extensively upon it, "it has one for almost every plant upon which it feeds and for every country which it inhabits, and as it is almost cosmopolitan and a very general feeder, these names are many. Throughout cotton-growing States it is very generally known as the 'bollworm' when it occurs upon cotton; when it occurs upon corn it is called the 'cornworm' or 'earworm.' . . . In many of the Southern States it is known in the early part of the season as the 'cornbud worm.' When found upon tomatoes it is the 'tomato-worm.'" It is also known as the "bud worm" of tobacco and as the "tomato fruit worm" when it attacks the fruit of the esculent. It may produce two to seven broods in a season, and ranks among the most destructive and difficult; to combat of all injurious insects. The moth has an expanse of about 1½ inches; the general color of the upper surface varies from light greenish gray to a rich yellow-gray, almost tawny, and the markings vary much in intensity and size. The moths fly in the evening dusk, seeking the flowers of some suitable plant of the season, and depositing their eggs upon the surface of, or more often near to, the flower bud. When in-

dian corn is about to flower this plant seems preferred to anything else (save perhaps cotton) then available, and tomatoes with corn near them will be saved to a great extent by this preference. The egg hatches soon, and the young caterpillar begins to feed and to make its way steadily towards flower bud or boll, searching patiently for it until found, when it begins at once to feed there, destroying the essential parts of the unfolded flower of corn or other plant, or running the cotton boll, whether more or less advanced. "As the bollworms increase in size, a most wonderful diversity of color and marking becomes apparent. In color, different individuals will vary from a brilliant green to a deep pink or a dark brown, exhibiting almost every conceivable intermediate stage, and from an immaculate, unstriped specimen to one with regular spots and many stripes." In addition to their feeding upon this vegetable matter, these caterpillars are carnivorous, seizing and devouring each other whenever opportunity offers, and invariably doing so when shut up together in a breeding cage or traveling cage, until only one remains. At the end of about three weeks the worms drop to the ground, work their way several inches into the soil, and, spinning a mantle of silk about them, become reddish-brown polished pupae. In the warmer parts of the United States no less than five broods appear. It is the third or July brood which does most harm to the corn, and the fourth (August) brood that furnishes the bollworm proper and the greatest destruction to cotton, while "budworms" are those of the spring hatching. The fifth brood winters as chrysalis and maintains the race.

BOLOGNA, bô-lô'n-ya (anciently, Lat. *Bononia*). A city of Italy, in Romagna, capital of the province of Bologna, situated in a fertile plain at the foot of the Apennines (Map Italy, F 3). The University of Bologna (qv) was founded in the eleventh century and was world famous as a school of jurisprudence. Industrially Bologna is of great importance. The products for which the city is especially famous are macaroni, Bologna sausages, liquors, and canned fruit. There are also large manufactures of silk, linen, glass, leather, and machinery. The commerce is considerable, and is greatly facilitated by excellent railway connections. Bologna is the seat of a court of appeals and of an archbishop, and the headquarters of a large army corps. The population of the city, including the suburbs, was 123,274 in 1881 and 172,628 in 1911.

The city was called in the early Middle Ages *La Dotta*, 'the Learned,' on account of its great university, or *La Libera*, from its democratic constitution, and later *La Grassa*, for the fertility of its soil and its wealth.

Architectural Features The town has not been generally rebuilt, and its narrow, irregular streets, numerous towers, and old palaces give it a mediæval aspect. In both the new and old

quarters the façades of most of the houses overhang the sidewalk, being supported on vaulted arcades. These arcades extend for miles in every direction, forming open galleries, protected from the weather, upon which all the shops open—an arrangement which never has been so thoroughly carried out in any other city. Many of these arcades date from the thirteenth to the sixteenth century, when the city was most flourishing, and illustrate both Gothic and Renaissance civil architecture in brick and terracotta. The finest are the portico of the Banconi (sixteenth century), under buildings by Vignola, and the portico of the Servi, built in 1312 by Manfredi. The later colossal portico of the Scalzi is 1700 feet long, with 167 arches. The longest of all the arcades is that leading from the city to the pilgrimage church of the Madonna di San Luca (1676-1739), with 635 arches, the distance is about a mile and a half.

The city is also remarkable for its churches, of which there are about 130, dating in unbroken succession from the eleventh century to the present. The earliest are the group of seven churches called San Stefano, dating from the eleventh and twelfth centuries, and unique in Italy as examples of simple Lombard brick architecture. This group includes a small basilica of SS. Pietro e Paolo, with early groin vaulting, originally the cathedral, the circular, vaulted church of San Sepolcro, built in imitation of the Holy Scripture (twelfth century), a well-preserved cloister, remarkable for its second-story arcades, usually destroyed in mediæval cloisters, an interesting subterranean church, and several other small churches and chapels, with monastic buildings, the whole being connected by numerous passages. In the thirteenth century Bologna was one of the important centres of the great religious revival emphasized by the two mendicant and preaching orders of St. Francis and St. Dominic. The churches of San Domenico and San Francesco were among the first erected by these orders (c. 1230-30), and among the earliest examples of Gothic architecture in Italy—earlier than their rivals in Venice and Florence, but that of San Domenico was completely remodeled internally in the eighteenth century in a cold classic style with domical vaulting. Other Gothic churches are the Madonna dei Servi, and, above all, the colossal church of the national patron, San Petronio, designed in 1390 to be the largest church in Italy. It was never completed as planned, only the nave and aisles being built (383 × 171 feet), without the transept with its central dome, or the apse, which would have made a structure surpassing the cathedral of Florence in size. The details are on so large a scale, with only twelve piers to support the arches and vaulting, that the real size is not at first apparent. The Gothic tracery of the large windows is the finest in Italy, and the sculptures on the façade doorways, by Giacopo della Quercia, are among the most interesting works of the earliest Renaissance. The finest work of Gothic sculpture in the city is the shrine of San Domenico (1267), by Giovanni Agnelli, from the designs of Nicola Pisano, the upper part by a Renaissance artist, perhaps Michelangelo. The churches are full of interesting Gothic sepulchral monuments of the old university professors, with reliefs representing them teaching their classes, while other monuments stand in the

streets under stone canopies and represent men of political note, in the same style as that which prevailed in Padua, Verona, etc.

Remains of fortified feudal palaces are numerous, the most imposing being the leaning tower of the Asinelli family, built in 1109, and 320 feet high, and that of the Garisendi family, of 1110, 163 feet high. The latter is 10 feet out of the perpendicular and is mentioned by Dante (*Inferno*, xxxi, 136), who compared it to the giant Anteus. Bologna had 180 such towers in the Middle Ages. There are also many quaint houses of the thirteenth century, combining wood and brick, and from this period date the two great palaces of the ancient republic, the Palazzo del Podestà, famous as the place where King Enzo, son of Emperor Frederick II, was imprisoned, and the Palazzo Pubblico, for the general popular assemblies; as well as such large private houses as the Palazzo Pepoli, with its great court; the Palazzo Malvasia, and the Loggia dei Mercanti, all of Gothic architecture. Bologna was then one of the foremost of free communes.

It is probable that most of the best mediæval works of art in Bologna were by artists from other cities; for Bologna was not greatly active artistically until the Middle Renaissance, but was given over to the pursuit of wealth. Nevertheless, there is originality in its arcades and in its use of terra-cotta decorations of brick constructions. It was late in adopting the Renaissance, and then (c.1500) it used terra-cotta work most effectively in the new style. As in the arcades of S. Giacomo Maggiore, the fine doorway of the Corpus Domini, and in the early and singular façade of San Spirito (1460?). Among the Renaissance churches are the Certosa, Corpus Domini, Madonna di Galliera, S. Michele in Bosco, and the interiors of S. Domenico and S. Giacomo Maggiore. The cathedral is a sordid Baroque edifice of no merit. Bologna is also remarkable for its fine Renaissance palaces. Such are the Palazzi Fava, Bolognini, Malvezzi, Bevilacqua, and Bentivoglio, and the latter part of the Palazzo del Podestà. More classic and later Renaissance buildings are the Malvezzi Medici Palace, and the old University (now library), by Terribilia with a remarkably fine court. In civil Barocco architecture, Tibaldi distinguished himself in the Magnani Palace and the present University building (1577).

History. According to legend, Bologna was founded about the eighth century B.C. by a colony of Etruscans, and was then called Felsina. Several necropolises, especially that called Villanova (q.v.), have yielded testimony to early occupation of the neighborhood of Bologna, but the civilization revealed by them is believed to be Umbrian and to antedate the Etruscan conquest. Many of the objects found in the tombs are of archaeological interest. They are exhibited at the Museo Civico. Felsina was long the most important Etruscan city north of the Apennines. It was conquered by the Gallic tribe of the Boii as early as 196 B.C., and was called by them Bononia, the name it has since retained. Having espoused the cause of Hannibal, it was conquered by the Romans, who made it a colony in 189 B.C. Through its position on the Æmilia Via (q.v.), on the road to Arretium (see AREZZO), and on that to Aquileia (see AQUILEIA), it became one of the most important cities of Italy. In 90 B.C. Roman citizenship was granted

to Bononia. Antony and Augustus both settled colonists here. The aqueduct built by Augustus has been in use again since 1881. Bononia remained a city of great importance under the Empire. It successfully resisted Alaric (q.v.) in 410 A.D. After the fall of the Western Empire, Bologna was annexed, with its territory, to the Exarchate of Ravenna. It passed to the Lombards on the fall of the Byzantine Exarchate, but was soon made a free city by Charlemagne. The Imperial charter of 1112 recognized its right to elect its own magistrates, and from that time the city became noted for its strongly organized guilds and its thorough democratic spirit, which went so far as to exclude the nobility from office, as in Tuscany. Bologna acquired world-wide fame during the Middle Ages through its university. Under Imperial protection it became the greatest centre of learning in Italy, and the expounder of Roman law. (See INNERBUS; BOLOGNA, UNIVERSITY OF.) The Archaeological Museum (Museo Civico) is one of the most important in the country. It is rich in treasures from the Villanova and the Etruscan periods, and in medals, illuminations, and sculptures of the Renaissance. The Academy of Fine Arts contains Raphael's famous "St. Cecilia"; otherwise it is chiefly remarkable as illustrating the local Bolognese school, not only the earlier men, like Francia, but especially the school of the Carracci (q.v.). Bologna possesses also one masterpiece of Barocco sculpture in the colossal statue of Neptune by Giovanni Bologna on the Giant's Fountain. Earlier sculptures of considerable merit are scattered through the churches.

The political history of Bologna after the adoption, in the twelfth century, of its democratic communal institutions shows at first a predominance of the Imperial or Ghibelline party; but after a long and sanguinary contest between democratic Guelphs and aristocratic Ghibellines the former triumphed. The city then fell into the arms of the papacy. Direct papal rule was imposed by Cardinal Albornoz and Pope Julius II, resulting in the loss of the city's liberties and the decline of its prosperity (1506). Here Leo X and Francis I met in 1515; here Charles V was crowned in 1530 by Clement VII. Bologna remained a part of the papal territory until 1796, when it was taken by the French troops under Augereau and made by Napoleon the capital of the Cispadane Republic. It reverted to the Papal States in 1815, but became a hotbed of revolutionary and national movements, such as those of 1831 and 1849. In the latter year it was taken by the Austrians, who held it until the war of 1859, when the defeat of Austria by France and Sardinia made an Italian kingdom possible. The Bolognese, by an overwhelming vote (1860), decided for annexation to the dominions of Victor Emmanuel.

BOLOGNA, GIOVANNI (the Italian form of his original name, JEAN BOULOGNE; Giovanni da Bologna is incorrect) (c.1524-1608). One of the most important sculptors of the Italian Renaissance. He was born at Douai, France, the son of a wood carver of the same name.

Little is known of his youth, but he studied sculpture under Jacques Duboucq at Mons. About 1554 he went to Rome, where he was unquestionably influenced by Michelangelo. Two years later, on his return, he stopped at Florence, where he won the friendship of Bernardo Vecchietti, who brought him the patronage of the Medicean dukes. About 1560 he was made their official sculptor, and he remained in their services until his death, April 13, 1608. In his best work Giovanni Bologna was the most remarkable sculptor of his day, Cellini being his only real rival. Although sometimes arbitrary in his treatment of form, he was a thorough master of technique, both in bronze and marble. His composition is bold and striking, and he is a master in the representation of movement. His latest works, however, scarcely excel those of his contemporaries. The most popular of his figures, the bronze "Flying Mercury" (c1564), is also his best. The delicately poised and graceful god is represented as just alighting and rushing forward. It was formerly in the gardens of the Villa Medici, where it showed to greatest advantage, but is now in the crowded Museo Nazionale (Florence). His other masterpiece is the marble group, "The Rape of the Sabinæ," completed in 1583—a remarkable piece of technical bravure, designed to show the sculptor's mastery of his art. A whole volume of verse was written in its praise. The relief of the pedestal representing the same subject is one of his very best. His other works include the marble group "Firenze" (1567-76), in the Museo Nazionale, "Apennino" or "Jupiter Pluvius," a colossal figure of 32 meters high, hewn from the living rock by his pupils after his design, a bronze "Venus" in the Villa Petraea, and the simple and stately equestrian statue of Duke Cosimo I in Florence (1604), which inspired Browning's "The Statue and the Bust." His fountains are masterpieces of their kind and surpass anything of his day. The principal are the fountain of "Neptune" in Bologna (1533-66), and those of "Oceanus," with three river gods (1576), and the "Bathing Woman Observed by Fauns" (1587), both in the Boboli Gardens. Among his late works are "Hercules Slaying the Centaur" (1599, Loggia dei Lanzi), the statue of Ferdinand I for his tomb in the Medicean Chapel, the fine bronze statue of St. Luke on the façade of Or San Michele (1602), the statue of Henry IV of France, destroyed during the Revolution. The celebrated portals of the cathedral of Pisa, long attributed to Bologna, have been shown by modern research to be the work of his pupils. He was the head of a numerous and important school, which he employed in executing his designs. Practically all of the small bronzes attributed to him and found in most important collections, were modeled and cast after his drawings. Consult Desjardins, *Vie et œuvre de Jean Boulogne* (Paris, 1901), Patrizi, *Il Gram-bologna* (Milan, 1905), De Bouchard, *Jean de Bologne* (ib., 1906).

BOLOGNA, UNIVERSITY OF One of the oldest and most famous universities in the world, though Paris, if not older, rivals it in antiquity, and Salerno had a school of medicine at a very early date. The origin of all these foundations is obscure. A school of law existed in Bologna in the eleventh century, and out of this the university grew, although the faculties of medicine and of the liberal arts did not come into promi-

nence before the fourteenth century. The earliest statutes date from 1317, with the faculty of law as the first and most famous department. In the early half of the twelfth century Irnerius, the famous teacher of the Civil Law, brought great renown to Bologna, which was augmented by the subsequent publication of the great *Decretum* or *Digest* of the Canon Law, compiled by Gratian, one of the doctors of the university. For the first time the church had its body of laws comparable with those of the state, and the *Corpus Juris Canonici* took its place by the side of the *Corpus Juris Civilis*, and both these epoch-making works are among the glories of the University of Bologna. Favored in its earlier years by the emperors for its knowledge of the civil law, which was of great value to the Empire, it was favored by the popes in later times for the service rendered to the papacy by the *Digest* of the Canon Law. In 1360 Innocent VI established here a school of theology. The university profited not less by private than by public benefactions, and rose to remarkable prosperity in the later Middle Ages. Among its students were Dante, Petrarch, and Tasso. The number of students is said to have reached 10,000. Its organization was probably a guild of students or scholars as opposed to the other medieval form, a guild of masters, such as prevailed in Paris. As early as 1158 these received a charter of privileges from Frederick I known as the *Authentica Habita*. The students were divided according to nationalities, and these were again subdivided. At first, as elsewhere, four nations seem to have existed, but later, after much subdivision, two great organizations emerge—the Citarantani or Italians and the Ultramontani or foreigners—each with its own officers and administration. One of the notable features of the later history of Bologna was its admission of women, as early as the eighteenth century, both as students and instructors, among the latter being Novella d'Andrea, Laura Bassi, Mme. Mazzolini, and Clotilda Tambroni. The study of anatomy has been here promoted by many illustrious teachers—Vesalius among the number, and it was here that Luigi Galvani made the famous discovery which perpetuates his name. At present Bologna has about 2000 students, and comprises faculties of philosophy and letters, physical, mathematical, and natural science, jurisprudence, medicine and surgery, pharmacy, veterinary surgery, an engineering school, a school of drawing and architecture, and a school of agriculture. The library (of which Cardinal Mezzofanti, the celebrated linguist, was once librarian), founded in 1605, contains 255,000 volumes, 48,000 pamphlets, 5000 manuscripts, and 880 incunabula. The university celebrated its eighth centenary in June, 1888. See GRATIAN, CANON LAW, CIVIL LAW, ETC.

BOLOGNA STONE A radiated or globular variety of the mineral barite. It was originally obtained from a bed of clay in Mount Faterno, near Bologna, Italy, and attracted considerable attention because of the phosphorescence which it exhibited when thrown into a fire in the presence of charcoal. The mineral, when heated with powdered charcoal, is partially reduced to barium sulphide, which, if sealed up in glass tubes after exposure to the sun's rays, will phosphoresce in the dark with a brilliant orange-colored light. This has been long known as *Bologna phosphorus*, and has been used as a

luminous paint for coating clock faces, match boxes, etc.

BOLOGNA VIAL, or **FLASK** (first made in Bologna). A short, thick, narrow glass vessel, closed at one end, and open at the other, which the glass blower prepares from each pot of the melted mixture before employing it in the fashioning of tumblers, glasses, bottles, etc. (See **GLASS**, **ANNEALING**.) It serves the purpose of enabling the glass manufacturer to judge of the color and other conditions of the fused glass or metal; and as the jar is not subjected to annealing, it is very friable, and a small angular fragment of any mineral allowed to drop into it at once causes it to fly in pieces. It will be noticed, however, that a Bologna flask will bear a very heavy blow on the outside without being fractured.

BOLOGNESE, *Il*, el bō'lō-nyā'za. See **GRIMALDI**, G. F.

BOLOGNESE (bō'lō-nyēs' or nyēs') **SCHOOL OF PAINTING**. The name usually applied to the Eclectic school, founded by the Carracci (q.v.) at Bologna about 1580. Like the contemporary Naturalist school, it was a reaction against the Mannerists of the sixteenth century, which imitated, in a meaningless manner, the forms of Michelangelo and Raphael. The Eclectic school of Bologna was the mother of modern schools of design. Its programme was to unite the best points of the principal schools of the Italian Renaissance: Michelangelo's form, Titian's color, Correggio's light and shade, and Raphael's symmetry and grace. The result of such training was a certain technical skill, but a lack of originality. The school also placed weight upon the study of nature, especially from the nude, but not to the same extent as the Naturalists, by whom it was much influenced. Its most important representatives will be found treated under the titles **CARRACCI**; **RENI**; **GUIDO**; **DOMENICHINO**; **ALBANI**; **FRANCESCO**; **GUERCIANO**; **GIOVANNI F. B.** The best modern treatise on the Bolognese school is "Die Malerschule von Bologna," in *Dolme, Kunst und Kuntster Italiens*, vol. iii (Leipzig, 1879). Consult also *Bolognini-Amorini, Vite dei pittori ed artefici Bolognesi* (Bologna, 1843). Contemporary accounts are those of *Malvasia, Felsina pittrice* (Bologna, 1678; new ed., 1841); *Baglione, Le vite dei pittori dal pontificato del Gregorio XIII* (Rome, 1649).

BOLOMETER (*Gk.* βολή, *bolē*, a throw, sunbeam + μέτρον, *metron*, measure). An instrument invented by Prof. S. P. Langley for the detection of minute changes in temperature, particularly those due to the absorption of radiant energy, and for a comparison of quantities of energy absorbed. It consists essentially of a balanced Wheatstone's bridge (q.v.), through which a feeble current is passing; one "arm" of this bridge is composed of three strips of platinum blackened and exposed to the radiation, e.g., from the sun; the temperature of this arm rises, its electrical resistance increasing; the balance of the bridge is thus destroyed, and there is a sudden deflection of the galvanometer needle, varying with the amount of energy absorbed by the arm of the bridge. This instrument was used originally by Langley in his investigation on the radiation from the sun; and within recent years, particularly in Langley's Astrophysical Observatory at the Smithsonian Institution, Washington, the bolometer has proved to be one of the most useful and reliable

instruments for the study of radiation. The instrument is described in vol. xvi of the *Proceedings of the American Academy of Arts and Sciences*, p. 342 (Boston, 1881), and in the *Annals of the Astrophysical Observatory of the Smithsonian Institution*, vol. i (Washington, 1900); *Goblentz, "Instruments and Methods used in Radiometry," United States Bureau of Standards, Bulletin No. 3*, vol. iv (Washington, 1907).

BOLONDRON, bō'lōn-drōn'. A town of Cuba, in the province of Matanzas, about 35 miles southeast of Matanzas by rail (Map: Cuba, D 4). Pop., 1899, 9528; 1907, 12,377.

BOLOR-TAGH, bō-lōr' tag' (Turk. *bolud*, snow cloud + *dagh*, *tagh*, mountain; cf. *Ben-Nevis*). A name formerly given to a mountain range supposed to extend in a north and south direction along the eastern edge of the Pamir Plateau connecting the Himalaya, Karakoram, Kuen-lun, and Tian-Shan ranges. The Kizil-Yart Range, attaining in the peak of Mustaghata an elevation of nearly 26,000 feet, may perhaps be taken to represent the Bolor-Tagh.

BOLSENA, bōl-sā'na (anciently, *Volsiniū*). An Italian town in the province of Rome, situated on the north shore of the lake of Bolsena (*Lacus Volsiniensis*), about 20 miles north-northwest of Viterbo. It was one of the 12 great cities of the Etruscans, but is now a town of little importance. The miraculous bleeding of the Host in the hands of a doubting priest at Bolsena in 1263 caused the institution of the festival of the Corpus Christi, celebrated the Thursday following the first Sunday after Pentecost. The incident has been treated by Raphael in a fresco now in the Vatican. Half a mile from Bolsena are a few traces of the Etruscan city, and many fragments of the Roman one remain. The lake of Bolsena is a fine expanse of water, about 10 miles long and 8 broad, and is supposed to be the crater of an extinct volcano. The Marta River carries its waters into the Mediterranean. It has two islands, Bisentina and Martana, which were favorite retreats of Pope Leo X. Martana is famous as the scene of the exile and murder of the Gothic Queen, Amalasuntha, by her husband, Theodahad.

BOLSTER, bōl'stēr (akin to Eng. *dole*, stem, *bowl*, hollow vessel). A piece of soft wood covered with canvas, placed on the trestletree of a vessel for the eyes of the topmast rigging to rest upon and thus prevent the injury to them which would result from being bent downward at a sharp angle. Pieces used for similar purposes elsewhere are also called bolsters; and the name is applied to cushions of tarred canvas and rope which are used to prevent the stays from being chafed when the ship pitches.

BOLSWARD, bōl'svārt (anciently, *Lat. Bol-verda*). An old town in the province of Friesland, Holland, 20 miles southwest of Leeuwarden (Map: Netherlands, D 1). It is surrounded by a navigable canal. The church of St. Martin, in the Gothic style, is the largest and handsomest in Friesland. Bolsward's trade is considerable, and its principal manufactures are bricks and pottery. The town was a member of the Hanseatic League in the Middle Ages. Pop., 1900, 6500; 1910, 7215.

BOLT. A specially constructed metallic pin for fastening together temporarily or permanently parts of structures or machines. Bolts for doors, windows, chests, drawers, etc. are employed to fasten temporarily the objects to

which they are applied and are thrown into and out of use by keys or by means of the hand Bolts for permanent fastenings are of various kinds and are given various names, according to their form or the use to which they are put, thus we have round, square, hook, and eyebolts as examples of bolts named according to their form, and we have foundation, rail, tire, shackle, and other bolts named from the use to which they are put. Expansive bolts are arranged so that when screwed into a hole as in a wall the forward movement causes movable and surrounding pieces to increase the diameter and bear firmly against the interior surface of the opening, thus enabling beams or other structural parts to be strongly attached. The most common form of bolt is that having a head at one end and a screw thread at the other. The threaded end is sometimes screwed into the last of two or more parts, but more generally it projects through, and a suitably fitting nut is screwed on to the projecting end. This form of bolt is made by passing heated rods of iron into a machine which automatically cuts off the proper length for a single bolt, and forges a head on one end by pressure, and the blanks thus formed are then threaded in other machines, the heated rods are fed continuously, and the bolts are forged and threaded with astonishing rapidity. Bolts of complicated shape and bolts of larger size for special purposes are forged by ordinary blacksmith work.

Metal bolts used on board ship are called *through bolts* if they extend completely through a part of the structure, and *blind bolts* if only extending part way through. Bolts having a hole in the projecting end are called *eyebolts*, *ringbolts* have a ring through the eye. *Lewis bolts* consist of an eye with a tapered lug on one side which fits in a socket in the deck, where it is firmly held by a wedge or key inserted behind it, these bolts are used in the decks where an eyebolt is needed, but where it is undesirable to have any projection extending permanently above the surface.

BOLT COURT One of the odd retreats in London, just beyond St. Bride's Church, off Fleet Street, associated with Dr. Johnson, who lived there for several years, and with Cobbett.

BOLTI, *bôl'ti*, or **BULTEE** (Ar. *boltuy*) A chichlid fish of the Nile (*Tilapia nilotica*), esteemed as food.

BOLTING CLOTH (ME *bulten*, OF *bultier*, *buleter*, Fr. *bultier*, from LL *buletare*, to sift, from LL *burra*, a coarse cloth, of It. *buratto*, sieve). A fine fabric, usually made of unsized silk and employed as a sieve in separating the products of flour mills. See **GAUZE**, also **FILOUR**.

BOLTON, *bôl'ton*, or **BOLTON-LE-MOORS** (from the moorlands where it is situated). An important manufacturing town in Lancashire, England, on both banks of the Croal, 11 miles northwest of Manchester (Map England, D 8). It is one of the principal seats of the cotton manufacture in England, its spinning factories alone employing over 20,000 workmen. In addition there are large foundries and iron works, bleaching and dye works, paper mills, soap factories, and silk-weaving establishments and coal mines in the vicinity. The municipal enterprise of the town in no way lags behind its industrial activity. Its water works were municipalized as early as 1847, it owns and operates the gas works, an electric plant, the electric street

railways, and maintains ice houses, markets, and slaughterhouses, all of which yield a substantial income after covering all expenses of maintenance, interest, and amortization, and saving immense sums of money to the citizens and the city treasury in lower charges. Even the sewage is utilized in connection with a sewage farm maintained by the city for that purpose. The public baths, numerous recreation grounds and parks, a higher-grade board school, technical and art schools, five public libraries, and two museums are the results of the city's efforts on behalf of its people. It was incorporated in 1838 and was made a county borough in 1888. It returns two members to Parliament. Pop., 1891, 146,487, 1901, 168,205, 1911, 180,885.

The history of Bolton since very early times is almost entirely industrial. Flemish immigrants in 1337 laid the foundations of the woolen manufactures, and this was further stimulated by the arrival of French Huguenots towards the end of the seventeenth century. Here velvets were first produced, in about the middle of the eighteenth century, and muslin and cotton quiltings about ten years after. The inventions of Arkwright and Crompton, who were natives of Bolton, naturally revolutionized industry there, though the new machines were met at first with great disfavor. During the Civil War the town was stormed by the Earl of Derby and Prince Rupert (1644). Lord Derby was executed here in 1651.

BOLTON, BENJAMIN MEADE (1857-) An American bacteriologist, born at Richmond, Va. He was educated at the University of Virginia, South Carolina College, and the universities of Heidelberg, Göttingen, and Berlin. After two years' work as assistant at Johns Hopkins he became professor at South Carolina College in 1888, director of the bacteriological department of Hoagland Laboratory in 1889, and then associate at Johns Hopkins in 1892. In 1895-96 he was director of the laboratory of the Board of Health, Philadelphia, in 1896-97 professor at the University of Missouri, and thereafter expert in experimental therapeutics at the Bureau of Animal Industry, Washington. Bolton is known for his extensive researches in bacteriology and experimental medicine. He published *The Bacteriolytic Power of the Blood Serum of Hogs* (1907) and *Hygienic Water Supplies for Farms* (1908), bulletins of the United States Department of Agriculture.

BOLTON, CHARLES KNOWLES (1867-) An American librarian and antiquarian, born in Cleveland, Ohio. He graduated at Harvard University in 1890, became librarian at Brookline four years later, and librarian of the Boston Athenæum Library in 1898. He wrote on the history of American libraries, especially in Boston and Cambridge, on special collections in American libraries, on posters, and on library administration. Among his books are *Sasha, the Wife of Rembrandt* (1893), *Brookline, History of a Favored Town* (1897), *The Private Soldier under Washington* (1902), and with his mother, Sarah Knowles Bolton (q.v.), *From Heart and Nature* (1902). He edited Lord Percy's *Letters from Boston and New York in 1774-76* (1902) and *The Athenæum Centenary* (1907), and in 1913 published *The Elizabeth Whitman Mystery at the Old Bell Tavern in Danvers*.

BOLTON, HENRY CARRINGTON (1843-1903)

An American chemist, born in New York City. He graduated at Columbia University in 1862, studied at Göttingen, and in 1872-77 was an assistant at the Columbia School of Mines. In 1877 he was appointed professor of chemistry and natural science at Trinity College. He was elected in 1900 president of the Chemical Society of Washington, D. C. His more important investigations have been made in connection with the action of organic acids on minerals. His publications include: *The Student's Guide in Quantitative Analysis* (1879); *An Account of the Progress of Chemistry* (4 vols., 1883-89); *The Scientific Correspondence of Joseph Priestley* (1892); *A Catalogue of Scientific and Technical Periodicals* (1897); *The Evolution of the Thermometer, 1592-1743* (1900); and *A Select Bibliography of Chemistry, 1492-1902* (1904). Dr. Bolton also made a study of comparative folklore, on which he published a number of monographs. Consult D. S. Marten, "Henry C. Bolton" in *Annals of the New York Academy of Sciences*, vol. xvi (1905).

BOLTON, SARAH KNOWLES (1841-). An American author, born in Farmington, Conn. She was at various times associate editor of the *Congregationalist*, assistant corresponding secretary of the National Woman's Christian Temperance Union, and vice president of the American Humane Education Society. She wrote: *Orlean Lamar and Other Poems* (1863); *How Success is Won* (1884); *Poor Boys who Became Famous* (1885); *Social Studies in England* (1886); *Famous American Statesmen* (1888); *Famous English Statesmen* (1891); *Famous Givers and their Gifts* (1896); *European Artists* (1902); *Emerson* (1904); *Raphael* (1904); *The Harris-Ingram Experiment* (1905); *Famous American Authors* (1905); *Memorial Sketch of Charles E. Bolton* (1907).

BOLTRAFFIO, bol-traff'fyo, GIOVANNI ANTONIO. See BELTRAFFIO.

BOLTROPE. The rope sewed on the edges of sails to strengthen them and prevent them from tearing. When on the perpendicular edge of a sail, it is called the *leech roping*; along the bottom of a sail, the *foot roping*; along the top, the *head roping*. Some sails, owing to their shape, have no head roping. All cordage employed in furling, loosing, or setting a sail, if attached to it at all, is, except the bunt whip, fastened to the boltrope.

BOLTZMANN, bolts'mán, LUDWIG (1844-1906). An Austrian physicist, born in Vienna. He studied in Vienna, Heidelberg, and Berlin; was appointed professor of physico-mathematics at the University of Graz in 1899, and in 1873 professor of mathematics in Vienna. From 1876 to 1890 he held the chair of experimental physics in Graz, from 1890 to 1895 that of theoretical physics in Munich, and from 1895 to 1900 that of theoretical physics in Vienna. In 1900 he was appointed professor of physics at the University of Leipzig and in 1902 was recalled to Vienna. He made valuable researches in connection with thermo-dynamics, the kinetic theory of gases, and other physical problems, and published *Vorlesungen über Maxwell's Theorie der Elektrizität und des Lichts* (2 vols., 1891-93); *Vorlesungen über kinetische Gastheorie* (2 vols., 1896-98); *Vorlesungen über die Prinzipie der Mechanik* (2 vols., 1897-1904); *Populäre Schriften* (1905).

BOLTUS, Dr. A character in a humorous

poem of the same name, by the younger Colman. It appeared in a volume entitled *Broad Grins*.

BOLY. See BOLZ.

BOLYAI, bôlyô-e, FARKAS (German, WOLFGANG) (1775-1850). A Hungarian mathematician. He was born in Bolya, spent his early years of study in Enged, Klausenburg, and Jena, and later studied three years (1796-99) in Göttingen. Here he formed an enduring friendship with Gauss, who was attracted to him by his profound thinking and excellent character. In 1804 he was made professor of mathematics in the Reformed College of Maros-Vásárhely, where he remained 47 years. In common with his friend Gauss, with Saccheri, Lambert, and numerous other mathematicians, Bolyai made many efforts to prove Euclid's postulate of parallelism. But it was reserved for his son, János (John), to declare the *science absolute of space*, which assigns Euclidean geometry to a particular kind of space. The chief work of the older Bolyai, known as the *Tentamen*, contains an appendix of 26 pages to vol. I, entitled *Scientiam Spatii Absolutis Veram Exhibens*. This little monograph, now so famous, is the work of János.

BOLYAI, JÁNOS (1802-60). A Hungarian mathematician, son of the above, was born in Klausenburg. He was a spirited boy, and, partaking of his father's mathematical genius, his progress was marvelous. He finished the Latin school at the age of 12, passed the philosophic curriculum in two years, and entered the Academy of Engineers in Vienna. In 1823 he was appointed lieutenant at Temesvár, from which place, Nov. 3, 1823, he wrote to his father in positive terms of his conception of parallels: "From nothing I have created another wholly new world." This conception, as formulated by him, became the appendix of the *Tentamen*. His later works, mostly unfinished, as the *Principia Doctrinae Nova Quantitativum*, add little to his fame. Consult: Baltzer, *Elemente der Mathematik* (Dresden, 1866); Schmidt, in *Abhandlungen zur Geschichte der Mathematik*, vol. viii (Leipzig, 1895); Halsted, *Bolyai-Non-Euclidean Geometry* (Austin, 1896); Bonola, *Non-Euclidean Geometry* (Chicago, 1912).

BOLZANO, bôl-tsa'no, BERNHARD (1781-1848). An Austrian theologian, philosopher, and mathematician. He was born in Prague, was ordained priest in 1805, and was appointed professor of the philosophy of religion at the university there. In 1820 he was removed on account of his liberal teachings, for which he had been denounced in Rome by the Jesuits, and henceforth devoted himself to his literary labors. As a philosopher he was a devoted adherent of Leibnitz, but was also influenced by Kant. He was a mathematician of remarkable ability and was one of the formulators of the present theory of functions. His most important works are: *Athanasia* (1827); *Lehrbuch der Religionswissenschaft* (4 vols., 1834); *Versuch einer neuen Darstellung der Logik* (4 vols., 1837); *Paradoxien des Unendlichen* (1851). Consult his *Autobiography*, ed. by Feisl (Vienna, 1875), also Palágy, *Kant und Bolzano* (Halle, 1902), and Schwarz, *Bolzanos Vorstellungstheorie und Kants Lehre von der Raumanschauung* (Göttingen, 1911).

BO.MA. The capital of Belgian Congo, Africa, situated on the Congo River, about 50 miles from the coast (Map: Belgian Congo, B 4). It has a residential section, containing the government buildings, and a business section.

The Congo is navigable for seagoing vessels as far as Boma, regular steamship communication being maintained with Antwerp. Boma is the chief shipping point of the bananas grown in the country. As a junction point of common routes it was at one time the centre of the slave trade in the Congo districts. In 1906 it became the seat of the American consul general.

BOMARSUND, bö'mar-sönd (Scand. *bomar*, rail, bar, bolt + *sund*, strait), STRAIT OF A channel in the Baltic Sea, at the entrance to the Gulf of Bothnia, between Verde and the islands of Åland and Bardo (Map Russia, B 2). The Russian fortress of Bomarsund, on the island of Åland, was taken on Aug. 16, 1854, by the Allies, and its fortifications destroyed. By the Treaty of Paris Russia must not rebuild the fortress.

BOMB, böm or büm (Fr. *bombe*, from Lat. *bombus*, Gk. *βόμβος*, *bombos*, a booming, humming), refers to the noise made by the projectile), **BOMBSHELL** and **SHELL**. A hollow ball of cast iron or steel filled with combustibles and shot, designed, on the explosion of the shell, to scatter in every direction. When first used, bombs were fired from mortars only, but since the invention of shell guns and other modern artillery the name *shell* has been gradually substituted. See **AMMUNITION**, **ARTILLERY**, **ORDNANCE**, **PROJECTILES**.

BOMB. In geology, a rounded mass of lava, from a few inches to two or three feet in diameter, usually formed by chilling of the mass in the course of its flight through the air. The round form is ascribable to the rotatory motion imparted by the violent ejection of the lava from the volcanic vent, it is sometimes modified by a flattening on opposite sides which mark the poles of the axis of rotation. The outer portion of a bomb which has cooled most quickly consists of a shell of dense or glassy character, while the interior is of porous nature or may be hollow. The shell in some instances is traversed by fractures which resemble those of a bread loaf and are caused by strain from the imprisoned gases. Bombs of this character are known as bread-crust bombs. A form similar to that of the bomb may be assumed by lava in its flow down the slope of a volcano, as has been remarked in the eruptions of Vesuvius.

BOM'BA (It. *bomb*). A nickname given to Ferdinand II, King of the Two Sicilies, in consequence of his fierce bombardment of the principal cities of Sicily in 1849.

BOMBARD'. See **ARTILLERY**, **ORDNANCE**.

BOMB'ARD. A wood wind instrument having a double reed, and belonging to the family of shawms (qv). It is the precursor of the modern bassoon (qv). It was built in four sizes known as contrabass, bass, tenor, and alto bombard. The unwieldy length of the two lowest kinds (6-7 feet) led during the sixteenth century to the doubling of the tube, whence the name *fagotto*.

BOMB'ARDIER (Fr. *bombardier*, It. *bombardiero*, for derivation, see **BOMBARDMENT**). A military title used in the British artillery. Acting bombardier is the first rank above gunner or driver, and bombardier the rank immediately higher. It is an appointment of the major commanding the battery, and, unlike the rank of sergeant, which can only be taken away by a regimental court-martial, may be canceled at any time by the commanding officer.

BOMBARDIER BEETLES (for origin of

name, see *Below*). Ground beetles, *Carabidae*, of the genus *Brachinus*. They are black, green, or blue beetles, with reddish-yellow legs. They live on the surface of the ground, and when closely pursued by an enemy, such as a predatory beetle, they discharge from the anus, with an explosive sound, a drop of fluid which turns to visible smoke-like gas on contact with the air. By the time the pursuer has recovered from astonishment and the inconvenience of this gas, the bombardier has frequently made good its escape, but, if needful, the discharge can be quickly repeated several times. The liquid or gas changes blue vegetable colors to red and then to yellow, produces sharp pain when applied to the tongue, and leaves a yellow spot upon its surface, like that produced by a drop of nitric acid. There are more than 25 described species in the United States, but as yet no definite characters have been discovered for their separation. See **GROUND BEETLE**.

BOMBARDMENT (Fr. *bombarde*, a cannon, a musical instrument, It. *bombarda*, a musical instrument, a cannon, from Lat. *bombus*, booming noise, cf. *bomb*). An attack upon the fortifications of an opponent by artillery, cannon, and other heavy ordnance. All modern battles begin, when possible, by a heavy bombardment of the enemy's position (See **ATTACK**). The bombardment of a fortified town is a much more difficult undertaking, owing to the practical impossibility of knowing what results are being accomplished, or with what degree of accuracy the aim is taken. With reasonably strong defenses and time for preparation, together with means speedily available for the suppression of conflagration, the modern bombardment is more formidable for its moral effect and usefulness in blockading than for the actual damage it does the enemy, great as that might possibly be. It is an established fact that few modern bombardments have been particularly destructive. At the siege of Paris by the Germans, in the War of 1870-71, an average of 500 shells daily actually fell within the city, but accomplished comparatively little damage. In the British-Boer War of 1899-1902 the bombardment of Ladysmith and Kimberley was of daily occurrence, the deadliest of modern ordnance and explosives being brought into use, but there also little damage was inflicted.

Buildings under the flag of the Red Cross are required to be some distance away from the combatants and are supposed to be exempt from bombardment. According to international agreement, 24 hours' or more notice of bombardment is given for the protection of non-combatants and their property.

The attack of defensive positions by naval vessels is not generally regarded as likely to result in serious injury, but much depends on the character of attack. Moreover, permanent injury may not be sought. In many instances it has been found possible to smother the fire of a fort by rapid fire from the small and medium calibre guns of ships. Where the guns are mounted behind low parapets or breastworks, and the embrasures are large, this may easily be done, if the preponderance of fire of the ships is considerable. At the attack on the defenses of San Juan, Porto Rico, in May, 1898, by the fleet under Admiral Sampson, the Morro batteries, armed with very recently constructed six-inch guns, were silenced, though not much injured. Protected in this way by the fire of

the fleet, the torpedo boat *Porter* was able to go close under the guns of the fort and examine the harbor, in order to ascertain what Spanish ships were in the port. Modern coast-defense armament, however, when well served, is practically impregnable to naval attack, ships not daring to come within the range of the high-power guns which have the great advantage of fixed bases.

In the various bombardments of the batteries at Santiago the men were driven from the works, but the damage done was of little account. The bombardment of the town by the vessels of the fleet was very successful and was the leading immediate cause of the surrender. The guns used were of eight-inch calibre, the shells weighing 250 pounds. The naval vessels fired over an intervening rise of ground with a range of 4 miles, the fall of the projectiles being reported by the Army Signal Corps. For fear of striking in the American lines the first shells were directed too far to the left and fell into the water. The next lot—about 25 of them—all fell on the water-front street, in a space about 200 yards long and 30 yards wide. The third lot fell in a space of about the same area, about half-way from the water front to the palace, wrecking the interior of every house they struck and in some cases destroying the exterior walls. The direction of firing was again changed, and three shells fell just beyond the palace, passing close to its roof, when the signal to cease firing was seen.

The problem of attacking a fortress armed with modern weapons was tested for the first time, on a large scale, by the Japanese at Port Arthur in 1904-05. They first tried without success the methods so long advocated by a prominent school of European artillerymen, who maintained that after a long bombardment the defenders would be so demoralized and exhausted, physically, mentally, and morally, that the place could be carried by assault. The Japanese used over 400 guns, mortars of 28 cm. (18 of them), 21 cm., and 15 cm., and siege guns of 15, 12, and 11 cm., besides 128 field pieces, all modern weapons firing explosive shell and most skillfully handled. Their bombardments were magnificently conceived and executed. During the 327 days of the siege the bombardments lasted 149 days, with only short interruptions, and the Russian forts were repeatedly silenced completely. Yet the total damage to material, ships as well as forts, was not considerable. The coast fortifications fulfilled their purpose well and kept the victorious Japanese fleet at a safe distance, while the Russian fleet could enter and leave the harbor at will. These works, on account of their altitude, had nothing to fear from the Japanese fleet. The effect of the sustained and irresistible fire of the large Japanese mortars on the *personnel* contributed largely to the downfall of the city.

All other recent bombardments have taught the same lessons as may be learned from these, which are, that the damage done to fortifications is trifling compared to the expenditure of ammunition, but that, when the bombardment is directed against trenches or troops in the open, the actual and moral effects are considerable. It must not be assumed that because ships cannot successfully attack forts the latter can stop a fleet of modern armored ships from running by them. Of course some of the ships may be badly damaged, but if the channel is clear and

not too close to the enemy's guns, the greater part of the vessels will probably get by without serious injury. This contingency is guarded against in harbor fortifications by the planting of mine fields in the waters over which ships must pass. Submarine mines have been so perfected that they may be controlled from mine casemates on shore and are absolutely harmless to friendly ships.

Bibliography. In the *Report of the British Naval and Military Operations in Egypt in 1882* (Office of Naval Intelligence, Washington, 1885), will be found a detailed account of the bombardment of Alexandria. Compare, also, attacks on Charleston by the Federal fleet during the Civil War, and the bombardment of Forts Jackson and St. Philip, below New Orleans, and of Fort Fisher, near Wilmington.

See COAST DEFENSE, SIEGE AND SIEGE WORKS, and FORTIFICATION, for military tactics to be followed and means employed for defense against bombardment.

BOMBARDON. See SAXHORN.

BOMBASTES FURIO'SO. The title of an opera (1790) by William Barnes Rhodes, a parody of *Orlando Furioso*.

BOMBAX. See ERIODENDRON.

BOMBAY, bōm-bā'. A presidency of British India, extending along the western coast of the peninsula from about lat. 14° to about 18° 30' N. (Map: India, B 5). It is bounded by Baluchistan on the north, Rajputana, Central India, the Central Provinces, Berrar, and Hyderabad on the east, Mysore and Madras on the south, and the Arabian Sea and Baluchistan on the west. The western part of the province is partly traversed by the range of the Western Ghats, running either close to the coast or retreating about 50 miles inland. They have numerous offshoots into the interior, and their slopes are covered with thick forests. Physically the province is divided into four parts: Sindh, the northern division, with a low surface, mostly unproductive; Gujarat, having a rich, alluvial soil, well watered; Konkan, a mountainous region, very little cultivated; and the Deccan, in the south, suffering from insufficient rainfall. The chief rivers are the Indus, which drains only the Sindh, the Tapti, and the Nerbudda. The climate, with a few exceptions, is hot and oppressive. A temperature of 130° is not rare, while in some places for about six months in the year the temperature averages about 95° in the shade. In the lower portions the rainy season is sometimes followed by epidemics of fever.

Throughout the greater part of the presidency very little cultivable land remains uncultivated, and about three-quarters of the population are engaged in or dependent on agriculture. The principal food crops are rice, bajra (spiked millet), jowar (great millet), and wheat. Rice is raised, especially in the Konkan, and wheat in Sind, northern Gujarat, and the Deccan; bajra and jowar grow almost everywhere except in the Konkan. Of non-food crops, cotton is the most important and is raised especially in Gujarat, the Tapti valley, and the south-eastern Deccan. As reported for 1909-10, the total area of the presidency was 85,610,300 acres, including native states with 36,989,440 acres, British territory aggregating 48,620,860 acres. Of the latter area, 25,353,065 acres were cropped (net area, i.e., exclusive of second crops), 7,501,470 were fallow, 1,879,259 cultivable waste other than fallow, 5,857,398 not

available for cultivation, and 788,353 forest. Of the net area cropped in 1909-10, there were under food grains and pulses 20,091,642 acres (rice, 1,864,054, wheat, 1,382,949, jowar, 6,401,742, bajra, 5,505,074, gram, 562,743), oil seeds, 1,444,037, fibres, 4,035,108 (cotton, 3,872,117), condiments and spices, 221,757, sugar cane, 58,947. The area under cotton amounted to over 29 per cent of the total cotton area of British India. With the exception of salt and building stone, the mineral production of the presidency is insignificant.

The manufacturing industries are chiefly confined to the production of cotton and silk fabrics, leather, and brass ware. The first cotton mill was started in Bombay City in 1857, in 1909-10 there were (in British territory) 216, producing 593,267,000 pounds of yarn and 215,361,000 pounds of woven goods. But many years of competition between machine-made and hand-woven cotton cloth have still left a very considerable home industry, the hand loom is employed in almost every district. The domestic demand for raw cotton is largely supplied by the presidency, which also sends some to other parts of India and exports immense quantities to Great Britain.

In its foreign trade Bombay is exceeded by no other province of India. Its imports of private merchandise in 1909-10 amounted to £33,008,660 and its exports £51,654,353 (£26,349,752 and £37,033,054 being credited to Bombay City and most of the remainder to Karachi). The imports represented over 42 per cent and the exports over 41 per cent of the total for British India. The chief imports are cotton piece goods, metals and machinery, sugar, oils, and silk and woolen manufactures, supplied largely by the United Kingdom. The leading exports are raw cotton, grain, and pulse, oil seeds, and hides.

At the end of 1904 there were 4137 miles of railway in the presidency, or one mile of railway to every 46 square miles of territory. The lines are government-owned, but mostly operated by private companies. The main lines concentrate at Bombay City, with one exception, whose terminus is the port of Karachi.

The government of the presidency (whose capital is Bombay City) is administered by a governor in council, consisting of the governor as president and two members of the Indian Civil Service, all of whom are appointed by the crown. The legislative power rests with a legislative council, consisting of 48 members (18 official, 28 unofficial, and 2 experts). Under the governor in council the presidency is administered by four commissioners—the commissioner in Sind, who has special powers, and the commissioners in the Northern, Central, and Southern divisions. Justice is administered by the high court at Bombay City and by numerous district courts. The control of the Bombay government over the native states is exercised through political agents placed at the principal native courts. (The important native state of Baroda, though geographically within the Bombay Presidency, is not included among the Bombay native states, as it is under the political control of the government of India.)

In British territory at the census of March 10, 1911, out of a total population of 19,672,642, the literates numbered only 1,372,826 (of whom 136,620 were female), and literates in English, 202,464 (26,769 female). In the native states, out of a total of 7,411,675, the literates num-

bered 487,667 (41,838, female), and the literates in English 28,472 (764 female). In 1909-10 there were in British territory 12,472 public educational institutions, with 770,435 scholars (of whom 116,731 were female), and 3008 private institutions, with 79,858 scholars (18,629 female), total, 15,480 institutions, with 850,293 scholars (133,360 female). The public institutions included 11 arts colleges (3034 students), 4 professional colleges (1162) 548 secondary schools (70,354), 11,790 primary schools (690,533), 21 training schools (1546), 50 other special schools (3806). Advanced private schools numbered 110 (4347 students), elementary, 2898 (75,511).

Below is shown the population according to the censuses of 1901 and 1911, with the percentage of variation between 1891 and 1901 and 1901 and 1911 (the figures for Aden shown separately).

	Pop 1901	Var	Pop 1911	Var
British territory	18,515,676	- 17	19,826,477	6.0
Aden	43,974	- 0.2	46,185	5.0
Bombay states	6,908,559	-14.5	7,411,675	7.3
Total	25,468,209	-5.5	27,084,317	6.3

In 1911 males numbered 14,011,248, and females 13,073,069. The principal religious elements in 1911 in British territory (including Aden) and in the native states were as follows: Hindu, 14,922,311 and 6,054,992, Mohammedan, 4,024,485 and 877,431, Jain, 212,309 and 277,643, Christian, 233,246 and 12,411, Animistic, 170,355 and 149,879, Parsee, 80,980 and 2535. The population of the larger cities in 1911 was: Bombay City, 979,445, Ahmedabad, 215,835, Poona, 158,856, Karachi, 151,903, Surat, 114,868, Sholapur, 61,345. The percentage of the people, in both British and native territory, speaking one of the four main languages (including kindred dialects), was as follows in 1901: Marathi, 40.66, Gujarati, 28.09, Kanarese, 12.18, Sindhi, 11.54. The only other languages of any importance are Western Hindi (which includes Hindustani), Rajasthan, Telugu, Bhill, and Baluchi, of which all but Hindi and Bhill are the languages of immigrants.

Consult Drew, *Bombay and its Feudatories* (Bombay, 1892), Edwards, *The Rise of Bombay* (1902), Douglas, *Bombay and Western India* (1893), Lee-Warner, *The Presidency of Bombay* (1904).

BOMBAY CITY (Hind *Bambai*, Malay *Bambé*, after the goddess *Bambé Mumba*, through popular etymology turned by the Portuguese into *Bom bahia*, *bon*, *Lat bonus*, good, fair + *bahia*, haven, port). A city and the principal seaport of western India, capital of the Presidency of Bombay, situated on an island in 18° 55' N lat and 72° 54' E long (Map India, B 5). Bombay Island, one of a group lying off the coast of the Konkan, is now, by causeways and breakwaters, permanently united on the north end with the larger island of Salsette and so continuously with the mainland. The city limits coincide with the island (22 square miles), but most of the built-up portion occupies only the southern part, it has two water fronts, one on the outer Back Bay and the other on the splendid inner land-locked harbor, which has an area available for shipping 14 miles long by 5 miles broad. It is defended by batteries equipped with modern armament, and by a small

navy comprising torpedo boats, destroyers, and monitors. Bombay vies with Calcutta as the commercial centre of India, surpassing the former as a centre of distribution and having double the coasting trade, though a smaller foreign trade. In 1910 Bombay's imports and exports were valued at £26,349,752 and £37,033,054, against £31,081,033 and £46,591,334 for Calcutta. It is the terminus and departing point of various European steamship and mail lines, of the Great Indian Peninsula Railway, and of the Bombay, Baroda, and Central India Railway. It possesses one of the finest railway depots in the world, extensive docks, basins, graving docks, and shipbuilding slips; the government dockyard covers about 200 acres. The construction of the Alexandra Dock, 50 acres in extent, with a dry dock 1000 feet long and a mole where mail steamers can lie alongside, was to be completed in 1913, the total cost (including that of the reclamation of 600 acres and the erection of a new railway station) being over £5,000,000. The principal portion of the city, with long, wide streets, traversed by street railways and lined by fine commercial establishments, presents a thoroughly European aspect. Many of the public and commercial buildings are of splendid dimensions and have no rival in any other Indian city except, perhaps, Calcutta. The objects most worthy of note are the Secretariat (in Venetian Gothic), the University Library, Senate Hall, and Rajabai clock tower, the cathedral, the Colaba church, the customhouse, post office, public-works office, missionary houses, the Elphinstone Institution, the Grant Medical College, Sassoon's High School, the Jamsetjee Hospital, and the Jamsetjee Obstetric Hospital. The city possesses a chamber of commerce, two English theatres and a native theatre, and numerous educational, benevolent, and charitable institutions. Since 1892 the city has owned a modern system of water works, supplied from Lake Tansa, 65 miles north. It is lighted by gas and electricity, and owns and maintains abattoirs, markets, public swimming and other baths, gardens, with weekly band concerts, and the esplanade, a favorite promenade. The streets of the native quarter are narrow and winding, but marked by cleanliness; and the well-stocked bazars, the temples, and the curiously painted houses, thronged by polyglot Oriental crowds, present a most picturesque appearance. Besides several native newspapers, there are three published in English.

Always favorably situated for foreign trade, Bombay profited largely by the opening of the Suez Canal. When the Civil War in the United States caused a sudden cessation of American supplies, cotton began to be exported from Bombay in vast quantities, and although the reopening of the Southern ports soon checked this extraordinary activity, Bombay was permanently benefited by the stimulus its commerce received. The chief exports are raw cotton, grain, seeds, and cotton twist and yarn. The local industries include the manufacture of yarn, cotton cloth, copper and brass utensils, wood carving, lacquer work, pottery, and gold and silver thread; and the dyeing and tanning trades are prosperous. But the characteristic feature of Bombay manufacture is the rapid growth of the European factory system. The chief imports are piece goods, thread, yarn, metals, sugar, wine, beer, tea, and silk. Bombay is the seat of various

foreign representatives, including a United States consul. The climate, though less severe than that of the interior, is oppressive, owing to the extreme moisture of the air for most of the year. The average temperature is 79.2° F.; the average rainfall for the 20 years ended 1901 was 74.27 inches. The population, which is exceedingly heterogeneous and dense, amounted in 1891 to 821,764; in 1901, 776,006, showing a decline of 5.6 per cent (it should be noted that when the 1901 census was taken plague was raging in Bombay, and many persons had left the city); in 1911, 979,445, the increase being 26.2 per cent. These figures relate to Bombay Island (22 square miles), the area administered by the Bombay municipality. Some of the early estimates of population were: in 1661, when Bombay was ceded to the English, about 10,000; in 1744, 70,000; in 1780, 113,726; in 1814, 180,000; in 1838, 236,000; in 1846, 566,110; in 1864, 816,562 (due in part to the prosperity Bombay enjoyed during the American Civil War); in 1872, 844,405. Before the outbreak of the plague in 1896, the death rate was 24 per thousand, it subsequently rose to 78. The birth rate is only about 14, the majority of the population being immigrants whose women return to their homes at the time of maternity. The Hindus predominate in numbers, the Parsis number over 46,000, and the rest are Mussulmans (156,747 in 1901), native Christians, Europeans, Indo-Portuguese, Jews, Jains, etc. Amid these various classes the Parsis, descendants of fire worshippers, driven from Persia by Mohammedan bigotry, rank next to the English in respectability and influence.

The Portuguese visited Bombay in 1509, about a year before the capture of Goa, and in 1534 it passed into their possession. In 1661 the island was ceded to Charles II of England, as part of the dowry of his bride, the Infanta Catharine. He granted it to the East India Company in 1668. The real founder of the modern city was Gerald Aungier (in 1669-77), who determined the land revenue, established courts of law, strengthened the defenses, and secured freedom of trade and worship. Consult: Windham, "The Town and Isles of Bombay, Past and Present," in vol. xlix of *Society of Arts Journal* (London, 1901), Eastwick, *Handbook to Bombay* (London, 1881); Hunter, *Bombay, 1885-90* (London, 1890); Edwardes, *The Gazetteer of Bombay City and Island*, 3 vols. (Bombay, 1900-10). See ELEPHANTA and accompanying Plate.

BOMBAY DUCK. See BUMMALOTI.

BOMBAY ISLAND. See BOMBAY CITY.

BOMBRAZINE, bōm'bā-zēn' or bōm'- (Lat. *bombycinum*, silk texture, from Gk. *bōmbrāzē*, *bombyx*, silkworm; through Fr. *bombasin*). A twilled cloth for dresses, in which the distinguishing characteristic is that the warp is silk and the filling worsted. The cloth has thus a shiny look. It is rather fine and light in weight and may be of any color. It was extensively made, chiefly in Norwich, England, from about 1816.

BOMBELLI, bōm-bel'le, RAFAELE. An Italian mathematician, born about 1530. He went a step farther than Cardano in dealing with imaginary quantities and simplified the solution of the cubic equation in the so-called irreducible case. His *Algebra* (1572) gave a remarkably clear exposition of the science as it then existed and was a widely read book for many years.

BOMBPROOF. A military structure capable of resisting artillery shot and shell, particularly that alighting overhead. In permanent fortifications and defenses they are either cut out of solid rock, as at Gibraltar, or constructed of massive masonry, as at Malta, or at Helsingfors, Finland, a position which is considered impregnable. Temporary bombproofs are constructed out of timber and earth or any other available and suitable material. Galleries are frequently run underground or in hillside for the protection of the sick, women and children, and noncombatants generally. See BLINDAGE, FORTIFICATION.

BOMBÓN See TAAL.

BOMB VESSEL See MORTAR VESSEL.

BOMBYCIDÆ, bóm-bis't-dé (Gk *bómbyx*, Lat *bombyx*, silkworm). A family of Lepidoptera with stout, hairy bodies, including the silkworm moths and their allies. They have no frenulum, the first maxilla is vestigial, and the palpi of the second maxilla are greatly reduced. "The feelers are bipennate in both sexes. The fore wings are usually pointed at the tip, and the lower radial nervures bend downward, the hind wings have two or three anal nervures. The caterpillars, with 10 fore legs, are elongate, not hairy, but furnished with dorsal humps on some of the segments, often with a spine on the hindmost. The pupa is inclosed in a cocoon of fine silk." (Carpenter.) The Bombycidae are fairly numerous in southeastern Asia, but less common elsewhere. Several North American forms are known, such as the great Cecropia, polyphemus, and luna moths, and the smaller puss moths, tussock moths, and tent caterpillars. These moths have long been noted for the strong attractive power which the virgin females exert on the males, drawing them from long distances and sometimes in large numbers, collectors utilize this trait to capture specimens, by exposing the females in cages about which males will soon assemble. Consult Packard, "Monograph of the Bombycine Moths of America," *Memoirs National Academy of Sciences*, vol vii (Washington, 1896), Beutenmuller, "Descriptive Catalogue of the Bombycine Moths within Fifty Miles of New York City," *Bulletin American Museum of Natural History*, vol x (New York, 1898), Neumegen and Dyar, "Revision of the Bombycines of North America," *Journal New York Entomological Society*, 1893 and 1894. See MOTH, SILKWORM, ETC.

BOMFIM, bóm-fén', José Lúcio Valdez, COUNT (1787-1863). A Portuguese soldier, born at Peniche (Estremadura). In 1828 he fought with the rank of colonel against Dom Miguel, and in 1832, when Dom Pedro landed in Portugal, continued under him the struggle against the usurper. He entered the cabinet as Minister of War and Marine in 1841, in 1842 took the field against the Absolutists, who had set aside the Constitution of 1837, and in 1844 was compelled to surrender and made his escape to Spain. He was prominent in the insurrection of 1846 and, having been routed at Torres Vedras, was sentenced to banishment to Africa. He returned under the amnesty of 1847.

BOMFORD, bóm-fórd, GEORGE (1780-1848). An American soldier, born in New York City. He graduated at West Point in 1805, served as an engineer in the construction of fortifications until 1812, and, as an ordnance officer during the War of 1812, rendered valuable services to the

government. Among other things he invented and introduced the bomb-cannon, called the "Columbiad," which was superseded by the Rodman gun at the beginning of the Civil War. He became colonel in 1832 and was chief of ordnance from 1832 until 1842, when he became inspector of arsenals, ordnance, arms, and munitions of war.

BOM JARDIM, bóm zhar-dén' (Portug. Good Garden). A city in the state of Ceará, Brazil, 200 miles south of Ceará City, in a rich and beautiful mountain valley. It is the centre of an extensive district, yielding manioc, sugar, etc. Pop., 6000.

BOM JARDIM. A city and municipality of Brazil in the state of Pernambuco. An active trade in cattle is carried on, and the surrounding country is taken up with the cultivation of sugar cane, manioc, tobacco, cotton, coffee, corn, rice, and beans. Pop., 28,000.

BOMMELWAARD, bóm-mel-vart. An island in the province of Gelderland, Holland, formed by the Waal and Meuse. It is 16 miles in length, with a maximum breadth of 6 miles. The district is extremely fertile and raises, besides other farm produce, considerable flax and hops. The town of Bommel is situated on the island. Fort St Andries defends the island on the east and Fort Loevestein on the west.

BON See BOZO.

BO'NA (pl of Lat *bonum*, something good).

A general legal term denoting property of any kind, whether real or personal. In the Roman law it was chiefly applied to real estate, in the later civil law it corresponds to the French term *biens*, comprising real as well as personal property, but in the common law it is confined generally to the latter. It is employed in phrases of varying significance in the English law and, derivatively, though less commonly, in American legal phraseology, as, *bona confiscata*, goods confiscated or forfeited to the crown, *bona notabilia*, property of sufficient value to be noted in an account (formerly in England this was fixed at £5 or upward, and in London at £10, but by the acts creating courts of probate this distinction has been abolished), *bona paraphernalia*, the personal possessions, such as clothing and jewels, which a wife may claim as her own after her husband's death, *bona vacantia*, unclaimed property, as wrecks, treasure trove, waifs, and estrays, which, contrary to the general rule, did not go to the finder, but vested in the crown, *bona vacuata*, property thrown away, as by a thief in flight, by common law going to the king, *nulla bona*, the return of an execution without property found. See CHATTEL.

BONA (Fr *Bône*, Ar *Beled-el-Areb*). A fortified seaport town in the department of Constantine, Algeria, situated on a bay of the Mediterranean, in lat 36° 54' N, long 7° 46' E (Map Africa, E 1). The town, divided into two parts, Upper and Lower Bona, is situated in a beautiful district, at the foot of a hill near the embouchure of the Seybouse. It has been much improved since the occupation by the French in 1832 and beautified by means of the quays and promenades encircling it, and the numerous fountains and gardens to be found all over the city. It is surrounded by walls flanked with square towers and further defended by Fort Cigogne, on the top of the hill. The fortress built by Charles V in 1535 stands on a hill over 340 feet high, and has been used as a prison since 1850 for persons sentenced to deportation.

from France. Among the other public buildings, the cathedral of St. Augustine and the convent of the Sisters of Mercy are notable. Bona has good bazars, shops, markets, reading rooms, etc.; manufactures of tapestry, saddlery, and native clothing; and a trade in cattle, sheep, wool, hides, corn, coral, fish, olive oil, tobacco, and wax. In the vicinity are valuable iron mines, marble quarries, phosphate beds, and cork woods. There are telegraphic communication with Marseilles and regular steam connection with France, Algiers, and Tunis. A fine harbor of 195 acres with an inner basin of 25 acres dates from 1870. It is visited annually by nearly 3000 ships of more than a million net tonnage. Since the construction of the railroad connecting the city with Algiers, Constantine, and Biskra, Bona has left Tunis behind as a port. The neighboring hills yield a fine water supply, and the former marshy and unhealthy condition of the surrounding districts has been improved by drainage. The United States is represented by an agent. Pop. (communal), 1911, 42,039. Near Bona are remains of the once famous city Hippo Regius, the favorite residence of the Numidian kings and the episcopal see of St. Augustine, who died there in 430. Hippo Regius, in early Christian times, was the central station of commerce and civilization in northern Africa and was celebrated for its schools, theatre, aqueducts, palaces, and temples, afterward changed into churches and monasteries. It was destroyed by the Mohammedans under Caliph Othman in 646. This city was connected with its seaport, the ancient *Aphroditum* (the present Bona), by a canal, of which the outline may still be seen in a morass.

BONA, GIOVANNI (1609-74). An Italian Cardinal, author of *De Principiis Vita Christianae* and *Manducatio ad calum*. The latter was translated into English (London, 1672; 6th ed., 1712); and parts of his *Vita Compendii ad Deum*, 'The Easy Way to God' (1876). A recent translation of the *Manducatio* is by L'Estrange, 'A Guide to Eternity' (London, 1900). His complete works appeared in Latin (2 vols., Antwerp, 1677). His work on the Mass appeared in French (2 vols., Paris, 1854-55). He also contributed to the *Acta Sanctorum*. For his biography, consult A. Ighina (Mondovì, Italy, 1874).

BONACI, bō'nā-sā' (Sp. *bonasí*, from the native name). A grouper of the genus *Mycteroperca*, specifically *Mycteroperca bonaci*. See GROUPERS.

BONA DE'A (Lat. 'the good goddess'). A mysterious Roman divinity, variously identified with Fauna, Ops, or Maia. She was worshipped in Rome from the most ancient times, but only by women, even her name being concealed from men. Her sanctuary was a grotto on Mons Aventinus, which had been consecrated to her, tradition said, by the virgin Claudia; here a festival in her honor was held on the 1st of May. Another annual festival in her honor, held in December, was not celebrated there, but in the house of a magistrate with *imperium*, a consul or a praetor, inasmuch as the sacrifices were then offered up for the whole Roman nation. The solemnities were performed generally by aristocratic vestals. At this celebration no males were allowed to be present; even portraits of men were veiled. The wine consumed was called milk, in order that its name might not be discovered, and the vessel in which it

was served, *mellarium*, honey vessel. The symbol of the goddess was a serpent, indicating her healing powers (see AESCULAPIUS); herbs with healing properties were sold in her temple. In his *Roman Festivals* (London, 1899), 101-106, Fowler holds that Bona Dea was "at one time . . . a protective deity of the female sex, the Earth-Mother, a kindly and helpful, but shy and unknowable deity of fertility." The victim sacrificed to her, as to other deities of fertility, was a *porca*, sow. The December festival Fowler (p. 256) regards as a survival from a time "when the wife of the chief of the community—himself its priest—together with her daughters (represented in later times by the Vestals), and the other matrons, made sacrifice of a young pig or pigs to the deity of fertility, from all share in which men were rigorously excluded." In 62 B.C. the notorious Clodius (q.v.) committed the sacrilege of appearing disguised as a woman at the mysteries of Bona Dea, an act which had an important bearing on the career of Cicero (q.v.).

BONA FIDE, fr'dé (Lat. abl. of *bona fides*, good faith). Literally, 'in good faith.' A term which embodied an important principle of the Roman law, one that exerted a powerful influence in the development of what we should call the "equity" of that legal system. Actions *bona fidei*, where the court entered into the motives of acts and administered justice on broad principles of natural equity, were distinguished from actions *stricti iuris*, in which the expressed intentions of the parties were given effect. The effect of *bona fides* in the determination of legal rights may be illustrated by the rule that one who claimed title to lands or goods by prescription was required to show that his possession was in good faith, i.e., was believed by him to be legal; as also by the doctrine which permitted one who had taken possession of another's land in good faith, i.e., believing himself to be the owner, to retain the profits of the land during the period of his possession, whereas the trespasser in bad faith was required to surrender with the land the profits he had gained therefrom.

The principle of *bona fides* has played a less important part in our legal system, it being a generally accepted doctrine of English and American civil law that the courts have nothing to do with the motive with which an act is performed. In the criminal law, of course, the case is different, the motive or "intent" being the determining factor in crime. But even in the civil relations of men, there are important exceptions to the doctrine above set forth, especially in equity. Thus if a person takes possession of another's property, honestly believing it to be his own, and, without notice of the other's title, adds to its value, his liability to the owner is for the value of the property when originally taken; but if the taking is in bad faith, he is held liable, generally, for the whole value of the improved property, without any allowance for his enhancement of its worth. A bona-fide purchaser is one who buys property for a valuable consideration, without notice of any defect in his vendor's title and believing that the vendor has a good right to sell and convey a good title. By the civil-law rule, which prevails on the continent of Europe and in Scotland, such a purchaser from a trader in the course of his business acquires a perfect title, though his vendor had none. According

to the English common law, however, his title is no better than his vendor's. If the vendor had title, but one which was voidable by a third person for fraud (qv), the bona-fide purchaser would be able to hold the property. So a bona-fide purchaser of property from a trustee clothed with the legal title can hold it as against the *cestui que trust* or beneficiary (qv). Again, the bona-fide purchaser of a negotiable instrument (qv) holds it free from any defect of title between prior parties, and free from defenses available to prior parties among themselves. This rule had its origin in the customs of merchants and received the sanction of common-law courts because it was necessary to enable negotiable paper to discharge the functions of currency. See CRIME, TORT, EQUITY, TRUST.

BONAINI, bô-nî-nê, FRANCESCO (1806-74). An Italian historian, born in Leghorn. He studied in Pisa and was appointed professor of ecclesiastical law there in 1827 and professor of the history of law in 1840. In 1852 he was appointed general superintendent of the state archives of Tuscany. He was successful as an archivist and was also exceedingly active as an author and editor. His works include a collection of the legends of Pisa, in the *Archivio Storico Italiano* (1844-45), a more important collection of documents, the *Statuti inediti della città di Pisa dal XII al XIV secolo* (1851), *Cronache e storie di Perugia* (2 vols., 1850-51), and the posthumous *Acta Henrici VII* (1877).

BONAIRE. See BUEN AYRE.

BONALD, bô-nâl', LOUIS GABRIEL AMBROISE, VICOMTE DE (1754-1840). A French publicist and theocratic writer, born at Mouna, in Aveyron. An ardent adherent of the old monarchy, he was compelled to emigrate during the French Revolution and went to Heidelberg, where he wrote politico-philosophic works in support of monarchy. His first important work, *Théorie du pouvoir politique et religieux* (3 vols., 1796), was seized by the Directory. It prophesied the restoration of the Bourbons. He returned to France about 1806, won the favor of Napoleon, and in 1808 was appointed Minister of Instruction. In 1815 he was elected to the Chamber of Deputies, and there, as well as afterward in the Chamber of Peers, was conspicuous by his opposition to all liberal projects, notably the freedom of the press. The July Revolution brought his public career to a close, and he refused to take the oath of allegiance to the new dynasty. His most important writings are *Législation primitive* (3 vols., 1802) and *Recherches philosophiques sur les premiers objets des connaissances morales* (2 vols., 1818).

BONAN'ZA (Sp. fair wind or weather, prosperity, from Lat. *bonus*, good). A term applied to the mining districts of the United States to the discovery of an exceedingly rich vein or body of ore. When such a vein has been struck, the mine is said to be a "bonanza." In the celebrated Comstock Lode in Nevada some 10 bonanzas were found, the most famous of which, known as the "Big Bonanza," was discovered in 1876. The word "bonanza" has a popular application also to a successful enterprise or to any piece of good luck.

BONAPARTE, bô-na-part, CHARLES JOSEPH (1851-) An American public official, the grandson of Jerome Bonaparte, born in Baltimore. He graduated from Harvard in 1871 and from the Harvard Law School in 1874, practiced

law in Baltimore and became prominent in movements for the betterment of municipal and national affairs. From 1902 to 1904 he was a member of the Board of Indian Commissioners, he was a Republican presidential elector from Maryland in 1904, chairman of the National Civil Service Reform League in 1904, and president of the National Municipal League in 1905. For 10 years from 1891 he was an overseer of Harvard University, and he was made a trustee of the Catholic University of America in 1904. In 1905 he became Secretary of the Navy, and was Attorney-General from 1906 to 1909. He wrote *Can We Trust Our Army to Spoilsmen?* (1898), *The Essential Element in Good City Government* (1901), *Some Duties and Responsibilities of American Catholics* (1905), *Civil Service as a Moral Reform Question* (1908).

BONAPARTE, bô-na-part, It. **BUONAPARTE**, bwô-na-par'tà, FAMILY OF. The Bonaparte family originated in Italy and may be traced in the records of Florence, San Miniato, and elsewhere. The Corsican branch, the only one of historical importance, went to Corsica from Sarzana, in Genoese territory, about 1610, and its representatives took up their residence at Ajaccio, where they occupied a respectable position as patricians, *padri del commune* or *cittadini*, without especial prominence until the rise of the great Napoleon. The Grand Duke of Tuscany in 1757 issued a formal patent of nobility to Joseph, the grandfather of Napoleon, and a coat of arms. The title of patrician was also granted by the Grand Duke two years later. In the eighteenth century the following representatives of the family resided at Ajaccio, the archdeacon, Lucien Bonaparte, his brother, Napoleon Bonaparte, and their nephew, Carlo—CARLO BONAPARTE, father of the Emperor Napoleon, was born March 29, 1746, studied law in Pisa, and married, in 1767, a beautiful young patrician, named Letizia Ramolino. In 1768, with his uncle Napoleon, he joined General Paoli in defending the island against the French invaders. When resistance was shown to be useless, Carlo Bonaparte attached himself to the French interest, and in 1771 was included by Louis XV in the list of 400 Corsican families chosen to form a nobility. In 1773, through the influence of Marbeuf, Governor of Corsica, Carlo Bonaparte was appointed royal counselor and assessor of the town and province of Ajaccio. In 1777 he was a member of the deputation of Corsican nobles to the court of France. In this capacity he resided for some time in Paris, where he gained for his son, Napoleon, through the interest of Count Marbeuf, admission into the military school at Brienne. In 1779 he returned to Corsica and in 1785 went to Montpellier, for the benefit of his health, but died there, Feb. 24, 1785. MARIA LETIZIA RAMOLINO, his wife and mother of Napoleon I, lived to see the rise and decline of power of her family and met them with equanimity and dignity. She was born at Ajaccio, Aug. 24, 1750. After the death of her husband she lived for some time in Corsica, and in 1793, when the island came under British rule, removed with her family to Marseilles, where she lived in poverty, mainly supported by the pension given to Corsican refugees. After her son became First Consul she moved to Paris, and when he was crowned Emperor, in 1804, received the title of Madame Mère. She never cared for the brilliant surroundings of the Imperial court. After the downfall of Napoleon

Letizia lived with her stepbrother, Cardinal Fesch—in winter in Rome, and in summer in Albano. She died, Feb. 2, 1836, leaving considerable property, the result of saving habits during prosperity.

Eight children were born to Carlo Bonaparte and Letizia his wife: Joseph, King of Spain; Napoleon, Emperor of the French; Lucien, Prince of Canino; Marianne (afterward named Elisa), Princess of Lucca and Piombino, Grand Duchess of Tuscany, Countess of Campignano, wife of Prince Baciocchi; Louis, King of Holland; Carlotta (afterward named Marie Pauline), Princess Borghese; Annunziata (afterward named Caroline), wife of Murat, King of Naples; Jerome, King of Westphalia. By a decree of the French Senate, Nov. 8, 1804, the right of succession to the Imperial throne was restricted to Napoleon and his brothers Joseph and Louis, with their offspring. Lucien and Jerome were excluded on account of their unsuitable marriages. Napoleon intended to give the right of succession also to Lucien, by the additional Act of April 22, 1815; but this never took effect. As Joseph, the eldest brother of the Emperor, had no son, the descendants of Louis became nearest heirs to the throne.

JOSEPH, the eldest brother of Napoleon, was born at Corte, in Corsica, Jan. 7, 1768, and was educated at Autun. On the death of his father he returned to Corsica, exerted himself to support the younger members of the family, and removed with them to Marseilles in 1793. In 1797 he was elected a member of the Council of Five Hundred and in the same year was sent as Ambassador from the Republic to Rome. In 1800 he was chosen by the First Consul as plenipotentiary to conclude a treaty of friendship with the United States of North America. He signed the Treaty of Lunville, Feb. 9, 1801, and that of Amiens, 1802, and with Cretet and Bernier conducted the negotiations relative to the Concordat. After the coronation of Napoleon Joseph was made commander in chief of the army of Naples, and in 1806 King of Naples. He effected many beneficial changes—such as the abolition of feudalism, the suppression of convents, the building of roads, the repression of banditti, and the codification of laws—but these reforms were not managed judiciously and frequently came into collision with the ambitions of his Imperial brother. He was a lover of the fine arts and a man of progressive ideas, but not a vigorous ruler for stormy times. In 1808 Joseph was summarily transferred by his brother to the throne of Spain, and Murat took his place as King of Naples. Joseph was not able to cope with the Spanish insurgents, backed by the power of England, and after the defeat of the French at Vittoria, in 1813, he returned to his estate at Morfontaine, in France. When Napoleon recognized Ferdinand VII as King of Spain Joseph refused at first to abdicate, though he had many times before implored his brother to release him from his royal chains; but he soon submitted, as in all other matters, to the Emperor's will. After the battle of Waterloo he accompanied Napoleon to Rochefort, whence they intended to sail separately for North America. In his last interview with Napoleon Joseph generously offered to give up the vessel hired for his own escape, but meanwhile Napoleon had determined to surrender himself into the hands of the English. After a residence of many years in the United States at Bordentown, N. J., where, as the Count de Sur-

villiers, he employed himself in agriculture, in 1841 Joseph was permitted to return to his wife, who had remained in Italy since 1815. He died in Florence, July 28, 1844. Joseph was the only one of his brothers for whom Napoleon professed any liking. He was a handsome, intellectual-looking man, of distinguished manners and polished speech. His wife, Julia Marie Clary, born Dec. 20, 1777, was the daughter of a wealthy citizen of Marseilles, and the sister-in-law of Bernadotte, King of Sweden. She was a quiet, unambitious woman, with no taste for the splendors of royalty, which fell to her share during Joseph's reign in Naples, for she never went to Spain. She died in Florence, April 7, 1845. By her marriage with Joseph she had two daughters: (1) Zénaïde Charlotte Julie (1801-54), who became the wife of Lucien Bonaparte's son, the Prince of Canino; (2) Charlotte Napoléone (1802-39), who married Louis Napoleon (died 1831), second son of Louis Bonaparte, King of Holland.

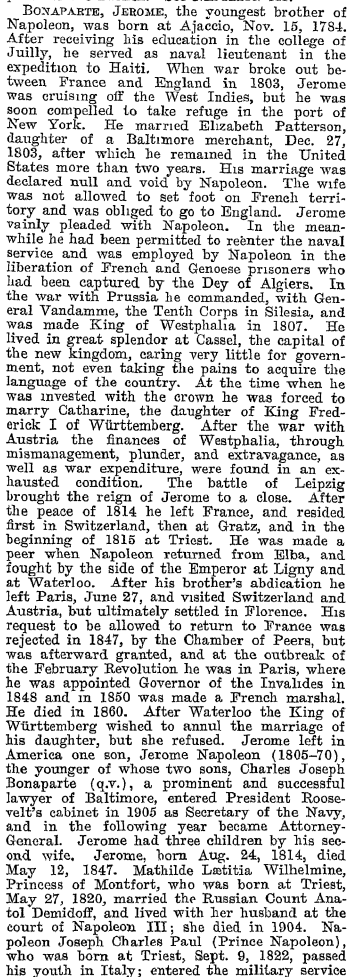

BONAPARTE, NAPOLEON. See NAPOLEON I. BONAPARTE, LUCIEN, Prince of Canino, and brother of Napoleon, was born March 21, 1775, and received his education at the college of Autun, the military school at Brienne, and the seminary at Aix. Rising gradually from one office to another, he was elected to the Council of Five Hundred, spoke against the wasteful distribution of state property, and formed a party favorable to the views of his brother Napoleon. Shortly before the 18th Brumaire (1799), he was elected President of the Council of Five Hundred, and as such was of signal service to his brother in securing the dictatorship of France. Afterward appointed Minister of the Interior, he was active in the encouragement of education, art, and science, and organized the prefectures. As Ambassador to Madrid, 1830, he contrived to gain the confidence of King Charles IV and his favorite Godoy, thus putting aside the British influence which had until then been exercised at the court of Spain. It is said that for his services in the treaty of peace concluded between Spain and Portugal, Sept. 29, 1801, he received 5,000,000 francs. But his constant opposition to Napoleon's progress towards monarchy involved Lucien in several misunderstandings with his brother, and their quarrel was brought to an issue by Lucien's second marriage against the wishes of Napoleon. He was exiled from France, went to Italy, and lived quietly at Canino in the province of Viterbo, near the frontier of Tuscany, where he devoted his time to art and science. Here he enjoyed the friendship of the Pope, who created him Prince of Canino; but having denounced in his private capacity the arrogant and cruel policy of his brother towards the court of Rome, he was "advised" to leave the city in which he was at that period residing. In 1810 he took ship for America, but fell into the hands of the English; was taken to England, and after a debate in Parliament was declared to be a prisoner, but treated with distinction. Upon his brother's downfall he returned to Rome. After the defeat of Waterloo Lucien maintained his presence of mind, advising his brother to dissolve the chambers and assume the place of absolute dictator. After the Restoration of Louis XVIII Lucien lived for some time in and near Rome. In 1830 he went to England, visited Germany in 1838, and died at Viterbo, June 29, 1840. Lucien possessed considerable talents and firmness of character. He

was in his early years an ardent Republican, but the weakness of the Directory convinced him that a military consulship was necessary to allay the social anarchy of France. He consequently threw himself eagerly into the designs of his brother, but protested against the establishment of a hereditary monarchy. As a writer he was by no means successful. His long and tedious epic poem, *Charlemagne, ou l'Eglise délivrée*, in 23 cantos, was written and published in London and was dedicated to the Pope (1814). Another heroic poem, *La Cygneide, ou la Corse sauvée*, followed in 1819. The *Mémoires secrets sur la vie privée politique et littéraire de Lucien Bonaparte* (2 vols., London, 1819), of which Alphonse de Beauchamp is supposed to be the author, is an untrustworthy book. Lucien was the father of a numerous family. In 1794 he married Christine Boyer, the daughter of a citizen of Saint Maximin. After her death he married, in 1802, the widow of a stockbroker, Madame Joubertion, who survived him. By his first marriage he had two daughters—Charlotte (1796-1865), who married Prince Gabrielli of Rome, and Christine (1798-1847), who married first a Swedish count named Posse, and then Lord Dudley-Stuart. By his second marriage Lucien had nine children. Charles Lucien Jules Laurent (eldest son of Lucien), Prince of Canino and Musignano, was born in Paris in 1803. He never exhibited any inclination for political life, preferring the pursuits of literature and science. He resided in Philadelphia from 1822 to 1828, during which time he studied the birds of the United States and wrote many technical papers published by scientific societies. He published *American Ornithology, or History of Birds Inhabiting the United States not given by Wilson* (Philadelphia, 1824-33), which came to be known as "Wilson and Bonaparte's Ornithology" and formed the basis for numerous subsequent editions of Alexander Wilson's great work. After his return to Europe he wrote extensively on American birds in German, French, Italian, and English. Among his works is *Iconografia della fauna italica*. The second son, Paul Marie, born in 1808, took a part in the Greek War of Liberation and died by the accidental discharge of a pistol, 1827. The third son, Louis Lucien (1813-91), distinguished himself by his studies in chemistry, mineralogy, and languages. Pierre Napoléon Bonaparte, the fourth son, born Sept. 12, 1815, passed through many changes of fortune in America, Italy, and Belgium, returning to France after the Revolution of 1848. In 1870 he shot a journalist, Victor Noir, for which he was tried at Tours, and acquitted of murder, but condemned to pay 25,000 francs to Noir's relatives. He died April 8, 1881. The youngest son, Antoine, born Oct. 31, 1816, fled to America after an affair with the papal troops in 1836, and returned to France in 1848, where he was elected to the National Assembly, 1849, but retired from politics in 1851. He died in 1877. The eldest daughter, Letizia (1804-71), married, in 1824, Mr. (afterward Sir) T. Wyse, an Irish gentleman, but a separation took place in a few years. The second daughter, Jeanne (1807-28), distinguished by her beauty and taste for poetry, died soon after her marriage with the Marchese Honorati. The third daughter, Alexandrine Marie, born in 1818, married, in 1836, Count Vincenzo Valentini de Canino, and gave birth to two sons and one daughter. Constanze, the youngest daughter

of Lucien, was born in 1823, became a nun, and died in Rome in 1876.

BONAPARTE, MARIE ANNE ELISA (1777-1820). The eldest sister of Napoleon Bonaparte. When Corsica was occupied by the English, she, with her family, emigrated to Marseilles, where she married Captain Bacciocchi, later created Prince of Lucca and Piombino. The elevation of Napoleon raised her also to rank and power, and in 1806 the principality of Massa and Carrara was intrusted to her administration, which was, on the whole, a beneficial one for the people. In 1809 she was made Grand Duchess of Tuscany. Here the arbitrary measures of her brother, which she had to carry out, and her own self-will and harshness, rendered her unpopular, and when the Allies entered Tuscany in 1814, she was forced to leave Florence.

BONAPARTE, LOUIS, third brother of the Emperor Napoleon, was born Sept. 2, 1778, and was educated in the artillery school at Châlons. Rising from place to place, he was made King of Holland in 1806, but, in fact, he was never more than a French Governor of Holland, subordinate to the will of his brother. He endeavored, however, to resist some of the demands of the Emperor and replied to one requisition by saying that, since he had been placed on the throne of Holland, he had "become a Dutchman." But Napoleon insisted on his submission, sent troops to Holland, and in 1810 annexed that country outright to France. Louis made no forcible resistance, he abandoned his throne, fled to Bohemia, and finally settled in Italy at Rome. Here he devoted himself for the most part to literature. He died in 1846. Louis Bonaparte was the writer of several works, *Marie, ou les Hollandaises*, 1814, a novel, giving some sketches of Dutch manners, *Documents historiques, etc., sur le gouvernement de la Hollande* (3 vols., London, 1821), *Histoire du parlement anglais* (1820), and a critique on M. de Norvins's *History of Napoleon*. His wife, the amiable and accomplished HORTENSE EUGÉNIE BEAUHARNAIS, the adopted daughter of Napoleon, Queen of Holland, and Countess Saint-Leu, was born in Paris, April 10, 1783. After the execution of her father she lived for some time in humble circumstances, until Napoleon's marriage with Josephine. In obedience to the plans of her stepfather, she rejected her intended husband, General Desaix, and married Louis Bonaparte in 1802. After the Hundred Days she visited Augsburg and Italy and then fixed her residence at Arenenberg, a mansion in the canton of Thurgau, where she lived in retirement. In 1831, when her two sons had implicated themselves in the Italian insurrection, the Countess traveled in search of them through many dangers and found the elder deceased and the younger, afterward Emperor of the French, ill at a place near Ancona. Returning with her son to Paris, she was pleasantly received by Louis Philippe and by Casimir Périer, but was obliged, in the course of a few weeks, to remove with her son to England. Thence she removed to her country seat, Arenenberg, where she died, after severe suffering, Oct. 3, 1837. She was the author of *La Reine Hortense en Italie, en France et en Angleterre, pendant l'année 1831*, and wrote several excellent songs. She likewise composed some deservedly popular airs, among others the well-known "Partant pour la Syrie," which the second Emperor of the French made a national air. Of her three sons, the

of Wurttemberg, 1837, afterward traveled in several countries of Europe, and was banished from France, 1845, on account of his intercourse with the Republican party. He returned to Paris with his father, 1847, and after February, 1848, was elected to the National Assembly. He commanded an infantry division of reserve at the battles of the Alma and of Inkerman in the Crimean War. In 1859 he married the Princess Clotilde, daughter of Victor Emmanuel, by whom he had two sons and a daughter. When war with Prussia was declared in 1870, Prince Napoleon proceeded on a diplomatic mission to his father-in-law, at Florence, but failed to obtain the cooperation of Italy with his cousin. After the fall of the Empire he took up his residence in England, but returned to France in 1872. On the death of the Prince Imperial, son of the Emperor Louis Napoleon, in Zululand in 1879, the eldest son of Prince Napoleon became the heir of the Bonapartist hopes. When, in 1886, the chiefs of the Bourbon family were, by a vote of both chambers, expelled from France, Prince Napoleon and his eldest son were exiled also. He died in 1911.

BONAPARTE, LETITIA. MARIE WYSE, MME DE SOLMS-RATTAZZI-DE RUTE (1829-1902). A French author, born at Waterford, Ireland. She is supposed to have been a granddaughter of Lucien Bonaparte by his second wife, through the marriage of his daughter Letizia to Thomas Wyse, an Irishman. In 1850 she was married to Frederic de Solms, but after four years separated from him and, taking the title of Princesse de Solms, settled in Savoy, not then a part of France. Here she founded *Les matinees d'Asa* (1853) and gathered about her nearly all the celebrities of the day. Among her friends were Victor Hugo, with whom she kept up a correspondence, Kossuth, Eugene Sue, Lamartine, Lamennais, Dumas, Rochefort, and Tony Revillon. She contributed to the *Constitutionnel*, through Sainte Beuve, under the pen name of Baron Stock. After Savoy was annexed to France she went back to Paris and again kept open house, playing a prominent part in the literary and social events of the time. In 1863, De Solms having died, she married Urbain Rattazzi, a well-known Italian statesman, and lived

with him in Italy. After his death she returned to Paris. She outlived her third husband, Señor de Rute, a Spaniard, whom she married a few years after Rattazzi's death. Her writings consist of miscellaneous sketches, verses, plays, and novels. Among the latter are *Si j'étais reine* (1868), said to be autobiographical, and *Les mariages de la croix* (1866), reprinted under the title *La chanteuse* (1870). Consult also, Grierson, *Parisian Portraits* (New York, 1913).

BONAPARTE, PRINCE NAPOLEON JOSEPH PAUL. See BONAVENTURA, FAMILY OF.

BONAPARTE, PRINCE ROLAND (1858-). A French geographer, grandson of Prince Lucien Bonaparte, and great-nephew of Napoleon I. He became a member of the Institute and was twice president of the French Geographical Society. His publications include *Les habitants de Surinam* (1883), *Le théâtre Javanais* (1885), *Récents voyages des Néerlandais à la Nouvelle-Guinée* (3 vols, 1885), *Une excursion en Corse* (1891), *Documents de l'époque mongole des XIII^e et XIV^e siècles* (1896). His daughter Marie married Prince George, the second son of George I, King of Greece, in 1907.

BONAR, HORATIUS (1808-89). An English Free Church clergyman and writer of hymns. He was born in Edinburgh and educated at the university there. In 1837 he was ordained to the ministry at Kelso, where he remained nearly 30 years, when he was called to the Chalmers Memorial Free Church, Edinburgh. He edited several religious journals and published more than 20 volumes of a religious character, among them *Hymns of Faith and Hope* (3 series, 1857-68) and *Selected Hymns* (1879). He was author of the hymns "What a Friend We Have in Jesus," "I Heard the Voice of Jesus Say," "I Was a Wandering Sheep," and "Here, O my Lord, I See Thee Face to Face."

BONAR, JAMES (1852-). A Scottish educator and political economist, born at Col-lace (Perthshire). He studied at Glasgow University and Balliol College, Oxford, and in 1881 was appointed junior examiner in the English civil service commission. In 1895 he became senior examiner. He was in 1898 president of Section F of the British Association. Among his publications may be mentioned a translation (1877) of J. T. Beck's *Umriss der biblischen Seelenlehre, a Catalogue of Adam Smith's Library* (1894), *Parson Malthus* (1881), *Malthus and his Work* (1885), *Philosophy and Political Economy* (1893), *Elements of Political Economy* (1903), and *Disturbing Elements in Political Economy* (1911).

BONA'SUS. The aurochs. See BISON.

BONAVENTURA (1221-74). A saint and doctor of the Roman Catholic church. His real name was Giovanni Fidanza. He was born in 1221 at Bagnorea, in Tuscany. In 1238 he became a Franciscan monk, was a theological teacher in Paris, where he had studied, 1248-55, and in 1257 became general of his order. The influence of his character now began to penetrate the Church, and it was mainly through his eloquent persuasion that the cardinals were induced to unite (1271) in electing to the papal dignity Tedaldus Visconti (Gregory X). Gregory created Bonaventura Bishop of Albano and Cardinal in 1273, when he accompanied Gregory to the council at Lyons, where he died, July 15, 1274, worn out by his strict asceticism.

On account of his unspotted character from earliest youth, as well as the miracles ascribed to him, he enjoyed, even during his lifetime, especial veneration. Dante, who wrote shortly after, places him among the saints of his Paradiso; in 1482 he was formally canonized by Sixtus IV and in 1587 was ranked by Sixtus V as the sixth of the great doctors of the Church. The religious fervor of his style procured for him the title of *doctor seraphicus*, and his own order, the Franciscans, are as proud of him as the Dominicans are of Thomas Aquinas. A great part of his writings is devoted to the praise of his order, and to the defense of hyperdulia, celibacy, transubstantiation, communion in one kind, and other doctrines and practices much discussed in his day, which he treats in a philosophical manner. His most important works, the *Breviloquium* (Tubingen, 1845; 2 vols., Venice, 1874), and *Soliloquium*, are properly text-books on dogmatics. Unfortunately his efforts to philosophize the Church creed, and that deep mysticism in which his spirit reveled, make him often obscure and unintelligible even in his most popular treatises. With Bonaventura theology is the goal of all art and science; and in his *Itinerarium Mentis in Deum*, as also in his *Reductio Artium in Theologiam*, he represents union with God, to which the soul attains through six stages, as the highest good. He did more than any other of the early theologians to give a scientific form to the mystical theology. The *Biblia Pauperum*, or 'poor man's Bible,' attributed to him, is a mystico-allegoric explanation of the plain contents of the sacred books for the benefit of the laity. In warmth of religious feeling, however, and in the practical tendency of his ethics, he far excels most of his contemporaries. In his commentary on the *Sententiae* of Peter the Lombard, he acutely argued against the eternity of the world and also advanced some original proofs of the immortality of the soul. The most complete edition of his works appeared at Paris (15 vols., 1864-71). In modern English have appeared his *Life of St. Francis of Assisi* (London, 1868; 2d ed., 1876, New York, 1905); *The Month of Jesus Christ* (1882); and *Instructions for the Season of Lent* (1884). *The Life of Christ* (1881), *The Psalter of the Blessed Virgin* (1852), *The Mirror of the Blessed Virgin Mary* (Dublin, 1849), are works attributed to him. His *Itinerarium* is translated in the *Journal of Speculative Philosophy*, vol. xxi. Consult *Lexicon Bonaventurianum philosophico-theologicum* (Venice, 1880); and for his life, A. M. Vicenza (from the Italian, Paderborn, 1874); Skeay (London, 1889), and Costello, *Saint Bonaventura* (London, 1911). See PLATE of BIBLIA PAUPERUM.

BONAVENTURA, FATHER. A pseudonym of Charles Edward Stuart, adopted on his secret visit to England in 1753; mentioned in Scott's *Redgauntlet*.

BONAVINO, bō'ná-vē'nō, CHRIST. See FRANCOIS.

BONAVIS'TA (It. Good View). The capital of Bonavista district, on a bay of the same name, on the east coast of Newfoundland, 73 miles north by west of St. John's (Map: Newfoundland, G 4). It is a thriving port of entry and one of the oldest fishing stations on the island. The surrounding land is well cultivated. Islands and rocks make the navigation of the bay dangerous. The entrance is marked by a

lighthouse on Cape Bonavista, 150 feet above the sea. Pop., 1901, 3696; 1911, 3971.

BON'BRIGHT, DANIEL (1831-1912). An American educator, born in Youngstown, Pa. He graduated at Yale in 1850, was tutor there in 1854-56, and in 1858 was appointed professor of Latin language and literature in the Northwestern University, at Evanston, Ill. In 1899-1902 he was dean of that university's faculty of liberal arts and in 1900-02 was acting president.

BONCHAMP, bōn'shān', CHARLES MELCHIOR ARTUS, MARQUIS DE (1760-93). A Vendean chief. He was born at Joverdeil, in the old province of Anjou; took part in the American Revolution; and when he returned to France was made captain. Of strong Royalist principles, he looked with disfavor on the Revolution. After living for some 18 months in solitude, he allowed himself to be chosen leader of the Anjou insurgents. The Army of the Vendée would have been more formidable if Bonchamp's tactics had been adopted, but this was not done until it was too late. He fought at Bressuire and Thouars, and in the sanguinary encounter at Chollet, Oct. 18, 1793, received a fatal shot in the breast. He was generous and merciful in his warfare, and the lives of 5000 Republican prisoners are said to have been spared at his dying request. Consult Chauveau et Dussieux, *Vie de Bonchamp* (Paris, 1817).

BONCI, bōn'chē, ALESSANDRO (1870-). A famous Italian tenor. He was born at Cesena in the Romagna. Although he had a remarkable voice even as a child, he did not receive any training until his twentieth year, when he entered the Conservatory at Pesaro. Here he studied for three years under Pedrotti and Felice Coen. He began his professional career in 1893 as soloist in a church in Loreto, but continued his studies and also began to study operatic rôles. His début on the stage was made in 1896, when he sang Fenton in Verdi's *Falstaff* at Parma. His success was instantaneous, and he received an offer from the Dal Verme in Milan, where he first appeared in the title rôle of Gounod's *Faust*. Not long after this he was among the principal artists of La Scala, and his services were in demand at all the great opera houses of Italy. His first European tour took him from St. Petersburg to Paris. Everywhere his success was phenomenal. When in 1906 Hammerstein opened the Manhattan Opera House, New York, Bonci was his principal tenor. Immediately he was set up as the rival of Caruso, who was drawing great crowds at the Metropolitan, and so keen did this rivalry become that the Metropolitan Company did not rest until it had secured the new star in 1908. Bonci, however, did not remain long with the Metropolitan Company. In 1910 he resigned to devote himself chiefly to concert work, in which field he is one of the supreme artists. He was expected to be a member of the Chicago Opera Company in 1913-14, but was released from his contract. Caruso's voice is more powerful and has perhaps more sensuous charm, but in all other respects Bonci is his superior. It is impossible to imagine how any of the bel canto artists of Rossini's time could have had a more perfectly trained organ, responding to every demand. Withal, he never yields to the temptation of exploiting his flawless technic to dazzle his audience by feats of mere virtuosity. What impresses most in Bonci's art is his fine musicianship, his exquisite taste, and unerring

instinct for revealing the composer's most subtle intentions

BONCOMPAGNI, bôn'kôm-pa'nyé, PRINCE BALDASSARE (1821-94) An Italian mathematician, born in Rome His noted critical and historical work, *Scritti di Leonardo Pisano*, appeared in 1857-62 In 1857 he found at the Cambridge library a Latin translation of the famous arithmetic of Al Khwarizmi, which he published in Rome under the title *Algoritmi de Numero Indorum* All traces of this work had disappeared for 250 years His numerous historical monographs were published for the most part in the *Bullettino di Bibliografia*, in 20 vols, edited by him (Rome, 1868-88)

BOND See MASOKRY, BUILDING

BOND (same word as *band*, a fastening, from the verb to *bind*) In a legal sense, an obligation in writing and under seal by which one party termed the obligor, binds himself to pay a sum of money to another, termed the obligee A contract under seal to perform any other act or duty is generally termed a covenant Bonds belong to the class of specialty contracts and are of two kinds, *simple* and *conditional*—the former where provision is made for the payment of a sum of money only, the latter where a clause is added, in the nature of a defeasance, upon the performance of which the obligation is void, but upon the breach of which the obligation, regarded in the nature of a penalty, is payable The latter is the class to which the term 'bond' is more commonly applied in modern usage In form a bond consists of (1) the obligation by which the obligor binds himself, his heirs, executors, and administrators, to pay a certain sum of money; (2) any recitals necessary to explain the transaction, (3) the conditions, defining the acts on the performance or breach of which the obligation terminates In an ordinary surety's bond, or one for the payment of a debt, the obligation is for a sum double the amount of the debt, hence called a "penalty," but is wholly discharged by the payment of the debt with interest by the debtor Formerly the condition was often stated in a separate instrument called the "defeasance" Under the old common-law rule of nonperformance of the condition of a bond on the day fixed, the penalty was absolutely forfeited and recoverable by the obligee in full, but the courts of equity intervened to give relief against such penalty on the payment of the sum or damages actually sustained with interest due, and later statutes confined the recovery at law to the debt or damages actually suffered, so that now a bond amounts merely to the promise of payment of a sum of money, its form being sanctioned by antiquity One of the great advantages of a bond over an ordinary contract to pay money is that the period fixed by the statute of limitations, in most jurisdictions, in which to bring action is 20 instead of 6 years Where the obligation runs to more than one obligee, all should join in a suit, unless then rights are expressly declared to be several

In the United States a bond or like obligation to pay money is frequently accompanied by an instrument of security or mortgage upon the property of the debtor or obligor On default the obligee may at his election either sue upon the bond or enforce the payment from the security A similar usage prevails in the Scotch and English law, in the former, a mortgage of

real estate being commonly termed a *bond* See MORTGAGE

Corporations are generally empowered by their charters to borrow money by the issue of bonds These bonds have a definite period to run and bear a fixed rate of interest The entire bond issue is frequently secured by a mortgage made to a trustee for the bondholders upon the property of the corporation, under which the bondholders may, upon default of payment of principal or interest, foreclose upon the property in satisfaction of their claims This right greatly enhances the value of the security in the case of first mortgage bonds, but is of less value in the second and subsequent mortgage bonds so frequently issued by railroad corporations ANY obligations issued in a group by a corporation are called bonds when they bear a fixed rate of interest The entire bond issue is divided into part obligations, each of which is a bond, usually in sums of \$1000 each In form they are either registered or coupon bonds In the former case they are issued to individual owners, who in case of sale must authorize the transfer on the books of the corporation or its trustee to the purchaser Coupon bonds are payable to bearer and provide for the payment of interest by a series of notes (coupons) attached to the bond, which promise the payment of the interest, usually expressed as a specific sum of money, at the several interest periods As they fall due they are cut from the bond and presented directly or through a bank for payment They may be payable at the company's offices or at banking institutions named on the coupons

Bonds issued by governments are not supported by any mortgage, as no citizen can enforce a claim against the state For their security they rest, therefore, upon the confidence of the purchaser in the ability and good intentions of the issuing government to meet its obligations In the case of refusal by the government to pay the debt or interest the holder is without legal redress In some of the States of the Union the issue of bonds by the State governments and in all the States the issue of bonds by counties, school districts, towns, and cities is hedged about by constitutional provisions fixing the maximum amount of bonded indebtedness that may be incurred and, in some cases, limiting the purposes for which bonds may be issued See DEBT, PUBLIC, RE-PUDEIATION

Consult Cook, *Treatise on Stock and Stockholders* (3d ed, Chicago, 1894), Short, *Law of Railway Bonds and Mortgages* (Boston, 1897), Hainer, *Modern Law of Municipal Securities* (Indianapolis, 1898), Dillon, *Law of Municipal Bonds* (St Louis, 1876) Also the authorities referred to under the articles FORECLOSURE, MORTGAGE, TRUST, MUNICIPALITY

BOND, SIR EDWARD AUGUSTUS (1815-98) An English librarian and scholar, born at Hanwell After holding several minor positions in the British Museum, he became Keeper of the Manuscript Department in 1867, and from 1878 to 1888 was principal librarian In 1870 he founded (with E M Thompson) the Paleographical Society, of which he was long president It was he who brought about the printing of the British Museum catalogue He edited *Statutes of the Colleges of Oxford* (1853), *Speeches in the Trial of Warren Hastings* (1859-61), the *Travels of Jerome Horsey* (for

the Hakluyt Society), *Facsimiles of Ancient Manuscripts* for the Paleographical Society (5 vols., 1873-88), and other works. He was made C.B. in 1885, K.C.B. in 1898, and from Cambridge he received an honorary LL.D.

BOND, EDWARD AUSTIN (1849-). An American engineer, born at Dexter, Mich. From 1868 to 1889 he held positions with various railways in New York State as engineer, then for a time served as a consulting engineer, chiefly in the construction of water works, and in 1899-1904 was State engineer and surveyor of New York. He was chairman of the advisory board of consulting engineers for the Barge Canal, having in his hands charge of both plans and the earlier construction work (1910-11), and after that period was employed as consulting engineer by an Albany banking investment firm.

BOND, GEORGE PHILLIPS (1825-65). An American astronomer, the son of William Cranch Bond (q.v.), born at Dorchester, Mass. He was his father's assistant in the Harvard Observatory, succeeding to full charge in 1859. He was the first to apply photography to the observation of double stars. He published a *Treatise on the Construction of the Rings of Saturn*; *Elements of the Orbits of Hyperion and the Satellite of Neptune*; and several mathematical memoirs on mechanical quadratures and the method of least squares. For a work on Donati's comet he received a gold medal from the Royal Astronomical Society.

BOND, SIR ROBERT (1857-). A British-American political leader, born at St. John's, Newfoundland. He studied law and was elected to the Legislative Assembly in 1882 and two years later became speaker. In 1889 he was in the cabinet as Colonial Secretary. He was chiefly concerned in the negotiation of the Bond-Blaine reciprocity convention of 1890 with the United States, which was rejected by the British government, and was chairman of the Newfoundland deputation, at the Ottawa conference of 1895, regarding a union with Canada. From 1900 to 1909 he was Premier and Colonial Secretary, and negotiated with the United States the Hay-Bond reciprocity treaty which was signed at Washington, Nov. 8, 1902, but failed to secure ratification in the United States Senate. In 1902 he was knighted and made a member of the Imperial Privy Council. In 1906 he procured the passage of a resolution in favor of old-age pensions. He opposed the union of Newfoundland with Canada, and strongly favored a direct ocean route between Newfoundland and Ireland. After 1909 he was leader of the Liberal Opposition, but on January 10, 1914, by reason of alleged bad faith on the part of his political allies, the Fishermen's Union, he resigned the leadership and retired from political life.

BOND, WILLIAM CRANCH (1789-1859). An American astronomer, born in Portland, Me. He was self-educated, and had a private observatory at Dorchester, Mass., where his discoveries attracted much attention. In 1838 he was chosen by the United States government to make observations for the use of the Wilkes exploring expedition to the South Pacific, and in 1839 he supervised the construction of the observatory at Harvard and became its director. In 1848 he discovered Hyperion, the eighth satellite of Saturn, and two years later detected the so-called crap, or dusky, ring of that planet.

He was the inventor of the electro-chronograph, by means of which it is possible to measure time to a very small fraction of a second, and was among the first to employ photography in stellar observations. His publications include *On the New Ring of Saturn* (1851) and *Observations of Solar Spots, 1847-49* (1871).

BOND'AGE (LL. *bondagium*, inferior tenure, held by a husbandman, from *bondus*, AS. *bonda*, householder, husbandman). A form of rural tenure which obtains in Scotland, based upon an obligation of the tenant, called a bondager, to render agricultural services to his landlord. It is a survival, in modified form, of the base tenure of villeinage, which prevailed in the early history of feudalism (q.v.). Analogous to this term is the phrase *bond tenant*, sometimes used in English law to describe copyholders and customary tenants. See COPYHOLD; TENURE.

BONDER, bönd'är (Norw. *bonde*). In Norway and Sweden, the landowners or farmers. Under the ancient kings of Norway they were a powerful class, able to wrest important concessions from, and even to depose, their rulers. They correspond nearly to bourgeois and barons in England.

BONDI, bön'dë, CLEMENTE (1742-1821). An Italian poet, born at Mezzano, near Parma. He lived some time in Austria, where he fled after writing satirical poems on the Jesuits. He wrote a good translation of the *Æneid*, and much poetry in elegant academic style. His *Apologhi* have survived as a classic. His works were published in Vienna in 1808.

BOND'MAN, THE. 1. A tragedy by Massinger (1623). 2. A minor opera by Balfe (1846). 3. A novel by Hall Caine (1890), the scene of which is laid in the Isle of Man and Iceland.

BONDU, bön-doo', or BONDOU. One of the constituent states of the French colony of Senegal, between lat. 14° and 15° N., separated from Bambuk by the river Faleme. The soil is very fertile and well watered, yielding millet, indigo, corn, rice, and cotton. Gold and iron ores are found in considerable quantities. Cotton fabrics are woven by the natives, who belong to the Fulah race and number about 30,000. The predominant religion is Mohammedanism. The king resides in Bulbani, the capital, which has a population of over 2000.

BONDU'CA. The title of a tragedy by Fletcher, acted before 1619, but not printed until 1647. It was several times altered, one of the alterations bearing a new title, *Caractacus*. It deals with the unsuccessful defense of Britain by Boadicea against the Romans under Suetonius Paulinus. The same title was used for plays by Charles Hopkins (1697) and Richard Glover (1753).

BONDUKU. See BONTUKU.

BONE (AS. *bān*, Ger. *Bein*, bone, leg; cf. Icel. *benn*, straight). The hard material of the skeleton or framework of mammalian animals, reptiles, most fishes, and birds. In the embryo it is preceded by cartilage (q.v.), which consists of cells massed together except in the flat bones, as those of the skull and shoulder blade, of which the primary foundations are to a great extent of fibrous tissue. Points or centres of ossification form, the cells alter their shape and arrangement, and a deposit of earthy materials, phosphate and carbonate of lime, takes place, rendering the formerly flexible substance rigid. By soaking a bone in dilute min-

eral acid, we can dissolve these earthy matters and render it again flexible, ossein, or bone cartilage, alone remaining. If we expose it to intense heat, the animal matter (gelatin) is burned, and though the bone retains its form, a slight touch will cause it to crumble away. In the disease called rickets (qv) the inorganic matter is deficient, and the too flexible leg bones bend under the weight of the trunk. In the aged person, on the other hand, the bone substance becomes more densely packed with earthy matter and becomes brittle, rendering the bones peculiarly liable to fracture. Animals lower in the scale than vertebrates have, in place of bone, mineral concretions or incrustations, principally consisting of carbonate of lime. Besides constituting the skeleton, bone occurs in plates in certain animals, as in turtles' integument, the heart of certain ruminants, the tongue of certain fishes, etc. The specific gravity of bone is between 1.87 and 1.97.

The bones of the skeleton are classified according to their shapes—viz., as long bones (e.g., the thigh bone and arm bone), flat bones (as the shoulder blade and skull bones), short and irregular bones (as those of the wrist or spine). The substance of bones is arranged differently in different parts—either hard and close, which is called the condensed substance, or loose and reticulated, called the cancellated structure. Long bones have a shaft of hard substance, terminating at each end in soft or cancellated structure, in the latter situations the bone is more expanded and rounded off to enter into the formation of a joint. Irregular bones consist of a shell of condensed tissue, inclosing a mass of cancellated structure, and are smoothed off into surfaces adapted to those of the adjoining bones. Flat bones consist of two layers of hard tissue, with an intermediate cancellated structure. Anatomists class as *mixed bones* those which are both long and flat, as the ribs, the breastbone, and the lower jaw.

Histology. Bone belongs under the general histological classification of connective tissue, its hardness being due to the deposition in its intercellular substance of calcareous matter. Bones are covered externally by the periosteum (qv). They are well supplied with blood vessels, which are carried into them from the periosteum, the largest being those which enter the cancellated ends of the long bones. The long bones are hollow, the central canal being filled with marrow and lined by a membrane which receives a nutrient artery for the supply of the adjacent compact tissue. This vessel enters the bone rather above the mid-point and divides into two branches—an ascending and a descending—which subdivide and anastomose with the vessels entering the cancellated portion. After the arteries enter the compact tissue of bone they run in small capillary canals, which permeate the bone and anastomose, forming loops or meshes. The veins of bone are also contained in these canals and are larger than the arteries. These capillary canals are named "Haversian," after their discoverer, Clopton Havers, an English anatomist (died 1702). They vary in diameter from $\frac{1}{250}$ to $\frac{1}{100}$ of an inch. They take a longitudinal direction, and appear as holes when a transverse section is examined under a microscope. Each canal is surrounded by its own layers of bone, forming a sort of thick-walled cylinder with the Haversian canal as the centre. Between the layers are minute

spaces arranged concentrically around the Haversian canal. These are known as *lacunae*, and each one has radiating from it numerous small canals or *canaliculi*, which anastomose with canaliculi from other lacunae belonging to the same system and probably serve as lymph channels for the nutrition of the bone. The lacunae are not empty, but contain bone cells or corpuscles, which are nucleated bodies and send out fine processes into the canaliculi. In addition to the Haversian systems are irregular interstitial *lamellae*, or layers of bone, which fill in the spaces left between the systems. Along the surface of the bone, and also along the side of the central canal, the *lamellae* are arranged parallel to the surface, and are known as *circumferential lamellae*. The cavities of bones and the various nutrient channels which run through them are filled with a substance called *marrow*. In all bones of young animals and in the flat bones of adults the marrow is red in color. As the bone grows older the marrow of the long bones becomes yellow from the accumulation of fat. Marrow consists of a delicate connective-tissue network, in which ramify numerous small blood vessels. In the meshes of this network are found various kinds of cells—marrow cells, or large oval cells, giant cells, or myeloplaxs, large cells containing several nuclei, red-blood cells, nucleated red-blood cells, white-blood cells, connective-tissue cells, and fat cells. The periosteum is rich in blood vessels and invests the surface of all bones except where they articulate with other bones. Connective-tissue fibres ("Shapley's fibres") extend from the periosteum into the superficial layers of the bone.

With the exception of the flat bones of the head, all bones are first represented by masses of hyaline cartilage which resemble in shape the future bone. The cartilage is covered over with the primitive periosteum, or perichondrium. From this membrane blood vessels extend into the cartilage at some point, usually near the centre of a long bone, and a rearrangement of the cartilage cells occurs. This point is known as the *centre of ossification*. New cells, probably derived from the white-blood cells, appear and are known as osteoblasts. Each osteoblast surrounds itself with a little layer of bone and is then known as a bone cell. In compact bone the formation of the Haversian systems is due to the laying down of the bone in concentric layers around the blood vessels. During the development of bone within the cartilage (intra-cartilaginous development) bone is also being formed under the periosteum (subperiosteal development). Here, also, the bone is formed by the osteoblasts surrounding themselves by bone. The flat bones are not laid down in cartilage, but develop in a membranous connective-tissue matrix (intramembranous development).

Nerves may be seen entering bone, and the acute pain felt in some of its diseased conditions proves their existence, but they have not yet been actually demonstrated in the osseous tissue, neither have *lymphatics*, though we suppose, from analogy, that bones are supplied with them. The several bones composing the animal frame will be treated of under the head *SKELETON*, any important peculiarities in the bones of different classes of animals, under the heads of these classes.

Chemical Composition. The principal chemical ingredients of bone are gelatin and phos-

phate of lime; the following table gives the composition in 100 parts of bone of average quality:

Constituents	Human bones	Ox bones
Gelatin	33.30	33.30
Phosphate of lime	53.04	57.35
Carbonate of lime	11.30	3.85
Phosphate of magnesia	1.16	2.05
Carbonate and chloride of sodium	1.20	3.45
	100.00	100.00

The gelatin of bones remaining behind after treatment with dilute hydrochloric acid has the size and shape of the original bone, but is soft, somewhat transparent, flexible, and slightly elastic. If this soft, gelatinous residue of bone be boiled with water, it dissolves in great part and yields a solution which *sets*, or gelatinizes, on cooling. A common way of extracting the gelatin from bone is to heat the bones covered with water in a digester to a temperature of 270° to 280° F., when much of the gelatin dissolves out and leaves the inorganic salts with the remainder of the gelatin. Besides the marrow (q.v.), a little fat is generally found permeating the entire structure of the bone. In some of the larger bones of man and other mammalia, there is a central cavity containing a considerable amount of fatty matter, known as *marrow*. These cavities are not found in the bones of the young animal, but gradually form as the animal approaches maturity. In the sloth, cetacea, seals, and a few other animals, the cavities are absent. Occasionally, as in man, the elephant, giraffe, etc., the bones in the skull have cavities filled with air instead of marrow.

The uses to which bone may be put are various. In the cooking of soups bones form a constant ingredient, supplying gelatin, which gives a *body* to the soup. How far gelatin is of itself nutritious is a disputed question. See **GELATIN AND NUTRITION**.

Bone is largely used in manufactures. It is sometimes employed as a fuel where coal or wood cannot be obtained, and it furnishes a valuable fertilizing material. Consult Macewen, *Growth of Bone* (New York, 1912). See **BONE FERTILIZERS**.

BONE, HENRY (1755-1834). An English enamel painter. He was born at Truro, in Cornwall, Feb. 6, 1755, the son of a wood carver and cabinetmaker. In 1771 he was apprenticed as a china painter to William Cookworth in Plymouth, and afterward at Bristol to Richard Champion. In 1778 he went to London, where he painted aquarelle miniatures and enameled designs for jewelers. The success of his first portrait in enamel, that of his wife, caused him to devote himself entirely to this branch. In 1800 he was appointed enamel painter to the Prince of Wales, and in 1809 enamel painter to George III, the appointment being continued under George IV and William IV. In 1801 he was elected to the Royal Academy. His most important works are: "Muse and Cupid" (1789), the largest painting executed up to this time in enamel; an enamel copy of Titian's "Bacchus and Ariadne" (National Gallery), which was inspected by 4000 people and sold for 2200 guineas, a series of cavaliers distinguished in the Civil War; 28 portraits of

the Russell family of the time of Henry VII, still at Woburn Abbey; and 85 portraits of illustrious men and women of Queen Elizabeth's time, now in the collection of Mrs. Ralph Banks, Kingston Lacy, Dorsetshire. In 1831 he lost his eyesight and removed to Somerstown, where he subsisted on a small pension from the Royal Academy until his death from a stroke of paralysis, Dec. 17, 1834. As a painter in enamel he has rarely been equaled, perhaps deserving the title "Prince of Enamelers" bestowed upon him by his admiring countrymen. Two of his sons followed their father's profession. Consult J. Joze Rogers, "Notice of Henry Bone and his Works," in *Royal Institution of Cornwall Journal*, 1878-81, vol. vi.

BONE ASH. See **BONE FERTILIZERS**.

BONE BLACK, ANIMAL CHARCOAL, or CHAR. A substance prepared from carefully selected, clean, hard bones, made by heating them in retorts, out of contact with air, until they are carbonized. In this process combustible gases and water, together with oil and the vapors of various salts of ammonia, are given off, and bone black is left in the retort. It is generally reduced to coarse grains from about the size of small peas, down to large pin heads, and is extensively used in the arts for decolorizing liquids, such as the syrup of sugar, and solutions of argol (impure cream of tartar). It is capable of removing various mineral substances from their solutions and is therefore used in filters for separating chemical impurities from water. The general mode of using the bone black for the purpose of decolorizing liquids is to allow the liquid to percolate through a layer of the charcoal, when all color is arrested, and the syrup of sugar runs through clear and colorless. This power of absorbing coloring matters is possessed also by vegetable (peat or wood) charcoal, but not to such an extent as by bone black. The application of heat to the liquids before filtration greatly facilitates the decolorization, and where the volume of liquid to be operated upon is not great, the most expeditious method is to boil the liquid and bone black together and then strain through filtering paper or cloth. The power of absorbing colors is due to the process of adsorption, by virtue of which particles of solid, liquid, or gaseous matter adhere to the surfaces of the pores. When syrup of sugar and other liquids have been run through bone black for some time, the pores of the latter appear to get clogged, and the clarifying influence ceases; then the bone black requires to undergo a process of *renovification*, which usually consists in reheating it carefully in ovens, or iron pipes inclosed in a furnace, when the absorbed material is charred, and the bone black can be of service once again as an arrester of color. After several reburnings the bone black becomes of very inferior absorptive quality and is disposed of for the manufacture of fertilizers. Bone black has also the power of absorbing odors, especially those of a disagreeable nature, and can be employed to deodorize apartments, clothing, outhouses, etc. See **BONE FERTILIZERS**.

BONE BREAKER (for derivation see below). The giant fulmar petrel (*Ossifraga gigantea*), which is nearly as large as an albatross and belongs in the South Pacific. It breeds upon Kerguelen and neighboring islands and feeds mainly upon the carcasses of dead seals and cetaceans, the bones of which it is able to smash

with its powerful vulture-like beak. It is called "Nelly" by the sealers. See FULMAR, and Plate of FISHING BIRDS.

BONE CAVE See CAVE.

BONE CHINA A porcelain in which the body is fluxed with bone ash instead of feldspar. See PORCELAIN.

BONE COAL A term used especially in the anthracite regions to designate lumps of coal containing shaly matter. In the sizing and sorting of anthracite the bone coal has to be separated by hand or by machinery. See ANTHRACITE.

BONE DOG The bone shark. See DOGFISH.

BONE FERTILIZERS Bones have long been used and are highly valued as a fertilizer. Sir John Lawes, of England, early in his career, recognized their value for this purpose and established a factory for treating them with sulphuric acid to increase their effectiveness, according to the process suggested by Liebig. Bones are valuable as a fertilizer on account of the nitrogen and phosphoric acid they contain. The proportions of these depend upon the kind of bones, and the method of treatment to which they are subjected. Untreated bone consists chiefly of tricalcium phosphate bound together by gelatinous matter rich in nitrogen. The bones of younger animals are, as a rule, richer in nitrogen and poorer in phosphoric acid than those of older animals. The same is true of the softer bones as compared with the harder.

Raw Bones According to Voorhees, raw bones free from meat and excess of fat should contain about 22 per cent of phosphoric acid and 4 per cent of nitrogen. They are highly valued as a fertilizer, although they often contain a considerable amount of fat which interferes with their decomposition in the soil. Bones from which the fat has been removed may contain as high as 6 per cent of nitrogen and 20 per cent of phosphoric acid, are easily ground, and decompose readily in the soil.

Bone Meal, Bone Dust These are different names applied to the same thing, viz., very finely ground bone. The product may be finely ground raw bones, but it usually consists of bones which have been boiled, steamed, or extracted with solvents, such as petroleum or benzene, previous to grinding.

Steamed Bone A large part of the bone used for fertilizing is either boiled or steamed. This treatment removes the fat, which is valuable for various purposes, and the larger part of the nitrogenous matter, which is used for the preparation of gelatin and glue. Bones degelatinized by steaming contain from 28 to 30 per cent of phosphoric acid and 1.25 to 1.75 per cent of nitrogen. Steaming at a high temperature improves the mechanical condition of bones.

Dissolved Bones This is the term applied to the product resulting from the action of strong sulphuric acid upon bones. The acid converts the insoluble (tricalcium) phosphate into soluble (monocalcium) phosphate and calcium sulphate. This method of treating bones is, however, little used at present, because soluble phosphates are more easily and satisfactorily prepared from mineral phosphates (qv).

Bone Tankage This is a product which consists of bone mixed with meat scrap and blood or other slaughterhouse refuse in a fine state of division, and is usually richer in nitrogen and poorer in phosphoric acid than pure bone. Several different grades are recognized in the

trade, in which the phosphoric acid varies from 7 per cent (tankage, qv) to 19 per cent (nearly pure bone).

Bone Ash, resulting from the burning of bones, contains no nitrogen, and its fertilizing value depends entirely upon the phosphoric acid present. This is quite variable, but good samples should contain, according to Voorhees, from 27 to 46 per cent. Bone ash is applied as a fertilizer, either directly or after being converted into superphosphate (qv) by treatment with sulphuric acid, as in case of dissolved bones. Its use as a fertilizer is, however, limited.

Bone Black This is the product resulting from the carbonization of bones by heating in closed vessels. It is used for clarifying solutions, especially syrups, as a pigment, and as a fertilizer, either directly or after treatment with sulphuric acid. It is usually the spent bone black from refineries that is used in the manufacture of fertilizers. The bone black from this source is somewhat variable in composition, but usually contains from 32 to 36 per cent of phosphoric acid. Dissolved bone black, the form in which it usually appears as a fertilizer, contains about 16 per cent of phosphoric acid, readily assimilable by plants (available). See BONE BLACK.

The nature and composition of bone are such that it gradually yields its nitrogen and phosphoric acid for the use of the plant in the soil, and while it is sometimes treated with acid, as described above, to render its phosphoric acid more available, it is probably most effective when applied in the fine-ground condition and to slow-growing crops. It is especially valued for application to lawns and grass lands. Consult Lambert, *Bone Products and Manures* (London, 1913).

BONEFISH' See LADYFISH.

BONELLI, bô-nel'î, FRANCESCO ANDRÉ (1784-1830). An Italian zoologist. He was born at Cuneo (Piedmont), became a professor in the University of Turin, a director of the Museum in Turin, and a member of the Academy of Sciences there. He made extensive scientific journeys in Europe and published a number of highly esteemed works on entomology, such as *Specimen Faunæ Subalpinae* (1807).

BONER, bôn'ér, CHARLES (1815-70). An English author, born at Weston, near Bath. He was Vienna correspondent of the London *Daily News* and also wrote for the New York *Tribune* and other well-known newspapers. Many notable translations from the German were made by him, including particularly Hans Andersen's *Danish Story-Book* (1846) and *Dream of Little Tuck* (1848). His other works include *Chamois-Hunting* (1853), *The New Dance of Death* and *Other Poems* (1857), *Verses* (1858), *Forest Creatures* (1861), and *Transylvania: Its Products and its People* (London, 1865).

BONER, bôn'ér, or **BONERIUS**, ULRIKH. One of the oldest German fabulists. He was a preaching friar of Beirn and is frequently mentioned in documents of the years 1324-49. His collection of 100 fables and jests from Latin sources, entitled *Der Edelstein* (new ed. by Paul Kristeller, 1908), was published at Bamberg, 1461, and was one of the first German books printed. It is marked by purity of style and by clear and vivid delineation. This book is one of the greatest of bibliographical rarities, not more than two copies being known to exist. Bodmer

BONESET, ETC.

1. BONESET (*Eupatorium perfoliatum*).
 2. CLIMBING FUMITORY (*Adumia olrhosa*).
 3. BURDOCK (*Aroctum Lappa*).
 4. VIRGIN'S BOWER (*Clematis virginiana*).
 5. BURDOCK (*Aroctum Lappa*).

and Bretinger published a complete edition of the work at Zurich, in 1757, under the title *Fabeln aus Zeiten der Minnesinger*. Recent years have seen frequent reprints, notably in Reclam's *Universal-Bibliothek* (Leipzig, 1895).

BONES. Originally four pieces of the ribs of horses, or oxen, held in the hands and rapped together to mark time and rhythm. In early times the bones were called "knicky-knackers," a word originating in the old English *nakers*, mentioned in Chaucer's *Knight's Tale*. The fact that Bottom speaks of the "tongs and the bones" in *A Midsummer Night's Dream* is proof that they formed part of the rustic music in Shakespeare's time. They are still played by negro minstrels. See CASTANETS.

BONE/SET (so named from its medicinal properties) or THOROUGHWORT, *Eupatorium perfoliatum*. A perennial herb belonging to the family Compositae, native of the United States, and growing in moist soil. The leaves and flowering tops are used as a tonic. They have a strong, bitter taste and are taken in the form of hot tea to produce perspiration. If very strong, it operates as an emetic. To make bone-set tea, steep an ounce of dried leaves in a pint of water; let it stand two hours, and strain. Boneset is a domestic remedy for influenza, muscular rheumatism, etc. See EUPATORIUM.

BONE SPAVIN. See SPAVIN.

BON'NESS. See BORROWSTOUNNESS.

BONET, bō-nēt', JUAN PABLO (1560-?1620). A Spanish instructor of deaf-mutes, born in Aragón. Pablo Ponce de León, a Spanish monk, and Pasch, clergyman of Brandenburg, were earlier teachers of deaf-mutes, but Bonet was the first to publish a manual of method. Like De León, Bonet first taught his pupils to write the letters and then instructed them in their phonetic values. This is his *Reduccion de las letras y arte para enseñar a hablar a los mudos* (Madrid, 1620). His other works, important in his time, include *Tratado de las cifras y su enseñançia*; *Indice de las ligaduras y abreviaturas de la lengua griega*; *Discurso sobre la lengua griega y su instruccion*. See DEAF-MUTES.

BONET-MAURY, bō-nē'-mō'rē', AMY-GASTON (1842-). A French Protestant theologian and educator. He was educated at the Lycée Henri IV, in Paris, and in the divinity schools of Geneva and Strassburg, was pastor of Walloon churches in the Netherlands (1868-72) and of Protestant churches at Beauvais and Saint-Denis, and became (1879) lecturer in church history in the Paris Protestant School of Divinity. As librarian of the Musée Pédagogique he worked for the reform of French primary instruction; and he did much to spread the knowledge of the history of French Protestantism. He frequently served as a delegate to "parliaments" of religion and similar congresses. Among his works are: *Les origines du christianisme unitaire chez les Anglais* (1881); *Histoire de la liberté de conscience en France depuis l'Édit de Nantes* (1900); *L'Islamisme et le Christianisme en Afrique* (1906); *L'Unité morale des religions* (1912).

BONE TUMOR. See ACTINOMYCOSIS.

BONFIGLI, bōn-fel'ye, or BUONFIGLI, bwōn-fel'yo, BENEDETTO (c.1425-c.96). An Umbrian painter of the Renaissance. He was born in Perugia, where, according to Berenson, he studied under Beccafis. From 1450 to c.1453 he executed numerous paintings in Rome for

Pope Nicholas V, all of which have perished. At Rome his art was much influenced by Fra Angelico and his pupil Benozzo Gozzoli. In 1454 he began the most important work of his life, the frescoes of the chapel of the Priors in the Palazzo Pubblico, Perugia. The first half of the chapel was completed in 1461, but the remainder occupied him intermittently until his death. In this, the most important piece of decorative art in Perugia during the fifteenth century, his artistic development can best be followed. The subjects, chosen from the life of St. Louis of Toulouse and St. Herulanus, are unusual, and the painting is especially charming in its pagantry and in the quaint vistas of towns, but deficient in form and movement. Bonfigli also painted many standards with customary religious subjects for the churches of Perugia and the neighboring towns, which still survive, such as those of San Francesco (1464), San Bernardino (1468), San Firenze (1466), all in Perugia. His panel paintings are most numerous in the gallery of Perugia.

BONFIRE (originally *bonafire*, as in a gloss of 1483; "*bonafyre, ignis ossium*," i.e., fire of bones). In its earliest usage, a funeral pyre, a fire lighted to consume heretical or forbidden books, etc.; in the early superstitions of Germany (where it was also called *Notfeuer* or needfire) and most other European nations, a fire kindled in time of pestilence among men or cattle to drive away the disease. Later, the kindling of such fires, with many traditional ceremonies, became a regular part of the observances on the night before the festival of St. John the Baptist or Midsummer Day—still with the ancient idea of driving away plagues and evil spirits. The casting of effigies into the flames, still observed in some places, seems to point to a survival of ancient propitiatory sacrifices. It is quite likely that all these ceremonial observances are relics of pagan worship of the heavenly bodies, modified by the introduction of Christianity. The Church, as in many other instances, preferred to adopt and consecrate what would have been almost impossible to suppress; thus the inclusion in the Catholic Easter ceremonies of the blessing of the new fire and the custom in the Russian Church of carrying lighted tapers on that festival may be related to the custom of the *Osterfeuer* among the Teutonic nations, which originally was probably celebrated on the 1st of May. Consult: Jahn, *Die deutschen Opfergebräuche bei Ackerbau und Viehzucht* (Breslau, 1884); Brand, *Popular Antiquities*, vol. i, ed. by Ellis (London, 1849); and Frazer, *Golden Bough*, vol. ii, iii, and iv, 3d ed. (London, 1911, 1913). For the customs more particularly associated with the Celtic races, see BELTANE.

BONGAR, bōng'gar (native name). A serpent; genus *Bungarus*. See KRAIT.

BON GAULTIER, bōn gō'tyā', BALLADS OF. The title of a satirical volume of verse by Prof. William Aytoun and Theodore Martin, published in 1854. The ballads originally appeared in *Blackwood's Magazine*, were mostly on the topics of the day, and included some excellent parodies.

BONGHI, bōng'gē, RUGGERO (1828-95). An Italian man of letters and a politician, born in Naples. His share in the political events of 1848 forced him into temporary exile. A chance meeting at Lake Maggiore with Manzoni

and Rosmini-Serbatì soon bore fruit in his much-discussed *Critical Letters on the Reason Why Italian Literature is Not Popular* (3d ed., 1873). He remained an active and acute exponent of Manzoni's theory of language and aesthetics. In 1858 appeared his translation of Plato, *Opere di Platone*, and of the *Metaphysics* of Aristotle, and the following year he refused to receive from Austria a chair of philosophy in the University of Pavia, but afterward accepted it from his own country, when Pavia had reverted to Italy. Thereafter he was connected successively with the universities of Turin, Florence, Milan, and finally (1870) Rome, where he was professor emeritus of ancient history at the time of his death. Bonghi was a man of great activity and many interests. From 1860 he sat almost continuously in the Chamber of Deputies, where he supported the Conservative party. In 1874-76 he was Minister of Public Instruction. In journalism he was equally active, editing successively the *Perseveranza* of Milan, and the *Unità Nazionale* of Naples, and founding the *Stampa*, which is still the leading journal of Turin, and the magazine, *Cultura*, which he edited until his death in 1895. He was for many years president of the Italian Press Association. Among his many published works may be mentioned *Pius IX and the Future Pope* (1877), *Leo XIII and Italy* (1878), *Contemporaneous Portraits: Cavour, Bismarck, Thiers* (1879), *Dissacels and Gladstone* (1882), *History of Rome* (1884-88), *Arnoldo da Brescia* (1884), *The Roman Festivals* (1891). Consult F. D'Ovidio, *Rimpanti* (Palermo, 1903).

BONGO, bō'ngō. A name applied to a negro people dwelling in the upper Nile basin, between the Dinka and the Zande. They are slightly blended with Hamites. They are of reddish skin and medium stature and are vigorous and fleshy, with crisp hair. They subsist by the chase, upon their flocks, and by agriculture. They are skilled in the working of iron. Their neatly thatched houses and granaries are conoid in shape, and the former are surmounted with lookouts. Little costume is worn, but the Bongo are fond of adornment. The women tattoo the upper part of the body and wear labrets in the upper lip, straws through the alae of the nostrils, and rings through the septum of the nose. Consult Schweinfurth, *Artes Africanae* (Leipzig, 1875) and *Heart of Africa* (New York, 1874).

BONGO. A large West African bush buck (q.v.).

BONHAM, bōn'am. A city and the county seat of Fannin Co., Tex., about 75 miles northeast of Dallas, on the Texas and Pacific and the Missouri, Kansas, and Texas railroads, and on the Red River (Map Texas, D 3). It is the seat of Carlton College (Christian), opened in 1867. The city is the centre of a fertile agricultural district and has a large export trade in fruit, cotton, grain, flour, and live stock. The industrial establishments comprise flour mills, cotton gins, cotton and cottonseed oil mills, a creamery, and ice factory, railroad machine shops, carriage and wagon works, planing mills, etc. The water works are owned by the city. Pop., 1900, 5042; 1910, 4844.

BONHAM, MILLEDGE L. (1815-90). An American soldier and statesman. He was born in South Carolina and in 1834 graduated at the South Carolina College. He served in the Mexican War and was a State's-rights Democrat in

Congress from 1856 to 1860, but withdrew when his State passed the ordinance of secession and was made a major general in the Provisional army of South Carolina. In 1861 he entered the Confederate army as brigadier general, and led a brigade at the battles of Blackburn's Ford and Bull Run, but resigned his commission (1862) to take a seat in the Confederate Congress. He was Governor of South Carolina from 1862 to 1864, when he returned to the army and served until the close of the war.

BONHEUR, bo'nēr', AUGUSTE FRANÇOIS (1824-84). A French animal painter. He was born at Bordeaux and, after studying with his father and his sister Rosa, entered the Ecole des Beaux-Arts. Beginning as a genre and portrait painter, he soon adopted animal painting under his sister's influence. Although his animals are inferior to hers, the landscape backgrounds are better, being more harmonious in color. His work is often marred by too much attention to detail. His principal productions include "Watering-Trough in Brittany" (1859), "Cattle Leaving the Pasture" (1861), "A Brook in Auvergne" (1863), "Le Dormeur" and "Ruins of the Castle of Apehon" (1867), and "Woodland and Cattle" (1890, Metropolitan Museum, New York). He received gold medals of the first class in 1861 and 1863 and the cross of the Legion of Honor in 1867.

BONHEUR, ROSA (MARIE ROSALIE) (1822-99). A French artist, considered the most eminent woman painter of animals. She was born at Bordeaux, Oct. 22, 1822, the daughter of a drawing teacher who afterward became the director of the Free School of Design for girls in Paris. Her remarkable talent and repugnance to dressmaking, the avocation chosen for her by her father, finally moved him to place her in his own school, and she also studied under Cogniet, but it was mainly her own study of animals in their natural environments that developed her ability. At the age of 19 she first exhibited at the Salon "Goats and Sheep" and "Two Rabbits," and until 1855 she was represented annually. In 1845 she received a gold medal of the third class, and in 1848 a first-class medal. Her first great picture, deemed by some her best, "Ploughing in the Niveinai" (1849), a commission from the state, is now in the Luxembourg. A summer in the Pyrenees, 1850, resulted in several important pictures. In her studies at the abattoirs on the outskirts of Paris, finding the attentions of the workmen disagreeable, she adopted man's attire, resembling the Breton, in which she henceforth painted. In 1853 she exhibited the famous "Horse Fair," which attracted widespread admiration. She offered it to her native town of Bordeaux for 15,000 francs, but the offer was not accepted, so she sold it in England for 40,000 francs, and it was finally purchased by Cornelius Vanderbilt for the Metropolitan Museum of Art in New York City for 268,000 francs. A copy, retouched by the artist, is in the National Gallery in London. Another important work of her early period was the "Hay Harvest in Auvergne" (Luxembourg), in fine afternoon light.

In 1856 Rosa Bonheur bought a Gothic château at By, near Fontainebleau, where she passed nearly all the remainder of her life. Here, in 1864, Napoleon III and the Empress Eugénie visited her, and the year following the Empress in person brought her the cross of the Legion of

Honor. A visit to Scotland was the occasion of a number of Scottish subjects, such as "Ponies of the Isle of Skye" and "Sheep in a Boat" (1867). Among the most noteworthy of her remaining paintings are "Cattle and Sheep in Pasture" (1860); "Sheep in Repose" (1860); "Wagon with Six Horses" (Wallace Collection, London); and "Foulaision," a troop of galloping horses—the masterpiece of her last period. In 1894 she received the officer's cross of the Legion of Honor, the first woman to achieve that distinction. In the Metropolitan Museum of Art, New York, are her "Deer in the Forest," "A Limier-Briquet Hound" (1877), and "Weaning the Calves" (1879), and in the Public Library, New York, is her "Deer Drinking." She died in Paris, May 25, 1899. As a painter she showed a sound and wholesome feeling for nature, not only in the modeling of her animals and in her spirited representations of action, but also in the truthful landscape setting in which she placed her subjects. Her drawing and composition are good; but the color is often hard, and the atmosphere is often imperfectly rendered. For her life and works, consult René Ménard, in *The Portfolio* (London, 1875); René Peyrol, in the *Art Annual* (ib., 1900); Roger-Miles (Paris, 1900); and especially the monograph by Klampke (ib., 1908), containing her autobiography and fine illustrations of her works.

BONHOMME, bônôm', JACQUES (Fr. James Goodman). A term of deprecation applied by the French nobility and others to one of the masses, more narrowly to the peasant.

BONHOMME RICHARD, rêshûr', THE. See JONES, JOHN PAUL.

BONI, bônê. Formerly an important kingdom occupying the southwestern part of Celebes (q.v.), covering an area of about 1000 square miles (Map: East India Islands, F 5). It was only with considerable difficulty that the Dutch succeeded in establishing their authority there in 1860. At the beginning of the century the British were compelled to send several expeditions against the Bonese for interfering with the British sea trade. Chief products include sugar cane, rice, coffee, tobacco, and cotton. A good breed of horses and buffaloes is raised. The population of Boni, which consists mainly of Bugis, is estimated at from 200,000 to 300,000. Capital, Boni, on the east coast.

BONI, GIACOMO (1859-). An Italian architect and archaeologist, born in Venice. He directed excavations of the Roman Forum and the Palatine Hill and is author of many important works on art and architecture, including: *L'avvenire dei nostri monumenti* (Venezia, 1883); *Sul Ferro Ossidabile* (Venezia, 1884); *Vecchie mura* (1885); *The Ca' d'Oro and its Polychromatic Decorations* (1887); *Imbellettata* (1887); *Il Catasto dei monumenti in Italia* (1892); *Lagons of Venice* (1898); *Studi Danteschi in America* (1898). He wrote also: *Ædes Vestæ; Fons Tuturnæ; Prisco-Latin and Romulean Sepulchretum in the Roman Forum; Methods of Archaeological Excavations; Hibernica; Forum Ulpium; Trajanic Legends and the Column of Trajan; The Tower of St. Mark, Venice*, etc.

BONIFACE. The name of nine Popes. BONIFACE I (Pope, 418-422), on account of prevailing party divisions, was opposed by a rival bishop, but was recognized by Honorius as his proper successor. His letters are in Migne, *Patrol. Lat.*, xx.—BONIFACE II (Pope, 530-532).

His letters are in Migne, lkv.—BONIFACE III, who was Pope for only 10 months in the year 607, was the first to whom the title of Universal Bishop of Christendom was conceded by the Greek Emperor (Phocas).—BONIFACE IV (Pope, 608-615).—BONIFACE V (Pope, 619-625).—BONIFACE VI (Pope, 806).—BONIFACE VII (Pope, 974, 984-985).—BONIFACE VIII (Benedetto Gaetano, Pope, 1294-1303). He was born at Anagni, and was elected Pope on Dec. 24, 1294. In 1296 Boniface issued his bull *Clericus Laicos*, forbidding the payment or collection of taxes on ecclesiastical property without the consent of the holy see. He failed in his attempts to assert a feudal superiority over Sicily and to exercise his papal authority in the disputes between France and England. Philip the Fair, of France, supported by the estates and clergy, maintained the independence of the kingdom, disregarding many bulls and briefs, and even the sentence of excommunication to which the Pope proceeded. Philip at last, with the aid of Italian enemies of Boniface, made him prisoner at Anagni, whither he had fled; and although he was liberated by the people of Anagni after two days' imprisonment, he died within a month (Oct. 11, 1303), in consequence of having refused food during those two days, through fear of poison. He instituted the Roman Jubilee in the year 1300 and in 1302 issued the bull *Unam Sanctam*, wherein he maintained the necessity of the submission of princes to the spiritual jurisdiction of the Roman pontiffs. For his life, consult: Luigi Tosti (2d ed., Milan, 1848, French trans., Paris, 1854); W. Drucmann (Königsberg, 1852).—BONIFACE IX (Pietro Tomacelli, Pope, 1389-1404). He was a native of Naples, and succeeded Urban VI as Pope at Rome, while Clement VII was Pope at Avignon. His financial expedients contributed chiefly to increase the many already existing abuses in the disposition of ecclesiastical offices. He acquired, after a struggle, almost absolute power in Rome, which he kept in awe by fortresses; but to secure himself against external enemies, particularly Louis of Anjou, whose claim to the crown of Naples he had opposed, he was obliged to give away part of his territory in fiefs, as Ferrara to the house of Este. Consult: Morum, *Popes in the Early Middle Ages* (St. Louis, 1902-); McKilliam, *A Chronicle of the Popes* (London, 1912).

BONIFACE, SAINT (680-755). The Apostle of Germany, whose original name was Winfrid. He was born at Crediton, in Devonshire, England, 680. He first entered a monastery in Exeter at the age of 13, and afterward removed to that of Nuthalling, where he learned rhetoric, history, and theology, and became a priest at the age of 30. At that time a movement, proceeding from England and Ireland, was going on for the conversion of the still heathen peoples of Europe; in 614 Gallus and Emmeran had been sent to Alemannia, Kilian (murdered 689) to Bavaria, Willibrord (died 738) to the country of the Franks, Swidbert to Frisland, and Siegfried to Sweden. Winfrid also took the resolution (715) 'of preaching Christianity to the Frisians, among whom it had as yet found no entrance. But a war broke out between Charles Martel and the King of the Frisians, and Winfrid returned from Utrecht to his convent, of which he was elected abbot. He declined the election, repaired to Rome in 718, and received the authorization of Pope Gregory II to

preach the Gospel to all the tribes of Germany in 719. He first went to Bavaria and Thuringia, then labored three years in Friesland, and traveled through Hesse, everywhere baptizing multitudes, and consecrating their idolatrous groves as churches. In 721 Gregory II called him to Rome, made him bishop (722), with the name of Bonifacius, furnished him with new instructions or canons, and with letters to Charles Martel and all princes and bishops, requesting their aid in his pious work. Returning to Hesse and Thuringia (723), he destroyed the objects of heathen worship (among which are mentioned an oak at Geismar, near Cassel, sacred to Thor, and an idol named Stufio, on a summit of the Harz still called Stufenberg), founded churches and convents, and called to his aid priests, monks, and nuns from England, whom he distributed through the various countries. In recognition of his eminent services, Gregory III sent him (732) the pallium, and named him Archbishop and Primate of all Germany, with power to establish bishoprics wherever he saw fit. Boniface now made a third journey to Rome (738) and was appointed Papal Legate for Germany. The bishoprics of Ratibon, Erfurt, Paderborn, Würzburg, Eichstadt, Salzburg, and several others owe their establishment to St. Boniface. The famous abbey of Fulda is also one of his foundations (742-744). He was named Archbishop of Mainz by Pepin (744), whom he consecrated as King of the Franks at Soissons (752), and he presided in the council held at that place. In 754 he resigned his archbishopric at Mainz and resumed anew his apostolic labors among the Frisians, and at Dokkum, near Leeuwarden, in West Friesland, this venerable Christian hero was set upon by a mob of armed heathens and killed, along with the congregation of converts that were with him (June 5, 755). His remains were taken first to Utrecht, then to Mainz, and finally to Fulda. In the abbey there is still shown a copy of the Gospels written by him. A collection of his letters, and the canons he promulgated for the discipline of the newly established churches, have been preserved. The best edition of his *Letters* (Epistolae) is that of Dümmler (1892). In 1811 a monument was erected to St. Boniface on a hill near Altenberga, in the Principality of Gotha, where, according to tradition, he erected (724) the first Christian church in north Germany. A statue by Henschel of Cassel was also erected to him in Fulda in 1842. His works are in Migne (*Pat. Lat.*, lxxxix), also ed. Giles (2 vols., London, 1844), for his *Life*, consult G. W. Cox (London, 1853), A. Werner (Leipzig, 1875), *Life of St. Winfrid—the traditional life* (London, 1878), O. Fischer (1880), Kurth (2d ed., 1902), A. Ehrhard (Gutersloh, 1882); W. Levison, *Vita Sancti Bonifatii* (Hanover, 1905), Schnuerer, *Die Bekehrung der Deutschen zum Christentum. Bonifatius* (Berlin, 1909). Tosti, *History of Pope Boniface VIII and His Times* (New York, 1911), Pastor, *The History of the Popes* (London, 1906-12).

BONIFACIO, bō'ne-fa'chō, STRAIT OF. The ancient Fretum Gallicum, between Corsica and Sardinia, it took its modern name from the little fishing town of Bonifacio, which is at the southern extremity of Corsica (Map Italy, D 6). The strait, which is 7 miles wide at its narrowest part, is dangerous to navigate on account of the swift current and the rocks and at

times tempestuous winds. Ovster, tunny and coral fisheries are prosecuted in its waters.

BONIFACTUS, bōn'f-fa'sht-us. A Roman general of the fifth century A.D. He fought against the Goths at Malsilla in 413 and against the Vandals in Spain in 422. He was subsequently Governor of Africa under Valentinian III and appears to have been successful in his administration. Having been maliciously advised by Actius (q.v.) that the Regent Placidia purposed his death, he unwisely invited the Vandals under Genseric to settle in Africa. Afterward, when he perceived that he had been duped, he endeavored to expel the barbarians, but was himself besieged at Hippo, whence he escaped to Italy, in 432. Here he regained the favor of the Regent, but was challenged by Actius to single combat, and died of his wounds soon afterward. Consult *The Cambridge Medieval History*, vol. 1 (New York, 1911).

BONIFAZIO, bō'ne-fa'tsē-ō, VERONESE, properly BONIFAZIO DI PITATI, sometimes called BONIFAZIO VENEZIANO (1487-1553). An important Venetian painter of the Renaissance. He was born at Verona (whence his name), the son of a soldier named Pitati, who probably removed to Venice in 1505. Until quite recently it was supposed, following the clever criticisms of Morelli, that there were three painters of this name: Bonifazio the Elder (I) (died 1540), the most important of the group, his brother, Bonifazio the Younger (II), a somewhat weaker artist, and Bonifazio (III) Veneziano, a son and pupil of either of the above, the least important of the group. The pictures of important European galleries were renamed accordingly. But the recent researches of Dr. Gustav Ludwig in the Venetian archives have proved that the family name of the painter who died in 1540 was Pasini and that he passed practically all his life in Verona, and that the work ascribed to the hypothetical Bonifazio III consisted entirely of decorative paintings assigned to Bonifazio di Pitati, executed for the most part by his pupils. Consequently there was only one painter named Bonifazio Veronese of the Venetian school. He was a pupil of Palma Vecchio and was influenced by Giorgione. Among his earliest works, which resemble Palma's, are a number of delightful *Sante Conversazioni* (q.v.), such as those in the Pitti Palace (Florence), the Ambrosiana (Milan), the National Gallery, London, the Louvre, the Museum of Vienna, and the Gardner Collection, Boston. The number of highly finished works of his best period, upon which his fame principally rests, is small. The best known are "Flight into Egypt" (Pitti), "Rich Man's Feast" (Academy, Venice), and the "Finding of Moses" (Brera, Milan). His most important commission was the decoration of the Palazzo Camerlengo with a great number of paintings, most of which are now in the Venetian Academy and the Museum of Vienna. They were begun in 1531, and the earliest, like "Christ Enthroned with Saints" and the "Judgment of Solomon" (Academy, Venice), are by his own hand, but about 1541 failing health impaired the quality of his work, which had to be entrusted more and more to his numerous pupils. At his best Bonifazio was one of the finest colorists and ablest painters of the Venetian school. His work, both in form and in color, was a development of that of Palma Vecchio. Consult Morelli, *Critical Studies of Italian Painters* (London, 1892-93), Ludwig, "Bonifazio di Pitati," in

Jahrbucher der koniglich preussischen Kunstsammlungen, xxii, xxiii (Berlin, 1901-02).

BONILLA Y SAN MARTÍN, bō'nel-ya' c sán mār-tén', ADOLFO (1875-). A Spanish humanist, juriconsult, and historian of literature and philosophy. He was born Sept. 27, 1875, at Madrid, and after the usual preliminary studies in the humanities, he followed the advanced courses at the Madrid University, receiving doctorates in philosophy and letters, and in jurisprudence. After serving several years as professor of commercial law at the University of Valencia, he went to the Madrid University, to accept a chair in Spanish literature and philosophy. For some years he was secretary of the Ateneo Científico, Literario y Artístico of Madrid. In 1911 he was elected to membership in the Real Academia de la Historia of Madrid. The breadth and depth of his scholarship and interests will best be shown by the following selected but representative list of his publications: *Concepto y teoría del Derecho* (1897); *Gérmenes del feudalismo en España*, etc. (1898); *Estudios de historia y filosofía jurídicas* (1909); *Arte Simbólico* (1902); critical and annotated editions of several important texts, *Erasmus en España* (1907); *Luis Vives y la Filosofía del Renacimiento* (1908); *Historia de la Filosofía Española* (1908-), 2 vols. have appeared; and *Fernando de Córdoba . . . y los orígenes del renacimiento filosófico en España* (1911).

BONIN, bō-nēn', EDUARD VON (1793-1865). A Prussian general, born at Stolp (Farther Pomerania). In 1806 he entered the infantry regiment of Brunswick-Oel, was at Jena and Lübeck, and rose in 1829 to be major. Promoted in 1842 to be colonel, he commanded a Prussian brigade in the War of 1848-49 and, having served as commandant of Berlin, was appointed Prussian Minister of War in 1852. He retired in 1854, was again appointed in 1858, but a second time retired in 1859 and was appointed general commanding the Eighth Army Corps at Coblenz. He published a military work entitled *Grundzüge für das zerstreute Gefecht* (1839).

BONIN (bō-nēn') **ISLANDS** (Jap. *Ogasawara-jima*). A group of small islands in the Pacific, belonging to Japan and situated between Japan and the Ladrones Islands, in about lat. 27° N. and long. 142° 20' E. and about 500 miles south of Tokyo (Map. World, Eastern Hemisphere, § 35). The entire archipelago occupies an area of about 27 square miles and is divided into three groups—the Parry Islands on the north, the Beechey Islands in the centre, and the Coffin or Bailey Islands in the south. The entire number is 20, of which only 10 are of any considerable size. They are of volcanic origin, and but few of them are inhabited. The chief products are sugar and indigo. The main port is Port Lloyd, on Peel Island (*Chidjima*). The population, Dec. 31, 1908, was 3595. According to Japanese annals, the islands were discovered in 1593 by Ogasawara Sadayori, whence the name Ogasawara-jima (*jima*, islands). They were also called Munin or Bunin ("without inhabitants"), whence Bonin. The Japanese practically abandoned the islands, and in 1830 a small party, including two Americans, two British, and some Hawaiian natives, settled on Peel Island. This colony regarded itself as British; it numbered 31 when Commodore Perry arrived in 1853 and 69 in 1875. The group has belonged to Japan since 1876 and is attached to the Tokyo fu.

BONINGTON, bōn'ing-tūn, RICHARD PARKES (1801-28). A genre and landscape painter of English descent, who was trained and practiced in France. He was born near Notting-ham, Oct. 25, 1801, the son of an amateur painter, who founded a lace manufactory near Calais. The boy sketched at three and derived his first artistic training with Louis François at Calais. His skill in water color won him the friendship of Delacroix and led to his enrollment at 15 in the Ecole des Beaux-Arts, after which he also worked with Baron Gros. He made his début as an exhibitor in the Salon of 1822, and in 1824, along with John Constable and Copley Fielding, he won the grand medal of honor. He painted with Delacroix in England (1825) and afterward studied in Italy, particularly at Venice (1826). From 1826 to 1827 he exhibited at the Royal Academy and in the British Institution at London. Returning to Paris, he played an important part in the artistic development of France. A victim of tuberculosis, he died in London, Sept. 23, 1828. In training as well as in his subjects Bonington belongs to the French rather than to the British school. At an early period he adopted the English plain-air methods, and was with Constable instrumental in their introduction into France and consequently to their later development by the painters of Barbizon. His drawing is delicate, his brush work facile, his color glowing. His subjects are chiefly seashore and street scenes, and also occasionally he painted historical genre pictures of much originality. He excelled especially in water colors. The largest and finest collection of his works is in the Wallace Gallery, London,—10 oils and 23 water colors. He is also represented in the Louvre, the National Gallery, South Kensington Museum, London, several provincial museums of England, and in the Metropolitan Museum of New York. A critical edition of his life was published by Bouvenne (1873). Consult Mantz, in *Gazette des Beaux-Arts* (Paris, 1876); Frantz, in the *Studio* (London, 1905); Hadard, *Les lithographies de Bonington* (Paris, 1891).

BONITO, bō-nē'tō (Sp., Portug. from Ar. *bainit*, *bainith*). Any of several species of fishes of the mackerel family. One of these (*Gymnosarda pelamis*) is well known to the sailors as one of the fishes most commonly seen pursuing the flying fishes. It is pelagic and occurs in all tropical seas, coming north to Cape Cod on the coast of America, and is rarely taken in English waters. The back is bluish, belly silvery, with four brownish stripes on each side parallel with the lower curve of the body. It grows to a length of 2½ feet. The alboree (*Sarda sarda*), another species reaching about the same length, occurs on both shores of the north Atlantic. It is a food fish of rather low grade. The California bonito (*Sarda chilensis*) occurs on the west coast of both Americas and in the waters of Japan. It, too, is a poor food fish.

BONITZ, bō-nī'ts', HERMANN (1814-88). A German classical scholar. He was born at Langensalza and studied at the universities of Leipzig and Berlin. In 1836-38 he was an instructor in the Blochmann Institute in Dresden. Subsequently he was a professor in the University of Vienna (1849-67), and from 1867 was director of a gymnasium in Berlin, and member of the Academy of Sciences. While in Vienna he de-

vised, with Exner, a system, in force since 1854, for the reorganization of the Austrian gymnasias. He was deeply versed in the philosophies of both Plato and Aristotle and wrote several expository works, such as *Ueber die Kategorien des Aristoteles* (Vienna, 1853), *Platonische Studien* (Vienna, 1858-60, 3d ed. 1886), and *Aristotelische Studien* (Vienna, 1862-67), *Observationes Criticae*, first on the *Metaphysica* of Aristotle (1842), then on Aristotle's *Magna Moralia* and *Ethica Eudemia* (1844), and edited (Bonn, 1848-49) the *Metaphysica*. He wrote also on Homer, Thucydides, and Sophocles. Consult the biography by Gompertz (Berlin, 1889), in the *Biographisches Jahrbuch für Altertumskunde*.

BON MARCHÉ, bôn mar'shâ'. One of the largest department stores of Paris, noted for its low prices and interesting on account of its successful application of the principles of cooperation. The business is conducted by a board of managers selected from its employees, who receive a share of the profits in addition to salary.

BONN, bôn. A city in the Rhine Province, Prussia, constituting a circle of the Cologne government district and advantageously situated on the left bank of the Rhine, about 15 miles south by east of Cologne. The pleasant villas with their gardens on the river, the fine promenades, the picturesque church towers, and the graceful bridge across the Rhine (completed in 1898), all combine to make Bonn an unusually attractive place. The surroundings also are pleasing and interesting. Of its churches—six Roman Catholic, two Evangelical, an English church (the university chapel), and a synagogue—the imposing Munster is the most important, a notable example of the late Romanesque style. It is a cruciform building of gray stone with two choirs, four small towers, and a great octagonal tower 315 feet high. The church, which dates from the eleventh, twelfth, and thirteenth centuries, was restored in 1875 and the following years and in 1890-94 was adorned with paintings. Among the secular buildings are the Rathaus, with its lofty flight of steps, completed in 1782, the famous Beethoven House, where the composer was born in 1770, now containing the Beethoven Museum, and the buildings of the university for which Bonn is celebrated. The last-named buildings occupy the larger part of the south side of the city.

The Provincial Museum, near the modern railway station, is a handsome building of red sandstone in the Italian Renaissance style. It was erected in 1859-93. It contains a large collection of Roman and mediæval stone monuments and prehistoric antiquities. At the Academic Museum of Art there is a noble collection of casts, among the ancient Greek works are marble Herme, bearing heads of Sophocles, Euripides, Aristophanes, and Menander. In the Poppelsdorfer Schloss are the natural history collections of the university. The Observatory is situated near the Poppelsdorfer Allee—a beautiful avenue shaded with horse-chestnuts. Bonn possesses several interesting monuments, among them a statue of Beethoven, executed by Hanel, a fountain column, in honor of Maximilian Frederick, and a bronze monument to Arndt, who died here in 1860. Bonn has long been a favorite residence of English and other visitors.

Bonn is governed by an over-burgomaster with three salaried assistants, and by 30 councilmen. It has water works, a municipal gas plant, and a volunteer fire department. The city in recent

years has become very prosperous commercially. Besides having an active trade, it manufactures machinery, earthenware, chemicals, jute, pianos and organs, porcelain wares, artificial flowers, faience, cement, and many other articles. Wessel's porcelain and stoneware factory employs 1000 men. It dates from 1755. The city is well provided with railway and river communications and with all the modern conveniences connected with manufacturing and commerce. In the village of Beuel, on the other side of the Rhine, are several important spinning and weaving mills. Bonn is the seat of various educational and industrial organizations. It is well supplied with schools. The university (qv), with its numerous laboratories and institutes, provides all the facilities of a modern seat of higher and professional education. Its several charitable organizations include two orphan homes, two hospitals, and two private insane asylums. In 1900 Bonn had 50,738 inhabitants, in 1910, 87,971.

Bonn, the *Bonna* or *Castra Bonnaensia* of the Romans, is frequently mentioned by Tacitus and was one of the first Roman fortresses on the Rhine. Investigations show that the Castrum here was very extensive. The town was destroyed by the Normans in the ninth century. Having been rebuilt, it acquired some importance when, in 1287, the Archbishop of Cologne transferred his residence and seat of government hither. Two German kings were crowned in its Munster in the fourteenth century. Bonn suffered from its Protestant tendencies and was repeatedly besieged by the Catholics. In 1794 the French marched into the town. They closed its university in 1797, and under their rule, which was recognized by the Treaty of Lunéville in 1801, Bonn's population decreased. It began to revive as soon as the city was recovered by Prussia in 1814, which country reopened the university in 1818.

BONN, UNIVERSITY OF. The second leading Prussian university. It owes its origin to Maximilian Frederick, Archbishop of Cologne, who established an academy here in 1777. Seven years later the Emperor Joseph II made it a university, but it was extinguished by the French invasion. In 1815 the King of Prussia, Frederick William III, decided to establish in the Rhine Province a university as an outpost of German thought and influence. After some contest Bonn was chosen for the site, and in 1818 the university was formally organized. While the archiepiscopal residence remains the central building of the university, many others have been added. In 1912 it had nearly 4000 students, divided among the faculties of evangelical theology, Catholic theology, law, medicine, and philosophy. Its income is over 1,940,000 marks, and its library contains 361,623 volumes, 1042 manuscripts, and 1951 MSS. There are buildings for the medical department, laboratories, a physiological institute, clinics, and an observatory. Among the great names connected with the faculties are those of Arndt, Niebuhr, and A. W. von Schlegel. Bonn has always been a favorite place for the education of Prussian royalty and is socially as well as in scholarship one of the leading German universities, ranking next to that of Berlin, the very greatest Prussian institution for higher learning.

BONNASSIEUX, bôn'a'syê', JEAN (1810-92). A French sculptor. He was born at Pan-

nissières (Loire) and studied first at Lyons under Legendre-Héral, then in the Ecole des Beaux-Arts, Paris, with Dumont, winning the *Prix de Rome* in 1836. His most famous work is a colossal statue of Notre Dame de France, for the town of Le Puy-en-Velay (1860) cast from the bronze of the cannon taken at Sebastopol. Among his works are "Love Clipping his Wings" (1842), in the Luxembourg, and "The Young David" (1844), also bought by the government. For his "Meditation" (1855) he received a medal of the first class and the cross of the Legion of Honor. Commissioned to model a statue of Voltaire for the façade of the Louvre, Bonnat, a firm Catholic, refused, and in its place a statue of Fénelon was erected. This caused him to become a kind of official sculptor to the French clergy, and much of his work was done for the churches of France. Besides his works already named mention should be made of the marble statue of Jeanne Hachette (1848, Luxembourg) and the bronze statues of General d'Andigné (1875, Monnet) and Père Lacordaire (1876, Flavigny).

BONNAT, bon'na', LÉON (JOSEPH FLORENTIN) (1833-). An eminent French portrait and historical painter. He was born in Bayonne, studied with Madrazo in Madrid, where he was much influenced by the works of Velazquez and Ribera, and with Léon Cogniet in Paris. His reputation began with "St. Vincent de Paul Taking the Place of a Galley-Slave" (1860), other religious works are his celebrated "Christ Crucified" (1874, Palais de Justice, Paris), in which he successfully rivals the great realists of the past, Holbein, Ribera, and Velazquez; and "Job" (1880, Luxembourg). Delightful genre subjects like his "Scherzo" attest his skill with Italian folk scenes. But his chief reputation rests upon his portraits, astonishing in their characterization and realism. His sitters included all the presidents of the Third Republic and most of the other celebrities of contemporary France. During the last decade of the nineteenth century he was also the favorite painter of wealthy and distinguished Americans. Among the most celebrated of his portraits are those of Thiers, Victor Hugo, Don Carlos, Léon Cogniet, and Jules Grévy—the last two in the Luxembourg. It is his practice, in producing a portrait, to light the sitter vividly, and to relieve him by the simplest of backgrounds, usually dark. He builds up his figures with the plastic sense of a sculptor; he gives them the projection of life itself. Although lacking in æsthetic charm, they suggest the physical presence of the sitter to a degree almost bordering on deception. He is well represented in American collections, particularly in the Metropolitan Museum, New York, which possesses his portrait of John Taylor Johnson, besides genre subjects. His ambitious mural paintings in the Pantheon, Hôtel de Ville, Palais de Justice, though sound realistic productions, are not successful from the decorative point of view. He was elected to the Institute in 1881, professor in the Ecole des Beaux-Arts in 1888, received the grand cross of the Legion of Honor in 1900, when he was also made Director of the Academy des Beaux-Arts; he is also honorary president of Société des Artistes Français. Consult: Claretie, *Peintres et sculpteurs contemporains* (Paris, 1884); *Modern French Masters*, ed. Van Dyke (New York, 1896); and many numbers of the *Gazette des beaux-arts*.

BONNECHOSE, bôn'shóz', FRANÇOIS PAUL

EMILE BOISNORMAND DE (1801-75). A French author. He was born at Leyerdorp, Holland, entered the French army, served until after the Revolution of 1830, and subsequently was appointed librarian of the Palace of Saint-Cloud. From 1850 to 1853 he was librarian of several of the libraries of the civil list. He published: *Histoire de France* (2 vols., 1834, revised and new ed. by F. M. King in *The History of Nations Series*, 1906); *Les réformateurs avant la réforme* (2 vols., 1844); *Les quatre conquêtes de l'Angleterre* (2 vols., 1851); *Bertrand du Guesclin* (1866), and *Lazare Hoche* (1867).

BONNELLI, ROSE STAHL. See STAHL, ROSE.

BONNER, EDMUND (c.1500-69). Bishop of London. He was born of obscure parentage about 1500. He was educated at Oxford and there admitted doctor of civil law in 1525. The reputation he gained at Oxford by his knowledge of the canon law recommended him to the notice of Wolsey, who made him his chaplain in 1529. After the fall of Wolsey (1530) Bonner took an active share in the endeavor to have Henry VIII divorced and received due promotion from that King. In 1533 he was deputed to appear before Clement VII in Marseilles to appeal for the excommunicated monarch to a general council; but the story that the violence of his threats on this occasion suggested to his Holiness the counter threats of having him burned alive, or thrown into a caldron of melted lead, may be dismissed as fabrications. In 1540 he was made Bishop of London. The death of Henry cooled his Protestant zeal; and having given proofs of his lukewarmness in the cause of Reformation, he was at length, in 1549, in the name of Henry's successor, Edward VI, committed to the Marshalsea and deprived of his bishopric. The accession of Queen Mary restored him to office (1553), and as vicegerent and president of the Convocation, he was the principal agent in the persecution which was carried on against the Reformers during Mary's reign. On the accession of Elizabeth, in 1558, Bonner accompanied his episcopal brethren to salute her at Highgate, but was, on account of his unpopularity, which antedated his career as persecutor, refused the honor of kissing her hand. On May 30, 1559, he was summoned before the Privy Council and there refused, with a consistency worthy of due respect, to take the oath of supremacy. He was accordingly deposed from his bishopric and shut up in the Marshalsea, where he died, Sept. 5, 1569.

BONNER, GERALDINE ("HARD PAN") (1870-). An American author, born on Staten Island, N. Y. She went West when 10 years old and lived in Colorado mining camps and then in San Francisco, where she did her first writing in 1887 for the *Argonaut*. She was dramatic critic and foreign correspondent for this daily. Besides short stories published in *Collier's Weekly*, *Harper's Weekly*, *Harper's Monthly*, and *Lippincott's*, she wrote the novels *Hard Pan* (1900)—she used this title as a pseudonym—*Tomorrow's Tangle* (1902), *The Pioneer* (1905), *The Castlecourt Diamond Case* (1906), and *The Book of Evelyn* (1913), and the plays *Sham* (with Elmer B. Harris, 1908) and *Sauce for the Goose* (with Harry Hutcheson Boyd, 1909).

BONNER, ROBERT (1824-99). An American editor. He was born in Londonderry, Ireland, but while very young emigrated to the United States, learned the trade of a printer,

and in 1839 became a compositor on the *Haitford Courant*. He removed to New York City in 1844 and in 1851 bought the *Ledger*, which soon attained an unprecedented circulation on account of its serial stories and its articles by popular contributors, such as "Fanny Fern" (Mrs James Parton), Edward Everett, Henry Ward Beecher, Longfellow, Tennyson, William Cullen Bryant, Sylvanus Cobb, and Charles Dickens. In 1837 Bonnet handed over the management of the paper to his three sons. He spent more than a half million dollars in purchasing some of the most famous fast trotting horses of his time, including Maud S, Sunol, Dexter, and Rarus.

BON'NET See **SAIL**.

BONNET (OF *bon[n]et*, Fr *bonnet*, from LL *boneta*, from *bon[n]et*, the stuff of which the article was made, possibly Hind *bānūt*, woolen cloth, broadcloth) A covering for the head, distinguished from the *hat* (q v) by being hairless.

Since the distinction between bonnets, hats, and caps has in all periods been to a great extent arbitrary, the history of bonnets is of necessity involved in the history of head-covering in general and that of the cap in particular. Just as the hat is the direct descendant of the roomy *petasos* of the ancient Greeks, with its broad brim for protection from the sun, the bonnet, in its original significance, is a descendant of the *phulos*, the conical, close-fitting cap of the Greek soldier, seaman, and mechanic, as well as of the Roman artisan, which was made of cloth, leather, or felt and resembled the modern fez. It differed from the modern Phrygian bonnet or liberty cap (q v) in not having the top bent or drooping forward. The *mitra* was a tall cap worn by the Persians and the neighboring nations during the Greco-Roman epoch. One form was alluded to as the Phrygian cap. Persons of dignity wore another style, which ended in an ornament and frequently resembled our modern conventional crown. This cap was in general use in western Asia from the time of the Assyrian Empire to the time of the Parthian wars against Rome. In this connection may be mentioned the "bonnets" in Ex. xvix. 9, and Lev. viii. 13, the round mitres worn by ordinary Jewish priests as distinguished from the half-egg-shaped headdress peculiar to the high priests. "Mitre" in Ex. xxviii. 4, and "diadem" in Ezek. xxi. 26, translate the same Hebrew word. A closely related headgear was the tiara-shaped cap worn by priests and married men and women. It is commonly supposed that the bishop's mitre and the tiara of the Pope are derived from the Asiatic headdresses.

The European bonnet of the Middle Ages was of cloth, silk, or velvet, according to the taste of the wearer, and varied greatly in shape at different periods. Among women it frequently took on such grotesque proportions as the *hennin*, worn in the fifteenth century—an absurdly high bonnet mounted on cardboard. In the sixteenth century hats, too, began to be generally worn. The Scotch clung to their old bonnet, celebrated by stories and songs. The braid bonnet of the Lowland peasantry, broad, round, and flat in shape, overshadowing the face and neck, resembled the *bonnet Béarnais* or *béret Basque* of the south of France. It was dark blue in color, except the red tuft on the top. The fabric was of wool, without seam or lining, and exceedingly durable. From having been worn until compara-

tively recent times by small rural proprietors, it gave to the local notabilities the distinctive appellation of "bonnet-lairds." The Highlanders have long worn bonnets of the same fabric, but of different shape. The Balmoral is flat and resembles the Lowland bonnet. The Glengarry rises to a point in front and is without any brim. It was the undress fatigue cap of the British infantry, but has now been superseded by what is known as the "field cap," provided with flaps to cover the ears. See **COSTUME**.

BONNET, *bo-nā'*, ALFRED MAXIMILIEN (1841-) A classical philologist, born in Frankfort-on-the-Main in 1841. He studied at Bonn and became professor of the Latin language and literature at Montpellier. He is the author of *De Claudii Galeni Subfiguratione Empirica* (1872), *Le latin de Gregoire de Tours* (1890), *La philologie classique* (1892), and *Acta Apostolorum Apocrypha* (1891-98).

BONNET, CHARLES (1720-93) A Swiss naturalist and philosopher, born in Geneva. He was educated for the law, but devoted himself to science. A dissertation on aphids, in which is described for the first time parthenogenetic reproduction, procured for him, at the age of 20, the honor of being made corresponding member of the French Academy of Sciences, and in 1743 he was elected a fellow of the Royal Society. In 1745 he published *Traité d'insectologie* and in 1754 *Recherches sur l'usage des feuilles dans les plantes*. Failing eyesight compelled him to abandon investigation, and he devoted himself to philosophical speculation. He wrote *Considérations sur les corps organisés* (1762-68), in which he expounded the theory of *emboîtement*, or the preformation of germs. *Contemplation de la nature* (1764-65), *Palingénésie philosophique, ou idées sur l'état passé et sur l'état des êtres vivants*, *Recherches philosophiques sur les preuves du Christianisme* (1773). Bonnet enjoyed a wide reputation and influence as a naturalist and philosopher, he originated the term "evolution" to apply to the successive unfolding of preformed germs, a meaning quite different from its present one.

BONNET FLUKE, SHARK, etc. See **FLUKE, SHARK** ETC.

BON'NETHEAD' A small shark of the genus *Remicps*, as *Remicps tiburo*, the shovel-head, related to the hammerhead, and frequenting warm seas.

BONNET MONKEY See **MACAQUE**.

BONNET PIECE A gold coin of James V of Scotland, so called on account of the King's head being decorated with a bonnet instead of a crown, as was usual. James V was the first Scottish sovereign who placed dates on his money and the first who diminished the size of the gold coins by "increasing their thickness." The most remarkable are those commonly called the "bonnet pieces," which were struck of native gold. In beauty and elegance of workmanship they approach the Roman coins. These "bonnet pieces" are among the most valued curiosities of the antiquary.

BONNET ROUGE, *bo-nā' rōōzh* The liberty cap of the French Revolution. The name was also transferred to the revolutionists.

BONNEVAL, *bōn'vāl'*, CLAUDE ALEXANDRE, COUNT DE (1675-1747) A French adventurer, also called Achmet Pasha. He was born of a noble family at Coussac, in Limousin, proved unmanageable at the Jesuit college, and was placed in the Royal Marine Corps in his thir-

teenth year. He was transferred to the Guards and served with great distinction in Italy and the Netherlands under Catinat, Villeioi, and Luxembourg, but having behaved with great insolence to the Minister of War, he was condemned to death by a court-martial. He fled to Germany, where, upon the recommendation of Prince Eugene, he obtained employment in the Austrian service. He now bore arms against his native country, was present at the battle of Malplaquet, distinguished himself by many daring exploits, was raised to the rank of lieutenant field marshal, and fought under Prince Eugene in the war between Turkey and Austria, at Peterwardein and Belgrade. At Vienna, after the Peace of Passarowitz, he made himself very disagreeable to the Prince, and was therefore sent in 1723, as master general of ordnance, to the Netherlands, where he soon got into a quarrel with the governor, was brought to trial, and condemned to death. The Emperor commuted the sentence to one year's imprisonment and banishment from German soil. Bonneval went to Constantinople, where he was cordially welcomed, became a Mohammedan, taking the name of Achmet, and was made a pasha of three tails. He was employed in organizing the Turkish artillery and achieved successes as general of a division of 20,000 men in the war of the Porte with Russia. For his services the Sultan appointed him Governor of Chios; but his own imprudence and the envy of others caused his removal from this office. He died in Constantinople. He vainly attempted to stir up the Sultan against Austria. His remarkable energy and great military talents were offset by a boorish and quarrelsome disposition, which always made him enemies on every side. Consult: *Memoirs of the Bashaw Count Bonneval* (London, 1750); Vandal, *Le Pacha Bonneval* (Paris, 1885).

BONNEVILLE, bôn'vil, LAKE. See LAKE BONNEVILLE.

BONNEVILLE, BENJAMIN L. E. (1795-1878). An American army engineer and explorer. He was born in France, emigrated to the United States, and graduated at West Point. In 1820 he was constructing a military road in Mississippi and in 1831 started on an exploring expedition to the Rocky Mountains and was not heard from for several years. He served in the Florida and Mexican wars, rising to the grade of colonel, and in 1861 was retired on account of disability, but served during the Civil War as superintendent of the recruiting service in Missouri, and was raised to the rank of brigadier general in 1865. The extinct Pleistocene lake, in what is now the interior desert basin of northwest Utah, was named for him. Washington Irving edited and amplified the *Adventures of Captain Bonneville, U.S.A., in the Rocky Mountains and the Far West* (2 vols., 1837).

BONNEVILLE, bôn'vel', NICOLAS DE (1760-1828). A French author and publicist, born in Evreux. Upon the outbreak of the Revolution he was appointed an elector and a district president of Paris and deposed, it is said, the idea of the National Guard. He was the founder of a society known as the Cercle Social, from whose press appeared several patriotic journals, such as the *Bouche de Fer*, the *Chronique du Jour*, and the *Bien-Informé*. He was imprisoned as a Girondist in 1793 and also suffered persecution under the Empire for his advanced views.

Among his works are: *Nouveau théâtre allemand* (12 vols., 1782); *Histoire de l'Europe moderne* (1789-92); *Le vieux tribun* (1791); *Nouveau code conjugal établi sur les bases de la constitution* (1792); *Poésies* (1793).

BONNEY, CHARLES CARROLL (1831-1903). An American lawyer, president of the World's Congress Auxiliary of the Columbian Exposition. He was born at Hamilton, N. Y.; studied at Colgate University, and was a teacher in 1848-52. He was admitted to the Illinois bar in 1852 and from 1890 to 1893 was president of the International Law and Order League. He organized and was president of the World's Congress, including the Parliament of Religions, held in connection with the Exposition at Chicago in 1893. Several of his addresses were published, including *Jury Reform* (1882); *The Present Conflict of Capital and Labor* (1886); *The Executive Power and the Enforcement of the Laws* (1890).

BONNEY, THOMAS GEORGE (1833-). An English geologist, born at Rugeley. He studied at St. John's College, Cambridge, where he was tutor from 1868 until 1876. Subsequently he became professor of geology at the University of London. In 1884 he was Hulsean lecturer, and in 1892 Rede lecturer, at Cambridge. He was president of the Geological Society of London in 1884-86, and in 1910-11 was president of the British Association. His publications include *The Alpine Regions* (1868); *Charles Lyell and Modern Geology* (1895); *Ice Work, Past and Present* (1896); *Volcanoes* (1898); *The Mediterranean, its Storied Cities and Venerable Ruins* (1902); *The Work of Rain and Rivers* (1912); *The Building of the Alps* (1912).

BONNIBEL (Fr. *bonne et belle*, good and beautiful). A stock name employed for the heroine in the old pastorals.

BONNIE BLUE FLAG, THE. A popular Confederate song, the authorship of which is disputed. It has been attributed to Henry McCarthy and to Annie C. Ketchum. The song was first given in 1861 at the Varieties Theatre in New Orleans.

BONNIEE, bôn'nyé', GASTON (1853-). A French botanist born in Paris. He studied at the Normal School there and was appointed a professor at the Normal School and subsequently (1887) at the Sorbonne. He founded the laboratory for botanical researches at the Sorbonne and the laboratory for the study of plant ecology at Fontainebleau. The *Revue générale de botanique* is edited by him, and he has published useful manuals: *Les plantes des champs et des bois: excursions botaniques* (1887); *Nouvelle flore des environs de Paris* (1894); *Le monde végétal* (1910); *Flore complète* (1911).

BONNIVARD (also **BONIVARD**), bôné'vâr', FRANÇOIS DE (1496-c.1570). A Swiss patriot, Byron's "Prisoner of Chillon." Educated at Turin, he became in 1510 prior of Saint-Victor, near Geneva, and aided the Genevese against the Duke of Savoy, who captured and imprisoned him for two years. Later he was taken by robbers and offered to the Duke, who imprisoned him from 1530 to 1536 at Chillon. The Genevese and Bernese liberated him. He returned to Geneva, where he was rewarded with a pension and died in honor. His *Chroniques de Genève*, written at municipal request, were published there in 1831 (last ed., 1867). Con-

sult Gribble, *Lake Geneva and its Literary Landmarks* (1901)

BONNYCLABBER An old provincial name for milk that, in the process of souring, has become thick and clotted. The word is a compound of *Ir bannne*, milk, and *ciaba*, thick mud. The word 'clabber' alone is sometimes used in the same sense as the compound.

BONO, **bō'nō**, **BON**, **bōn**, or **BUONO**, **bwō'nō** A family of Venetian architects and sculptors. Its founder, GIOVANNI BONO (1375?-42?), and his son BARTOLOMEO BONO (1400?-42), were the greatest artists of the late Gothic period in Venice, the authors of the famous Palace Ca' d'Oro (1421) and the Porta della Carta (1438), between the Doge's Palace and St Mark's. See **GOthic ARCHITECTURE**.

Another BARTOLOMEO BONO (died 1529), sometimes known as BERGAMASCO, was the designer of the upper part of the Campanile of St Mark's and of the Scuola di San Rocco. He also began the Procuratie Nuove, later completed by Sansovino.

BONOMI, **bō-nō'mé**, GIUSEPPE (1739-1808) An Italian architect, who in 1767 settled in England. He was well known in Italy, having been appointed an architect of St Peter's and in England aided greatly in the revival of Greek architecture. His most celebrated work was a villa erected for the Duke of Argyll at Roseneath, Dumbartonshire. He was elected an associate of the Royal Academy in 1789, and his subsequent failing to obtain election to full membership was the cause of the withdrawal of Reynolds from the presidency. Between 1783 and 1806 he exhibited numerous drawings at the Academy.

BONONCINI, **bō'nōn-chē'né**, or **BUONONCINI**, **bwō'nōn-chē'né**, GIOVANNI BATTISTA (1660?-c 1750) An Italian operatic composer and violinist. He was a pupil of his father, Giovanni Maria Bononcini, and of Paolo Colonna. He became violinist to the court at Vienna in 1691. In 1716 he visited London, where he soon acquired a popularity which made him a formidable rival of Handel, the respective merits of the two musicians being for a time hotly contested. In 1731 it was discovered that he had plagiarized an anthem by Antonio Lotti, and soon afterward he left London in disgrace and went to Paris, where he became interested in alchemy, in the pursuit of which he impoverished himself. He was invited to Vienna in 1742 to compose the festival music in celebration of the Peace of Aix-la-Chapelle. He died in Venice at the age of 90 and is said to have preserved his power of productivity unimpaired to the last. His principal compositions include the operas *Tullo Ostilio* (Rome, 1694), *La fede pubblica* (Vienna, 1699), *Polifemo* (Berlin, 1703), *Asarte* (London, 1720), the *Funeral Anthem for the Duke of Marlborough* (ib, 1722), the oratorio *Il Giosue*, also several symphonies, and some chamber music.

BONONCINI, or **BUONONCINI**, GIOVANNI MARIA (1640-78) An Italian composer. He was born in Modena and studied in Bologna. He early entered the service of the Duke of Modena and became *maestro di cappella* of San Giovanni in Monti. He wrote a great number of instrumental and vocal compositions, and a theoretical work entitled *Musico prathico* (1673).

BONONTA See **BOLOGNA**.

BONPLAND, **bōn'plān'**, AImé JACQUES ALEXANDRE—his real name was Goujard—(1773-

1858) An eminent French botanist. He studied medicine and botany in Paris, and in 1799 accompanied Alexander von Humboldt to America, and with him traveled extensively in Mexico and the Andes (1799-1804), where Bonpland collected 6000 new species of plants. After his return he was appointed director of the gardens at Navarre and Malmaison in 1804, and published several splendid and valuable botanical works, such as *Plantes équinoxiales recueillies au Mexique* (2 vols, 1808-16), *Monographie des Melastomacees* (2 vols, 1806), and *Description des plantes rares cultivees à Navarre et à Malmaison* (1813). He went to Buenos Aires in 1816, with a collection of European plants and fruit trees, and was there appointed professor of natural sciences. In 1821 he undertook an expedition of scientific discovery up the Paraná, with the view of prosecuting his investigations to the Andes, across the Gran Chaco Desert, but Dr Francia, then Dictator of Paraguay, believing him to be a spy, arrested him, and kept him prisoner for eight years. In 1829 Bonpland obtained his liberty, went to Brazil, and resided at Santa Borja till 1850. He then removed to Corrientes, where he practiced medicine till his death. His remarks on the herbarium collected in his travels with Humboldt have been published by Kunth in his *Nova Genera et Species Plantarum* (12 vols, Paris, 1815-25). For his biography, consult Brunel (Paris, 1872).

BON'SAL, STEPHEN (1865-) An American newspaper correspondent, born in Baltimore. He studied at St Paul's School, Concord, N H, and in Heidelberg, Bonn, and Vienna. He was a correspondent for the *New York Herald* in the war between Bulgaria and Servia in 1885, in the Macedonian uprising of 1890, and in the China-Japanese War of 1895, and for the *New York Times* in Mexico in 1910-11. In 1891-96 he was in the American diplomatic service in Peking, Madrid, Tokio, and Korea, and in 1913 he became assistant executive secretary to the Philippine government under the newly appointed governor, F B Harrison. Besides many newspaper and periodical articles he wrote *Morocco as It Is* (1893), *The Real Condition of Cuba To-Day* (1897), a biography of Edward Fitzgerald Beale (1912), *The American Mediterranean* (1912).

BONSTETTEN, **bōn'stēt-en**, CHARLES VICTOR DE (1745-1832) A Swiss author. He was born in Bern and studied in Leyden, Cambridge, and Paris. He was a member of the Grand Council of Bern in 1775 and subsequently bailiff at Saanen and Nyon. He became superior judge at Lugano, but in 1796, to escape the Revolution, withdrew to Italy and thence to Copenhagen, where he remained until 1802, when he removed to Geneva. His works, mostly travels and letters, include *Kleine Schriften* (4 vols, 1799-1801), *Voyage sur la scène des dix derniers livres de l'Énéide* (1805), *Études de l'homme* (1821), *L'homme du Midi et l'homme du Nord* (1824), *Souvenirs écrits en 1831* (1833), *Briefe an Friederike Brun* (2 vols, 1829). For his life, consult Morell (Winterthur, 1861), also, Jenny, *Geschichte der schweizerischen Literatur* (Bern, 1910).

BONTEBOK, **bōn'tē-bōk** One of the hartebeests (*Damaliscus pygargus*), the Dutch name meaning pied goat. See **HARTEBEEST**.

BONTEMPS, **bōn'tān'**, ROGER The pen name used by Roger de Collerye, a jolly Parisian

of the fifteenth century. The name has passed into the language for a "good fellow."

BONTOC-IGOROT, bôn'tók ig'ô-rôt. A powerful head-hunting tribe of Bontoc sub-province, Luzon. They live in compact villages, each one of which is made up of several political and exogamic divisions. Each division is supposed to have separate dormitories for the unmarried men and women. Trial marriage is the rule. Owing to the rough nature of the country and scarcity of game, intensive agriculture is carried on in the mountain-side terraces. Consult A. E. Jenks, "The Bontoc Igorot," *Ethn. Survey Pub.* (Manila, P. I., 1905); Seidenadel, *First Grammar of the Language Spoken by the Bontoc Igorot* (Chicago, 1900).

BON TON, Fr. pron. bôn tôn (Fr. good tone or manner). A comedy by Burgoyne (1760), altered and produced by Garrick (1775) with a subtitle *High Life above Stars*. It was designed as a satire on the introduction of French customs.

BONTOUX, bôn'tou', EUGÈNE (1824-1904). A French financier. He studied at the Ecole Polytechnique and was by profession an engineer, but subsequently was appointed general director of the Southern Railway of Austria. With the support of the Rothschilds he made large speculations. Later, having lost much of his fortune and quarreled with the Rothschilds, he founded in Paris, in 1878, chiefly with the aid of clerical and Legitimist capital, the Union Générale, whose success was marked and extensive. A severe decline in prices in 1882 bankrupted the Union, whose projector escaped five years' imprisonment by flight. He published *L'Union Générale, sa vie, sa mort, son programme* (1888).

BONTUKU, bôn'tou'koo, or BONDUKU. An important commercial town in French Sudan, situated close to the English boundary. It lies at an altitude of nearly 800 feet, on the caravan route connecting Kong and Timbuktu with the western Sudan, and has a large trade in gold dust, salt, and cotton goods. The houses have flat roofs and are inclosed by high clay walls interspersed with buttresses. The architecture suggests a higher state of civilization than is found in the surrounding country. The population is estimated at from 2500 to 3000 and is chiefly immigrant.

BONUS (Lat. *bonus*, good). A special allowance beyond what is formally due. It is applied (a) to a special dividend. If the previous dividend has been 4 per cent on the capital, and if the profits of the current year admit of 5 per cent a formal dividend of that amount might commit the company to a like dividend in future; and to prevent such a precedent, 4 per cent is declared, and a bonus of 1 per cent. It is also used (b) to designate the inducement offered to security holders to part with their securities in exchange for others. Thus, in industrial combinations, it is not infrequent that stockholders of the older corporations receive, in addition to the nominal value of their holdings in the new securities, a bonus, either in cash or in securities of the new organization. The term also designates (c) the payment to the government for the privileges which the act of incorporation confers upon a company.

BONVALOT, bôn'vâ'lô', PIERRE GABRIEL (1853-). A French traveler and explorer. He was born at Epagne (Aube), studied at the lycéum of Troyes, in 1880 accompanied Uffalvy

on a journey of exploration to the interior of Asia, and in 1886-87 accompanied by G. Capus and the painter Pepin, undertook a second journey thither. In 1889-90, with Prince Henri d'Orléans (q.v.), he traversed Asia from Siberia to Tongking. He was sent in 1897 on a government mission to Antoto, Abyssinia. His principal works include: *De Moscou en Bactrane* (1884); *Du Caucase aux Indes à travers le Pamir* (1888); *De Paris au Tonkin à travers le Tibet inconnu* (Eng. trans., 1891, under title *Across Thibet*); *L'Asie inconnue* (1896).

BONVIN, bôn'vân', FRANÇOIS (1817-87). A French genre and still-life painter. He was born at Vaugirad (Seine) and began life as a typesetter. Although his art was self-taught, he achieved an excellent technique, reminding one somewhat of such old masters of genre as De Hoogh, Vermeer, and Chardin (whose successor he claimed to be). His pictures are small in size and represent scenes from popular life—kitchens, workshops, asylums, convents, etc., and less frequently still-life subjects. He is represented in a number of French provincial museums, and in the Luxembourg (Paris) by "The Servant at the Fountain" (1861), "Ave Maria" (1870), and "The Rectory" (1872).

BONY PIKE. A gar pike (*Lepidosteus*). See GAR.

BONZE, bôn'zê. A word corrupted from the Japanese *bōzu*, a Buddhist priest, which in southwestern Japan is nasalized and softened. Correctly applied in general to members of the Buddhist fraternities, by natives, it is used also by foreigners for the priests and monks in other countries of Asia. The term is general, referring to the Buddhist religious members of the community rather than to the rank or priestly character of one who professes the Buddhist religion, the special term for priest being *ōshō* or *so*. Popularly it has especial reference to the shaven head, the old term being also applied to former retainers of the daimios.

BOOBY. Any of various of the lesser and more tropical species of gannets (genus *Sula*). The name is said by Newton (*Dictionary of Birds*, London, 1896, p. 48) to be a corruption of the Portuguese *bobo*, a fool, derived from the Latin *balbus*, stuttering or unarticulate; and to have been "applied, most likely by our [British] seamen, originally, to certain birds from their stupidity in alighting upon ships and allowing themselves to be taken easily by the hand," instances of which have been mentioned in many accounts of early voyages. There is no reason to suppose that these birds are any more stupid than other sea fowl little accustomed to man. Boobies differ from gannets in having the whole lower jaw, chin, and throat naked, but gradations are found, and no hard and fast line can be drawn. Several species are known, one confined to the Peruvian coast, and the others ranging throughout the warmer seas of the whole world and coming north on American shores to Georgia and Lower California. Their habits are those of the gannet (q.v.), with the most important exception that they make their nests, as a rule, on bushes and trees instead of on rocks. The site is always near the seashore. It is a rude platform of sticks and dry seaweed, and contains one or two eggs, "chalk-white superficially, but beneath the calcareous crust pale greenish blue." The commonest and typical species is *Sula sula* or *leucogastra*,

which is dark sooty brown (often tawny), with the naked skin of the face and throat yellowish and the feet dull green. The blue-faced booby (*Sula cyanops*) is white, with wings and tail sooty brown, the naked skin about the face and throat bluish, and the feet reddish. The red-footed booby (*Sula piscator*) is yellowish white, with the wing quills slate colored and the feet red.

BOOBY ISLAND A rock in Torres Strait in lat 10° 38' S and long 141° 53' E, 63 feet in height and one fourth of a mile in diameter. There is a lighthouse on the island, which was formerly used by sealers as a post office. They left letters there to be picked up by passing ships and forwarded on.

BOOG, boog See Bug

BOOK The aim of the first scribes in the choice of the material for their work was to give durable form to the production. Accordingly the earliest inscriptions which have been preserved were placed on stone or baked brick or metal rather than a more flexible but more perishable material. The Ten Commandments, for instance, were graven on slabs of stone. Josephus records that the columns on which the children of Seth placed the records of their inventions were of stone and brick. The Laws of Solon (about 594 B.C.) were inscribed on wooden planks. The earliest productions answering to our modern books of which we have any record were the tiles covered with inscriptions in the soft clay by the Chaldean scribes and rendered permanent by being baked in ovens. The excavations carried on in Lower Mesopotamia (1895-1901) by Dr. John P. Peters and others have brought to light, from the ruins of the Temple of Nippur, tablets believed to have been produced about 6000 B.C. The text inscribed on these is, with few exceptions, devoted to the hymns and invocations used in the temple services. The larger of these Chaldean tablets are flat and measure 9 × 6½ inches, the smaller are slightly convex, and in some cases are not more than 1 inch long, bearing but one or two lines of cuneiform characters. These characters are impressed on the soft clay by a little iron rod (the equivalent of the Roman stylus), not pointed, but triangular, at the end. The impression bears, therefore, the shape of a wedge. In the literature of Egypt the earliest examples (apart from certain inscriptions on the tombs) are copies of what was known as the *Book of the Dead*. The text of this varied with the different copies, as these were prepared for placing in the tombs or in the cases with the mummies, and while all contained invocations to the deities, together with prayers and psalms, differed in including special records, referring to the life of the deceased and to his personal expectations for the world to come. The Chinese speak of their own literature as having originated many thousand years back, but its earliest-known work of which any copies have been preserved dates from 1150 B.C., or some 200 years earlier than the generally accepted date of the Homeric poems. The book in question bears the title *Y-king*, the Book of the Metamorphoses or Developments. The material next in importance to the baked clay, and probably also next in point of antiquity, was the skin of goats. In the earlier form in which this was utilized by the Hebrews, Greeks, and others, the skin was dressed only on one side and did not present any thoroughly finished surface. These dressed skins were

called by the Greeks *diphtherai*, and writings upon them came to be known by the same name. (Ctesias speaks of the *diphtherai basilikai*, royal books) (or writings or documents) of the Persians, and Herodotus says that such skins were used in the earlier ages even in Egypt. It was, however, not until the production of parchment (qv) (*membrana* or *pergamena*), that the value of skins for literary purposes began to be properly understood and even parchment made its way but slowly among writers in competition with the long established papyrus, which it was, however, destined to outlast for many centuries. The name "parchment" (*pergamena*) is derived from the city of Pergamum, where, according to the tradition, it was first prepared under the direction of King Eumenes II, about 190 B.C.

It is probable that parchment had actually been produced considerably before this date, but great impetus was undoubtedly given to its use and its manufacture was improved, owing to the embargo placed by the Egyptian King, Ptolemy Philadelphus, on the exportation from Egypt of papyrus. The papyrus is a species of reed which in ancient times abounded on the banks of the Nile. According to Wilkinson, the plant has now entirely disappeared from Egypt, recalling the prophecy of Isaiah (xix 7) "The paper reeds by the brooks, by the mouth of the brooks, shall wither, be driven away, and be no more." The material used from the papyrus plant was the pith of the stem, which was rolled out into a tissue. Pliny speaks of the layers of the pith being soaked in water of the Nile and woven into a sheet (*plagula* or net). An evidence of the early use, in various countries, of vegetable tissue for writing is found in the etymology of Greek and Latin names for books (*βιβλος*, *liber*, *codex*), all of which refer originally to parts of trees or reeds. The writing on the sheet of papyrus was done with a split reed, for ink, different colored pigments were utilized. The oldest Egyptian papyrus known to have been preserved has been assigned to a date about 2000 B.C., or 4000 years later than the baked tiles of Chaldea. The papyrus book, whether Egyptian, Greek, or Roman, was arranged very much like a modern mounted map. The length of the material, written on one side only, was wound upon a wooden roller. Such rolls were found often 20, 30, or even 40 yards long. Herodotus tells us of a copy of the *Odyssey* written on one such roll. With the increasing scarcity of papyrus, the improved parchment came into general use, superseding papyrus by the beginning of the seventh century. But from the fourth century B.C. to the close of the sixth century A.D., by far the larger proportion of the literature of the world was recorded on sheets of papyrus. The perishability of the papyrus is responsible for the loss of a very large proportion of this literature of antiquity. Bearing in mind the fragile character of the material itself and its liability to destruction through damp, dry rot, mice, and insects, and recalling also that the mere handling of the most careful readers of a papyrus roll destroyed in a very brief period the outside sheets (that is to say, the beginning and the end of the manuscript), one is surprised, not that the literature of Greece and Rome has come to us in such fragmentary condition, but that so many important works have been preserved.

When there came to be as in Rome, in the

first and second centuries A.D., a continued and increasing demand for copies of a work, the booksellers organized methods for speedier multiplication of copies than had been possible when each copy was produced by a single scribe. By using readers who dictated at one time to a group of from 12 to 50 scribes, they secured a very considerable speed in the multiplication of copies. Nearly all of these scribes were slaves, but they were well-educated slaves. Accuracy was, however, sacrificed to speed; there was often no proper collation, and many of the deficiencies in the texts of classical works are to be charged to the carelessness of these copyists. The scribes who prepared the manuscripts were known as *librarii*. This name came afterward to be applied to the booksellers through whom the manifolded copies were sold. The smaller dealers had themselves given the manual labor for the production of their wares; the larger *librarii* hired for the purpose the work of the slaves.

With the institution of the first Christian monasteries, with their *scriptoria* or writing rooms, the business of book making takes on a new phase. The material is parchment. The stylus is developed into a reed pen. The scribes are no longer slaves working under hire, or booksellers preparing copies for sale, but monks manifolded sacred writings for the glory of God. We have thus at once a higher standard of work, both for accuracy and for beauty. The classic texts that exist to-day have come down to us in these parchment copies prepared by the monastic copyists. The texts from which the first of these scribes worked were the papyrus sheets, which shortly thereafter disappeared altogether. Fortunately for the literature of the world, the labor of these earlier generations of monks was not confined exclusively to the duplication of the Scripture or of the sermons of the Fathers. At the instance of Cassiodorus, who in 567 organized in his own monastery at Vivarium the first of these *scriptoria*, a portion of the working time was given to selections of the classics, though the books which were multiplied most frequently were the Scriptures in the Latin version of St. Jerome, St. Augustine's *City of God*, and the *Consolations of Philosophy*, by Boethius. In fact, it was to the monastic scribes that the first printers owed the existence of the classical texts from which their own work was done. See BENEDICTINES.

The next period in the making of books comes with the organization of the oldest universities, Bologna and Paris, all of which date, as far as their effective work is concerned, from the beginning of the thirteenth century. In these universities the making of books became part of the educational work. The bookmakers, i.e., the scribes who had charge of the multiplication of the texts, were appointed by the university authorities. They were held strictly responsible for the accuracy of their manuscripts, which were to be used as texts for the lecturers and for their students. The first scholarly editorial work in the collation and correction of the classic texts dates from this period. The name given to the officials who were charged with the duty of providing texts for the universities was *stationarii*. The work of these men comprised, in addition to the preparation of the texts, the renting at specified rates of the manuscripts so prepared to the students and instructors. During the earlier years of book making

in the universities the sale of manuscripts by the *stationarii* was not permitted.

Paper (q.v.) was introduced into Europe about the beginning of the tenth century. This earliest paper (*charta bomblacina*) was made from cotton. Paper made of linen first came into use, according to Mabillon, in the twelfth century, although Montfaucon asserts that no specimens have been identified earlier than 1270.

According to tradition, the University of Bologna owed its foundation to Charlemagne. This connection is now held to be but a legend. It is true, however, that before the close of the eighth century Charlemagne rendered an important service to the making of books. In 782 the monk Alcuin was called by Charlemagne from his home monastery in York to the court at Tours. Alcuin established a series of royal schools. In these schools was instituted a uniform system of script, which was prescribed for the educational and for the official documents of the realm. Fortunately for the work of the later scribes and for the interests of literature, Alcuin selected for his standard of form not the Gothic, but the Latin script. It was this script of Alcuin's which was accepted as the model for the *scriptoria* of the monasteries, and later for the working rooms of the universities. It was this same script, as developed through the centuries of book writing in the universities, that became the model for the type founders after 1472, who shaped the fonts of the Latin alphabets, i.e., of all the Western alphabets other than the Gothic or German.

It was the practice of the manuscript copyists to place at the close of the text information in regard to the date and place of production, and occasionally, although by no means uniformly, the name of the writer. Such a record at the close of the work is known as "colophon." Even after the introduction of printing we find in a number of books of the last half of the fifteenth century such records presented at the end of the volume in a colophon. It is an inconvenient peculiarity, however, of a large number of the earlier printed books that they fail to present either the name of the printer or the date of their production.

An instance of the price of a manuscript work of the ninth century is given in the life of King Alfred, who bought in 880 from Ceolfried, Bishop of Wearmouth, a work on cosmography, for which he paid in land sufficient to support eight families. It is not safe, however, to deduce an average market value for written books from this or from similar instances of exceptional prices paid for manuscripts. It happened not infrequently that the manuscript contained, in addition to the work of the scribe, designs and illuminations contributed by artists who may have given to this additional labor years of time; and certain manuscripts were inclosed in very elaborate and costly covers. Finally, in case the manuscript happened to be the only copy of that particular text that was within reach, it would possess what might be called a competition value, irrespective of the actual cost of the labor of its production. If the owner forbade any copying, its unique value would remain. We have, therefore, instances through the manuscript period of single works being purchased at exceptional prices, while other works, which called for no less labor on the part of the scribes, could be secured at moderate cost. For additional information in regard to books produced in the manu-

script period, see PALEOGRAPHY, and MANUSCRIPTS, ILLUMINATION OF

With the invention of printing we come to what may be called the modern period of the making of books. The press of Gutenberg was brought to completion in Mainz by the year 1450. For a century prior to this date, books of a special character, made up mainly of pictures with an inconsiderable interpolation of text, had been printed from blocks of solid wood, and later of zinc. These books were chiefly devotional in character. The printing of these block books is termed *xylography*, as contrasted with the printing from movable type, which is classed as *typography*. It is certain that the more important part of Gutenberg's invention was not the mechanism of his press, which differed in detail rather than in principle from the presses previously in use, but the use of movable type. It may be recalled here that movable wooden type had been utilized by the Chinese as early as the beginning of the eleventh century. The first work produced by the movable metal type of Gutenberg was a Latin Bible. Prior to the invention of the printing press, the book had been something with which the scholarly class (chiefly the clerical or ecclesiastical class) alone was concerned. With the distribution of printed copies, first of religious works, then editions of the classics, later writings addressed directly to the understanding of the general public, the book becomes an influence for directing public opinion. It is through the printed sheet that the thought of a Luther or a Calvin becomes a means of revolutionizing the opinions of a large proportion of his generation.

The chief difference in the external appearance of books since the sixteenth century is the general abandonment of the large sizes which were common in the days when books were not supposed to appeal to such a large and varied class as at present. The folio and quarto have almost entirely gone out of use, except for very elaborate and costly books. The technical names of the various sizes are based upon the number of times the old-fashioned large sheet of paper was folded for the binding. The sheet folded once, to make 2 leaves or 4 pages, constitutes a folio, folded into 4 leaves, a quarto, into 8, an octave, into 12, a duodecimo, and so on through the smaller sizes. It is usual to write the Arabic numeral with the Latin termination, as 4to, 8vo, 16mo, etc. The old sizes are not so strictly followed nowadays, though the names are retained for convenience.

See also PRINTING, BOOKSELLING, BIBLIOGRAPHY, BOOKBINDING, LITERARY PROPERTY.

BOOKBINDING The history of bookbinding is chiefly the history of the ornamentation of book-covers. The mechanical work of sewing and covering a book, described below, might indeed be studied chronologically as regards the changes in the processes employed, but this is of little general interest. The date when strips of vellum were replaced by cords at the back of the

book, though perhaps discoverable, is a less attractive question than that as to the place and time when gold tooling was introduced. Thus in the twelfth century there appear in England the earliest stamped leather bindings, and for our present purpose this is the beginning of the history of the art. The workmen of that time were familiar with the arts of softening leather and then shaping it into the most complicated forms. Under the name of *cur-bouilli*, corrupted in England into quirkboily and the like, the material was used for much of the war equipment of man and horse, as well as for decorative arts in peace. It was therefore easy to take the further step of drawing the soft leather tight on a thin oak board, impressing upon it stamps most commonly of wood and engraved in relief. In this way designs in the taste of the epoch, Romanesque or semi-Byzantine scrolls and conventional birds, are found stamped in leather. In the thirteenth century the design becomes more notably Gothic, in the fourteenth century the emblems of lions, fleurs-de-lis, roses, castles, and all the other devices of heraldry, divide the field with religious emblems. All this is in what is called 'blind' tooling, i.e., in patterns impressed but not colored or gilded.

Gold tooling seems to have come into Europe from the East, probably in the fifteenth century. The custom of coloring the impressed pattern seems to have been introduced about the same time. The art of inlaying was the natural result of this taste for colored patterns and is probably of the sixteenth century. It was for many years chiefly confined to Italy, where it was used with the greatest freedom, the color patterns being partly in inlaid leather, partly in painting, and everywhere bordered and touched with gold.

According to tradition, oak boards were first abandoned in favor of paper by the workmen who covered the books of the famous printer Aldus of Venice in the sixteenth century. Previous to this time even small books had their stiff covers a quarter of an inch thick, and often beveled to a sharp edge to disguise this disproportionate thickness. The "half-binding" of the time was, then, that with leather back, this cover extending not more than an inch over the oak boards, which were otherwise exposed with no decorative effect except the grain in the wood. The cheaper kind of full binding was of brown leather stamped sometimes with separate though not very small tools and with letters put on by separate type, so as to form inscriptions, and sometimes with larger stamps, as where a Christ bearing his cross and a David with his harp are on the two flats of a cover, dated 1568, each stamp measuring $1\frac{1}{2} \times 2\frac{1}{2}$ inches, these and the inscriptions around being gilded in a singular way by a process of lacquering, probably Oriental in its origin. Vellum, parchment, and white pigskin were used, replacing the brown leather, and these light-colored materials were often covered all over with minute patterns, in which apparently metal stamps were freely used.

Jean Grolier de Servières was treasurer of Francis I, King of France, and for him were prepared bindings of great richness and beauty. It appears that the volumes of a library, large for its epoch, were bound for him in this sumptuous way, the characteristic ornamentation being interlacing bands, dark, and edged with gold upon a lighter ground, or scrolls of gold lines only, the name of the book being lettered in the centre

panel of one or both of the sides, and the familiar motto, *Poito meo, domine, in terra viventium*, alternating with or accompanying the phrase, *Io. Grolierii et amicorum*, [the property] of John Grolier and his friends.' The decoration and the friendly legend were both rather closely imitated by Maioli, an Italian, of whom but little is known.

In the seventeenth century the use of coats of arms fully displayed in gold, and occasionally in all the colors of the different bearings, became the most common adornment, though indeed such ornamentation dates from an earlier epoch. The tendency of design in the seventeenth and eighteenth centuries was away from polychromatic efforts and toward insistence upon the beauty of the grained leather set off by the slightly impressed points and lines of gold. It was during the last quarter of the nineteenth century that effects of color, generally procured by means of inlay, were restored to favor.

Metal mountings of all sorts are adjuncts whose principal object is dignity and sumptuousness. When books are very heavy and very precious, clasps have their utility, and bosses, four or five on each side, keep the leather and its ornamentation from being rubbed. Still, however, these mountings, like the far more elaborate covers of wrought silver gilt set with enameled plaques and *cabochon* jewels, are chiefly ornamental in their purpose. Europe has never made so great a use as might have been expected of bindings in rich stuffs beautiful in themselves.

The term "bookbinding" should properly be confined to the process of covering a folded and sewed book by stiff sidepieces of paper, board, or wood, which are secured to the package of folded leaves by flexible strips running across it at the back; which sidepieces are afterward covered by material such as leather of some kind, cloth, or paper, pasted or glued to the stiff sides and to the back. The mounting of a book which is issued in a roll like the Roman *volumen*, or the Japanese scroll of similar character, is hardly bookbinding, although the very delicate use of decorative paper and rich stuffs, and the mounting of the scroll upon a cylindrical roller with ivory or other knobs at the ends, may provide the medium for much decorative treatment; and the modern so-called binding in pasteboard covered by muslin or silk and issued in large quantities by publishers should not be called bookbinding at all. For this the entirely appropriate name "casing" may be used.

In the present art of binding the first process is the folding of the sheets, if the printer has not folded them, or the careful pulling of the book to pieces if it has been bound before. This folding can never be neatly done unless the sheets have been so printed that the letterpress on one side is exactly over that on the opposite side. Sheets of blank paper are added at beginning and end for "end papers" or "fly leaves."

The first page of each sheet of a printed book is usually marked at the bottom with a letter or number (A, B, C, or 1, 2, 3, etc.), technically called the "signature," by which the sheets after folding are arranged in their proper order for sewing. The sheets are then beaten on a smooth stone with a broad-faced hammer and put into a press for several hours, to secure solidity. After thorough "collation," i.e., examination to see that the "signatures" are in regular order, with

all plates and maps, if there be any, in their places and properly mounted on guards, the sheets are ready to be sewed. They are carefully jogged up on the back and top and screwed up tight, back upward, in the lying press. Lines are then drawn across the back to show the sewer the position of the cords or bands on which they are to be sewed. The sewing may be done in the old "flexible" style by sewing on raised cords that stand out from the backs, forming the foundation for the "bands" in finishing; by sawing grooves in the sheets and sewing on the cords let into them; by sewing on tape or parchment instead of the cord; and by whip-stitching in sections, which is necessary for books filled with plates or composed of single leaves, these sections being treated like folded sheets. If the book is to have an open or spring back, grooves are commonly sawed in about one-sixteenth of an inch to take in the cords. This is not first-rate binding; it is far better to let the bands project from the back and let the covering leather adapt itself to these.

After sewing, the book goes to the forwarder, who again jogs it up on back and top and hammers it along the back edge to make it perfectly even. The cords are pulled tight, the first and last signature pasted to its neighbor, and the end papers are attached. The edges are then cut, and the back thoroughly covered with thin hot glue. When this is nearly dry, the back is carefully rounded, the book put in the lying press between backing boards, and the backs of the sections are evenly fanned out, one over the other, from the centre outward, by light blows of a hammer, preserving the round and forming a groove on each side for the cover boards to fit into. These boards are attached by lacing in the frayed-out ends of the cords, called "slips," into holes punched directly opposite the bands. These slips are pasted, and hammered down after lacing in, so as to leave little or no projection. Cover boards are attached also by lacing in tapes, and by introducing the cords or tapes between thin double boards in each cover. These are known as split boards. Headbands are put on to protect the top edge of the binding when the book is tilted by the finger from the shelf. The ideal way of putting on the headbands is to sew the sheets to them as well as to the other bands, and at the same time, rendering them firmer and more secure.

The edges of a cut book may be sprinkled, marbled, gilded, or painted. The most effective gilding is done on the rounded front-edge, over a red stain. Gaufered edges are made by stamping with heated tools on the gilded edges before burnishing. Landscapes are sometimes painted on the sloping surface produced by crowding back the front cover; the edge is then gilt and burnished as usual, the picture becoming visible only when the front cover is pushed back.

The covering of the book is done by simply gluing or pasting the material to be used upon the boards of the sides and upon the back. There is, however, this difference between different kinds of back. Thus, the hollow back, so called, which allows the mass of folded sheets forming the book proper to leave the back and to hinge itself at any point, while the back remains independent and rounded out with an open space between it and the book, is made by putting a piece of stout paper between so that the leather or silk of the cover is glued to it. The "fast back" or "tight back" is made by gluing the cov-

ering directly to the rounded back of the book. As this covering material is added to the completely made book, to the stiff covers and the back after they are put together, it is evident that a great deal of care must be used in stretching it to cover the bands, the corners, and the edge where it is turned under and has its edges covered by the lining paper or *doublure*. This doublure is commonly a piece of marbled or colored and glazed paper, half of which is pasted to the inside of the cover, while the other half forms an additional end paper, but sometimes the cover is lined with a piece of leather or silk.

Finally, the book is ornamented by stamping or tooling. These terms are used generally to imply, in the one case, large plates from which a stamp is taken covering the whole or a large part of the cover at one impression, while tooling is the putting on of the impressed or gilded lines, dots, leaves, and the like, separately, one by one, with a number of tools, the impressions of which are combined together so as to produce the patterns desired. The French term *fer* (iron) is used for one of these tools, hence the phrase *à petits fers*, meaning that the ornamentation is applied by hand, with little tools, one by one, making separate points, short bars, single leaves or flowers, which are combined in patterns. Rollers are used, by means of which indefinitely long lines, zigzags, or simple scroll patterns are applied.

For a still more elaborate adornment, different-colored leathers are combined by "inlaying." Very rarely this is done by a mosaic process of the full thickness of the leather, most commonly the background is lowered or cut away very slightly, and the piece to be inlaid is a mere film. The lines of junction are generally concealed by broader lines of gold, impressed by means of a tool.

When the book is simply to be "cased," as in editions for the trade, the cloth cover, with its board sides and flexible back, is made independently. The sheets of the book having been sewed and backed are then fastened into the case by means of a piece of cheese cloth or loosely woven "super" glued fast to the back of the book, and having projecting side pieces, like hinges, which are pasted to the covers under the end papers.

Casing is made decorative chiefly in two ways—first, by the use of a textile material which is in itself decorative, and secondly, by printing upon the surface of the boards, whether covered with silk or cotton cloth or with paper, a pattern which may be "blind," i. e., merely impressed without color, or in one or several colors. The first method, that by the use of stuff which of itself is ornamental, may be very rich if a brocade is used, and it is noticeable that the large and carefully made books of the Japanese, made to contain water colors, pieces of old drawings, or rare old stuffs and the like, have sometimes for their sole decoration a beautiful piece of brocade for covering material, and sometimes this with the addition of richly worked metal corners. Thirty years of rather constant use, as of a popular book in a reading family, does not seem to injure it except by slightly loosening or "spreading" the back. This, however, is for small books only, those weighing two pounds, or a kilogram, can hardly remain firm more than two or three years. The "decorative bindings" of modern English and especially American popular books are sometimes adorned in a

very effective way either by stamped gold patterns rather deeply impressed upon the cloth sides, or by surface printing without deep incision, which printing may be in one or many colors. It is not hard to combine the two processes. Thus, in one rather pretty book, each cover, about $5\frac{1}{2} \times 8\frac{1}{4}$ inches, has a conventionalized landscape in two dull colors, and above this picture, which occupies two-thirds of the surface, the title, consisting of seven words, is impressed in gold. Some admirable designs are prepared for English publishing houses in which the almost lost art of designing patterns of conventional leafage and the like has been revived. American work runs more often, as in the case mentioned above, towards descriptive and suggestive art, landscapes, emblematic compositions, even figure subjects of some pretension.

Books cased in this way need not be injured for future binding, but they often are, as by the pasting of the edges of inserted plates to the folded sheets of the letterpress, or by sewing the sheets together in such a way that while the same sewing will not be found sufficient for permanent binding, it has still injured the backs for better work. Where "stabbing" of the sheets with tinned wire is done, the book is ruined as a permanent possession.

BOOK CLUB. A convenient title for private associations which print books for distribution among a limited circle of subscribers. Such clubs, being usually composed of scholarly men and endowed with sufficient means, have rendered no slight services to literature and learning by rendering accessible a number of valuable works which had existed only in manuscript or in very rare printed copies. "While associations like the Dilettanti Society (q.v.) accomplished some work in publishing, yet books as such were not their primary care. The Roxburghe Club (q.v.), founded in 1812, was the earliest English book club, properly so called, its system imposed on each member the re-printing of one book, and its work was not specially important. The Bannatyne Club, originated by Scott in 1823, was more practical. The Camden Society (1838) began the modern method of publishing by the society instead of leaving it to individual members, it has produced a long series of most useful historical publications. Among many English societies of the kind, the following are especially worthy of note. The Parker Society (1840-55), the Percy Society (1840-52), the Hakluyt Society (1846-), the Early English Text Society (1864-), the Settle of Odd Volumes (1878-), and the Bibliographical Society

(1893-). Other important European book clubs are the Société des Bibliophiles français, the Société des amis des livres, and the Société leonophile de Belgique.

During the Colonial Period in America, and that which immediately followed the Revolution, there were a number of literary associations whose members jointly published their writings, after the fashion of the time, in periodical form. The earliest and most famous of these was the Junto, founded by Benjamin Franklin in 1726. To its efforts the Philadelphia Library (1731), the University of Pennsylvania (1749), and the American Philosophical Society (1768) owe their small beginnings; and it published at different times 10 periodicals of a literary and historical nature, most of which lasted for only a few numbers. The Drone Club, founded in 1792 by Charles Brockden Brown and others, and the Literary Confederacy, formed in 1817 by William Cullen Bryant, Robert C. Sands, James M. Eastburn, and Gulian C. Verplanck, were of the same nature. The first book club in the full sense, however, was the Seventy-six Society, originated in Philadelphia in 1854 by Edward D. Ingraham, stating its object as "the publication and republication of books and papers relating to the American Revolution." It lasted only three years and was immediately succeeded in New York by "The Club," as it was called—it never received any specific name—and two years later by the Bradford Club, an offshoot from the former. In 1858 began the longer career of the Prince Society in Boston, which is still in existence, and has a list of 26 publications, made or in preparation. In the sixties there was a veritable mania for club publication, and absurd ventures were numerous, charging extravagant prices for their subscription books. The revival of club publication dates from about 1876, since when it has been carried forward in a dignified and rational manner. The Historical Printing Club of Brooklyn (1876-1902) was founded by Gordon L. Ford and his sons; it published, chiefly under the editorship of Paul Leicester Ford, over 70 valuable historical documents. But the best known and most important of all is the Grolier Club, founded in New York in 1884 by a number of well-known makers and collectors of books. It has been very successful, not only in its distinctive purpose, but also in drawing together men of scholarly culture in the delightful home which it built for itself in 1889. Its membership was originally limited to 50, but has now been extended to nearly 400. It has published in elaborate and beautiful form more than fifty important literary and bibliographical works, besides catalogues of the valuable exhibitions given by it at frequent intervals. Other American book clubs are the Caxton Club, Chicago; the Bibliophile Society, Boston; the Club of Odd Volumes, Boston; the Rowfant Club, Cleveland; and the Franklin Club, St. Louis. Consult: Hume and Evans, *Learned Societies and Printing Clubs of the United Kingdom* (London, 1853); Growoll, *American Book Clubs* (New York, 1897). Rowfant Club, *Auction Prices of American Book-Club Publications, Compiled by R. F. Roden* (Cleveland, 1904). See GROLIER CLUB.

BOOK COLLECTING. See BIBLIOMANIA.

BOOKKEEPING. The application of the general principles of debit and credit, and of classification of accounts, to the details of busi-

ness. The object of bookkeeping is to furnish a complete and systematic record which may enable the proprietor readily to ascertain any desired facts regarding the progress and condition of his business and his financial relations with others. Without the knowledge thus gained, business cannot safely be carried on, and success or failure is often very closely related to the character of the work done at the bookkeeper's desk. In order that it may meet all the demands which are likely to be made upon it, bookkeeping must be practiced in such a way as to be intelligible, not only to the one who performs the work, but also to others. For if a dispute arises and it becomes necessary to place the books in evidence, suspicion naturally attaches to methods that can be understood and explained only by the interested party. There are two systems of bookkeeping which satisfy the requirements named, and which are accepted and used by practically the entire commercial world. They are known, respectively, as single-entry bookkeeping and double-entry bookkeeping.

Business records of some form or other were doubtless employed in the earliest times in the history of trade and credit. Of the early forms of bookkeeping, however, practically nothing is known. From the works of Leonardo of Pisa it appears certain that the merchants of Italy, France, and Spain practiced systematic bookkeeping for some time prior to the thirteenth century. It is, however, to the Italian traders of the fourteenth and fifteenth centuries, the enterprising merchants of Genoa, Florence, and Venice, that we owe the system of bookkeeping which takes the lead at the present time. In the year 1494 Luca Pacioli, or Luca di Burgo, a Tuscan friar, published a work which contained a treatise upon double-entry bookkeeping. This is the first systematic treatment of the subject of which we have any record. From Italy the system spread to the Netherlands, thence to England, and from there to all parts of the world. And it is worthy of remark that the more complete system of double entry was perfected and brought into general use considerably before the system of single entry.

Double Entry. In double-entry bookkeeping, sometimes called the Italian method on account of its origin, every transaction requires equal entries on both sides of the ledger. The number of entries on the two sides need not correspond, but the amounts must. This representation of every transaction on both sides of the ledger arises from keeping account, not with persons alone, but also with property and allowances. It is this feature which gives the system its name and constitutes its essential characteristic. Property is conceived of as debtor or creditor, according as it has required outlay or has brought in value or discharged indebtedness.

The simplest combination of books suited to double-entry bookkeeping consists of a daybook, journal, and ledger, ruled in accordance with the forms given below. Daybook and journal may be combined to form the daybook journal. The daybook is the one in which are entered the details of each transaction at the time it occurs. This is the original entry and should be made with the greatest care. It is this which must be brought into court in case of legal dispute. In this book, therefore, as in all original entry, erasures should be avoided, and all

changes, for whatever reason made, should be so managed that their nature can readily be determined. In the *journal* are entered the names or titles of the ledger which are to be debited and credited, together with the proper dates and amounts. These are determined from the daybook record, and the process is termed *journalizing*. This is a very important part of the bookkeeper's work and makes the largest demands upon his ability to think correctly. The remainder of his work, with the exception of making out the balance sheet, is to a large extent mechanical. The *ledger* is the book of accounts. From the journal the various items are carried to the ledger, items having the same name or title being gathered together under that title, each on its proper side, debits to debit side, credits to credit side, the left-hand side in this, as in all other books, being debit, and the right credit. The ledger, on account of the classified and summarized nature of its contents, is the business man's principal book of reference. If he wishes to find out how much John Doe owes him, it is to his ledger that he goes for information. Should he wish to pay Richard Roe the balance due him, it is from the ledger he will determine the amount which he must remit. In short, when he desires full, up-to-date information regarding any matter connected with his business, it is generally the ledger which is called into requisition. Towards the perfection of the contents of this book, therefore, all the bookkeeper's work is aimed. The process of carrying the items of the journal to the ledger is termed "posting." In performing this work the careful bookkeeper will follow an invariable order, that the process may be made as nearly mechanical as possible. First, the year should appear in the column at the left on the side to which the item is to be posted, the year need not be entered again until it changes. Next come month, day, explanation, the page of the journal from which the entry is brought, and the amount of the entry. The page of the ledger to which the item has been posted is then immediately entered in the column at the left of the journal, on a line with the item transferred. The last step is taken to leave evidence that the posting has been done.

To open a set of books by double entry, the bookkeeper states in the opening entry of the daybook the kind or name of the business in which the proprietor is to engage. He then enumerates in detail the items which are to constitute his investment, such as cash, real estate, accounts due him, etc., and the debts, if any, which are to be paid out of the business. These two sets of items represent, respectively, his resources and liabilities. The difference between them will be his net investment. When this entry is journalized, each of the items which will make up the resources will be debited, and each of the titles entering into the liabilities will be correspondingly credited, and the proprietor's name or stock will be credited for the net investment, or the difference between the sums of the two. When this journal entry has been posted, the books are properly opened. When the posting for any period has been completed, the debit and credit sides of the ledger should be equal. To determine whether this is the case or not, the *trial balance* is taken—i.e., all the headings of the ledger, excluding those which are in balance or

ruled up, are entered on a suitable sheet, together with the debit and credit footings of each in their proper columns. The two columns are then footed and ought to give equal amounts. If the results are not equal, there is certainly some error which must be found. On the other hand, should the trial balance prove, it would not be certain that no mistakes had been made. For the trial balance will not discover errors of computation, omission of transactions, posting to wrong accounts, etc. The trial balance should be taken, as a rule, at least once a month. The *balance sheet*, which is to be distinguished from the trial balance, involves a classification and analysis of accounts in such a way as to exhibit in detail the resources, liabilities, losses, gains, net gain or loss, and present capital of the business. The balance sheet is of great importance to the business man, and should be made at least once a year, or whenever the business is closed out or otherwise disposed of. It involves the taking of an inventory of all the property on hand, which, in some lines of business, is quite a laborious process. A form of balance sheet is presented below.

When accounts balance, when they become crowded for space, or when they show a loss or gain at the time of making a balance sheet, they are ruled up or closed. The form of closing varies somewhat in accordance with individual taste. The foregoing example of ledger accounts furnishes also an illustration of a simple and convenient form of closing. When red ink is used in the process, it indicates that the entries distinguished by it have been made upon the wrong side of the ledger for the purpose of balancing, and before the work can be regarded as complete, they must be transferred to the opposite side of the ledger, either below the rulings of the account just closed, or below some other heading of the ledger, which is indicated in the red-ink entry.

Aside from the purpose of eliminating from an account the element of loss or gain, or of preventing crowding, an account is closed in order to condense it into a single item, thus simplifying and making intelligible at a glance all the information which the account can give. After a general closing of the ledger it is usually advisable to take off a trial balance of the ledger balances to make sure that all have been correctly transferred, as a mistake in this matter may cause great trouble at the time of the next trial balance.

In the simple combination of books for double-entry bookkeeping, which has been explained, practically all the principles of the system are exemplified. In addition to the books named, however, there are generally found in use one or more such books as the following: cashbook, sales book, invoice book, bill book, order book, check book, inventory book, etc. It is unnecessary to enter upon an explanation of the purpose of these books, it being sufficiently indicated by the name. Of the ways in which they may be combined, there is great variety, every business and every establishment introducing some peculiarities of its own. The general principles, however, are the same in all. They may be used either as principal or auxiliary books. A principal book may be defined as one from which or to which posting is done, an auxiliary book, one kept for convenience of reference, but from which no posting is done. When these books are used purely as auxiliary books, they

do not affect the work in the other books. When, however, they are used as principal books, all entries found in them are omitted from the journal. No account is kept in the ledger of the property with which such books respectively deal; or if kept, only the footings are posted at regular intervals. The latter plan is followed by some in order that a trial balance of the business accounts may be taken without reference to any other book than the ledger. When this is not done, the footings or balances from such books must be properly entered in the trial balance before it can be expected to prove. The ledger titles found on the debit side of these books must be credited in the ledger with the amounts set opposite them and those on the credit side similarly debited. These books are often ruled with special columns for items of frequent occurrence, and when this is done the footings of such columns only are posted to the title which heads the column in accordance with the principle stated below. A form of the cashbook is given below and the method of posting and ruling it is illustrated.

Single Entry. Single-entry bookkeeping, in its pure form, which, however, is rarely used, keeps no account of property. Only personal accounts appear in the ledger, which as a consequence will not be in balance except when the business is closed out. It therefore involves less labor than double entry and, on the other hand, furnishes fewer checks for detecting errors. It is, however, well adapted to some forms of business, and its results are as intelligible and significant as in the more complete system. It fails, of course, to give detailed information in regard to the sources of gain or loss, and this, for some kinds of business, is a fatal objection, for it is this information, clearly set forth by the double-entry balance sheet, which the merchant needs to keep him within the lines of safety and profit.

In single-entry bookkeeping, in its pure form, the only book needed, besides the ledger, is a daybook or journal, in which are made all entries involving debit or credit of persons. The cashbook, sales book, etc., are combined with the books first named as in double entry, but when so used the method becomes no longer pure single entry, but a mixed form. To determine the proprietor's capital at any time, when the books are kept by single entry, an inventory of resources and liabilities is taken, the difference between the totals representing the capital. The loss or gain is found by comparing the present with the former capital. So great is the importance to a concern of its books, and so great the calamity of their loss by theft or fire, that they are usually guarded with great care and kept in a fireproof safe when not in use.

Details. The principles of bookkeeping remain to-day practically as set forth by Luca Pacioli. In details, appliances, and forms, however, there have been many changes. Most of the important changes in the forms of books are of recent date and consist largely in the introduction or extension of the use of special columns. One or two ledger forms which are now in use may be mentioned in this connection. The *centre-ruled ledger*, as it is termed, has the credit amount column arranged alongside of the debit in the centre of the page. It is followed by the *folio column*, the *explanation* and *date columns*, in the order named. The advan-

tages claimed for it are that, being brought close together, comparison of the two columns is made easier, the trial balance can be more readily taken, and in ruling the account no trouble arises because of the rolling of the page. The *card system*, which has become indispensable in so many lines of work, is also being introduced. Large numbers of firms are now using either the detachable or loose-leafed ledger or have adopted the card ledger. The advantages claimed for these forms over the ordinary ledger are the saving in indexing, the removal of dead accounts, escape from the continual transfer of accounts which have become crowded, the elasticity which permits new accounts to be introduced indefinitely, ease of classification, etc.

In no part of the actual practice of bookkeeping has there been a greater advance than in that which deals with the orders sent to the home office by the traveling salesman. Instead of sending these orders, as formerly, illegibly written on any scrap of paper that came to hand, and leaving it for the home office to make the proper entries in the regular sales book, the sales-agent is now furnished with a book with perforated leaves properly ruled and correspond-

BOOKKEEPING FORMS

DAYBOOK			
JANUARY 2, 1914			
Bela M. Wilson began to-day the grain, flour, and feed business with the following investment:			
RESOURCES			
Cash per cashbook	\$5,000 00		
William Jones, note due Jan. 5	300 00		
Joseph Call, on account	400 00		
George Randolph, on account	300 00	\$6,000 00	
LIABILITIES			
Note favor Thomas Wall	200 00		
Charles Johnson, due him on account	550 00		
Nathan Barlow, due him on account	250 00	1,000 00	
Bought of Hanley Bros. on account:			
100 bushels beans . . . @ \$1.50	150 00		
200 " wheat . . . @ .70	140 00		
500 " corn . . . @ .35	175 00		
100 barrels flour . . . @ 4.00	400 00	865 00	
Sold F. E. Thomas, on account:

All rulings and balancing entries should be made with red ink

ing with a book kept in the office. In this book the agent enters his orders, giving prices, terms, etc., and making extensions and footings complete. The leaves containing the orders are then torn out along the perforated line, sent to the home office, and there by a simple contrivance bound into the book devoted to this particular agent. From this book of original entry, posting is made directly to the ledger. The agent is thus made a part of the working force of the home office, and by the saving thus accomplished the office expenses have been decreased without loss of accuracy or efficiency, and with an actual increase in business.

Expert Work. An expert bookkeeper is sometimes called upon to clear up difficulties brought about by slovenly methods of work or by dishonest practices. It need hardly be remarked that the expert reaches his conclusions not through any mysterious or extraordinary insight, but by systematically taking the original entries and determining whether they have been correctly handled or not. If fraud is present, it may be necessary to correspond with the various firms represented in order to discover to what extent fictitious and fraudulent entries have been made. This takes time, but is entirely simple and makes it impossible to escape from the conclusions to which the method leads. If proper entries were not made or have been lost, the discovery of this will be in some measure accidental, determined through correspondence and settlement with the firms with which the concern in question has had dealings. As in every other department of the bookkeeper's work, so in this, system, care, and attention to details finally secure the result sought.

Consult: Bogle, A.M., *Comprehensive Bookkeeping* (New York, 1905); Lisle, *Accounting in Theory and Practice* (Edinburgh, 1906); Hamilton, *The Principles of Modern Bookkeeping* (London, 1912); Campbell, *Campbell's Actual Accounting* (Indianapolis, 1912); Woolf, *A Short History of Accountants and Accountancy* (London, 1912). See ACCOUNTING, and authorities there referred to.

BOOK LICE. Small, pale, wingless insects of the family Psocidae. To the casual observer they closely resemble plant lice. Some of them are very destructive of books and insect collections, while other forms live in the open on lichens, maple and willow trunks, etc. One of the commonest of the book eaters is *Atropos divinatoria*. The minute pseudoscorpions (Chelifer) sometimes found in old books are called "book scorpions." See BOOKWORM.

BOOK MAKING. The legal offense of keeping a book or record of bets for the purpose of fixing the liability of the losers. The practice is common on race tracks and may also be employed in connection with other gambling transactions, as in "bucket shops," at card games, and the like. The business of a "sporting bookmaker" is not in itself illegal at common law, but it has been made a misdemeanor by statute in New York and other American States.

Consult New York Penal Law, sec. 986. See BETTING; GAMBLING; POOL SELLING.

BOOK OF COMMON ORDER, THE. The name of the Church of Scotland service, evidently suggested by the Book of Common Prayer. Its source was the service of the Genevan English church, and, tentatively adopted in 1562, it came into general use in 1564.

BOOK OF COMMON PRAYER. See PRAYER BOOK.

BOOK OF MARTYRS, THE. One of the most famous books in religious history. Written in Latin, by John Foxe, in 1559, it appeared in his own English translation, under the title of *Actes and Monuments*, in 1563, though from the first popularly called the *Book of Martyrs*. It relates the history of persecution down to about the end of Mary's reign.

BOOK OF MORMON. See MORMON, BOOK OF.
BOOK OF SAINT ALBANS, al'banz. The title of a rhymed book on certain sports wholly or partly written or translated by Dame Juliana Berners and first printed in 1486. It consisted of four parts: "Hawking," "Hunting," "Lynage of Coate Armiris," and "Blasying of Armys." Consult Blades, *Introduction to the Boke of Saint Albans* (London, 1881).

BOOK OF SNOBS. Under this title appeared in 1848 *The Snob Papers*, by Thackeray, a collection of papers contributed to *Punch* (1843).

BOOK OF SPORTS. See SPORTS, BOOK OF.
BOOK OF THE DEAD. See DEAD, BOOK OF THE.

BOOKPLATE. A typographical or pictorial label, used to denote the ownership of a book. Bookplates are considered to have had their origin in Germany; though an unsupported claim has been made that they were used in Japan in the tenth century, and certain small clay tablets are believed to have performed in Babylonia and Assyria an office similar to that of the bookplate of to-day. The earliest printed bookplate we know to-day was used about 1490. It is a hand-colored heraldic design and recorded a gift of books and manuscripts to the Carthusian monastery of Buxheim in Swabia. Until Albrecht Dürer gave his attention to the designing and engraving of bookplates, they were rude woodcuts utterly lacking artistic form. Dürer is sometimes called "the father of bookplates," because under his hand they became works of art. Several undoubted bookplates of his workmanship are known. The earliest of these bearing a date (1516) was the property of Hieronymus Ebner of Nuremberg. Dürer made a bookplate for Bilibald Pirckheimer of the same city which is believed to be earlier than 1503. Among the famous early German artists who engraved bookplates on wood or copper were Lucas Cranach, Hans Holbein, Jost Amman, and Virgil Solis. In the eighteenth century Daniel Chodowiecki engraved several very charming designs. Ever since Dürer put his impress upon them the ornamentation of bookplates has been an important feature, and while their first purpose is to indicate the ownership of the book in which they are pasted or bound, they may, by perfection of design and execution, give pleasure as works of art. Allegory, quotations from the classics, the name of the owner, and his coat of arms are the prominent and customary features.

From Germany the use of the bookplate spread to France, and finally to all continental countries. There is considerable similarity between the early bookplates of Germany and France, but the former are more numerous. The French engravers, as time went on, tended to over-ornament their designs, and the later examples suffer a great loss of dignity for which the delicacy and exquisiteness of their workmanship is no compensation. There are a few very charm-

ing bits by such artists as Collin, Durand, and Eisen.

England was apparently a little slow in adopting the bookplate, as her first ones seem to have been made towards the end of the sixteenth century, but once fairly started, the idea spread rapidly, with the result of making English bookplates outnumber those of all other countries. Up to the beginning of the eighteenth century most English bookplates are in the style known, by the universally accepted nomenclature of Warren, as early armorial. This shows the coat of arms and the name and motto of the owner, with surrounding foliations originally intended to represent the slashed mantle of the helmet. The Jacobean style, extending approximately from 1700 to 1750, is very formal and heavy, its ornamentation resembles carved wood, and the right and left sides of the design usually coincide with precision. About 1750 came in the Chippendale style, so called from the well-known designer and upholsterer of furniture. Light, graceful effects took the place of the sombre designs, fruit and flowers, even pictures of meadows and streams with shepherdesses and swains, were introduced. This was succeeded by the ribbon and wreath style, whose simple, elaste manner well expressed contemporaneous changes of manners and forms. At a date difficult to give, but towards the middle of the eighteenth century, bookmen and engravers began to show more individuality in their bookplate designs, the portrait and the pictorial plate came in, library interiors and many allusions to classical allegory and to the feats of arms or peaceful pleasures of the owners are frequently found, while landscapes and rivers, castles and ruined abbeys contribute to the variety of the pictured scenes. Such names as Hogarth, Marshall, Vernet, Bartolozzi, and Bewick are signed on English bookplates.

The bookplates first used in America were of English make, brought over by the wealthy Colonists. They possess great interest as memorials of the old families, but the plates engraved by the hands of our first American engravers, Nathaniel Hurd and Paul Revere, of Boston, Amos Doolittle, of Connecticut, and Alexander Anderson, of New York (the last of more recent date, but the first to engrave on wood), easily surpass them in value. The earliest date on an American bookplate by an American engraver is 1740, on the Thomas Dering plate engraved by Hurd. There were numerous early engravers through the New England Colonies and States, and in and around New York, Philadelphia, and Baltimore, whose work is highly prized by the collector and student. All of these followed in the main the English styles, though some crude designs, incorrect heraldry, and clumsy engraving mark certain efforts as the work of untrained hands who had no good models to work from. The bookplate of George Washington, though engraved in England, is the most highly valued American bookplate of the early period. The few plates known to be the work of Paul Revere rank next, and high prices have been paid for them.

The present revival of interest in the bookplate dates from the foundation of the Ex Libris Society in 1890. Though the headquarters are in London, the membership is thoroughly cosmopolitan. An illustrated monthly journal is issued to members. France, Germany, and the United States also have societies which issue

publications at stated intervals. All these club journals are of the utmost value and importance to those who wish to keep in touch with the progress of bookplate affairs. The American Book-Plate Society was organized Feb. 1, 1913. Bookplates have become of sufficient importance to be listed by the sellers of old books and to have an occasional catalogue devoted to them entirely. Auction sales of bookplates are not uncommon, and their recognition as interesting items of literary property is widespread. The late Sir Augustus Wollaston Franks, of London, had a collection which is said to have numbered towards 200,000. It is now in the British Museum. The late Dr. Joseph Jackson Howard (who acquired the first collection of bookplates known to have been made) possessed more than 100,000 specimens. Several important collections exist in the United States, notably those of John P. Woodbury, Henry S. Rowe, and Fred J. Libbie, of Boston, W. E. Baillie, of Bridgeport, Conn., Henry Blackwell, and the Grolier Club, of New York, which gave, in 1894, the first public exhibition of bookplates in America. At the present day the black and white reproductions of drawings form the greater number of bookplates, but the copper-plate engraver has found in the renewed interest in these marks of book possession an increasing demand for his art. Among the more notable of recent engravers of bookplates in the United States are Edwin Davis French, Sidney L. Smith, W. F. Hopson, Fred Spenceley, and George W. Eve, of London, who have international reputations as engravers on copper.

Bookplate literature has increased rapidly in the last decade. Very numerous contributions to periodicals and many monographs of permanent interest, but dealing with subdivisions of the subject, have been published. These would swell a complete bibliography to the dimensions of a book. The following list comprises the authoritative works on bookplates: Poulet-Malassie, *Les Ex Libris français* (Paris, 1875), Warren, *A Guide to the Study of Book-Plates* (London, 1880), J. W. Spenceley, *Book-Plates* (Boston, 1905), Carlander, *Svenska Bibloteck och Ex Libris autografer* (Stockholm, 1889), Warnecke, *Die deutschen Bucherzeichen* (Berlin, 1890), Guigard, *Nouvel armorial du bibliophile* (Paris, 1890), Bouchot, *Les Ex Libris et les marques de possession du livre* (Paris, 1891), Castle, *English Book-Plates* (London, 1892), Hamilton, *French Book-Plates* (London, 1892), Hardy, *Book-Plates* (London, 1893), Allen, *American Book-Plates* (New York and London, 1905), Labouchere, *Ladies' Book-Plates* (London and New York, 1895), Hamilton, *Dated Book-Plates* (London, 1896), Fincham, *The Artists and Engravers of British and American Book-Plates* (London, 1897), Count Karl Emich zu Leiningen-Westerburg, *Deutsche und österreichische Bibliothek-Zeichen, Ex Libris* (Stuttgart, 1901), Stone, *Women Designers of Book-Plates* (New York, 1902), *Ex Libris Soc. Journal* (London, 1891-1908), American Book-Plate Society, *The Biblio* (New York, 1913), succeeded by *The Miscellany* (Kansas City, Mo., 1914).

BOOK-SELLING. The earliest history of the production and sale of books is so obscure that little can be added to what is told in the article *Book of the Chaldean tablets of baked clay*, the *Egyptian Book of the Dead*, and other similar productions. We find, however, in Athens, something approaching an organized

BOOKPLATE OF THE GROLIER CLUB

trade in books about the middle of the sixth century B.C. when Pisistratus paid scholars from the municipal treasury for preparing an authorized text of Homer and Hesiod for the use of copyists. Through the Museum of Alexandria and the publishers of Rome, whose work was largely carried on by Greek scribes from Alexandria and Athens, this text has brought down to us the poems of Homer and Hesiod. It is probable that the first regular sales of literature in Athens, and therefore the first in Greece, were carried on by students of philosophy. Diogenes Laertius says that the hearers of Plato interested themselves in the work of circulating the written reports of his lectures, sometimes selling them, but more frequently in the first place lending them out for hire. The facilities for the work of scribes in Athens were evidently, however, during the most important period of Athenian literature, inadequate to supply the demand of the scholars. Books continued to be very costly, and their ownership was limited to the wealthy. Diogenes Laertius is the authority for the statement that Plato paid for three books of Philolaus which Dionysius had secured for him in Sicily, three Attic talents, equal in currency to \$3240, when money was worth much more than it is now. Aristotle says that Gelias paid a similar sum for some few books of Speusippus. Buchl is of the opinion that the order of book trade was carried on in the orchestra of the Athenian theatre, during the time, of course, when no performance was going on.

By the time of Xenophon (about 400 B.C.) Athens was the centre not only of the literary activities of Greece, but of any book trade that existed. The first booksellers prepared with their own labor the scrolls, mainly papyrus, that constituted their stock in trade. The next step in the development of the business was the introduction of the capitalist, who, instead of working with his own hands, employed a staff of copyists and sold the products of their labor. A comedy by Aristophanes refers to a dealer in books. Eupolis speaks, in 430 B.C., of the "place where books are sold," the inference being that a special place in the market was reserved for the book trade. Nicophon, in the next century, gives a list of men who support themselves with the labor of their hands and groups the bookseller with the dealers in food and household utensils. It would appear that the Athenian booksellers derived receipts not only from the sale or from the hire of manuscripts, but from the reading of these aloud in their shops to hearers who paid for the privilege. After the conquest of Greece by the Romans there was a revival in Athens of the trade in books owing to the increased demand from the scholars of Rome, where Greek was accepted as the language of refined literature and its authors were diligently studied.

About 250 B.C. the literary activity encouraged by Ptolemy Philadelphus caused Alexandria to become one of the great book marts of the world. Its first publishing and bookselling were done in connection with the great museum founded by Ptolemy. This comprised in one organization a lending and reference library, a series of art collections, a group of colleges endowed for research, a university for instruction, an academy with functions like those of the French Academy, and a series of workrooms where the scribes prepared from authenticated texts the papyrus manuscripts to be distributed throughout the

civilized world. Ptolemy Soter gave authority to traveling scholars to collect for the museum in Alexandria all the authenticated manuscripts they could find. He is said to have supplied food to the Athenians during a famine only on condition that they would sell to his representatives authenticated copies of the tragedies of Æschylus, Sophocles, and Euripides. For these, in addition to the promised shipment of corn, the sum of 15 talents was paid. Through their enterprise in training numbers of skilled scribes (including now not only educated slaves, but many of the impecunious scholars of the university), and by means of the distributing facilities afforded by the commercial connections of their capital, the Alexandrian publishers retained in their hands for more than two centuries the control of the greater part of the book production of the world. The publishers of Athens disappeared, while those who in the last century B.C. and the first century A.D. were carrying on book businesses in Rome were obliged to have done in Alexandria the work of transcribing such of their issues as were in the Greek language, these forming, until the time of Trajan, a very large portion of their total production. The earlier Roman publisher found it usually to his advantage to send to Alexandria his original texts and to contract with some Alexandrian correspondent who controlled a book-manufacturing establishment for the production of the editions required.

It is in Rome that we find the first records of publishers whose names have been preserved. During the second century B.C. a number of important and costly literary enterprises were undertaken; and the continued production of books addressed to a general public implies the existence of machinery for their distribution. Here, as in Athens, those who first interested themselves in publishing undertakings were men who combined with literary tastes the control of sufficient means to pay for the production of the editions. Their aim was not the securing of profits, but the service of literature and of the state, and these earlier publishing enterprises must frequently have resulted in a deficit. As the size of the editions could easily be limited to the probable demand, and as further copies could always be secured when called for, one would imagine that the expense need not have been considerable. The high prices, however, which under the competition of a literary fashion it became necessary to pay for the educated slaves trained as scribes, constituted a serious item of outlay. Horace speaks of slaves competent to write Greek as costing 8000 sesterces, about \$400. Calvisius, a rich *dilettante*, paid for each of his *servi literati* as much as 10,000 sesterces. In one of the laws of Justinian, in which the relative price of slaves is fixed for the division of estates, *notarii* or scribes are rated 50 per cent higher than artisans.

The man whose name is most intimately connected with the work of publishing in the time of Cicero was his friend Titus Pomponius Atticus, who organized, about 65 B.C., a great book-manufacturing establishment in Rome with connections in Athens and Alexandria. The editions issued by him came to be known as the *Atticiarum*, *Attikiana*, and secured wide repute for their accuracy. Atticus did not confine his book business to his publishing house, but established retail dealers, *tabernarii*, in different

quarters of Rome and also in one or two of the provincial capitals. The publishers of Horace were the brothers Sosii. Their shop was in the *Vicus Tusculus*, near the entrance to the Temple of Janus. It was in a bookshop that Clodius had himself (68 B.C.) from his pursuers. Later we find the stalls of the bibliopoles placed in the most frequented quarters of the city, by the Janus gate of the Forum, by the Temple of Peace, on the Argiletum, in the *Vicus Sandaliarius*, and on the *Sigillaria*. Martial speaks of the street Argiletum as being chiefly occupied by the booksellers, with whom were associated the fashionable tailors. Both Horace and Martial describe the bookshops as places of resort where the more active-minded citizens were in the habit of meeting to look over the literary novelties and to discuss the latest gossip, literary and social.

By the close of the first century the book trade in Rome and in other larger cities of the Empire had developed into large proportions. The packets from Alexandria brought into Rome great cargoes of papyrus from Egypt, which speedily found their way into the workrooms of the publishers. Here a hundred skilled slaves followed with swift pens the rapid dictation of the readers, who from time to time relieved each other. Others occupied themselves with the work of comparison and revision, while a third group covered the completed manuscripts with proper bindings. In the bookshop, *taberna*, collections of the accepted classics and of the latest literary novelties are attractively presented. Here a cheap edition of the *Æneid* for school use is sold for a few pennies, there, great sums are expended for a veritable "original" text of some work by Demosthenes, Thucydides, Cato, or Lucius, while a third buyer is placing a wholesale order for a "proper assortment" of literature to serve as an adornment for a new villa. From the Roman shops large shipments of books were made to other cities, even as far as Gaul. The average editions of works addressed to the general public are estimated by Birt to have comprised from 300 to 1000 copies.

By the time of the accession of Constantine (306 A.D.) the Roman book trade had very much decreased, and with the removal (in 328) of the capital to Byzantium the activities of Rome in connection with general literature came very much to an end. Under the rule of Theodoric the Goth there was, mainly owing to the influence of his minister Cassiodorus, some continued interest in literature, which manifested itself in the preservation and extension of libraries and in the maintenance of the schools. There was, however, during the time of the Gothic rule in Italy, no such demand for books as to render practicable the continued existence of booksellers.

The next bookselling undertakings were carried on from the *scriptoria* of the monasteries. For some centuries, however, the books written in these *scriptoria* were produced for the use only of the monks or of the pupils under their charge. Later there came into vogue a practice of exchanging manuscripts between monasteries, a practice which developed in a measure into a trade in books. There would be in one *scriptorium* a manuscript of special antiquity and authority, from this the scribes would prepare copies which would carry with them a varying value, depending first upon the record (the pedigree, so to speak) of the original manuscript,

and secondly upon the repute that had been secured by that particular *scriptorium* for accurate and scholarly work. See BENEDICTINES.

For centuries the knowledge of reading and writing was so far confined to the clerics that there was no demand for such manuscripts outside of the monasteries. Later, under the influence of such monarchs as Alfred in England, and through the developed interest of certain other princes who had owed their early education to monastery schools, the fashion arose of collecting, in the libraries of kings and nobles, manuscripts containing specimens of the world's literature. Such a taste could advantageously be cultivated by the abbots and their scribes. A nobleman desiring, as a matter of scholarly interest or honorable ambition, to possess a certain manuscript, was willing to pay a high price for it. Not a few of the landed estates connected with the literary monasteries, and more particularly with those of England and Burgundy, were largely secured in exchange for noteworthy manuscripts.

The next important work in the production, exchange, and sale of books was carried on in the universities. The term *stationarius*, which stands for the official bookmakers of the university, first appears in Bologna in 1259 and in Paris some years later, but the work of preparing books for the use of instructors and students had already been carried on for a number of years. In Paris, as in Bologna, the *stationarii* were university officials, and, in the majority of cases, graduates. The conditions of their trade, closely controlled by the regulations of the university, were peculiar. During the thirteenth and part of the fourteenth century the books supplied to the students were not sold, but rented, and the amount of the hire was fixed by university regulation. The *bidells* of the university published from term to term a list of the authoritative university texts which the booksellers were ordered to prepare, to keep in stock, and to hire out. The statutes of the University of Padua of the year 1283 provided that two *stationarii* should be employed. The rental for a term of a fortnight of a *pecia* (a division of from 16 to 32 pages) of the prescribed text was four *denarii*, of the *glossarii* (the commentaries on the text) five *denarii*, and of texts not on the official list six *denarii*. In the year 1289 the list of texts which must be kept in stock in Bologna comprised 117 works. In Padua, as in Bologna, the *stationarii*, in entering upon their business, had to make a deposit of 400 *libra* and go through an examination. Towards the close of the thirteenth century the statutes of Bologna permitted the sale of manuscripts for a commission of 2½ per cent.

The authorities of the University of Paris exercised from the beginning a very complete control over all the details of making, renting, and selling books. Two centuries and a half before the introduction of the printing press the book trade of the university had become in great measure the book trade of the city. The scribes and then masters who were manufacturing manuscripts in the Latin Quarter were not only supplying text-books to the students of the university, but preparing literature for the scholarly readers of France and of Europe. The book dealers of Paris constituted for centuries a guild organized within the university. Its members, the *libraires jurés*, were members of the uni-

versity, and its operations were under the direct control of the academic authorities. It was essential not only to secure for the members of the university, at a fixed and moderate charge, a sufficient supply of correct and complete texts of the prescribed works, but also to protect these students from the contamination of heretical writings or of heretical comments on books of accepted orthodoxy. (See CENSORSHIP.) In the universities of Oxford and Cambridge the *stationarii* began their work some years later than in Paris or Bologna. They had, however, the advantage of freedom from the greater portion of the restrictions which hampered the work of the French and Italian scribes, and their business developed so actively that they soon became the booksellers of the university towns and in large part of the scholarly public of the whole country. It was, of course, from the university term that the name "stationers" came at the outset to be applied to the organized book dealers of Great Britain. The first guild of the British book dealers (the forerunner of the Stationers' Company of 1556) completed its organization in 1403, nearly 60 years before the introduction into England of the printing press.

Outside of the universities an important trade in manuscripts came into being with the close of the fourteenth and beginning of the fifteenth century. The headquarters, not only for Italy, but for Europe, of the trade in Greek manuscripts was for a number of years in Venice, whose close relations with the East gave it an early advantage in connection with this particular class of Eastern products. Among the great manuscript dealers of Italy of the fourteenth century were Auretinus and Vespasiano of Florence, Aurispa of Venice, and Galiotti of Milan. The trade in manuscript books in the Low Countries was distinguished by the beauty of the art work which was associated with the text of the scribes. The manuscripts from Bruges secured, chiefly on this ground, a larger price in the market than is noted for the productions of any other book centre of Europe. The dukes of Burgundy, during the first half of the fifteenth century, were noted for their literary interests and did much to further the book trade of Ghent, Antwerp, and Bruges. The first publishers' guild of the Low Countries was organized in 1424 at Ghent.

The invention of printing (c.1450) revolutionized the methods of bookselling, but the revolution extended over a period of nearly half a century. For years after the first printers began their work in Germany, in France, and in Italy, the production of manuscripts went on, and even as late as the beginning of the fifteenth century certain of the noble book collectors in Italy took the ground that the printed book was for the use of the vulgar reader only, and that the libraries of gentlemen must be devoted exclusively to the manuscript form of literature. Gutenberg's first partner, Fust, and his associate, Schöffer, were the first printers who acted also as publishers and booksellers. Notwithstanding the many difficulties with which they had to contend, they were able to offer their books at prices which to the old dealers in manuscripts seemed so astounding as to give some pretext for the charge of magic. Madden says that a copy of the "forty-eight line Bible," printed on parchment, could be bought in Paris in 1470 for 2000 francs, while the cost of the same text a few years earlier in the manuscript

form would have been five times as great. One of the earlier of the important publishing centres of Europe was Basel. Its most famous name for our purpose is that of Froben, in later years the publisher and friend of Erasmus. The publisher whose work was, between 1475 and 1512, the most important in Germany was Koburger of Nuremberg, who by the year 1500 was utilizing no less than 24 presses and sending out annually more books than any other publisher of his time. He had branches or agencies in Frankfort, Paris, and Lyons, and business correspondence in the Netherlands, Italy, Austria, Hungary, and Poland, as well as throughout Germany. In respect to the bulk of the business done by him and of the commercial success secured, he was a greater publisher than either Aldus or Froben, his two most famous contemporaries. The greatest publisher of this period, however, taking into account not simply the commercial returns of his business, but his influence upon the literature and, one may say, upon the civilization of his time, was Aldus Manutius of Venice. It was to the high scholarly ideals and courageous and unselfish labors of Aldus and his immediate successors, no less than to the imagination, ingenuity, and persistency of Gutenberg and Fust, that the Europe of 1495 was indebted for the great gift of the poetry and of the philosophy of Greece. Mainz and Venice joined hands to place at the service of the scholarly world the literary heritage of Athens. The work of Aldus as a printer publisher (his earlier years had been devoted to teaching) began in the noteworthy year 1492. His first publication was the Greek and Latin grammar of Lascaris. This was followed shortly by the works of Aristotle, a Greek grammar, and a Greek-Latin dictionary. From 1480 to 1500, when the Republic came to be harassed by the war inaugurated by the League of Cambrai, Venice was the most active literature-producing centre in Europe. In the organization of his printing and publishing business Aldus had special obstacles to overcome. A large proportion of his undertakings were issued in Greek; and while he could secure the service of Greek editors, his composers were of necessity Italians. He was obliged, after supervising the founding of the type, to watch typesetting and proof reading. To the text his contributions as an editor were often important. When the book was printed, the copies had to be disposed of by personal correspondence with scholars throughout Europe, to whom the knowledge that Greek classics were obtainable in printed form came but slowly, and with whom grew still more slowly the interest in such classics and the knowledge needed for their study. The delivery of books from Venice to different points of the Continent, particularly during the years of war (and these years were the most numerous), and the securing of the remittances in payment, were by no means easy matters. It is not surprising that Aldus died poor, or that he writes plaintively in 1510 that "for seven years books had had to contend against arms." His most famous editorial associate was Erasmus, for whom also he published the first editions of the famous *Colloquies* and *Praise of Folly*. A serious difficulty with which the books of Aldus had to contend was the competition of the piratical copies of his editions which promptly appeared in Cologne, in Tübingen, in Lyons, and even so close at home as Florence.

In 1589 the guild of the printers, publishers, and booksellers of Milan was organized. The Stationers' Company in England had secured its charter from Queen Mary in 1536, 33 years earlier. Like most of these trade guilds, its object was to restrict the trade to a certain privileged class, the professed aim being "the removal of great and detestable heresies," and the charter ordering "that no man should exercise the mystery of printing, except he was of the stationers' company, or had a license." The guild of the Venetian printers dated from 1548, and was the earliest association of the kind in Europe. The guild of Milan was, however, in certain ways the most important of these earlier organizations. It gave an important incentive to printing and to publishing, it secured a high standard for the quality of the work done, and its regulations tended to keep the business in the hands of a good class of men. The guild of printers and publishers in Paris was a direct development of the earlier guild of manuscript dealers, and, as has been stated, constituted a division of the university. The regulations which had controlled the work of the manuscript dealers, and the supervision and censorship of this work, were continued in France for the productions of the Paris printing presses. The first publishing office in Paris was founded in 1469, at the request of two of the instructors of the Sorbonne, by Gering, Krantz, and Friberger, from Constance, at that time an imperial city of Germany. The work of these bookmakers was carried on in one of the halls of the Sorbonne. Printed books had, however, been sold in Paris seven years earlier. It was in 1462 that Faust brought from Mainz a supply of his folio Bible, copies of which he was able to sell for 50 crowns, while the usual price for manuscript work of this compass had been from 100 to 600 crowns. By the close of the century here were in Paris over 50 printing concerns. After Paris, Lyons was the city of France in which the production of printed books secured the earliest introduction and the most rapid development. The printer publishers of Lyons showed themselves enterprising in more ways than one. They were free from the immediate supervision and control of the authorities of the university of Paris, and, as the history of the Paris press shows, the difficulties placed in the way of publishing undertakings by the bigoted and ignorant censorship of the theologians must have more than offset the advantages usually to be secured in the production of scholarly publications through the facilities of the university and the editorial service rendered by its members. Paris was, however, fortunate in having among its earlier publishers a number of men whose interest in literature was that of scholars as well as of merchants. Gourmont (who established, in 1507, the first Greek press in Paris) and Badius Ascensius had produced before 1530 a long series of important classical works. The printer publishers whose undertakings were, however, of the largest importance for the world of scholarship were the Étienne and the Stephani. They contributed no less than four generations to the publishing business. The work of the Stephani was carried on under exceptional difficulties—commercial, literary, theological, and political. Their books were, with a few exceptions, edited and supervised by the publishers themselves. No publisher except Aldus has ever contributed to the issues of his press as much

original scholarly work as is to be found in the books bearing the imprint of Robert Stephanus Willem Jansoon Blaeu (1571-1638), his sons and grandsons, also deserve honorable mention among the Netherland publishers.

The name of William Caxton holds an honorable place in the early publishing undertakings, not only of England, but of Europe. The list of the books issued from his press was not very great, and the books themselves were much less important for scholarship or for permanent literature than the first publications of certain of the printer publishers of the Continent. The fact, however, that through Caxton printing was introduced into England, and that he was the means of first utilizing for English readers the publishing, training, and scholarly interests which had been developed for him in the Low Countries, gave his work a distinctive importance. Caxton's first printing press was set up in Bruges, and his first seven publications were there issued. The earliest volume printed in Europe in the French language was Caxton's edition of the Burgundian romance *Le Recueil des histoires de Troye*. It was in 1476 that Caxton migrated to Westminster. His list of publications there was largely devoted to romances more or less similar in character to the book first issued from his press in Bruges. The demand at that time in England as indicated by the lists of Caxton and of his immediate successors, for the classical and theological works which constitute so important a portion of the earlier publications of Venice, Paris, Mainz, and Cologne must have been much less considerable than abroad. The period of the beginning of Caxton's publishing business in London was one of political excitement and of civil war, and the times were not favorable for the selling of literature.

A publishing business which, while of no great moment from the commercial point of view, exercised an enormous influence on public opinion in Europe was that instituted in Wittenberg in 1517, at the instance of Luther and Melancthon. Luther's first publisher was Johann Weissenberger, from Nuremberg, who printed a tract by him at Lanschott, in Bavaria, in 1517, and later in the same year the treatise on the Seven Penitential Psalms. Issues of the Lutheran press in Wittenberg followed each other with rapidity. The pamphlets that went out from this press, reprinted in other places by printers who were in sympathy with Luther's work, secured an enormous circulation. It is difficult at this time to understand how, with all the obstacles which existed at that time in making announcement of publications issued, it proved to be possible to bring these pamphlets into the hands of so many thousands of interested readers. The question was also not merely one of making known their existence, but of overcoming the impediments placed by the Church authorities in the way of their distribution. Thousands of copies were sold in the market places, not only by booksellers, but by dealers of all kinds, many of whom had never before handled books. Large supplies were distributed by traveling peddlers among readers out of reach of the bookshops and the market places. These popular tracts met the needs of all classes, educated and uneducated, and secured a wider circulation than had heretofore been achieved by any religious works—or, for that matter, by any writings whatever. Luther

made no profit from these sales. Every gulden that was paid for the books, every pfennig that came in for the fly leaves or pamphlets, was at once expended in further printings and in instituting further distributing machinery.

One of the most noteworthy of the printing houses of the sixteenth century was that established in 1555 by Christopher Plantin in Antwerp. His publications were distinguished not only for the perfection of their typography, but for the beauty of the illustrations, chiefly produced by engraving on copper plates. The books produced in the Low Countries, even during the manuscript period, had always been distinguished by their artistic effectiveness. The illuminations in the manuscripts prepared in Bruges and in Liège were the finest that the world had as yet seen. The same interest in the ornamentation of literature persisted in the Low Countries after the printing press had replaced the work of the *scriptorium*. For a quarter of a century after 1555, Plantin's publishing house was the most considerable in Europe. In 1557 his consignment to the Frankfort Fair comprised no less than 1200 volumes, together with a large assortment of prints from copper plates. The publishing business founded by him continued in the hands of his descendants until 1867 and had thus a continuous existence of nearly three centuries. In 1867 the "plant" was purchased by the city of Antwerp, and the Plantin Museum was instituted.

The Elzevirs of Leyden and Amsterdam, whose work continued during the century between 1587 and 1688, were the most noteworthy publishers of Holland, and the repute of the books issued from the Elzevir Press has continued to the present day. While the fame of Plantin had rested chiefly on his illustrated volumes, the reputation of the Elzevirs was connected more particularly with the classical publications produced by their press. They had the advantage of a community of scholars whose services could be secured at moderate cost for the editing of the long series of classical texts which bear the Elzevir imprint. Their catalogues presented also the names of a number of contemporary writers whose works have achieved an abiding fame, among them Descartes, Galileo, Grotius, Salmasius, Heinsius, Hobbes, Spinoza, and Molière.

The book trade of Germany was first organized by the institution, in 1480, of a division of the Frankfort Fair for the sale of printed books. For many years before this date this fair had been the centre of an active trade in many classes of goods, including not only manuscripts produced in Germany, but also those from the Low Countries, France, and Italy. After 1480 the printer publishers secured an apportionment of space in the buildings assigned for the fair, which was utilized for semiannual gatherings. It was not only the German booksellers who made use of this machinery. The Étienne and the other leading publishers of France, Plantin and his associates of Antwerp, the Elzevirs of Holland, and the leading dealers from Italy, all found it to their advantage to be represented there at least once, and frequently twice, a year. From the beginning of the sixteenth century Leipzig came into importance as a book-producing and bookselling centre, and the rulers of Saxony took an early interest, through the encouragement of the book trade, and through liberal regulations concerning censorship of the

press and a recognition of property rights in the books produced, to further the undertakings of the printer publishers of Saxony.

In the beginning of the bookmaking industry it was understood without further specification that the printer was also the publisher of the works coming from his press. Soon, however, we find associated with his undertakings the names of partners, who had nothing directly to do with the book manufacturing, but who contributed their aid, either for the sake of literary development or for some other motives apart from that of business profit; and in the list of such associates occurred the names of nobles, ecclesiastics, and wealthy scholars. The period of 1650-1764 witnessed the growth of the system of book exchange under which publishers, in disposing of their productions, were obliged to accept in payment the stock of other publishers, so that the market value of books came to be measured in other books. This method, if it did not add very promptly to the receipts of the dealers, had at least the advantage of facilitating the distribution of books and of furthering the organization of the book trade. The first general catalogue of the books offered at the Frankfort Fair was printed in 1564, of the Leipzig Fair, in 1595. Catalogues of individual dealers, however, were published soon after the invention of printing, and more than a score from the fifteenth century are still extant, the oldest of which is that of Johann Mentelin (Strassburg, 1469). The operations and results of the Thirty Years' War (1618-48) had much to do with the transfer of the centre of the book trade from Frankfort to Leipzig, but a large factor in the matter was the increasing intellectual activity of the Protestant states of north Germany, as compared with the southern, which remained under the restrictions imposed by the Catholic authorities. The German publishers and booksellers have all along had the advantage of a more effective organization than that of any other country, under which there has been, with the smallest possible tax on readers, a larger return than elsewhere for the work of writers, and more stable and less speculative conditions for both sellers and purchasers of books. The Leipzig "fairs" are still held annually; after they ceased to be actual occasions for exposing the books for sale, they were long the scene of the settlement of the year's business and are still important reunions of all the publishing interests. Every bookseller in Germany, Austria, and Switzerland has a representative in Leipzig, as the centre of the trade for those countries, and an official organ has been published there since 1834; daily since 1867. Other smaller gatherings similar to the Leipzig Fair occur in Stuttgart, for south Germany, and in Vienna, for Austria-Hungary. While the modern trade is nowhere so elaborately organized as in Germany, all the principal European countries have their associations. In England there are the Associated Booksellers of Great Britain (1874), the London Foreign Booksellers' Association (1895), and the Publishers' Association (1896). Stationers' Hall, in London, is the headquarters of the business, and the *Publishers' Circular* and the *Bookseller* are its recognized organs. The *English Catalogue* has, since 1835, furnished an annual list of all books published in the United Kingdom. The principal French association is the *Cercle de la Librairie*, whose organ is the *Bibliographie de*

la France (1818) Italy has its Associazione Tipografico-libreria Italiana, publishing the *Bibliografia Italiana*

The English book trade was finally released from the earlier restrictions in 1738 and began to develop rapidly. A number of eighteenth-century booksellers have left behind them a reputation for literary as well as business ability. Michael Johnson (1658-1731), father of the great lexicographer, used to travel from town to town with a stock of books which he sold at auction. Andrew Millar (1707-68) was the publisher of Thomson and Fielding and had a large share in Johnson's Dictionary. Dibdin calls Thomas Osborne (fl 1738-67) "the most celebrated bookseller of his day." Some idea of the profits of the business in this period may be gained from the statement which in his old age he used to make with pride, that he had been in business more than 40 years and was worth more than £40,000. That these profits were not always easily made, is recalled by the story of Osborne's being knocked down by Dr Johnson with a folio *Biblia Graeca Septuaginta* (Frankfort, 1594). His name appears on a number of title pages as a shareholder with several other publishers, according to the sociable custom of those days, which gradually died out as the spirit of competition gained ground. A late analogy to this method may be found in the history of the "Friends of Literature," an association of booksellers which existed from 1805 to 1811 and during that time published a number of large editions, which were for the most part divided among the members, though sometimes other booksellers were allowed to hold shares in these undertakings. Bernard Lintot (1674-1735), the publisher of Pope's Homer, and Robert Doddsley (q.v., 1703-64), with his brother James (1724-97), are also conspicuous figures in this era. The novelist Richardson, as a printer, and in 1754 master of the Stationers' Company, has a place here. Charles Rivington (1688-1742) founded the famous house to which he left his name and gave it the somewhat theological character which it long retained. (See also RIVINGTON, JAMES, and consult Rivington, *The Publishing House of Rivington*, London, 1894.) Thomas Longman (see LONGMANS) founded another business, which, like that of the Elsevirs and Stephani, was continued from generation to generation, and a third dynasty was begun by John Murray (q.v., 1778-1843). The great university presses, the Clarendon (q.v.) at Oxford, and the Pitt at Cambridge, have published a vast number of books, largely classical texts, in a uniformly scholarly manner.

There is some controversy as to the placing of the honor of producing the first book published on the American continent. It is asserted that a printer subsidized by Mendoza printed the *Spiritual Ladder* of St John Chrysostom in Mexico in 1532, but a counterclaim is put in for another Mexican publication of seven years later, a *Compendium of Christian Doctrine* in Spanish. A hundred years after the publication of this latter work, we come to the beginning of printing in the English Colonies in America. In 1639 Stephen Daye printed the *Freeman's Oath* and an *Almanack* at Cambridge, Mass., and in the following year appeared the famous Bay Psalm-Book (q.v.), which is now worth more than its weight in gold. This Cambridge Press turned out one book a year for the next 21 years.

Apart from these origins, the history of publishing and bookselling in America may be divided into four periods: (a) the Colonial period; (b) from the Revolution to 1820; (c) from 1820 to 1860; (d) from 1860 to the present time. The selling of books, mostly imported, was usually combined with that of other wares, thus Benedict Arnold sold books and drugs. The early publishers were all primarily printers, and book publishing was merely an incident in their business. Most of them published newspapers, a thorough account of their work is given in North, *History and Present Condition of the Newspaper and Periodical Press of the United States*, a part of the report of the tenth census (Washington, 1884). The second period was the real beginning of the American publishing business in any modern sense. The first book-trade organization was effected through the efforts of Mathew Carey. The principal object was to introduce annual gatherings similar to the Leipzig book fairs. Several such meetings were held, the last one in Elizabethport, N. J., this place being selected for the meeting on account of its central position in the inadequate traveling facilities of the time. These book fairs were succeeded by the "trade sale," held twice a year, first in Philadelphia and later in New York, the heads of publishing houses themselves stood on the platform and sold their books only to members of the trade. The system decayed when people who were not legitimate booksellers gained admission and indulged in reckless underselling and speculation. A final attempt to go back to the "book-fair" arrangement was made in 1877, but it was too late, and the system quietly died out in the eighties. Throughout the second period, whose production Sydney Smith characterized in his famous question, "Who reads an American book?" the greater part of the business done in the United States consisted in the importation of English books, and in the third, probably more than half the titles comprised in the American catalogues were the works of English authors, reprinted usually (in spite of honorable exceptions) without compensation. This period, however, was really the golden age of American publishing and witnessed the foundation of a number of the famous houses. The following dates may be given for the foundation of some of the more famous Methodist Book Concern, 1780, Harper & Brothers, 1817, D Appleton & Co, 1825, John Wiley & Sons, 1828, J B Lippincott & Co, 1835, G P Putnam's Sons, 1838, Little, Brown & Co, 1837, Dodd, Mead & Co, 1839, Charles Scribner's Sons, 1846, Houghton, Mifflin Co, 1849. Stereotyping was introduced into the United States in 1813, and lithography in 1819. These mechanical improvements, together with the gradual development of transportation facilities, gave a great impetus to the American book trade, which, since 1860, has reached enormous proportions. Editions running to several hundred thousand are common at the present time and may be accounted for not only by the immense increase in the numbers of the reading public, but also by the improvements in advertising methods. See ADVERTISING.

Among the later developments the most notable is the formation, in 1901, of the American Publishers' Association and the American Booksellers' Association. Local book organizations have been formed in a number of leading

cities—New York, Philadelphia, Boston, and San Francisco. The most notable of these is the Booksellers' League of New York, which maintains an employment bureau and school for book-store clerks. This latter is the first systematic attempt in America to bring together booksellers' assistants, to give them the benefit of expert knowledge with a view to increasing their usefulness to employers and their worth to themselves.

A large increase in the volume of the English book trade followed upon the foundation of Mudie's Circulating Library, in 1842, its orders frequently amounting to several thousand copies of a single work, and the total number of volumes in it being counted by millions, although the surplus copies of popular books are usually disposed of to smaller libraries when the first demand is over. In this connection it is natural to speak of the practice (common in England throughout the latter half of the nineteenth century and generally abandoned at its close) of publishing nearly all novels originally in three volumes, which largely increased the number of volumes published. The railway bookstall business, conducted for so many years all over England by W. H. Smith & Sons, was another characteristic feature of book distribution in England during the nineteenth century. Statistics show a generally steady increase in the number of works annually published. In 1912 this reached the large total in the United States of 10,135 new books and 768 new editions. Of this total of 10,903, 7975 were books by American authors. In the same year, 1912, in England, the number of books was 9197 and of new editions 2890, a total of 12,067.

Of the immense number of books which have been published since the invention of printing, the vast majority are sooner or later destroyed, many finding their way back again to the paper mill. The buying and selling of out-of-print, old and rare books is a separate branch requiring, to be an expert, a long experience and a wide bibliographical knowledge. Though all old books are rare, not all old books are valuable; in fact, the contrary is the case; most old books are of slight value. Libraries and large collections of old and rare books have been generally offered for sale at auction, and the prices paid at these sales are one of the best guides to the value of out-of-print books. The first book auction, so far as known, was held July 6, 1599, at Leyden. The first book auctioneer in England was William Cooper, who, on Oct. 31, 1676, at nine o'clock in the morning, began the sale of the library of Dr. Lazarus Seaman, vice chancellor of the University of Cambridge.

A *Catalogue of Books to be Sold at Auction*, probably by Benjamin Franklin, was advertised in the *Pennsylvania Gazette* for March 5, 1745, and this is perhaps the earliest record of such sales in America. There are annual records published of the sales of rare and valuable books at auction in England (since 1888) and in the United States (since 1894). In 1905 a compilation containing about 100,000 records selected from various sales, arranged in a single alphabet, was published under the title of *Auction Prices of Books*. Rare books are sought after by the great public libraries, but the rapid increase in price of certain classes of books in recent years has been brought about principally by competition among private collectors. The largest collection of books on the subject of

bookselling may be found in the library of the Bursenverein der Deutschen Buchhändler at Leipzig. The catalogue of this collection, in 2 vols. (vol. i, 1885; vol. ii, 1902), contains several thousand titles in all languages and is an ultimate authority. A very valuable working bibliography on the subject of bookselling has been compiled by William Henry Peet and forms Appendix II, pp. 431-470 of *Mumby's Romance of Bookselling*.

S. Livingston, *Auction Prices of Books* (4 vols., New York, 1905); Putnam, *Authors and their Public in Ancient Times* (New York, 1908); Putnam, *Books and their Makers during the Middle Ages* (New York, 1898); Mumby, *Romance of Bookselling: A History from the Earliest Times to the Twentieth Century* (London, 1910); Growoll, *Profession of Bookselling* (New York, 1913).

BOOK-WORM. A name given to the larva or grub of several beetles closely related to the death watch (q.v.). These grubs may feed on the paste, paper, and binding of books. M. Feignot, the French bibliophile, relates that he once found 27 volumes pierced completely through by a single bookworm. Consult *Blades's Enemies of Books*, chap. vi. Books are liable also to be injured by other insects that do not have a grub stage, e.g., the imported cockroach (*Blatta*) called the croton bug, a pest introduced from Europe to the United States; and the book lice (*Psocidae*).

BOO'LAK. See BULAK.

BOOLE, 1801, GEORGE (1815-64). An English mathematician and writer on logic, born in Lincoln. At the age of 16 he became assistant master in a Doncaster private school and subsequently established a school of his own in Lincoln. In 1849 he was made professor of mathematics at Queen's College, Cork, where he died. He is best known, perhaps, for his contributions to logic. His first publication on this subject appeared in 1847, under the title, *Mathematical Analysis of Logic*, and was followed in 1854 by a more extensive work bearing the title *An Investigation of the Laws of Thought on which are Founded the Mathematical Theories of Logic and Probabilities*. The latter work forms a complete exposition of his original method of applying mathematics to

logic According to this method classes of objects and ideas are denoted by mathematical symbols, to which are applied the ordinary rules of algebra, so that the results of logical reasoning may be arrived at by an almost purely mechanical process Much more valuable, however, are Boole's contributions to mathematics The modern theory of invariants may be said to date from a memoir published by him in the *Cambridge Mathematical Journal* in 1841, and he was among the first to contribute to the general theory of covariants His two larger mathematical works, the *Treatise on Differential Equations* (1859) and the *Treatise on the Calculus of Finite Differences* (1860), are standards on their respective subjects His special contributions were published in several scientific periodicals A list of these papers may be found in the Royal Society's *Catalogue of Scientific Memoirs*

BOOM, bōm A town in the province of Antwerp, Belgium, about 10 miles south of the city of Antwerp (Map Belgium, C 3) Its situation at the junction of the Brussels Canal with the river Rupel makes it a place of considerable commercial importance It has numerous and extensive brick and tile works, breweries, tanneries, shipbuilding yards, rope works, sail-cloth manufactures, salt works, etc A suspension bridge, 800 feet long, is a feature Pop., 1890, 14,100, 1900, 15,863, 1910, 17,481

BOOM (Dutch *boom*, Ger *Baum*, tree, beam) A long pole or spar used to extend the foot of certain sails of a ship, as the *main boom*, *jib boom*, *studding-sail boom* Some of the booms are stationary, others are pivoted at one end, the other end being controlled by guys or sheets, and others, like the studding-sail booms which are only occasionally used, rig in and out by means of tackles The space in the waist of a vessel of old type used for stowing boats and spare spars is called the *booms* To *boom off* a vessel or boat is to shove it away with spars The term "boom" is applied also to a chain of floating logs fastened together at the ends and stretched across a river, etc, to stop floating timber Hence the name is adopted in military usage to denote a strong barrier, as of beams, or an iron chain or cable fastened to spars, extended across a river or the mouth of a harbor to prevent an enemy's ships from passing Such a boom should be protected by a battery or batteries, and the approaches thickly planted with submarine mines It is considered best to have booms made double, one to stop the way of ships that have penetrated the first. A chain for this purpose was stretched across the Hudson River at West Point during the American Revolution The Russians effectually closed the harbor of Sebastopol with a boom defense in 1854, thereby preventing the entrance of the English and French ships This was done partly by sinking some of their own ships and partly by the laying of booms Some of the most gallant and daring pieces of work that have been done by seamen have been in connection with blowing up or cutting away booms in order to make a free passage for the vessels of the fleet During the American Civil War, when Farragut's fleet attacked New Orleans, formidable chains stretched across the river and, buoyed up by hulks, were first encountered and destroyed The torpedo netting of steel wire or rings used to protect a ship from torpedoes which may be discharged towards it is held

suspended 20 or more feet from the ship by means of a series of linged booms

BOOMERANG (native name in New South Wales, *bumarin*, *woomurung*, among the designations for a club) A curved missile of the Australians made of the green wood of the acacia or some other hard tree treated with fire The

BOOMERANGS AND BOOMERANG-SHAPED CLUBS
(In the British and Berlin Museums)

boomerang averages $2\frac{1}{2}$ feet in length and $2\frac{1}{2}$ inches in width, is convex on one side and flat on the other, with a sharp edge along the curve convex When thrown with a certain movement of the hand (the grasping end is marked by incised lines, etc.), flat side down, convex side forward, this weapon will, after traveling some distance return in a sort of ellipse almost to the feet of the thrower, who is also able to vary its course considerably In Australia the shape, use, and power of the boomerang vary greatly—it ranges all the way from a mere toy to a large and powerful war weapon It is sometimes ornamented in simple fashion Boomerang-like objects are claimed by some to have existed in ancient Assyria, Egypt, and elsewhere far outside of the Australian area, and Schoetensack (1901) has even claimed certain bone objects belonging to prehistoric man in western Europe as boomerangs, but all this remains to be proved Of late years the boomerang has been the subject of mathematical and physical experimentation, and an excellent paper by Mr G T Walker, "On Boomerangs," is to be found in the *Philosophical Transactions of the Royal Society* (London, 1897) Consult also Sarg's *Die australischen Bumerang im städtischen Volkmuseum* (Frankfurt, 1911)

BOOMSLANGE, boom'slange (Dutch *boom*, tree + *slang*, Ger *Schlange*, snake) A beautiful South African tree snake (*Bucephalus capensis*), so variable that it has furnished several supposed species to zoology, and regarded as poisonous, though possessing no venom glands

BOONE A city and the county seat of Boone Co., Iowa, 43 miles north by west of Des Moines, on the Chicago and Northwestern, the Chicago, Milwaukee, and St Paul, and the Fort Dodge, Des Moines, and Southern railroads (Map Iowa, D 2) Noteworthy features include the high school building, the Eastern Star Home (Masonic), the public library, Swedish National Old People's Home, Biblical College, Orphans' Home, Armory, the Boone Viaduct, and the hospital The region abounds in coal

and clay, and the city has an extensive trade in coal, grain, agricultural produce, and live stock. Industrial establishments include brick and tile works, machine shops, nickel-plating works, foundries, cement tile machines, carriage and plow works, and glove, saddlery, hosiery, medicine, soap, hair tonic, broom, and wire-fence factories; and extensive shops of the Chicago and Northwestern and the Fort Dodge, Des Moines, and Southern railroads. The water works are owned by the municipality. Pop., 1910, 10,347.

BOONE, DANIEL (1735-1820). A famous backwoodsman and pioneer. He was born in Bucks Co., Pa. About 1752 his family moved to Holman's Ford, on the Yadkin, in North Carolina, where Daniel Boone became remarkably proficient as a hunter and trapper, and, for a time, attended school. He soon became restive under the restraints of civilized society and, fired by the tales of John Finley, a trapper who had visited the Kentucky River in 1752, entered the wilderness with five companions and spent two years (1769-71) roaming through the unknown forests. His companions were soon captured or killed by the Indians, and he himself, together with a brother who had joined him in January, 1770, had many narrow escapes. In 1773 he started for eastern Kentucky with five families besides his own, but was forced to turn back by an Indian attack, and in 1774 served on the frontier during Lord Dunmore's War. In 1775, as agent of a North Carolina company, he built a fort on the site of the present Boonesboro, Ky., whither, soon afterward, he brought his family. This fort was twice attacked, in 1777, by a large force of Indians, who, however, failed to capture it. Early in 1778 Boone led a party of 30 to the Lower Blue Licks on the Licking River to secure a supply of salt. Here, February 7, he was captured by a band of Indians, who, after taking him to Detroit, finally adopted him and allowed him such freedom that he managed to escape (June 16) and reached the fort at Boonesboro five days later, in time to help defend it (August 8) against an Indian attack. (See **BOONESBORO**.) He then went to North Carolina, but in 1780 returned and in 1782 took a prominent part in the "Battle of Blue Licks." He lost his Kentucky land through defective titles and moved, about 1790, to the Kanawha River, near Point Pleasant, Va. (now W. Va.), where he lived until 1795, when he again moved, this time to the Femme Osage settlement, in Spanish territory, about 45 miles west of St. Louis. From 1800 to 1804, under a commission from the Spanish authorities, he was commandant of the Femme Osage district. After the purchase of Louisiana by the United States he was again involved in litigation and ultimately lost nearly all his Missouri land. He died Sept. 26, 1820, and was buried in Missouri, but in 1845 his remains, with those of his wife, were reinterred at Frankfort, Ky. Boone has come to be regarded as the typical pioneer. He was bold and venturesome, insensible to fear, remarkably skilled in woodcraft, a fine marksman, and a successful trapper. Personally he was mild-mannered, quiet, and unassuming. An account of his life, based on his own relation, was written by Filson in 1784. This so-called *Autobiography*, which is inaccurate, increased his fame as a hunter and fighter. But his services have in all probability been greatly overestimated. He was neither the first to explore nor the first to settle the Kentucky region. The latest and

best biography of Boone is that by R. G. Thwaites (New York, 1902). Consult also Sparks's *American Biography* (New York, 1856).

BOONE, WILLIAM JONES (1811-64). An American clergyman, first missionary bishop to China of the Protestant Episcopal church. He was born at Walterborough, S. C., graduated at the College of South Carolina in 1829, was admitted to the bar, but relinquished law, and in 1837 was ordained priest of the Protestant Episcopal church. In 1844 he was consecrated missionary bishop. He was a profound scholar in the Chinese language and literature, translated the Prayer Book, and was prominent in the revision of the Chinese scriptures.

BOONESBORO, böönz'bur'ö. A village in Madison Co., Ky., on the Kentucky River, about 18 miles southeast of Lexington (Map: Kentucky, G 2). In 1775 Daniel Boone built his first fort here, and later in the year a land office was opened and the first legislature which ever assembled beyond the Alleghenies met here. In April and July, 1777, and in August, 1778, the fort was unsuccessfully attacked by the Indians. Consult Ranck, *Boonesborough, a Pioneer Town of Kentucky* (Louisville, Ky., 1901).

BOONTON, böön'ton. A town in Morris Co., N. J., 30 miles northwest of New York City, on the Rockaway River, the Morris Canal, and the Lackawanna Railroad (Map: New Jersey, D 2). It is picturesquely situated among high hills and is popular as a suburban place of residence and a summer resort. The town has important manufactures of storage batteries, hats, bronze, paper, silk, and rubber. The Jersey City water works, forming a large lake three miles long by a mile or more in width, are located here, and the town contains a public library, a lyceum, an opera house, and fine natural falls. Boonton was started by the establishment of a large factory, in 1831, by the New Jersey Iron Company. In Old Boonton, one mile distant, first settled about 1700, one of the first iron works and the first slitting mill in America were built, the latter in 1770. Pop., 1900, 3901; 1910, 4930.

BOONVILLE. A city and the county seat of Warrick Co., Ind., 17 miles east by north of Evansville, on the Southern Railway (Map: Indiana, B 4). It is the centre of an agricultural region, and contains some timber and valuable deposits of bituminous coal and fire and pottery clay. Boonville manufactures snuff and smoking tobacco extensively and has flour mills. The water works are owned by the municipality. Pop., 1890, 1881; 1900, 2849; 1910, 3934.

BOONVILLE. A city and the county seat of Cooper Co., Mo., about 41 miles northwest of Jefferson City on the Missouri River, here crossed by a fine railroad bridge, and on the Missouri Pacific and the Missouri, Kansas, and Texas railroads (Map: Missouri, D 3). It has an important river commerce, and manufactures soda water, flour, brick, pottery, carriages, pipes, harrows, etc. The city has some reputation as a summer resort. It is the seat of the State Training School for Boys and Kemper Military School, contains Harley Park, comprising 35 acres, and a fine county courthouse. The water works are owned by the city. Founded in 1818, Boonville was incorporated in 1839, and is now governed under a charter of 1896, which provides for a mayor, elected every two years, and a city council. Here, on June 17, 1861, the Union

General Lyon, with 2000 men, defeated the Confederates under Maimaduke, commanding a somewhat larger force of ill-organized volunteers. Boonville is situated on the National Ocean to Ocean Highway. It is the place where this road crosses the Missouri River and is the end of the old Boon's Luck Trail and the beginning of the Santa Fe Trail. Pop., 1890, 4141, 1900, 4377, 1910, 4352.

BOORDE, **BERD**, **ANDREW** (c1490-1549). An English traveler and physician, born near Cuckfield. He was educated at Oxford and was early received into the order of Carthusian monks at the London Charterhouse. Disliking this rigid life, he went over to France, about 1528, to study medicine. He traveled extensively, visiting the leading universities and eventually reaching the Holy Land. His works comprise mainly the *Introduction of Knowledge* (c1547), said to be the first printed handbook of Europe, and to contain the first printed specimens of the Gypsy language, the *Dyciary* (c1542), *Breuiary of Health* (1547), *Book of Beards* (lost), and *Itinerary of England* (1735). He also issued prognostications, or almanacs. He was known as a wit and merry fellow, and for this reason he had fathered upon him the famous *Scagins Jestis*. Consult ed FURNIVALL (for Early English Text Society), *The Introduction*, and *Dyciary* (London, 1870).

BOO'SA. See **BUSSANG**.

BOOSTER. See **DYNAMO-ELECTRIC MACHINERY**.

BOOT. A lengthened variety of shoe, which is among the most ancient articles of attire. Shoes, extending a certain height up the leg, laced, ornamented, and of fanciful colors, were in use by the ancient Egyptians, Greeks, and Romans. A description of these and other varieties of shoes, as well as an account of the trade and manufacture of shoes and boots generally, will be found in the article **SHOES**, and below will be given a few historical particulars respecting what properly are called boots, in the sense of leather coverings for both the legs and feet. Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans, and in the reign of Edward IV, if not earlier, the boot proper, with tops and spurs, was established as an article of knightly dress. In the reign of Charles I a species of boot, exceedingly wide at the top, made of Spanish leather, came into use, and with Charles II the highly decorated French boot was introduced as an article of court attire. Meanwhile the jack boot, as it is called, had become indispensable in the costume of cavalry soldiers and horsemen generally, and it was regularly adopted in England by William III and his followers. Strongly made, the jack boot extended in length above the knee, was wide at the top, had a very high heel, and around the ankle had a flat leather band, by which a powerful spur was attached.

The jack boot, a form of which is still used in the British Horse Guards and other European cavalry regiments, is almost entitled to be called the parent of the top-boot and other more or less similar styles. Boots with tops of yellow were so commonly worn by English gentlemen in the eighteenth century as to become a peculiarity in the national costume. When Philip, Duke of Orleans, and other revolutionists of note affected to imitate English sentiments and manners, they ostentatiously wore

top-boots. Early in the nineteenth century top-boots were habitually worn by English gentlemen, but at the present time they characterize the apparel of coachmen, grooms, jockeys, and cross-country riders. The introduction of the Hessian boot as an article of walking dress tended to break up the general use of top-boots, and, worn over tight trousers, it had an attractive and ornamental appearance. Boots of this shape, as may be seen from engravings, were worn by English general officers in the early part of the Napoleonic wars and somewhat later. At length they were superseded by the well-known Wellington boot, which, as its name signifies, was introduced by the great Duke to be worn under the loose military trousers. This species of boot has, in its turn, been almost entirely abandoned in consequence of the universal use of short ankle boots or shoes. Boots are worn by cavalry and horsemen generally, though in many instances leather leggins known as puttees are preferred. Boots are often to be seen in the rural districts of America and Europe. They may be made of rubber and cloth and in such form are used extensively by men working in water or damp places, while boots of wool or felt are found useful under certain conditions.

The word "boot" is also used to indicate a leather flap fastened to the front or dashboard of a carriage to be drawn up over the lap of the rider as a protection from the rain. See **SHOES** AND **SHOE MANUFACTURE**.

BOOT, BOOTS, or BOOT'IKIN. A Scottish instrument of judicial torture, formerly used to force confessions from persons accused of crimes, or answers from unwilling or suspected witnesses. Bishop Burnet, in the *History of his own Time*, and Sir Walter Scott, in his *Old Mortality*, speak of the boot as made of iron, but the Rev. Thomas Mozer, in his *Short Account of Scotland*, written from personal observation of the country at a time when the boot was still in use, describes it as "made of four pieces of narrow boards nailed together, of a competent length for the leg, not unlike those short cases we use to guard young trees from the rabbits." One or both legs of the person to be tortured having been placed in this case, wedges were inserted between the limb and the sides of the case, and these wedges were driven down by the executioner with a mallet or hammer, questions being at intervals put to the sufferer, until either he gave the desired information, or fainted away, or showed such endurance as satisfied the judges that no answer could be extorted from him. The wedges were commonly placed against the calf of the leg, but Bishop Burnet says he had heard that they were sometimes placed against the shin bone. When the boot was first used is unknown. After 1630 it is said to have fallen into disuse for about 30 years. It was revived after the insurrection of the Westland Covenanters in 1666, and continued to be used throughout the reigns of Charles II, James II, and during the first years of William III. In 1690 Neville Payne, an English gentleman who was supposed to have entered Scotland on a treasonable mission, was put to this torture under a warrant superscribed by King William, and still shown in the Register House in Edinburgh. This is believed to be the last time that the boot was used. Its further use was prohibited by act of Parliament. Under the name of "Spanish boots," a similar

instrument was used in Germany. Iron boots, which were heated to an unbearable degree, are shown in some museums. Consult Bingham, *Dustillo* (London, 1888), for the boot in France.

BOOTAN, by-tin'. See **BHUTAN**.

BOOTES, bo-ŭ'tēz (Gk. *βοῦτης*, *boûtes*, the herdsman). A northern constellation known to the ancients. It is situated to the east of Ursa Major. Its principal star, Arcturus (q.v.), is the brightest star north of the celestial equator. ϵ and ξ Bootes are fine double stars. The components of the former are an orange star of the third magnitude and a greenish blue star of the sixth magnitude; those of ξ Bootis are of magnitudes 4.6 and 6.6 respectively—the former being yellow, the latter purple. The ancients conceived this constellation as representing a man grasping a club in one hand and holding by the other a leash of dogs barking at the Great Bear; in consequence, Boötes was often called *Arctophylax* (the bearward).

BOOTH (Icel. *búf*, MHG. *buode*, Ger. *Bude*, AS. *bīam*, to dwell). An unpretentious or temporary structure, a dwelling or hut or shelter of boughs, canvas, boards, or other light materials. In the Levitical legislation the Israelites were commanded to dwell in booths seven days in the seventh month, to keep the Feast of Tabernacles (Lev. xxiii. 39-43). The name came to be used of the stalls or tents at fairs for the installation and sale of wares, for shows, or refreshments, and later, of the permanent stalls in market buildings. In old London the most famous line of booths was on Cheapside, in Edinburgh on High Street ("the Booth row"); in these the various trades were usually grouped together. The term is also applied technically in the United States to the closets or screened inclosures in which the voters at an election mark their ballots.

BOOTH, AGNES (1843-1910). An American actress. She was born in Sydney, Australia, and first appeared there as a ballet dancer, but came to California when she was about 14 years old (1858). Her maiden name was Marion Agnes Land Rookes. In 1861 she became Mrs. Perry, in San Francisco, where she continued till 1865, attracting attention especially for her *Hermione* in *A Winter's Tale*. She came to New York in 1865 and appeared at the Winter Garden. The same autumn, at Niblo's Garden, she played with Edwin Forrest in a series of important rôles, including those of Julie to his Ruchelieu, and Desdemona and Ophelia. In 1866 she joined the Boston Theatre Company, of which she was a member for several years. In 1867 she was married to Junius Brutus Booth, Jr., its manager. Touring in 1874-76, she became well known as a star. In the spring of 1877 she made a great success as Cleopatra. From 1881 to 1891 she was with the Madison Square Company, among her popular parts being those of Nora in *Esmeralda* and Mrs. Ralston in *Jem the Penman*. Mr. Booth died in 1883, and in 1885 she became Mrs. John B. Schoeffel. After 1891 she left the stage and went to Europe, but upon her return resumed her work for a time, appearing from 1895 to 1897 in *The Sporting Duchess* and other pieces. Consult: Strang, in McKay and Wingate, *Famous American Actors of To-day* (New York, 1896); Clapp and Edgett, "Players of the Present," *Dunlap Society Publication* (New York, 1899); Montrose J. Moses, *Famous Actor-Families in America* (New York, 1906).

BOOTH, BALLINGTON (1859-). The organizer and leader of the "Volunteers of America" (q.v.). He was born in London, the second son of William Booth, founder of the Salvation Army, and brother of (William) Bramwell Booth. In 1887 he was sent to the United States with his wife, Maud, and had charge of the work in this country till 1896, when, disagreeing with his father's plan of operations in the United States and Canada, he withdrew from the Salvation Army and organized a similar body under the name of the Volunteers of America. In order to bring the work of the new organization into closer harmony with that of the various churches, he obtained ordination as a presbyter of the Evangelical Church in Chicago. Both he and his wife are fluent writers and eloquent speakers. He published *From Ocean to Ocean* (1890). See **SALVATION ARMY**; **VOLUNTEERS OF AMERICA**.

BOOTH, BARTON (1681-1733). A celebrated English tragedian. He was of a Lancashire family, nearly related to Henry Booth, Earl of Warrington, and received a good education under the well-known Dr. Busby at Westminster, where he attracted notice by his acting in a Latin comedy (Terence's *Andria*). He was expected to enter the Church, but on being sent to Trinity College, Cambridge, he ran away in order to go upon the stage. Betterton (q.v.), to whom he applied, refused at first to help him, for fear of offending his family, and he went to Dublin, where he secured an engagement. Returning after some success to London, he was now received by Betterton and appeared in Lincoln's Inn Fields as *Maximus* in *Valentinian*. He won immediate recognition. At Drury Lane, in 1708, he received immense applause as the Ghost in *Hamlet*, a part in which he is said never to have had an equal. April 14, 1713, he acted Cato in Addison's tragedy, upon which he became quite the rage among the nobility, who vied with each other in placing their carriages at his disposal, and he frequently stayed over night at Windsor, where the court was then held. This seems to have been in some degree due to the political conditions of the time, since Whigs and Tories both professed the most complete approval of the character of Cato; yet Booth won high critical commendation. Among his greatest parts were Brutus, Othello, and Henry VIII. In 1716 he published *The Death of Dido: A Masque* and was the author of other poems. In 1728 he retired from the stage. He died at Hampstead, and was buried in Westminster Abbey. His second wife, Hester Santlow, herself an actress of reputation, survived him. Consult: Victor, *Memoirs of the Life of Barton Booth* (London, 1733); Genest, *History of the Stage* (Bath, 1832); Cilber, "Life and Character of Barton Booth," in *Lives and Characters of the Most Eminent Actors and Actresses* (London, 1753); and Galt, *Lives of the Players* (London, 1831).

BOOTH, RT. HON. CHARLES (1840-). An English statistician and writer on social questions. He was born in Liverpool, March 30, 1840, and now resides in London, though a member of the business firm of Alfred Booth & Co., Liverpool. His work entitled *Life and Labour of the People of London*, published in 10 vols. (1891-1903), is a storehouse of accurate social facts, dealing chiefly with the people of East London, and has won for him world-wide renown from men of science as well as from practical legislators.

Mr Booth is a fellow of the Royal Society (FRS) and was president of the Royal Statistical Society, 1892-94. In 1904 he was appointed a member of the Tariff Commission. He has taken an active part in the agitation in England for old-age pensions, in the support of which he has written several useful books: *Pauperism A Picture, and the Endowment of Old Age* (1892), *The Aged Poor, Condition* (1894), *Old-Age Pensions* (1899), *The Religious Influences of London* (1903). See OLD-AGE PENSIONS.

BOOTH, EDWIN THOMAS (1833-93). A distinguished American actor, the son of Junius Brutus Booth. He was born at Belair, Md., Nov. 13, 1833, and early showed his studious temperament. Brought up to the stage by his father, he made his debut in Boston in 1849. In 1851 he took his father's place as Richard III at the Chatham Square Theatre, New York. The next season they went to California, and after his father's return he remained in the West for several years, visiting also the Sandwich Islands and Australia (1854). He returned from California late in 1856, and after a tour in the South made, in Boston (April, 1857), an immense success as Sir Giles Overreach. Shortly afterward he repeated his triumph in New York. There, also, he became acquainted with Mary Devlin, whom he married in 1860. She died in 1863. It was in 1861 that he first appeared in London, where, after playing Shylock and Sir Giles, he won great popularity as Richefeu. In 1863 he took control of the Winter Garden, New York, and there his productions of *Hamlet* and other Shakespearean plays were famously successful. After the assassination of Lincoln by his brother, John Wilkes Booth, he retired temporarily from the stage, but reappeared in New York in January, 1866. He married, in 1869, Mary McVicker, who lived till 1891. In 1869 "Booth's Theatre" was built, where his success for a time was both artistic and financial, but the panic of 1873 made him a bankrupt. His tours in the years that followed, however, amply restored his fortunes. In 1880, and again in 1882, he visited Europe, and was received with the most flattering distinction, both in England and Germany. Some time after his return he formed a partnership with Lawrence Barrett, with whom he continued to appear till the death of Barrett in 1891. He himself then retired from the stage. He was generally regarded as the leading American tragedian, and, in a few great characters he was without a rival. His *Hamlet* was probably his most popular rôle, but his *Lear* and *Othello* were especially admired, besides other parts already mentioned. He was not a man of imposing bodily appearance, being rather below the medium stature, but his frame was compact, his carriage at once dignified and graceful, his eye piercing, his features grave. He was thoroughly absorbed in his parts, and his voice was under such complete control as to express, upon occasion, any shade of feeling, sentiment, or conviction. His rendering of familiar Shakespearean passages displayed a fine appreciation of their substance, and of the lights and shades of manner and expression by which their full meaning may be brought out. In his private life he was greatly esteemed. He was the founder and first president of the Players' Club, of New York, in the home of which, given by

himself, he died, June 7, 1903. Consult *Actors and Actresses of Great Britain and America*, ed. by Lawrence Hutton and Brander Matthews (New York, 1886), William Winter, *The Life and Art of Edwin Booth* (New York, 1894), Edwin Booth Grossman, *Edwin Booth, Recollections by his Daughter, and Letters to her and to his Friends* (New York, 1894), Asia Booth Clarke, *The Elder and the Younger Booth* (Boston, 1882), Montrose J. Moses, *Famous Actor-Families in America* (New York, 1906), Henry A. Clapp, *Reminiscences of a Dramatic Critic* (Boston, 1902).

BOOTH, JAMES CURTIS (1810-88). An American chemist. He was born in Philadelphia and graduated at the University of Pennsylvania in 1829. He then remained one year at the Rensselaer Polytechnic Institute and in 1832 went abroad. There were at this time no regular organized student laboratories at German universities, and Booth continued his studies of chemistry at Wohler's private laboratory at Cassel. After further studies at Berlin, Vienna, and in England, he returned to Philadelphia, where in 1836, he established a laboratory for instruction in analytical chemistry, the first of its kind in the United States. Many distinguished chemists, such as Campbell Morfit, R. E. Rogers, J. F. Frazer, Thomas H. Garrett, and R. T. McCulloh, were educated at this institution. Mr Booth was professor of applied chemistry at the Franklin Institute from 1836 to 1845, and was superintendent of smelting and refining in the United States Mint at Philadelphia from 1849 to 1888, in which capacity he experimented with the nickel ores of Pennsylvania, introducing the fusion of that metal with other alloys in the coinage of cents during the year 1857. Among his principal works may be mentioned *Annual Reports of the Delaware Geological Survey* (1839), *Encyclopedia of Chemistry* (with Campbell Morfit, 1850), *On Recent Improvements in the Chemical Arts* (with Campbell Morfit, 1852), and a translation of Regnault's *Elements of Chemistry* (2 vols., 1853).

BOOTH, JOHN WILKES (1839-65). The assassin of President Lincoln. For several years he was an actor, but met with indifferent success and abandoned the stage in 1863. During the Civil War he was a violent secessionist and towards its close organized a conspiracy first for abducting the President and, later, for assassinating not only the President, but also the Vice President and the members of the cabinet. On the night of April 14, 1865, the President attended Ford's Theatre with his wife and several friends. About 10 P.M. Booth approached him unseen, and shot him through the head. Leaping from the box upon the stage, crying out, "Sic semper tyrannis!" The South is avenged!" he escaped by the stage door, where a horse was held for him. He had reached Bowling Green, near Fredericksburg, Va., before he was overtaken (April 26). Here he took refuge in a barn and, refusing to surrender, was shot after the barn had been fired. Most of his accomplices were subsequently captured, and four of them, Powell, Atzerodt, Herold, and Mrs. Surratt, were hanged. He was the son of Junius Brutus Booth and the brother of Edwin Booth. Consult Bates, *Escape and Suicide of John Wilkes Booth* (Memphis, Tenn., 1907).

BOOTH, JUNIUS BRUTUS (1796-1852). An English actor, on his mother's side a relation

of John Wilkes, the English statesman. When a boy in London, where he was born, he learned printing and after studying law, painting, and sculpture, received a commission as midshipman in the navy, but instead of going to sea he turned to the drama. He appeared on the provincial stage, Dec. 13, 1813, and in London, in October, 1815, at the Covent Garden Theatre. Here within two years he became a rival of Edmund Kean, whom he greatly resembled, though he more than once played Iago to Kean's Othello at Drury Lane. Booth gained great celebrity in Richard III and Sir Giles Overreach; but he was taken with a fancy for travel and, in 1821, arrived at Norfolk, Va. He spent most of the remainder of his life in the United States, where he was exceptionally popular, and esteemed by many critics to be the greatest tragedian of his time. Though his range of characters was not wide, the people never tired of the best of them, such as Richard III, Sir Giles, Lear, Shylock, Hamlet, and Iago. He was noted for his eccentricities, which at times verged upon insanity; and in acting he was so intensely carried away that the fencing matches in *Hamlet* and *Richard III* became duels in which Richmond and Laertes were sometimes compelled to defend themselves in earnest. Consult: Clarke, *The Elder and the Younger Booth* (Boston, 1882); Gould, *The Tragedian: an Essay on the Historic Genius of Junius Brutus Booth* (New York, 1868); Montrose J. Moses, *Famous Actor-Families in America* (New York, 1906).

BOOTH, MARY LOUISE (1831-89). An American journalist, translator, and miscellaneous writer. She early devoted herself to making translations, among the most important of which were *About's King of the Mountains*, Cousin's *Secret History of the French Court* (1859), Pascal's *Provincial Letters*, Gasparin's *Uprising of a Great People* (1861), *America Before Europe* (1861), Laboulaye's *Paris in America* (1865), Cochin's *Results of Emancipation* (1862), and *Results of Slavery* (1862). All this work was done before the close of the Civil War, and in the meantime she had published a *History of the City of New York* (1859). She translated also some fairy tales of Laboulaye and Macé, Martin's abridgment of his *History of France* (1880), and part of the original work. An enlarged edition of her *History of New York* appeared in 1861, and a second revision in 1880. Miss Booth was editor of *Harper's Bazar* from its beginning till her death.

BOOTH, MAUD BALLINGTON (CHARLESWORTH) (1865-). A leader of the Volunteers of America, wife of Ballington Booth (q.v.). She was born near London, the daughter of a wealthy clergyman, early became interested in the work of the Salvation Army, and at the age of 17 left home and became a companion of Miss Catherine Booth in organizing a branch of the Army in Paris. There she remained two years, then went with a party of Salvationists to Switzerland, where, after suffering vicissitudes and even imprisonment, she finally succeeded in establishing a Salvation Army corps. In 1886 she married Ballington Booth and, in accordance with the custom of the Army, assumed her husband's rank as marshal. In 1896 she withdrew with her husband from the Salvation Army and founded the Volunteers of America, of which they became directors. She turned

her attention to prison work particularly. Her publications include: *Branded* (1897); *After Prison—What?* (1903); *Twilight Fairy Tales* (1906).

BOOTH, WILLIAM (1829-1912). An English religious leader and founder of the Salvation Army, born in Nottingham. He was the son of a contractor, who contrived to give him fair educational advantages. A private theological tutor coached him for preparation for the Methodist ministry, and at 23 years of age he began an evangelistic career, after having done a great deal of such work as a layman. He plunged into the mission field with great zeal, traveling over the greater part of England on itinerant preaching tours and making many thousands of converts. During one of his tours he met Catherine Mumford, to whom he became engaged and whom he married in 1855. After some years in settled pastorates, Mr. and Mrs. Booth conceived the idea of carrying the gospel to those whom all other missionaries had overlooked or shrunk from—the dwellers in sordid city slums. They laid a plan for such a campaign before the Methodist New Connection church, but this body found it too radical. Thereupon Booth, who now had three small children, separated from orthodoxy (largely upon the advice of his wife) and in 1865 began preaching in an old tent in a disused Quaker burial ground in Mile End Waste, one of the blackest corners of the East End of London. In 1878 he organized a body which he named the "Salvation Army" and the members of which he equipped with uniforms and flags, drums and cornets. The first appearances of this little band were greeted with riotous demonstrations, and in many cases the police sided with the roughs and arrested the Salvationists for obstructing the highways. A military form of government was prescribed, and Booth was given the title of "General," while officers below him were given subsidiary titles. As the work developed, General Booth and his wife carried out a long series of social reforms and charities. These included prison-gate missions, food and shelter depots, rescue homes, slum posts, children's homes, and other agencies for aiding and reforming the wretched and the criminal. The Salvation Army gradually spread all over the world, General Booth being in control, with International Headquarters in London. In 1906 a breach occurred between the General and his son, Ballington Booth, who had been given command of the Salvation Army in America, and when the latter was called upon to "farewell" from his command, in conjunction with several other territorial leaders, he deemed it best to withdraw from the Army and establish another organization called the "Volunteers of America" (q.v.). The Army, however, continued its work in this country.

In addition to his activity as head of the Salvation Army, William Booth wrote several books, the best known of which is *In Darkest England and the Way Out* (1890). His other writings include *Love, Marriage, and the Home*; *The Training of Children*; *Religion for Every Day*; *Letters to my Soldiers*; *Salvation Soldiers*; *Visions*; etc. He also founded the *War Cry*, the official organ of the Salvation Army, which has a weekly circulation of one million. The last four years of General Booth's life were clouded by the failure of his eyesight and by weakened health. After his death, on

Aug 20, 1912, a paper which had been prepared and sealed many years earlier was opened, and it was found that he had named as his successor his son, Bramwell Booth (qv), who for many years had been chief of staff in the Salvation Army. Consult G S Raiton, *Official Life of General Booth of the Salvation Army* (New York, 1912).

BOOTH (WILLIAM), BRAMWELL (1856-) An English religious leader, born in Halifax, Nova Scotia, a son of the founder of the Salvation Army, William Booth. He was educated in private schools, at the age of 18 took charge of the insurance of the international organization, and in 1880 was promoted to the office of chief of staff. In 1882 he married Capt Florence Soper of the Army. From this time on he served as his father's chief counselor, especially after 1896, when his brother, Ballington Booth (qv), broke from the parent organization and founded the Volunteers of America. On the death of Gen William Booth, in 1912, his son Bramwell became, by his father's will, general and commanding officer of the Salvation Army.

BOOTHBY, GUY NEWELL (1867-1905) An English novelist. He was born at Adelaide, South Australia, Oct 13, 1867. He was educated in England and traveled through Australia and in the East. His novels, mostly tales of adventure, became exceedingly popular. He was "discovered" by Rudyard Kipling, who saw in him the capabilities of a writer of stories. His fiction, much of which was written in England, amounted to nearly half a hundred novels, the *mise en scene* of some being placed in Australia. Notable among them are *The Beautiful White Devil* (1896), and *Dr. Nikola* (1898). See AUSTRALIAN LITERATURE.

BOOTHIA (booth'ia) **FELIX** A peninsula about 180 miles long and with a greatest width of about 50 miles, its northern end, Murchison Point, being the most northern extension of the American continent (Map Canada, M 2). Towards the south it contracts to a narrow isthmus, while on the north Bellot Strait (qv) separates it from North Somerset Island. It was discovered by Sir John Ross during the most famous of his voyages (1829-33) and named after Sir Felix Booth, the chief contributor to the expedition. It was supposed at the time to reach as far north as Barrow Strait. Near Cape Adelaide, on the west coast, Sir John's nephew, Lieutenant, afterward Sir, James Clark Ross, first located the northern magnetic pole on June 1, 1831, in 70° 5' N lat and 96° 47' W long. Consult Ross, *Narrative of a Second Voyage in Search of a Northwest Passage* (London, 1860).

BOOTHIA, GULF OF An inlet of the Arctic Ocean separating Boothia Felix, in northern Canada, from Cockburn Island and Melville Peninsula (Map Canada, M 2).

BOOTH-TUCKER, EMMA MOSS (1860-1903) An officer in the Salvation Army. She was born at Gateshead, England, and was a daughter of Gen William Booth and the wife of Commander Booth-Tucker. She held the rank of consul in the organization and exercised joint jurisdiction with her husband over the Army in the United States. In 1880-88 she was in charge of the "International Training Homes" of the Army. She was killed in a railroad wreck at Dean Lake, Kans., Oct 29, 1903.

BOOTH-TUCKER, FREDERICK ST GEORGE DE LATOUR (1853-) Commander of the Salvation Army in the United States. He was born at Monghyr, Bengal, India, and passed the Indian civil-service examination in 1874. After studying in London (1874-76) he was appointed to an official position in the Punjab, from which, however, he resigned in 1881 to join the Salvation Army. He inaugurated the Indian branch of that organization in 1882 and conducted it till 1891, when he went to London as secretary for the international work. From 1896 until 1905 he was in charge of the United States division of the service, with headquarters in New York City. His works include *Life of Gen William Booth* (1898), *Favorite Songs of the Salvation Army*, *Monograph for the Paris Exposition on the Work of the Salvation Army in the United States* (1900), *Farm Colonies of the Salvation Army* (1903).

BOOTKIN, or BOOTS. See Boot.

BOOTLE A town in Lancashire, England, at the mouth of the Mersey. Although an independent municipality, it is practically a northern suburb of Liverpool. About 110 acres of the Liverpool dock system, including some of the most important docks, are within the boundaries of Bootle. The town was incorporated in 1868 and was created a county borough in 1888. It obtains its water supply from Liverpool. It owns an electric plant which supplies the current for lighting purposes and for motive power for street railways, which the corporation owns, but leases to the Liverpool corporation. The town maintains numerous parks, public baths, a gymnasium, and an isolation hospital. Among its educational institutions are a technical school, a public library, and a museum. It has foundries and grain mills. Pop., which has increased rapidly, 1881, about 27,000, 1891, 49,200, 1911, 69,881.

BOOTS AND SADDLES. A bugle or trumpet call for cavalry or light artillery drill or other mounted duties. See BUGLE AND TRUMPET CALLS.

BOOTT, FRANCIS (1813-1904) An American composer, born in Boston, Mass., of English parentage. He studied music in Florence and became honorary professor in the Academy of Fine Arts. His first work appeared under the name of Telford. He left the sum of \$10,000 to Harvard University for a prize for compositions by native composers. He composed a *Mass* for voices and orchestra, *Te Deum*, *Miserere*, *Maia Mater*, *The Sands o' Dee* (Kingsley's poem), and many songs.

BOOTTOPIPING In wooden ships not sheathed with copper it was the custom when far away from a dock—particularly in warm climates—occasionally to scrape off the grass, barnacles, and other matter adhering to the side in the vicinity of the water line and apply a mixture of grease, sulphur, and tar as a temporary protection against worms. This operation was called *boottopping*. The name is now applied to that portion of the hull of iron and steel ships which is below the load water line, but above water under ordinary circumstances. It is commonly painted red, green, or black except on ships of war, which have all visible parts painted gray like the rest of the hull. The frequent painting of this part of a vessel is not done merely for the sake of appearance, but for preservation as well, the portion of the side which is sometimes wet and some-

times dry being much more liable to corrosion than the plating above or below it.

BOO'TY (Ger. *Beute*, Dutch *buit*; cf. Icel. *byti*, exchange, barter, Sw. *byte*, barter, booty). In military usage, the property captured from the enemy. Booty is not recognized officially in the army of the United States; though prize money, its naval equivalent, is, anomalously enough, still a prominent feature of naval warfare, the naval blockade in the Spanish-American War (1898) and the battle of Santiago furnishing notable examples. The regulations concerning booty in the British army are clearly defined, such booty being apportioned as the king, through his advisers, may direct. There are few regiments in the British service that have not among their regimental effects articles of more or less value, such as bric-à-brac, mess plate, heathen images, etc., taken from enemies. Booty of a more concrete and valuable description is collected and afterward sold, and the proceeds divided. By law, all booty is the property of the sovereign and may, at his discretion or pleasure, be returned to the enemy or given to the captors. Similar laws obtain with all other European countries. The siege of Peking (Boxer uprising in China, 1900) furnishes one of the best illustrations of modern looting. After the defenses were rushed, and the city taken, civilians as well as the international troops seized and carried off anything and everything worth their while. The peculiar nature of the campaign, however, and the worldwide criticism of this wholesale looting, induced most of the Powers concerned to return the booty to the Chinese government. The idea of taking booty, which is as often as not property of noncombatants, has been abandoned by practically all armies of countries within the family of nations. See **LOOT**; **PRIZE**.

BO-PEEP, **LITTLE**. The little shepherdess whose story is a never-failing source of interest to the nursery world. The origin of the name and its application are unknown, but Halliwell, in his *Nursery Rhymes*, quotes from a ballad of the seventeenth century, which has the couplet:

"Half England's nowt now but shepe,
In everye corner they plays a boe-pepe."

BOPP, **böp**, **FRANZ** (1701-1867). A distinguished German philologist. He was born in Mainz, Sept. 14, 1791, began the study of Oriental languages in Aschaffenburg, and in 1812 went to Paris, then the centre of Oriental studies, where he was encouraged in his labors by Chézy, Silvestre de Sacy, and August Wilhelm von Schlegel. He afterward visited London, to pursue further the study of Sanskrit, and in 1821 was appointed professor of philology and Oriental literature in the University of Berlin. His first publication, *Ueber das Konjugations-system der Sanskritsprache* (Frankfort, 1816), proved epoch-making. In 1820 he published in English, in the *Annals of Oriental Literature*, an article in which he developed the ideas presented in his first work. It was entitled "Analytical Comparison of the Sanskrit, Greek, Latin, and Teutonic Languages, showing their Grammatical Structure." This was followed by a Sanskrit grammar (originally published in Latin, 1820-32, and then in German, 1834), a *Glossarium Sanscritum* (1830), and editions of several fragments of the great Indian epic, the *Mahābhārata*, in the original text, with a translation. His most important labors centred in

the analysis of the grammatical forms of the different languages of the Indo-Germanic family, through which he became the founder of the science of comparative philology. His great work is a comparative grammar of the Sanskrit, Zend, Armenian, Greek, Latin, Lithuanian, Old Slavic, Gothic, and German (*Vergleichende Grammatik*, etc., Berlin, 1833-52—a second edition, entirely recast, appeared in 1857, and a third was published after his death in 1868-71). An English translation by Eastwick was published in 3 vols., 1845-50, and a French translation by Bréal (Paris, 1866-72). During the publication of his masterwork Bopp found the time to write important dissertations on Celtic (1838), Malay-Polynesian languages (1840), Georgian (1846), Borussia (1853), Albanian (1854), and his *Vergleichender Akcentuations-system* (1854), all of which reveal an extensive knowledge as well as a remarkable intellectual activity. In his honor the *Bopp-Stiftung*, for the promotion of the study of comparative philology, was founded in Berlin in 1866. His library was purchased by Cornell University. He died Oct. 23, 1867. Consult Lefmann, *Frans Bopp* (Berlin, 1891-97); Introduction to Bréal's translation. See **PHILOLOGY**.

BOPPARD, **böppärt** (ancient Bodobriga). A town in the district of St. Goar, Prussia, on the left bank of the Rhine, 9 miles south of Coblenz. It is an ancient and picturesque walled town with dark, narrow streets and mediaeval timbered houses. Among its notable buildings are the old castle of the archbishops of Treves, the tower of which is now utilized for the law courts; the Pfarrkirche in late Romanesque, dating from the twelfth century; the Gothic Carmeliterkirche of the thirteenth century containing interesting sculpture and paintings, and the famous hydropathic establishment, the Marienbegr, occupying a former Benedictine nunnery. Boppard is of Celtic origin; it was fortified by the Romans as a depot for their slingers, "Balistarii Bodobrigae," and important remains of Roman walls and fortifications still exist. Boppard was a free Imperial city in the twelfth century, and many councils were held there. Pop., 1900, 5800; 1910, 6396.

BOR, **bör**, **PIETER CHRISTIAENSZON** (1559-1635). A Dutch historian, born in Utrecht. He studied history extensively, and in 1615 was appointed historiographer of Holland and West Friesland. His most important work is the *Oorsprong, begin, ende vervolg der nederlandse Oorlogen* ('The Causes, Beginning, and Course of the Wars of the Netherlands,' 1679), in the preparation of most of which he had access to the archives of the Dutch States. In style the work is little more than a monotonous chronicle, but as a source book it is highly valued.

BORÁ (It. dial. variant of *borea*, north wind, Lat. *boreas*, Gr. *Boréas*). The bore is a violent, gusty, northeast wind, usually dry and cold, which sometimes visits the Adriatic and the Black Sea during the winter. Its gusts have attained velocities higher than 60 meters per second (134 miles an hour), and its violence whips the waves into so fine a spray that the waterdust forms a peculiar haze over the sea. This wind owes its force and temperature to a special topographic combination, viz., an elevated back country shut off from a warm sea by a moderately high coastal range. In the winter, and particularly under the influence of a high pressure, the elevated inland cools to

very low temperatures, but the sea remains relatively warm. When a centre of low pressure passes over the sea and a marked high centre builds up rapidly over the inland plateau, the cold plateau air is forced to rush rapidly from the mountains to the warmer low-lying sea. This downrush gives the violent cold wind from Istria and Dalmatia, lying along the northeast coast of the Adriatic. Hence the name "bora," or "stormy northeast wind" at Trieste, Fiume, etc. The bora extends but a short distance from the land, nor is it very noticeable far back from the summits whence it flows. The same kind of wind, due to the same causes, is met at Novorossisk on the northeast shore of the Black Sea. Here, however, the temperature of the wind is much lower, due to the colder hinterland and the smaller vertical fall to which the air is subjected. The Adriatic bora rarely falls to freezing, but at Novorossisk the icy spray from the sea often coats the ships with a dangerously heavy load of ice.

BORA, KATHARINA VON (1499-1552) The wife of Luther, daughter of Anna, of the Haugwitz family. She was born at Klein-Laussig, near Bitterfeldt, Saxony, on Jan 29, 1499. When 10 years old, she entered the Cistercian convent of Nimptsch or Nimbschen, near Grimma. Becoming acquainted with Luther's doctrines, she found herself very unhappy in her monastic life, and finally, along with eight other nuns, whose relatives, like her own, refused to listen to them, she fled from the convent, with the knowledge of Luther and the active assistance of Leonard Koppe, a member of the city council of Torgau, on the nights of April 4 and 5, 1523. They arrived in Wittenberg on April 7. Luther took up a collection for them and wrote to their relatives, who declined to receive them. He then arranged for them to live with honorable people. Katharina became an inmate in the house of the burgo-master Reichenbach. Luther, through his friend, Nicholas von Amsdorf, minister in Wittenberg, offered her the hand of Dr Kaspar Glaz, pastor in Orlamunde. She declined this proposal, but declared herself ready to marry Von Amsdorf, or Luther himself, who had already laid aside his monastic dress and was living by himself in the deserted Augustinian monastery. There her marriage with Luther took place on June 13, 1525. In his wife Luther found an affectionate and faithful helpmeet. Six children were born to them: (1) Hans, or Johannes, born June 7, 1526, (2) Elizabeth, born Dec 10, 1527, died Aug 3, 1528, (3) Magdalena, born May 4, 1529, died Oct 20, 1542, (4) Martin, born Nov 7, 1531, (5) Paulus, born Jan 28, 1533, (6) Margaretta, born Dec 17, 1534. After Luther's death the Elector of Saxony and Christian III of Denmark contributed from time to time to Katharina's support. She was involved in the losses and disasters of the Schmalkald War and was for a while very poor. She fled from Wittenberg to Torgau to avoid the plague, but on the way met with an accident, and sickened and died at Torgau on Dec 20, 1552. For her life, consult F G Hofmann (Leipzig, 1846). A Stein, pseudonym for H Nietschmann (Halle, 1879, 3d ed, 1886), A Thoma (Berlin, 1900), Krokén, *Katharina von Bora* (Leipzig, 1906).

BORACIC (bó-rás'ík) **ACID** See BORIC ACID

BORACITE (from *borax*) A magnesium

chloroborate that crystallizes in tetrahedral forms of the isometric system. It is usually white, although sometimes found in gray, yellow, or green shades, due probably to slight impurities. The principal places in which it is obtained are the vicinity of Lüneburg, Hanover, Holstein, several places in France, and Stassfurt, Prussia, where a massive variety occurs. It has been prepared artificially by Heintz.

BORAGE, bú'rāj (LL *borago*, from *borra*, *burra*, rough hair), *Borago*. A genus of plants of the family Boraginaceæ, having a wheel-shaped corolla, the mouth of which is closed with five teeth, and forked filaments, of which the inner arm bears the anther, the anthers connivent around the style, in the form of a cone. There are three species, natives of the countries around the Mediterranean. The common borage (*Borago officinalis*) is found in waste places in many parts of Europe, is pretty frequent—perhaps naturalized—in Great Britain, and introduced into various parts of the United States. It is a plant of rather coarse appearance, with a stout, erect herbaceous stem, one to two feet high, somewhat branched, the lower leaves elliptical, obtuse, tapering to the base, the stem, leaves, flower stalks, and calyx rough with hairs. The flowers are more than half an inch broad, of a beautiful blue color. Borage was formerly much cultivated and highly esteemed, being reckoned among the "cordial" flowers and supposed to possess exhilarating qualities, for which it no longer receives credit. The belief in its virtues was at one time extremely prevalent in England and its use accordingly universal. The flowers were put into salads, Gerard tells us (1597), "to make the mind glad", and he adds "There be also many things made of them, used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind." Like some other plants of the same family, borage contains nitrate of potash (nitre) and is slightly febrifuge. It is mucilaginous and emollient and has been used in pectoral affections, its leaves impart a coolness to beverages in which they are steeped, and with wine, water, lemon, and sugar, enter into the composition of an English drink called "cool tankard." The young leaves and tender tops are pickled and occasionally used for salad in parts of Europe. The flowers bear an abundance of nectar, and borage has quite a reputation as a bee plant.

BORAGINACEÆ (Neo-Lat *Boraginaceus*, pertaining to Borage, see BORAGE) A family of dicotyledonous plants consisting chiefly of herbs, but also containing a few shrubs and trees. The leaves are generally rough, with hairs which proceed from a thick, hard base, and the whole plant is mucilaginous and emollient. On account of the harshness and roughness of the plant, the name *Asperifolia* has been given to the family. The leaves are alternate and without stipules. The flowers are in spikes, racemes, or panicles which are almost always coiled up, and gradually uncoil and elongate themselves, the flowers expanding in succession. The calyx is 4- to 5-partite and remains till the fruit is ripe, the corolla is generally regular, 4- to 5-cleft, imbricated in bud, the stamens rise from the corolla and are equal in number to its divisions, generally five, and alternate with them. The ovary is 4-partite, 4-celled, the style simple, arising from the base of the lobes of the ovary. The fruit consists of 4, or sometimes of 2, distinct

achenia in some cases; the nutlets are often covered with hooked spines. There are about 1500 known species of Boraginaceae distributed among 85 genera. They are widely distributed and are particularly abundant in the south of Europe and in the temperate part of Asia. The most familiar members of the family are such prized plants as heliotrope and forget-me-not, and such weedy plants as hound's tongue, stickseed, comfrey, bugloss, and puccoon.

BORAH, bŏ'rá, WILLIAM EDGAR (1856-). An American legislator. He was born at Fairfield, Ill., and was educated at the Southern Illinois Academy and the University of Kansas. He began the practice of law at Lyons, Kans., in 1889, removing two years later to Boise, Idaho. He was elected United States Senator for Idaho for the term of 1907-13, and was a member of the Republican National Committee in 1908-12. At the time of the Republican split in 1912 Borah denounced Taft's nomination as fraudulent, but did not leave his party, preferring to be classed as a progressive Republican rather than a Roosevelt-Progressive. He was reelected United States Senator in 1912 and was active in affairs of state during 1913. In that year he directed his efforts against the growth of imperialism, attacking Secretary Bryan's plan to create a United States protectorate over Nicaragua, and introduced a bill (defeated) for raising the income exemption to \$4000.

BORÁS, bŏŏ-rŏs' or -rās'. A town in the district of Elfsborg, Sweden, situated on the river Viske, 36 miles east of Gothenburg. The town has a technical institute and school for weavers and is a textile centre (Map: Sweden, E 8). Pop., 1904, 17,842; 1911, 21,097. It was founded in 1632 by Gustavus Adolphus.

BORAS/S PALM. See PALMYRA PALM.

BO'RAX (Ar. *bŏrag*, *bŏrag*, Pers. *bŏrah*), or SODIUM BIBORATE. An inorganic salt crystallizing in the monoclinic system. It occurs native as a saline efflorescence and in monoclinic crystals on the shores of a series of lakes, covering a large extent of country, in Ladak, Ceylon, Transylvania, Peru, Chile, in Borax Lake, and other places in southern California and in various localities in Nevada. Borax is a clear, white, translucent crystalline compound, soluble in water, and having a pleasant, sweetish taste. The crude material called tincal, from Tibet, Asia, is sent on sheep's backs over the Himalaya Mountains to Calcutta, and thence to Europe, where it is purified. The product on the Pacific coast, which was discovered in 1864 at Clear Lake and subsequently in many other places, is refined in Alameda and Searles, Cal., and also in New Jersey. At Alameda the crude material is dissolved in water, and heated with sodium carbonate in a digester; the resulting solution is drawn into cooling and crystallizing tanks, where the borax forms on steel rods which are suspended in the vats. The product thus obtained is refined by successive crystallizations until the desired degree of purity is reached. A new plant was under construction at Searles in 1913 where the method of refining was to be entirely different from that at Alameda. An important source of commercial borax is found in the volcanic rocks of Tuscany, Italy, where the process, invented in 1818, is as follows: boric acid, either as vapor or solution, is added to a solution of sodium carbonate, which is dissolved in a covered lead-

lined vessel and heated with steam. The solution of borax thus obtained is evaporated until crystals form. Much more important at present than any of these sources is the calcium borate, locally known as colemanite, found in San Bernardino Co., Cal.; and for several years the production in the United States has come almost entirely from this source. The crushed mineral is washed to remove soluble impurities and then boiled with a slight excess of sodium carbonate. The sodium borate obtained is purified by recrystallization. The mineral pandermite found in Asia Minor is also a calcium borate and is extensively worked. Next to the United States, Chile produces the largest amount of borax, the ore being a sodium calcium borate. Borax is extensively used for household purposes. It is also employed as a solvent for resins, albumens, fatty acids, and certain organic bodies; also as a detergent, either by itself or in borax soaps, loosening dirt without injury to the finest laces; and as an antiseptic and disinfectant. It also finds extensive application as a flux for the glazing of pottery and chinaware and in the making of enamels. Its property of dissolving metallic oxides makes it useful in soldering metals. It is used as a flux in assaying gold and silver ores and in the refining of bullion and as a reagent in chemical analysis. Finally, it is often used in medicine. The production of borax in California gradually increased from 5950 tons in 1905 to 53,330 tons in 1911, valued at \$1,569,151. Efforts are being made to stimulate the consumption of borax along all possible lines, and a number of new uses in various commercial forms have been found, and at the same time the consumption has materially lessened in other industries. The average American annual output, taken by four-year periods, was as follows: 1895-99, 9914 tons; 1900-04, 28,829 tons; 1905-10, 44,358 tons. Consult *Mineral Resources of the United States* (Washington, annual), and *Annual Bulletin No. 24, California State Mining Bureau*.

BORCHARDT, bŏrk'ärt, KARL WILHELM (1817-80). A German mathematician, born in Berlin. He studied at the University of Berlin and at that of Königsberg, under Jacobi, and in 1848 became a lecturer in the University of Berlin. In 1856 he was made a member of the Academy of Sciences and assumed the editorship of the *Journal für die Reine und Angewandte Mathematik*. His studies regarding determinants were particularly valuable. His complete works have been edited by G. Hettner under the auspices of the Academy of Sciences (Berlin, 1888).

BORCHGREVINK, bŏrk'grē-vīnk, CARSTEN EGBERG (1864-). A Norwegian scientist and explorer, born in Christiania. He studied there and at the Royal Saxon School of Forestry, Tharandt, and in 1893 emigrated to Australia, where he was a surveyor in New South Wales and Queensland, and an instructor in languages at Coorwell College, New South Wales. In 1894-95 he accompanied a whaling expedition to the South Seas, and in 1895 presented to the Sixth International Geographical Congress, assembled in London, the results of his observations within the Antarctic Circle. On Aug. 22, 1898, he set sail from London for the South Pole, in command of the *Southern Cross* expedition, organized by Sir George Newnes, proprietor of the *Westminster Gazette* and the *Strand Magazine*. He effected a land-

ing at Cape Adare, South Victoria Land, on Feb 17, 1899, erected a station, and spent nearly a year there in exploration and scientific investigation. (*The Southern Cross* was sent to New Zealand on March 2, 1899, and returned on Jan 28, 1900) The expedition mapped the coast about Robertson Bay, discovered a new island, which was named after the Duke of York, studied Antarctic flora and fauna, found the south magnetic pole to be in (approximately) lat 73° 20' S and long 146° E, and with sledges reached the then "farthest south"—lat 78° 50' Consult Borchgrevink, *First on the Antarctic Continent* (1901, in Norwegian-Danish, 1903, in German, 1905)

BORDA, bôr'da', JEAN CHARLES (1733-90) A French mathematician, born in Day, France In 1756 he was made associate member of the Academy of Sciences for a paper on the movement of projectiles In 1771 he was associated with Verduin de la Crenne and Pingre in proving the accuracy of chronometers He also devoted much attention to the subject of shipbuilding and suggested important improvements in the form of vessels Along with Delambre and Méchain, he was a leading member of the French commission intrusted with the measurement of the meridian arc comprised between Dunkirk and Barcelona He rendered essential service in the commission that developed the metric system of weights and measures He invented a new instrument for measuring the inclination of the magnetic needle, and his corrections of the seconds pendulum are still in use He is best remembered, however, for his improvement of the reflecting circle, on which instrument he published a work in 2 vols, *Description et usage du cercle à réflexion* (1787)

BORDE, bôrd, ANDREW See BOORDE, ANDREW.

BORDEAUX, bôr'dô' (anciently, Lat *Burdigala*, from, perhaps, a Celtic or Iberian source) One of the most important seaports of France, seat of an archbishop, and capital of the department of Gironde (Map France, S, D 4) It is beautifully situated in a plain on the left bank of the Garonne, about 60 miles from its mouth in the Atlantic Ships of more than 1000 tons' burden can easily ascend the river at high water to Bordeaux, which is accessible at all times to vessels of 600 tons Its harbor is capacious and counts a floating dock among its many facilities It is the fourth French port, and is an important centre of the French cod-fishing ships for Newfoundland and elsewhere Tonnage entered and cleared in 1910, 5,646,000 The river is crossed by a noble bridge of 17 arches, 1534 feet in length, erected by the elder Deschamps in 1811-21 The old town, consisting partly of high wooden houses of the fifteenth century, has narrow, crooked streets, but the newer parts of the city and the suburbs have wider streets, fine squares, and pleasant promenades, lined with trees The cathedral of Saint-André, which was consecrated in 1096, is remarkable for its beautiful towers, 160 feet high The church of Saint-Croix is a Romanesque basilica of the twelfth and thirteenth centuries, that of Saint-Seurin dates from the eleventh to the fifteenth The former archiepiscopal palace is used as a town hall The university numbers 100 professors and 2300 students The city possesses a public library of about 200,000 volumes and 1563 MSS, including a MS copy of Montaigne's essays

The principal branches of industry include the production or manufacture of sugar, brandy, liquors, vinegar, nitric acid, printed calicoes, woolen goods, carpets, hats, paper, earthenware, glass bottles, metallic wares, and re-inous articles The rope works, cooperages, and dockyards are extensive and full of activity The Canal du Midi, connecting Bordeaux with the Mediterranean, enables it to supply the whole south of France with the colonial produce which it imports, and also with English tin, lead, copper, coal, dyestuffs, herrings, etc Wine, brandy, vinegar, dried fruits, hams, turpentine, and glass bottles are among its principal exports

Except the wines of Champagne, no French wines are so much exported to foreign countries as those grown in the district of Bordeaux and known as Bordeaux wines Some of them are red (known in England as claret), others white Of the red wines, Medoc is one of the best known The red wines produced by the vineyards of Château-Lafitte, Château-Latour, Château-Margaux, and Haut-Brion are particularly celebrated for their quality The white wines of Graves, Sauternes, Barsac, Preignac, and Langon are in the highest repute Pop (communal), 1896, 256,908, 1901, 256,638, 1906, 251,947, 1911, 261,678 (municipal pop, 250,236)

In ancient times Bordeaux was called *Burdigala* and was the capital of the Bituriges *Vivisci* It was a very prosperous town in the time of the Romans, was made in the fourth century the capital of *Aquitania Secunda*, and was both the principal emporium of the southwest of Gaul and the seat of its best educational institutions Its history follows the same course as the general history of Aquitania It was sacked by the Saracens in 720, passed to the Carolingians, and was capital of the Kingdom of Aquitania It was plundered by the Northmen in the ninth century It became the capital of the Duchy of Guienne and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterward Henry II of England), under his dominion Bordeaux was for a considerable time the seat of the splendid court of Edward the Black Prince During the Revolution Bordeaux was the principal seat of the Girondists and suffered fearfully at the hands of the Terrorists Its inhabitants declared for the Bourbons in 1814 During the Franco-Prussian War a delegation of the Government of National Defense, retreating before the advancing German army, stationed itself, December, 1870, at Bordeaux, and the first sittings of the National Assembly were held there in 1871 Rosa Bonheur was born in Bordeaux Consult Lourget, *Documents relatifs au port de Bordeaux* (Bordeaux, 1889), Julian, *Histoire de Bordeaux depuis les origines jusqu'en 1895* (Bordeaux, 1895), Mauriac, *L'Association de Bordeaux* (Bordeaux, 1890), Saunier, *Bordeaux* (Paris, 1909)

BORDEAUX, DUO DE See CHAMBORD, HENRI CHARLES

BORDEAUX, UNIVERSITY OF A university founded in 1441, while Bordeaux was under English rule, by combining earlier convent and cathedral schools and a school of medicine Its privileges, confirmed by Louis XI, made it self-governing till the time of Francis I Thenceforward it was under state control In 1808, at the Napoleonic reform of the universities, it received faculties of science and of letters, in 1870 a faculty of law, and in 1875 a faculty of medi-

cine and pharmacy. In 1912 it had a budget of 299,972 francs, and 2528 students, of whom about 800 were in medicine and 962 in law. In the library there are some 10,000 volumes. Connected with the university is the Marine Zoological Laboratory of Archachon.

BORDEAUX MIXTURE. See FUNGICIDES.

BORDEN, SIR FREDERICK WILLIAM (1847-). A Canadian political leader, born at Cornwallis, Nova Scotia. He studied at King's College, Windsor, N. S., and at the Harvard Medical School, and began the practice of medicine at Canning in 1868. He was elected to the Dominion parliament in 1874 from King's, N. S., and continued to represent that constituency with the exception of the years 1883-86. Long identified with the militia forces of the country, he became in 1896 Minister of Militia and Defense in the Laurier cabinet, a position which he held for 15 years. On the outbreak of the Boer War in 1899, he was active in the organization and equipment of the Canadian forces sent to South Africa in aid of Britain. In 1905 he arranged with the Imperial government for the assumption of the defenses at Halifax and Esquimaux by the Dominion forces. He organized the Canadian militia under the Act of 1904, which placed the land forces under a militia council modeled after the British Army Council; and he took a prominent part in the London conferences at which Canadian coöperation in Imperial defense was discussed. He was a delegate to the Colonial Conference in 1907, the Imperial Defense Conference in 1909, and the Imperial Conference in 1911. He also became a member of the Imperial Council of Defense. In 1902 he received the honor of knighthood. He lost his seat in the Canadian Parliament at the general election of 1911, which resulted in the defeat and resignation of the Laurier cabinet.

BORDEN, RT. HON. ROBERT LAIRD (1854-). A Canadian statesman. He was born at Grand Pré, Nova Scotia, and was educated at the Acadia Villa Academy, Horton. In 1872 he became an instructor in the Glenwood Institute, N. J., but afterward returned to Nova Scotia and studied law at Halifax. He was called to the bar in 1878 and practiced law first at Kentville and afterward at Halifax. He soon became notable in his profession and appeared as counsel in important cases in which his knowledge of maritime and constitutional law gained him a wide reputation. For an extended term he was president of the Nova Scotia Barristers' Society. He was elected a Conservative member of the House of Commons in 1896, and in 1901 he succeeded Sir Charles Tupper (q.v.) in the leadership of the Conservative Opposition. He was the first Canadian Opposition leader whose position was officially recognized by the payment of an additional parliamentary indemnity, which in 1905 was fixed at \$7000 a year. In 1904 he lost his seat for Halifax at the general election, but in 1905 was reelected for Carleton and in 1908 for Halifax. He did not at first oppose the policy of the Canadian naval service established by the Laurier administration in 1910, but he advocated an immediate emergency contribution of the cash equivalent of a fleet unit, or of a powerful battleship. After the Liberal defeat in 1911 on the issue of reciprocity with the United States (see CANADA, *History*), Borden became Premier. In 1912 he visited England to confer with the British government in regard to the naval situation, and during the

parliamentary session after his return he introduced a measure providing for a contribution of \$33,000,000 for the construction of three battleships of the largest size, to be at the disposal of the British government. After prolonged discussion the bill passed the House of Commons, but was rejected by the Senate. In 1912 Borden was appointed a member of the Imperial Privy Council.

BORDENTOWN. A city in Burlington Co., N. J., on the Delaware River, 6 miles southeast of Trenton, on the Pennsylvania Railroad, and the terminus of the Delaware and Raritan Canal (Map: New Jersey, C 3). It contains Bordentown Military Institute. The city is the market and shipping point for a tributary agricultural district and has extensive manufacturing interests, represented by worsted mills, machine shops, and iron works of various kinds, shipyards, brickyards, and other industrial plants. Bordentown was incorporated first in 1849, and the commission form of government was adopted in 1913. The water works and sewage system are owned by the city. Pop., 1890, 4232; 1900, 4110; 1910, 4250. Near Bordentown Joseph Bonaparte (q.v.) lived in 1817-32, and 1837-39; his fine park, and "Ironside," the home of Rear Admiral Charles Stewart (q.v.), are among the city's notable features. Prince Murat, the son of Marshal Joachim Murat (q.v.), also lived here for many years prior to 1848. Consult Woodward, *Bonaparte's Park and the Murats* (Trenton, 1879).

BORDER (Fr. *bordure*, edge, of Teutonic origin; cf. MHG. *borte*, border), THE. A term employed in historical as well as popular phraseology to signify the common frontier of England and Scotland. The border shifted to and fro frequently in former times. At present the dividing boundary of the two countries consists of natural and imaginary outlines. It is customary to speak of Scotland as a country "north of the Tweed"; but the Tweed is the boundary for only about 16 to 18 miles. At Carham Burn the line proceeds toward the Cheviot Mountains, which form the boundary for about 25 miles; thence it strikes Kershope Water, a tributary of the Esk. That river is the boundary for a number of miles, to a point above Longtown, where the line quits the Esk abruptly in a northerly direction and, taking into England part of what was known as the "Debatable Land" (q.v.), strikes on the small river Sark, which is the boundary to the Solway Firth, the great natural division on the west. Such, in general terms, is the entire boundary, extending from sea to sea for about 100 miles. The counties lying on the English side of the border are Northumberland and Cumberland; on the Scottish side, Berwickshire, Roxburghshire, and Dumfriesshire. From the eleventh till the end of the seventeenth century there was almost constant disturbance on the border. Ruthless wars on a great scale between English and Scots sometimes caused the most frightful devastation and became the source of lasting ill will on both sides.

In the present day there is nothing to distinguish the border from other districts of the country, unless it be the prevalence of picturesque ruins of old castles, which are generally roofless, but whose walls, of vast thickness and strength, are still in a good state of preservation. The border strongholds were of three kinds—regular fortresses, large baronial castles,

and the lesser kind of towers. For an account of these and other architectural remains on the Border, consult *Border Antiquities of England and Scotland*, by Sir Walter Scott (2 vols., folio, illustrated with plates), also Billings' *Baronial and Ecclesiastical Antiquities of Scotland* (4 vols., 4to), illustrated with plates (Edinburgh and London, 1848-52).

The greatest channels of communication across the Border are two railway routes, one by way of Berwick and the other by Carlisle. There are also good roads in various directions for those who wish to explore this extremely interesting district. Besides the books already referred to, there are works of local note, among which the most comprehensive are Richardson, *Romance of English and Scottish Border* (Newcastle-on-Tyne, 1846), Jeffrey's *History and Antiquities of Roxburghshire* (3 vols., London, 1851-64), Ridpath's *Border History* (1 vol., 4to, London, 1776), Veitch's *History and Poetry of the Scottish Border* (Glasgow, 1877), Craig-Brown's *History of Selkirkshire* (Edinburgh, 1886), Oliver's *Upper Teviotdale and the Scots of Buccleugh* (Edinburgh, 1887), Crockett's *In the Border Country* (London, 1906), Lang's *Land of Romance* (London, 1910).

BORDER MINSTREL, *See* SCOTT, SIR WALTER.

BORDER RUFFIANS In American history, a name applied to the proslavery residents of Missouri, who, in 1854 and thereafter, crossed over into Kansas for the purpose of turning the elections and of committing depredations on the "Free-State" settlers. *See* KANSAS.

BORDER STATES In American history, the name applied to those slave States which at the outbreak of the Civil War were contiguous to the more southerly of the free States. They were Delaware, Maryland, Virginia, Kentucky, Missouri, while North Carolina, Tennessee, and Arkansas were also frequently so designated. Of these, Virginia, North Carolina, Tennessee, and Arkansas seceded and joined the Confederacy.

BORDER WAR The war in Kansas between the "Sons of the South," or proslavery men, mostly from Missouri, and the "Free-State Men," mostly from the New England States, who had emigrated to Kansas for the purpose of excluding slavery therefrom. It continued for several years after the passage of the Kansas-Nebraska Act (q.v.) in 1854. *See* KANSAS. Consult, also, Eli Thayer, *A History of the Kansas Crusade* (New York, 1889).

BORDES, bôrd, CHARLES (1863-) A French organist and writer on music. He was born at Vouviay sur Loire and studied music under César Franck. After 1890 he was organist of St Gervais in Paris. In 1898 he founded the Schola Cantorum de St Gervais, which soon became famous for the masterly rendition of sacred choral works, notably those of Bach. He is the editor of the *Anthologie des maitres religieux primitifs*, and published *Archives de la tradition basque* (1890), a valuable study of Basque folk songs, and *Du sort de la musique religieuse en France* (1906). He composed a number of pieces for orchestra, a phantasy for piano and orchestra, piano compositions, and songs.

BORDIGHERA, bôr-dâ-gâ'ra A winter resort in the province of Porto Maurizio, Liguria, north Italy, on the Riviera, overlooking the Mediterranean, 91 miles southwest of Genoa and 7 miles from the French border (Map Italy,

B 4). It has beautiful villas, good hotels, and a splendid promenade, the Strada Romana, which runs through pine and olive groves on the high ground back from the sea. The situation is picturesque, the drinking water excellent, and the climate agreeable. Snow falls only occasionally, the average number of rainy days in the year is 45, of cloudy days 100, and the average winter temperature is 53° F. Bordighera is famous for its roses, carnations, anemones, palms, and its floriculture in general. There are an English church, a museum, and a theatre. It suffered severely in the earthquakes of 1887. Pop., 1881 (commune), 2556. 1901, 4673, 1911, 4229. Consult Miller, "Bordighera, Past and Present," in the *Westminster Review*, vol. cliv (London, 1900).

BORDONE, bôr-dô'na, PARIS (1500-71) A Venetian painter of the Renaissance. He was born at Treviso and came to Venice as a lad of eight. He was a pupil of Titian, but, dissatisfied with that master, worked independently, studying particularly the paintings of Giorgione. According to Vasari, he had much to suffer in his early career from the enmity of Titian. In 1535 he painted for the Scuola di San Marco the celebrated legend of 'A Fisherman Presenting the Ring of St Mark to the Doge,' now in the Venice Academy—one of the finest pageant pictures in Venetian art. Nevertheless he was excluded from the decorations of the ducal palace, to make room for inferior artists. He was active for some time in Treviso, where he frescoed the cupola of San Vincenzo, and at Ciema. At the invitation of Francis I he went to France in 1538, and there painted the portraits of the King and of many distinguished members of the court, returning to Venice in 1540, via Augsburg, where he painted in the Fugger Palace. Bordone's art resembles that of Palma Vecchio rather than that of his teachers. As a technician pure and simple he is one of the best of the Venetian school, particularly in his wonderful color. But his paintings are often devoid of content. He excels especially in portraits, but he also painted religious subjects, such as the "Last Supper," in San Giovanni in Bragora, Venice, and many mythological themes. He is well represented in the galleries of Venice, Milan, Florence, and Rome, also at Vienna, Dresden, Berlin, and London. The New York Historical Society possesses an example of his work. For the list of his paintings consult Berenson, *Venetian Painters* (New York, 1909), for his life and works, the exhaustive monograph of Bailo and Biscaro (Treviso, 1901), Cook, in *Burlington Magazine*, ix (1906).

BOR/DURE, or **BORDER** *See* HERALDRY. **BORE** (AS bôr, Ger *Bohr*, auger, gimlet, ME *boie*, Icel *bora*, hole) The interior of a gun. In the case of breech-loading guns the length of the bore is from the front face of the breech plug to the muzzle. It is also used in place of calibre, but, except in regard to shot-guns, this is not now very common. *See* ORDNANCE, GUNS, NAVAL, SMALL ARMS.

BORE (Icel *bora*, a billow caused by wind, Sw dial *bôr*, a mound), or **EAGRE** Names applied to the advancing wall of water caused by the incoming tidal wave in funnel-shaped bays and in the estuaries of certain rivers. The height of this rolling mass of surf increases towards the narrower part of the bay, and the wave is converted into a mass of roaring breakers that are the more pronounced in proportion as the bay

is shallower. When the water has reached the head of the bay, and its onward movement has been stopped by the resistance of the land, it remains for a short time as a high tide and then slowly and smoothly returns to the sea. The tidal range at the head of the Bay of Fundy exceeds 40 feet, reaching a maximum of 70 feet at the highest tide. The tidal wave causes an advancing breaker in almost every river. The bore in the estuary of the Tsien-Tang-Kiang may be mentioned as the most remarkable example of the phenomenon. The bore of the Amazon occasionally reaches a height of 16 feet. The rivers in India, especially the Ganges, are also celebrated for their bores. (See TIDES.) Consult Darwin, *The Tides* (Boston, 1898).

BOREAS (Gk. *Borēas*; cf. It. *bora*, Russ. *burja*, Bulg., Serv. *burra*, storm). The north or northeast wind, blowing toward Hellas from the Thracian Mountains, and personified in mythology as the son of Astræus and of Eos, or Aurora, and the brother of Notus, Zephyrus, and Eurus. Boreas was said to dwell near the Hyperboreans, in a cave of the Thracian Hæmus, to which he carried Orithyia, the daughter of the Athenian King Erechtheus, who bore him Zetes and Calais—employed as the symbols of swiftness—and Cleopatra, the wife of Phineus. According to Homeric fable, he begat, with the mares of Erichthonius, 12 horses of extraordinary fleetness. The rape of Orithyia, while she was gathering flowers on the banks of the Attic Ilissus, is said to have been represented on the chest of Cypselus at Olympia and is found on a number of red-figured vases, on an acroterion (q.v.) of the Temple of Athena at Delos, and on a fine bronze relief now in the British Museum. Boreas had a sanctuary in Athens and a festival called Boreasmos, for his help in wrecking the ships of Xerxes off Eubœa, and for similar reasons he was worshiped in Thuri and Megalopolis. His cult, however, was general, for Achilles prayed to him, and sacrifices were offered to him by the Ten Thousand Greeks, to say nothing of other allusions in the Greek writers. In art he is usually represented as a winged man of wild appearance, with rough, disordered hair and beard. On the Tower of the Winds at Athens (see ANDRONICUS CYRRESTES) he holds a Triton shell.

BOREGAT, bôr'e-gât. A name given to several rock trouts of the Pacific coast of the United States, especially *Hexagrammus stelleri*. See ROCK TROUT.

BORELLI, bô-rèl'la, GIOVANNI ALFONSO (1608-79). An Italian physicist and astronomer, the founder of the iatro-physical school. He was educated in Florence and was a professor of mathematics in Pisa and afterward in Messina. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder of his life in Rome. He carefully observed the motions of the satellites of Jupiter, then little known, and seems to have been the first to discover the parabolic paths of comets. In his epoch-making work, *De Motu Animalium* (1680-81; Eng. trans., *The Flight of Birds*, 1911), we find the first attempt to apply the principles of mechanics to the movements of animals. Regarding the bones as levers in which the power acts between the weight and the fulcrum, he endeavors to calculate the power of muscles from a consideration of their fibrous structure, and the manner in which they are united to the tendons.

BOBER. The hagfish (q.v.).

BORER. An animal that bores into the hard parts of other animals or plants, or makes tubular burrows. A tiny sponge of the genus *Cliona* perforates an oyster shell, one of these minute organisms inhabiting each perforation. The method of their action is yet a mystery; it is thought, however, to be both chemical and mechanical, i.e., by secretion and by spicules. Many worms are borers, working not only into the soil, but into sponges and like organisms. The crustaceans are said to bore, but this is an error; they burrow rather—e.g., the crayfish in search of water. One of the marine isopods, the gribble (*Limnoria lignorum*), however, is remarkable for the damage it does to wharves and other wooden structures in northern American harbors. But the most important borers are the mollusks, particularly the tereido (q.v.) and the family Pholadidae. A closely allied family (Gastrochamidae) have the same habit, the most important being the genera *Aspergillum* and *Gastrochama*. Lithodomus (see DATE SHELL) is another powerful borer. Lyell, in alluding to the alternate upheaval and submergence of the land on the coast, gives us the following fact: On the coast of the Gulf of Naples, near the ancient town of Pozzuoli, are three marble pillars rising 40 feet above the water, the remains of an ancient temple whose marble pavement still exists many feet below the surface of the bay. For a distance of 12 feet from the water these pillars are smooth and free from blemish. Then comes a distance of 9 feet, throughout which the marble is perforated with innumerable holes. At the end of each of these perforations may be found the remains of the tiny *Lithodomus*. The adjacent waters are still filled with the same species. There is a difference of opinion as to the precise manner in which bivalve mollusks bore, but there is little doubt that the foot and adductor muscles afford the motor power and the anterior part of the shell the cutting instrument. Among gastropod mollusks several small species are known as "borers" along the northern American coast, because of their method of perforating the shells of clams, oysters (resulting in serious annual loss to the oysterculturists), and similar victims. This boring of the shell is made with their rasp-like tongue ribbons, and through the perforation the juice of the victim is sucked out. The chief offender in Long Island Sound and New York Bay is *Urosalpinx cinerea*, commonly called drill. Insects of similar habits are described under BARK BEETLE; CARPENTER BEE; and similar titles.

BORGEHOUT, bôr'gêr-hout (Dutch *borg*, safety, security + *hout*, wood). A suburb of the city of Antwerp, Belgium (Map: Belgium, C 3). It contains diamond-cutting establishments, dyehouses, bleaching works, tobacco factories, and a church noted for its architectural beauty. Pop., 1900, 37,300; 1910, 49,333.

BORGHESE, bôr-gâ'sâ. A family of great distinction in the Republic of Siena and afterward in Rome.—CAMILLO BORGHESE (1650-1621) ascended the papal throne in 1605 as Paul V (q.v.) and by him other members of the family were advanced to high positions.—CAMILLO FILIPPO LUDOVICO, PRINCE BORGHESE (1775-1832), joined the French army when it invaded Italy and in 1803 married Pauline, the sister of Napoleon Bonaparte and widow of General Leclerc. His wife subsequently received the prin-

epality of Guastalla, and he was created Duke of Guastalla. He held his court in Turin and was very popular among the Piedmontese. He sold the Borghese collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part payment the Piedmontese national domains, but when these were reclaimed by the King of Sardinia, in 1815, he received back some of the works of ancient art. The remainder are in the Louvre. After the overthrow of Napoleon he separated from his wife and broke off all connection with the Bonaparte family. He lost Guastalla, but retained the principalities of Sulmona and Rossano, his hereditary possessions. His heir was his brother, Francesco Borghese, Prince Aldobrandini (1778-1839), a general in the French service, who was succeeded by his eldest son, Marco Antonio (1814-86). Of the latter's two sons, the elder, Prince Paolo, born in 1845, lost through unlucky speculations the greater part of his fortune, in consequence of which most of the precious collections of the family had to be sold at auction in 1891-92. The valuable family archives were acquired by Pope Leo XIII for the Vatican. By negotiations subsequently concluded the art treasures of the palace became the property of the Italian government.

BORGHESE, VILLA. The summer palace of the Borghese family, situated outside the Porto del Popolo, Rome, in an extensive garden, ornamented with artificial ruins and fountains. It was built by Cardinal Scipio Borghese, nephew of Pope Paul V, on the Cenci estate. Many of its former treasures of ancient sculpture were removed to Paris in 1806.

BORGHESE GLADIATOR. A work of Agassias (qv) of Ephesus, formerly in the Borghese collection in Rome, whence the name. By order of Napoleon it was sent to the Louvre, in Paris, where it now is. It belongs to the first century B.C.

BORGHESE MARS. A fine example of ancient sculpture once in the Borghese collection in Rome, now in the Louvre, Paris.

BORGHESI, bôr-gâ'sê, BARTOLOMEO (1781-1860). An Italian numismatist and epigraphist, born at Savignano, near Rimini. His earliest studies were on documents of the Middle Ages, afterward he turned his attention to Roman numismatics and epigraphy. During the troubled times of 1821 he retired to the little Republic of San Marino, where he made his home until his death. He arranged and catalogued the coins in the Vatican. By his publication *Nuovi Frammenti dei Fasti Consolari Capitoli* (2 vols., 1818-20), Borghesi established himself as one of the most eminent epigraphists of modern times, indeed, he may be called one of the founders of present-day epigraphy. The design of publishing a collection of all ancient Roman inscriptions, conceived by Borghesi, was carried into effect through the influence of Mommsen (qv), the result was the monumental *Corpus Inscriptionum Latinarum*. His writings were very numerous. After his death a collected edition of them, begun at the order of Napoleon III, was published under the title *Œuvres complètes* (10 vols., 1862-97).

BORGIA, bôr'ja. An Italian family of Spanish origin which acquired great eminence after the elevation of Alfonso Borgia to the papacy as Calixtus III in 1455. He had previously been a counselor of the King of Aragon. He died in 1458.—RODRIGO BORGIA, nephew of the fore-

going, ascended the papal throne in August, 1492, under the name of Alexander VI (qv). Before his elevation to the papacy he had a number of children by a Roman woman named Vanozza (Giovanna de' Catanei), of whom the most celebrated were Cesare and Lucrezia.—CESARE or CESAR BORGIA was one of the most noted men of the times, and his character, like that of his father, has been the subject of much historical controversy. He had early received high ecclesiastical preferment, and his father, soon after becoming Pope, made him Cardinal. The assassination of his brother Giovanni, Duke of Benevento and Count of Terracina and Pontecorvo, has been laid to Caesar's charge, but with no evidence save that Caesar succeeded him. He obtained the duchy and counties for himself and was permitted by his father to resign the purple and to devote himself to the profession of arms. He was sent, in 1498, to France, to convey to Louis XII a bill of divorce from his consort Jeanne, on the ground of no consummation. Louis rewarded him, in his royal gratitude, with the Duchy of Valentinois, a bodyguard of 100 men, 20,000 livres of yearly revenue, and a promise of support in his schemes of ambition. In 1499 Caesar married a sister of the King of Navarre and accompanied Louis XII to Italy, where he undertook the conquest of the Romagna for the Holy See. But before the conquest was completed, Caesar was compelled to desist on account of the defeat of his French allies in the northern part of Italy. In 1501 he was named by his father Duke of Romagna. In the same year he wrested the Principality of Piombino from Jacopo d' Appiano, but failed in an attempt to acquire Bologna and Florence. He took Camerino and caused Giulio di Varano, the lord of that town, to be strangled along with his two sons. By treachery as much as by violence he made himself master of the Duchy of Urbino. A league of Italian princes was formed to resist him, but he kept them in awe by force until he succeeded in winning some of them over by advantageous offers, employed them against the others, and then treacherously murdered them on the day of the victory (Dec. 31, 1502) at Singaglia. He now seized their possessions and seemed to have removed every obstacle in the way of becoming King of Romagna and of Umbria, when, on Aug. 17, 1503, his father died, probably of malaria, though at the time there were rumors of poison. Caesar, also, who was a party to the design, had himself partaken of the poison, and the consequence was a severe illness. Enemies rose against him on all hands, and one of the most inveterate of them ascended the papal throne as Julius II. Caesar was arrested and conveyed to the castle of Medina del Campo, in Spain, where he lay imprisoned for two years. At length he contrived to make his escape to the King of Navarre, whom he accompanied in the war against Castile, and was killed on March 12, 1507, by a missile from the castle of Biano. With all his intrigue and cruelty, Borgia was temperate and sober. He loved and patronized learning and possessed in a remarkable degree a ready and persuasive eloquence. Machiavelli, who was at one time dazzled by the energy and ability of Caesar and believed that he was capable of unifying Italy, has delineated his character in his *Prince*.—LUCREZIA BORGIA, sister of Caesar Borgia, a woman of great beauty, was born in Rome in 1480. She was married first to Giovanni Sforza, Lord of

Pesaro, June, 1493; but her father, on the ground of her husband's impotence, annulled this marriage (Dec. 20, 1497) and gave her (June 20, 1498) to Alfonso, Duke of Bisceglie, nephew of the King of Naples. Alfonso, believing that Cesar had sought his life, attempted to retaliate and was in turn cut to pieces by his own bodyguard at Cesar's command. For the third time free, the Pope's daughter became, in spite of the repugnance of the Duke Ercole d'Este, the wife of the latter's son, Alfonso, who soon after inherited the Duchy of Ferrara. Lucrezia has been represented as placed outside the pale of humanity by her wantonness, her vices, and her crimes, but the recent researches of most accurate and impartial historians have refuted the more extravagant of these assertions. She died June 24, 1519.

Bibliography. For a general view of the Borgias the best Protestant presentation is W. Creighton, *History of the Papacy* (7 vols., London, 1887). For the best Catholic presentation consult Pastor, *Geschichte der Papste* (Eng. trans., "History of the Papacy," 3 vols.). For Cesar Borgia, consult Yriarte, *César Borgia* (Paris, 1889), and Woodward, *Cesare Borgia* (London, 1913). For Lucrezia Borgia, consult Gregorovius, *Lucrezia Borgia* (Stuttgart, 1875). Consult also Corvo, *Chronicles of the House of Borgia* (New York, 1901); Mathew, *Life and Times of Rodrigo Borgia, Pope Alexander VI* (New York, 1912); Fyvie, *Story of the Borgias* (New York, 1913).

BORGIA, FRANCISCO (1510-72). A general of the Jesuit Order, born at Gandia, Valencia. His early life was spent at the court of Charles V and in 1545, after his wife's death, he entered the Order of Jesus and was appointed by Loyola vicar-general of the order in Spain and Portugal. This position he held until the death of Lainez, whom he succeeded as the third general of the order. He instituted reforms in the society and so greatly promoted its progress that he is sometimes spoken of as its second founder. He was canonized in 1671.

BORGIA, STEFANO (1731-1804). An Italian antiquarian and prelate, born at Velletri. In 1759 he was appointed papal governor of Benevento, and in 1764, by precautionary measures, protected the city and district against an impending famine. He became secretary of the Propaganda in 1770, Cardinal in 1789, and in 1801 rector of the Roman College. He was well known for his valuable archaeological collection, to which admission was freely granted to scholars, and from which, it is said, he once sold a gold plate to defray the expense of imprinting San Bartolommeo's *Systema Brahmanicum*. He wrote *Memorie storiche della pontificia città di Benevento dal secolo VIII al secolo XVIII* (3 vols., 1763-69).

BORGLUM, GUTZON (JOHN GUTZON DE LA MOTHE) (1867-). One of the most prominent of American sculptors, and also a painter; brother of Solon Borglum. He was born in Idaho, March 25, 1867, the son of a Danish woodcutter, who later became a physician. He received his early education in the public schools of Fremont and Omaha, Neb., and in St. Mary's College, Kans. He first studied painting in the San Francisco Art Academy under Virgil Williams and William Keith, and from 1890 to 1893 he studied painting and sculpture in the Académie Julian and the Ecole des Beaux-Arts, Paris. In the latter year he returned

to California, removing to London in 1895. From 1896 to 1901 he exhibited both painting and sculpture in Paris and London, and was elected to the Royal Society of British Artists and to the Société Nationale des Beaux-Arts. In 1902 he established his residence in New York. The two principal influences in his very original art are Rodin in sculpture and Whistler in painting. To an able technique he adds a vivid imagination; his work always embodies an emotion or ideal. Among his principal works in sculpture are: "Pursued," two youthful figures upon horseback (in possession of the Kaiser); "The Boer," an equestrian figure; the "Mares of Diomedes" (Metropolitan Museum), an original and brilliant work; the small and characteristic figures of John Ruskin (Metropolitan Museum), and Nero; a number of highly original gargoyles for Princeton University; a statue entitled "I have piped and ye have not danced" (1905); and a series of statues for St. John's Cathedral, New York. The most important of his later works are at Washington, D. C.: a group entitled "North America" and a bas-relief for the building of the Bureau of American Republics; the Sheridan Monument, the statue of James Smithson, and the colossal head of Lincoln in the rotunda of the Capitol. His paintings include "Captive Pan," "Abandoned," "Iago and Cassio," and mural decorations in Leeds and Manchester, England.

BORGLUM, SOLON HANNIBAL (1868-). A distinguished American sculptor. He was born at Ogden, Utah, Dec. 22, 1868, and spent his youth in Fremont, Neb., and his early manhood on a cattle ranch. At the age of 24 he turned to art, spent two years with his brother Gutzon in California, and in 1895 entered the art school of Cincinnati. His first group, a "Horse Pawing a Dead Companion," won a special prize, and in 1897 he won a scholarship which brought him to Paris. There he studied under Louis Rebisso and Frémiet. He achieved honorable mention with his "Lame Horse" in the Salon of 1899, and attracted much attention by the originality of his subjects, taken from the life of the western frontier, which he himself had experienced. His art has perpetuated the life of the cowboy, ranchman, Indian, and the animals, particularly the horses, of the plains, with truth and inspiration, and shows little French influence, even in technique. After 1900 he was active in New York. He became an associate of the National Academy and a member of the National Sculpture Society. Among his principal works are a "Stamped of Wild Horses" (Cincinnati Museum), "The Last Roundup," "On the Borders of White Man's Land" (Metropolitan Museum), "Burial on the Plains," "Tamed," "Just Born," "Evening," and "The Bucking Broncho." His later works include the equestrian statues of Gen. J. B. Gordon (1907, Atlanta, Ga.), and Captain O'Neill (1907, Prescott, Ariz.); a number of portrait busts, including those of ex-Mayor Schieren of Brooklyn and Simon Newcomb; portrait reliefs such as that of Brig. Gen. Joseph A. Mower (Vicksburg Battlefield); and "Private Jones of the Confederate Army," a bronze statue in Lynchburg, Va.

BORGNE (börn), **LAKE**. An inlet of the Gulf of Mexico extending into the southeast of Louisiana and covering an area 60 miles long by 10 broad (Map: Louisiana, F 3). It is con-

nected by Rigolets Pass with Lake Pontchartrain and is used by steamers plying between New Orleans and Mobile

BORGIO, Pozzo di See Pozzo di Borgo

BORGOGNONE, bôr'gô-nyô'nâ, AMBROGIO, also called AMBROGIO DA FOSSANO, or IL BORGOGNONE (c1445-c1523). An important Lombard painter of the Renaissance. He was born probably at Fossano, and first appears in 1481 as a master in the "University of Arts" at Milan. His earliest work shows the influence of Vincenzo Foppa, whom he imitates, and, in certain details, of Butinone. To his early period, usually called his "gray manner," belongs the most important commission of his life—a series of panels and decorations for the Certosa di Pavia, where he labored seven years. Among surviving altarpieces of this series are "The Crucifixion," with intense but reserved expression of grief, and harmonious color; the grandiose and majestic altar of St Ambrose, the altar of St Siro. The principal decorations were the colossal frescoes of the vault of the apse representing Gian Galeazzo Sforza offering the model of the Certosa to the Madonna, and the "Coronation of the Virgin," with figures of Dukes Francesco Sforza and Ludovico il Moro, in these he was assisted by his younger brother Bernardo. In his later period Borgognone's style becomes more personal, especially in form, as is shown in the elongated figures. More than any other painter of the day he held aloof from the prevailing influence of Leonardo, retaining the mild and pious ideals of old Lombard art. His most important works of the later period are the frescoes of San Sattiro, Milan, now in the Brera (1495), "The Coronation of the Virgin" (1498), in Santa Maria Incoronata at Lodi, and four other incidents of her life, and the greatest of all his paintings, the imposing fresco of the "Coronation of the Virgin," in the apse of San Simpliciano, Milan, executed shortly before his death. Consult his biography by Bona (Fossano, 1897). The chief authorities on Borgognone are Beltrami and Zappa, whose articles have appeared in various Italian publications.

BORGU, bôr-gô' A kingdom in the Sudan (q.v.), west of the Niger, and bounded by the states of Gurma and Gando on the north and Chanjo on the south. The country is generally level, and the soil is fertile. The population is composed of pagan negro Bariba, Fulahs, etc. The principal settlement is Bussa, on the Niger. Near Bussa Mungo Park met his death. At the demarcation of the western boundary line of Nigeria in 1885-86 the eastern part of Borgu was included in the British possession of Northern Nigeria, and the western in the French colony of Dahomey (q.v.). Consult "The Struggle for Borgu," in *Blackwood's Magazine*, No 65 (London, 1899).

BORIC or **BORACIC ACID** (from *boron*, or *borax*), H_2BO_3 . A soluble, solid substance crystallizing in the triclinic system and known mineralogically as *sassolite*. It is found in the waters of the Tuscan lagoons of Monte Rotondo, Castelnuovo, and elsewhere, also as an incrustation on sulphur in the crater of Vulcano in the Lipari Islands, it has been found in the form of borates in the borax lakes of California. It is also found native (See BORON). It was extracted from borax by Homberg in 1702 and became known as "Homberg's sedative salt." In 1774 Hôfer, a Florentine apothecary, discovered its presence in the lagoons of Tuscany

—the principal source of supply. The acid is obtained by passing the hot vapors from the lagoons through water, in which the acid dissolves. At present part of the boric acid of commerce is derived from borax and from the minerals boracite and sodium-borocalcite. Boric acid is a white translucent crystalline compound, readily soluble in water, alcohol, and other liquids. Besides its use in the production of borax, it is employed for glazing porcelain, in the manufacture of glass and certain pigments, and in preparing the wicks of stearine candles. At $106^\circ C$ boric acid changes into meta-boric acid, HBO_3 , at $160^\circ C$ it changes into pyro-boric acid, $H_2B_2O_5$, and at a red heat it changes into boric oxide, B_2O_3 .

Boric acid or borax used in food experimentally has caused indigestion and vomiting. It has produced kidney disease in animals. Used in open wounds it has caused vomiting, delirium, and death. It is a questionable, if not dangerous, preservative of food. Boric acid is a mild, non-irritating, and slightly astringent antiseptic, and as such is extensively employed in medicine. Solutions of it are particularly grateful to the mucous membranes, and therefore may be used as an eyewash, as a nasal douche, or to irrigate the bladder, or to cleanse the mouth in cases of aphthous stomatitis. It is a safe domestic remedy, since it is only moderately soluble in water (1-256) and hence not apt to be used in excessive strength.

BORING TOOLS AND MACHINERY
The simplest implement for boring holes in wood is the awl, which displaces the fibres of the wood and leaves a hole without removing the wood

to any great extent. For boring small holes of larger size than can be easily bored with awls, gimlets are employed. A gimlet has a conical screw point followed by a spiral groove for clearing the hole and is fitted with a wooden or metal cross handle or with a square shank for insertion into a bitstock or brace. For boring larger holes than can be bored with gimlets, augers and bits are employed. These tools are too familiar to require description. Bits and augers are operated by hand by means of bit braces or bitstocks, or by some simple mechanism operated by power. In recent years pneumatic boring machines have come into extensive use for wood boring in car-shops, shipyards, and other places where large amounts of heavy boring are done. These machines are fully described under PNEUMATIC TOOLS. In boring holes in metal and rock the drills used are different from those employed in wood working, they will be found described under METAL-WORKING MACHINERY AND DRILLS.

BORIS GODUNOFF, bô-rës' gô'du-nôf' A

BRACE AND BITS

1, Ring bit, 2, 3/4 inch gimlet bits, 4, auger bit, A, ratchet brace

play by Pushkin based on the life of the Russian ruler of that name. See GODUNOFF.

BORIS GODUNOFF. An opera by Moussorgski (q.v.), first produced in St. Petersburg, January 24, 1874; in the United States, March 19, 1913 (New York).

BORISLAV. See BERISLAV.

BORISOVKA, bô-ré'sôf-ka. A town in the government of Kursk, Russia, situated about 120 miles south of the town of Kursk. It has a considerable tanning industry and holds five fairs annually. In the vicinity is situated the Tikhvin-Borisov Convent, founded by Count Sheremetiev in the eighteenth century, and the house which Peter the Great occupied during the war with the Swedes. Pop., 1897, 16,400.

BORISSOGLEBSK, bô-ré'sô-glêpsk' (in honor of the two canonized princes, Boris and Glib). The capital of a district in the government of Tambor, Russia, on the left bank of the Vorona, 110 miles southeast of the city of Tambor, and 424 miles southeast of Moscow (Map: Russia, F 4). It is an active commercial town, with good harbor, and contains, among other educational institutions, a school for railway mechanics. Borissoglebsk is in direct communication with ports on the Sea of Azov and Black Sea by means of the waterways of Vorona, Khoper, and the Don, and is connected by rail with Tzaritzin and the territory on either side of the Volga, on the one hand, and with the ports on the Baltic on the other. Grain, timber, kerosene, fish, caviar, watermelons, for St. Petersburg and Moscow, and salt from the lakes of Astrakhan, pass through Borissoglebsk. Rafts and barks are built here annually and are laden with goods for Rostov and Taganrog. Borissoglebsk was founded in 1646 for defense of the frontiers against the incursions of the Crimean Tatars. Pop., 1885, 13,000; 1897, 22,370.

BORISSOV, bô-ré'sôf. The capital of a district in the government of Minsk, Russia, on the Beresina, 50 miles northeast of Minsk, near the place where Bonaparte's army crossed the river Borisov in 1812 (Map: Russia, C 4). There is trade in cattle and grain, and flour mills, breweries, and tobacco factories are the chief industrial establishments of the town. Borissov is known to have existed in the twelfth century and came into the possession of Russia in 1795. Pop., 1897, 14,931, including about 10,000 Jews.

BÖRJESON, bër'ye-son, JOHAN HELENUS LAURENTIUS (1836-1910). A Swedish sculptor. He was born in Tolö, Holland, and studied in Rome and Paris until 1879, when he returned to Stockholm. In 1882 he was appointed associate, and in 1886 full professor, in the academy at Stockholm. His works include genre and ideal subjects, and portrait statues of various sizes. The following are among the principal ones: "The Bowler" (Göteborg Museum); "Youth with a Tortoise" (National Museum, Stockholm); the colossal statues of Holberg at Bergen, of Axel Oxenstierna in the House of Lords, Stockholm, and of King Charles X. Gustavus at Malmö (1896), his masterpiece, and the equestrian statues of Magnus Stenbock (1901, Helsingborg) and Charles IX (1904, Göteborg). His works vary in quality, but the best are full of energy and strength.

BÖRJESSON, bër'ye-sôn, JOHAN (1790-1866). A Swedish poet and dramatist, born in

the parish of Tanum. He studied theology at the University of Upsala and in 1828 became pastor of Weckholm. He published two volumes of poems, *Karlels och goesi* (1849) and *Blommor och tårar på en dotters graf* (1854); but his reputation came first with his tragedies, clearly under the influence of Shakespeare. Of these, *Erik den Fjortonde* ('Erik the Fourteenth,' 1846) is his best, accessible in the German rendering of Winterfeld (1855). His collected works were edited by Dietrichson (Stockholm, 1873-74).

BORLAND, SOLON (1811-64). An American soldier and politician. He was born in Virginia, but early removed to Arkansas. He served as major of volunteers during the Mexican War, was in the United States Senate from 1849 to 1853, and in 1853-54 was Minister to Central America. While returning to the United States (1854), the inhabitants of Greytown tried to arrest him for having aided an accused person, and, by order of the United States government, the town was bombarded by Commander Hollins. In the spring of 1861, before his State had seceded, he organized a body of troops, and, in the name of the Southern Confederacy, took possession of Fort Smith, Ark. Later he was made a brigadier general in the Confederate army.

BORLASE, bôr'las, WILLIAM (1695-1772). An English antiquary, born at Pendeen. He graduated at Exeter College, Oxford, and in 1720 was ordained priest. In 1722 he became rector of Ludgvan, and in 1732 he received the vicarage of St. Just. He was a close student of the antiquities and natural history of Cornwall, and published as the first result of his researches the essay on *Spar and Spary Productions* (1750). His most important work was his *Antiquities of Cornwall* (1753)—a collection of learned and original essays, followed in 1756 by *Observations on the Ancient and Present State of the Islands of Scilly, and their Importance to the Trade of Great Britain*. He published, in 1758, a *Natural History of Cornwall*. He was a friend of many contemporary men of letters, including Pope, for whose Twickenham grotto he supplied most of the mineral and fossil decorations.

BORMANN, bôr'mân, EDWIN (1851-1912). A German poet and song writer. He was born in Leipzig, and educated at the Polytechnic School, Dresden, and the universities of Leipzig and Bonn. His first literary work was a series of humorous sketches in the Saxon dialect, contributed to the *Fliegende Blätter*. He is also the author, in High German, of a book of humorous songs, entitled *Seid umschlungen Millionen* (1879), and also of *Schelmeheder* (1883); *Das Buchlein von der schwarzen Kunst* (1886); *Liederhort in Sang und Klang, in Bild und Wort* (1888), *Klingsinsland* (1891); *Das lustige Buch* (1900); *Ut de Franzosenlîd*, a comedy (1905). After 1894 he published several books in defense of the theory that Shakespeare's works were really written by Francis Bacon.

BORMANN, bôr'mân, EUGEN (1842-). A classical philologist, professor of ancient history and epigraphy in Vienna, author of *Pastorum Civitatis Tauromenitanæ Reliquiæ Descriptæ et Editæ* (1882); *Inscriptiões Emilieæ Etruriæ Umbriæ Latine* (1888). He is also a corresponding member of the Imperial Academy of Sciences, Vienna, and was one of the assistant editors of the *Corpus Inscriptionum Latinarum*. In 1885 he wrote with O. Benndorf

the *Archäologisch-epigraphischen Mittheilungen des Oesterreich-Ungarn*

BORMIO, bôr'mê-5 (Ger Worms). An antiquated town in the province of Sondrio, north Italy, 4020 feet above the sea, in the upper valley of the Adda, at the south entrance of Stelvio Pass (q.v.) (Map Italy, E 1). The nearest railway station is at Sondrio, 44 miles to the southwest, which is 25 miles east of Colico, on Lake Como. Two miles northwest of Bormio are the New Baths (Bagni Nuovi di Bormio), 4380 feet above the sea. They are supplied through pipes by springs, some 400 feet higher, which were mentioned by Pliny and by Cassiodorus. The baths are frequented by tourists, especially during July and August. The old Roman baths (*piscinae*) hewn in the rock can still be seen. Pop. 1881 (commune), 1800, 1901, 1814, 1911, 2126. Consult Kilha, *Rhätische Kurorte und Mineralquellen* (Chur, 1883).

BORN, bôrn, BEERTRAND DE (1140-1215). A French soldier and troubadour. He was born at the castle of Born in Perigord. He fought with his brother for the family possessions and defeated him. But Richard I sided with his brother and deprived Born of them. He is generally represented as a breeder of dissensions and especially as embittering the strife between Henry II of England and his sons. Dante refers to this in the *Inferno* (xxviii). Late in life Born entered the monastery of Dalon, and is supposed to have joined the Cistercian Order. He wrote some poems of love and war which breathe a spirit of passion. There are two editions of his works edited by Albert Stimming (Halle, 1879) and A. Thomas (Toulouse, 1881). Consult for an interesting but not entirely trustworthy account, Hewlett's novel, *Richard Yea-and-Nay* (1900), E. Magne, *Bertrand de Born* (Paris, 1904), R. de Baysson, *Etudes sur Bertrand de Born* (Paris, 1902).

BORN, bôra, IGNAZ VON (1742-91). An Austrian mineralogist and metallurgist, born in Karlsburg, Transylvania. He studied law in Prague and went into the Department of Mines there in 1770. In 1776 he went to Vienna and took charge of the Imperial mineralogical collections. Against much opposition he succeeded in substituting amalgamation for smelting and cupellation for extracting silver from the ores in the mines of Hungary, and also introduced other practical improvements in mining, salt working, and chemical bleaching. His works include *Ueber das Anquellen der Erze* (1786), *Lithophylacium Bornanum* (2 vols., 1772-75), *Bergbaukunde* (2 vols., 1789-90), and satires against the Jesuits.

BORNE, bôr'ne, LUDWIG (1786-1837). A German political pamphleteer and satirist, born in Frankfurt-on-the-Main, son of a Jewish banker. According to his father's wishes he studied medicine at Berlin, Halle, and Heidelberg, where he turned rather to political economy and the science of government, which latter studies he also continued at Gießen. After a few years' work as a government official in Frankfurt he began his career as an author with several pamphlets in the interest of the Frankfurt Jews. Already estranged for some time from his kin, he renounced his Hebrew faith and name, Lob Baruch, in 1818. He then published various political journals that were successively suppressed, of which the best known is *Die Wage*—*Blätter für Bürgerleben, Wissenschaft und*

Kunst (1818-21). He was an able and caustic critic of the political condition of Germany, and after the *Wage* was discontinued (1821), led a restless life in Paris, Heidelberg, Frankfurt, Berlin, and Hamburg. After the July Revolution he returned to Paris (1830), where he reestablished *Die Wage* under the French title of *La Balance*, for the purpose of promoting a closer intellectual union between France and Germany. He is now best remembered for his dramatic criticism and for a bitter controversy with his fellow exile Heinrich Heine. His collected *Works* (12 vols.) appeared in 1863. His best-known satire is *Maximal der Franzosenfresser* (1837). His *Denkrede auf Jean Paul* (1826) is famous for its beauty of thought and style. Consult Heine, *Ueber Borne* (Hamburg, 1840), Holzmann, *Leben Bornes* (Berlin, 1888), Bundes, *Das Junge Deutschland* (Leipzig, 1890), L. Geigier's editions of his *Berliner Briefe* (Berlin, 1905), and *Bornes Briefe an Henriette Herz* (Oldenburg, 1905).

BORNEENE. See BORNEOL.

BORNEIL, bôr'nâ'y, GRAUD DE. A French poet belonging to the close of the twelfth century. He was born at Exideuil (Dordogne) and won high rank for his verses. Mention is made of him in the *Purgatory* by Dante, who also, in the *De Vulgari Eloquio*, classes him with Arnaut Daniel and Bertrand de Born. His patrons included Richard I of England (Cour-de-Lion), Alfonso VIII of Castile, and Pedro II of Aragon. Of his work there have been preserved 82 specimens, many satiric, most of them obscure.

BORNEMANN, bôr'ne-man, FERDINAND WILHELM LUDWIG (1798-1864). A German jurist and statesman. He was born in Berlin and studied jurisprudence there. In 1843 he became Minister of Justice in the Camphausen ministry, and in the same year second president of the Superior Court at Berlin. In 1849 he was elected to the First Chamber of the Prussian Diet, and in 1860 he became a member of the House of Peers. He is known as one of the most eminent authorities on Prussian civil law, of which his *Systematische Darstellung des preussischen Civilrechts* (6 vols., 1834-39) was the first adequate presentation. He also wrote *Die Rechtentwicklung in Deutschland und deren Zukunft* (1856).

BORNEO (corrupted from *Brunei*, Malay *Burni*, *Burni*, a district, the island having no comprehensive native name, though sometimes called *Pulo Kalamantan*, after one of the native fruits). The third largest island in the world, only Greenland and New Guinea exceeding it in area (Map East Indies, D 4). It is situated in the East Indian Archipelago between 7° 3' N and 4° 10' S lat and 108° 53' and 119° 22' E long. It is bounded on the north by the South China and Sulu seas, the latter separating it from the Philippine Islands, on the east by the Celebes Sea and Strait of Macassar, which separate it from Celebes, on the south by the Java Sea, which separates it from the island of Java, and on the west by the southern part of the south China Sea, which separates it from Malacca and Sumatra, and by Karimata Strait. It is 780 miles long and 690 miles wide, has an area of 293,500 square miles, a length of coast line of about 3230 miles, and its population is estimated (Meyer) at 1,737,000. The interior of the island is still inadequately explored, but some of its leading features are known more

or less definitely. Extending in a generally northeast direction from Kendawangan near the extreme southwest of the island to the neighborhood of Labuk Bay on the northeast coast are mountain ranges usually closely connected but bearing different names, as the Schwaner, Muller, and Iran mountains. This line of highlands forms the largest water-parting between the drainage systems of the island, the rivers to the west of it reaching the sea on the west coast and those to the east of it on the east or southeast coasts. About two-fifths of the island lies to the west and three-fifths to the east of this natural dividing line. In the central part of the island and on this line of ranges is Batoe Tiban, a mountain 5617 feet high, which may be called the nucleus of mountain systems radiating to the west, east, and southeast, the other two limbs of these radiating ranges being the ranges above referred to as crossing the island in a northeast to southwest direction. The island is thus divided by these radiating highlands into six drainage areas, in most of which are a considerable number of distinct river systems.

None of the mountains attains great elevation. The highest summit is the granite Mount Kinabalu (13,700 feet) in the northwest part of the island. It is the giant among the mountains of the entire archipelago. The Schwaner Mountains form a highland of from 3300 to 6000 feet in height. The Iran Mountains are the dividing line between the British territory of Sarawak and Brunei in the west and the Dutch district Tidoeng in the east. In the west are a few small volcanic cones, but the island has no active volcanoes.

Borneo stands upon a submarine plateau of no great depth. Its coasts, on the whole, are flat and marshy. The rainfall being heavy, the rivers are numerous. Those of the territory of British North Borneo are of little importance, because the mountains they cross are near the coasts, so that the rivers fail to afford navigable connections with the sea. All other parts of the island are well supplied with useful waterways, and the greater part of the population live near them. Two important rivers, the Baram and the Rejang, and many smaller streams drain the territory of Sarawak. All the other leading rivers are in Dutch Borneo, the northeastern division being drained principally by the Balungan River, or Batang Kayan, the southeastern by the Kotei and Banjarmasin rivers; and the southwestern by the Kapuas, which is the largest of all the rivers, having a course of about 700 miles from the centre of the island to its southwestern side. While the intersection of the two principal mountain chains is very nearly in the centre of the island, the southern half of it is so much wider than the northern that the southern rivers have much longer courses and therefore are serviceable to much larger areas. It is also important to note that all these rivers have their sources not far from the intersection of the two principal mountain chains near the centre of Borneo—the Batang Kayan, flowing east-northeast, the Kotei southeast by east, the Banjarmasin south, the Kapuas a little south of west, the Rejang west, and the Baram north-west. The movement of the population has always chiefly followed these highways.

All the larger rivers are navigable by small steamers for many miles above their mouths; thus a large steam launch can ascend the Rejang for 160 miles, the Baram for 120, and some of

the rivers on the Dutch side for still greater distances.

The land adjoining nearly all of the coast is a belt of low-lying swamp consisting of alluvium brought down by rivers from the central islands. In many places this belt of alluvium is 50 miles wide and is especially extensive in the south and southeast of the island. Between the swampy coast belt and the mountains is a zone of irregular hill country, with an average height of about 1000 feet above the sea, peaks occasionally rising to 5000 feet or more.

The coast of Borneo is, in the main, indented only by open bays. It has a considerable number of islands, the chief of which are Labuan on the northwest coast, Banguey on the north coast, Laot on the southeast coast, and Maivang on the southwest coast.

While the geology of Borneo is very imperfectly known, it may be said that the mountain ranges forming the backbone of the island are mostly crystalline schists, slates, sandstones, and limestones. The low-lying country between the mountain ranges is largely covered by Tertiary and Quaternary deposits. Economically the most important formations are the coal deposits of the Tertiary period, and they show the remains and much of the detailed structure of the luxuriant vegetation of this period. The chief products of the rich mineral deposits are gold, diamonds, silver, platinum, mercury, tin, and antimony, to which must be added petroleum, sulphur, rock salt, marble, rock crystal, and porcelain clay. Most of the streams appear to be auriferous.

At a comparatively recent date Borneo was probably continuous with the mainland of Asia. The submarine bank upon which it stands is nowhere more than 600 feet below the surface. That the separation was effected in a recent geological period seems to be shown by the presence in Borneo of many Asiatic mammals, such as the rhinoceros, elephant, wild cattle, several species of deer and pig, the tiger cat, numerous bats, squirrels, and two of the anthropoid apes which are incapable of crossing even narrow channels of water and must be regarded as related to the anthropoids whose fossil remains have been discovered in Asia.

The climate of the island is warm, moist, and very equable. The rainfall is copious throughout the year, but heaviest during the northeast monsoon from October to February, and least in April and May. At Kuching the average annual rainfall for 30 years has been 160 inches, the maximum 225, and the minimum 102 inches. The greatest rainfall recorded in one day was 15 inches. The temperature ranges between 70° and 90° F. and rarely reaches 100° F. Snow and frost are unknown except occasionally on the tops of the highest mountains. The climate is, however, trying on account of the great humidity of the air. There is no actually dry period, such as occurs farther from the equator, except for accidental droughts. The lowland climate is unhealthful for Europeans. The winds partake of both trade and monsoon characteristics.

The rich fauna of Borneo belongs to the Malayan subregion of the Oriental region of Wallace and indicates past connection with the continent. Of the mammalia, the most typical are the apes and monkeys (the orang-outang and proboscis monkey), the elephant, rhinoceros, and tapir in limited areas, the honey bear, wild cattle, wild pigs, deer (especially the "mouse

deer"), flying lemurs, the feather-tailed tree shrew, and several members of the cat family. Birds are numerous. The avifauna includes, among other birds, various hornbills, the argus pheasant, and the edible-nest swallow. Snakes are common, and in the waters of the lower regions dangerous crocodiles abound. The coast and inland waters abound in fish, some of which are dried and form an article of export. Butterflies are very numerous and exceedingly beautiful, beetles, while abundant and of many species, are not so prominent. Insect pests are very annoying, mosquitoes and sand flies in the air, fire ants on the ground, and leeches in the waters.

Practically the whole of Borneo, from the sea-coast to the summits of the highest mountains, is covered with dense forest. The vegetation of Borneo is rich in species and luxuriant in growth. In the flooded regions the vegetation consists of tangled and matted reed and bush growth, which presents a marked contrast to the forests of the adjacent dry lands. Upward of 50 kinds of trees furnish timber, among them are the mohor, tappau, ironwood, ebony, sandalwood, and teakwood. Various trees furnish saps, gums, and resins, such as gutta-percha, camphor, and dragon's-blood. Numerous palms flourish, among others the useful fan, coconut, and sago palm. Spices, nuts, and numerous tropical fruits are produced in profusion. Sugar cane, cotton, and tobacco are cultivated extensively. In the mountain region rhododendrons grow in profusion, and ferns, orchids, and clinging plants are common, the huge pitcher plants, deserving special mention.

Politically Borneo is divided into British Borneo and Dutch Borneo, the two being separated by the mountain barrier which extends from the central west coast in a northeasterly direction nearly across the island. British Borneo consists of the state of North Borneo, Brunei, and Sarawak. The state of North Borneo occupies the northern part of the island, and extends from the Sipitong River, which flows into Brunei Bay, on the northwestern coast, to the shore of St. Lucia Bay, on the northeastern coast, in 4° 10' N lat. It has an area of 31,106 square miles and a coast line of about 900 miles. The inhabitants are mainly Bruneis, Ilanuns, Bajaus, and Sulus on the coast and Dusuns and Muruts in the interior. The total population in 1911 was 208,183, of whom some 26,000 were Chinese and 355 Europeans. The chief town and seaport is Sandakan (pop. with suburbs, 12,000 in 1911), situated on a harbor of the same name, on the northeastern coast. Kudat, Gaya, Papar, and Silam are important stations. While this territory is held and administered by the British North Borneo Company, yet since May 12, 1888, the British government has exercised a formal protectorate over it.

The chief products are timber, tobacco, rice, sago, coffee, spices, gums, and sea and jungle produce. Imports and exports in 1911 amounted to 4,603,071 and 4,836,795 Straits Settlements dollars, respectively. The government issues its own paper notes and copper coinage, accounts being kept in Straits Settlements dollars and cents. Revenue and expenditure in 1911 were 1,366,768 and 829,251 dollars (exclusive of 574,385 dollars expended on railway construction and other public works).

When the Singapore-Labuan-Hongkong cable was completed in 1894, a cable (about 10 miles

long) was laid to connect Mempakol, on the west coast of the mainland, with Labuan (Labuan in 1907 was annexed to the Straits Settlements). Connecting with the cable, the telegraph was constructed to Beaufort, whence lines now extend to Jesselton and Kudat, to Sandakan and Lahat Datu, and to Brunei Bay. Total telegraphs open, over 700 miles. A railway is in operation from Brunei Bay to Beaufort (20 miles), from Beaufort to Jesselton (57 miles), and Beaufort to Tenom (33), railway in operation, including all branches, 130 miles. At Jesselton there is a steel jetty at which vessels of 2000 tons can load and discharge cargo.

Brunei (Borneo) lies southwest of British North Borneo, occupies the coast as far west as Baran River, covers an area officially estimated at 4000 square miles, and has a mixed population of about 30,000. Its chief town is Brunei (pop. 10,000). It is governed by a sultan of Brunei, but is under British protection. Brunei has been called the "Venice of the East." Its trade is of little importance, the chief article of export being sago.

Sarawak lies southwest of Brunei and extends along the northwestern coast of Borneo for a distance of about 380 miles, from Cape Baram to Cape Datu. Its southern limit is the watershed of the Krumbang and Klinkang mountains. It covers an area estimated at 42,000 square miles and has a mixed population of about 500,000. The chief town and capital is Kuching, with a population of about 25,000, 23 miles from the coast, on the Sarawak River. Sibn, on the Rejang River, which is navigated for some distance by large steamers, is another important town and has a large population of Chinese traders. The territory is governed by a rajah (of the English Brooke family), but is under British protection. Commercially Sarawak is of considerable importance, the import trade in 1911 amounting to 5,666,441 Straits Settlements dollars, and the export to 7,132,926. The revenue and expenditure in 1911 were 1,420,420 and 1,341,761 dollars, respectively, the revenue being derived from both import and export duties and various personal taxes. The chief products are tobacco, sago, rice, gums, coffee, spices, jungle produce, and dried fish. Coal is abundant, and the precious metals, diamonds, and mercury are found. The gold export increased from 23,685 dollars in 1898 to 1,839,956 in 1905, and then decreased to 992,915 dollars in 1911. Both the Church of England and the Roman Catholic Church have established missions and built churches. Several schools have been established at Kuching.

Dutch Borneo, which occupies the southern and most of the eastern part of the island, has a coast line extending from St. Lucia Bay (lat. 4° 10' N) in northeast Borneo to Cape Datu on the west coast. It has an area of about 213,645 square miles and a population estimated in 1905 at 1,233,655. The country is divided into two outpost provinces—West Borneo and South and East Borneo. In 1905 the estimated population of West Borneo was 450,929, of whom 400,332 were indigenes, 48,348 Chinese, 1342 Arabs, 374 Europeans, and 533 others. South and East Borneo, 782,722, of whom 772,532 were indigenes, 1714 Chinese, 1799 Arabs, 1008 Europeans, and 213 others. By religion the indigenes in West Borneo and in South and East Borneo, respectively, were reported as follows: Mohammedan, 171,741 and 657,575, Animistic, 111,990

and 84,217; Christian, 62 and 1985; no specific religion, 116,539 and 28,755. The Dutch govern the country, so far as possible, through the native rulers. West Borneo embraces the valley of the Kapuas, and has great mountain ranges on the northern and southeastern boundaries; on the coast it extends from Cape Datu on the north to Cape Sambur on the south. It has an area of 56,060 square miles. The chief city is Pontianak, on the Kapuas River. Sambas, Sintang, and Sukadana are important towns. The exports amount to over a million and a half dollars a year. The chief of these are copra, gutta-percha, rattan, and coconut oil. South and East Borneo, which extends from Cape Sambur to St. Lucia Bay, and occupies the southeastern half of the island, has an area of 157,585 square miles. The chief city and capital is Banjarmasin. Other important towns are Kotarigin in the southwest, Matapura in the south, Pasir in the southeast, Tangarung, Somarinda, and Koti in the east, and Gunung Tebui in the northeast. The regions best known and most densely populated are in the south and west. North of the Pasir River the interior and even the coast is but little known. The chief exports are gutta-percha and rattan.

Inhabitants.—Although the vast extent of the island, with its numerous cave and other shelters, shell heaps, etc., has not been completely explored, the human remains and evidences of man's industry so far discovered go to prove that man is a much less ancient resident than in Java and Sumatra. The native population, recent immigrants of other races like the Arabs and Chinese excluded, belong, as their languages show, without exception, to the Malayan family. It is possible, but not certain, that at one time Borneo was peopled by the Negrito race; for though no communities of this race now exist, individuals from the northern districts suggest an infusion of Negrito or Negroid blood. The interior and certain portions of the coast are peopled by the Dyaks (nomadic and sedentary, land and sea Dyaks, the farther away from the coast the less mixed with other Malayan peoples, Chinese, etc.), the best-known aborigines of the island. A great part of the coast region is controlled by Malays, the descendants of colonists from the peninsula of Malacca, the islands of Java, Sumatra, and other islands of the great East Indian Archipelago, Bugis from Celebes, and, in the extreme north, Suluans from the Sulu Archipelago in the Philippines. The Malays and the Bugis are the more civilized classes and are more devoted to trade, commerce, and a sedentary life; and it is from the Malay state of Brunei, north of Sarawak, that the island has received its name. The Malays profess Islam, the Dyaks, those of the interior especially, retain much of their primitive shamanism and nature worship. Borneo has been the classic land of the "head-hunter," and here are to be found many other curious Malayan customs. It is also the home of a species of blowgun and the poisoned arrows that belong with it. The simplest culture is possessed by the Punans, who alone of all the natives do not plant rice, but collect wild fruits and hunt game. Their main industries are matting and basketry, other manufactured objects being obtained from the more civilized tribes through barter.

Borneo was first discovered by Europeans in the early part of the sixteenth century, when

both the Portuguese and Spaniards visited it. The Portuguese soon established commercial relations with the natives. In the latter part of the century the Spaniards also entered upon similar relations. Neither of these European peoples, however, had any very marked influence on the country. The Dutch began trading in Borneo in 1604, and five years later the English appeared and gained a foothold in the south, which they held for nearly a century. In the early part of the eighteenth century the Dutch forced the English out of this section, but about the middle of the century the latter reappeared in the northern part. Then, after a lapse of about 25 years, the English influence waned for half a century, to be renewed in the early part of the nineteenth century, chiefly through the activity of Sir James Brooke. Meanwhile the Dutch slowly but surely strengthened their position in the southern and eastern parts of the island, by affiliating their governing officers with the native chiefs, through whom they controlled the people.

The only portion of Borneo which has yet been developed to any extent is the British. By 1888 the territory of the British North Borneo Company became a British protectorate, although still under the control of Rajah Brooke's family (q.v.). A few years later this domain was greatly enlarged by cessions made by the Sultan of Brunei. This brought about a native rebellion headed by Mat Saleh which assumed such large proportions that in 1900 a considerable military expedition was found necessary to expel him. Great trouble has been caused of late years by the exploitations of the great rubber companies, and it is feared that when Rajah Brooke's nephew dies the natives will lose what protection they now have. In 1913 the boundary between the British and Dutch territory was finally determined.

Nieuwenhuis, *Quer durch Borneo*, vol. i (Leyden, 1904); Hose and McDougall, *The Pagan Tribes of Borneo* (London, 1912).

BORNEO CAMPHOR. See BORNEOL.

BORNEOL, $\text{b}^{\text{or}}\text{n}^{\text{e}}\text{-ol}$, or BORNEO CAMPHOR ($\text{C}_{15}\text{H}_{26}\text{O}$). A substance often used as a substitute for common or Japan camphor. It is a crystalline organic compound, similar to common camphor, but having an aromatic, pepper-like odor. It sinks in water and is thus readily distinguished from common camphor. Borneol is obtained chiefly from the *Dryobalanops camphora*, growing in Borneo and Sumatra. It is one of the constituents of oil of rosemary and occurs in the rhizome and roots of the *Valeriana officinalis*. It can be produced by reducing common camphor with nascent hydrogen. The hydrocarbon Borneene ($\text{C}_{15}\text{H}_{24}$) is obtained by distilling borneol with anhydrous phosphoric acid.

BORNET, $\text{b}^{\text{or}}\text{n}^{\text{e}}\text{-}^{\text{e}}$, JEAN BAPTISTE EDOUARD (1828-1912). A French botanist, born at Guérigny (Nièvre). He studied medicine in Paris, and botany, especially fungi, under the direction of Tulasne (q.v.) and Leveillé. Afterward he accompanied Thuret to Cherbourg, where he devoted his attention chiefly to the study of

marine algae, with which several of his books deal. His works, in some of which he collaborated with Thuret, include *Recherches sur la structure de l'alghe pubescens* (1852), *Recherches sur la fécondation des Floridées* (1867), *Recherches sur les gonidies des Lichens* (1873), *Notes algologiques, recueil d'observations sur les algues* (1876-80), *Revisions des Nostocacees hétéocystées*, in collaboration with Flahault (1886-88), *Les Algues de Schönsboe* (1892).

BORNHOLM, *börn'hölm* (anciently, *Borgundarholmi*, Burgundians' Island, from Old Norse *hölmr* Ger. *Holm* Eng. *holm*, an islet). An island in the Baltic Sea, belonging to Denmark and situated 90 miles east of Zealand, in lat 55° N, long 15° E. Area, 223 square miles (Map Denmark, G 2). Most of the island consists of granite and gneiss and forms a plain about 270 feet above the sea, with coal on the west coast, and a fine grade of porcelain clay used for industrial purposes. The inhabitants carry on successfully agriculture and cattle raising and the manufacture of porcelain ware. The capital, Rønne, on the west coast, has over 8000 population and is connected by a railroad 23 miles long with Nekso on the east coast. There are four other small towns, but most of the people live on their farms. Population, over 41,000. Independent prior to 1000, the island became a Danish possession, subsequently belonging to Lubeck in the sixteenth century and to Sweden in the seventeenth century, but was returned to Denmark in 1660.

BORNIER, *boi'nyá'*, HENRI, VICOMTE DE (1825-1901). A French poet and dramatic author. He was born in Lunel (Hérault), Dec 27, 1825, and after studying at Montpellier, and elsewhere, went to Paris to become a law student. About the same time he published his *Premières feuilles* of verse and the *Comédie Française* accepted his play, *Le mariage de Luther* (1845). He received a post at the Bibliothèque de l' Arsenal, where he rose successively, till in 1880 he became its administrator. Among his dramas are *Le monde renversé* (1853), *Dante et Béatrice* (1853), *Agamemnon* (1868), *La fille de Roland* (1875), *L'apôtre* (1881), *Mahomet*, which, though received at the Théâtre Française, was in 1890 forbidden representation, at the request of the Turkish Ambassador, and *Le fils de l'Arétin* (1895). He was the author of numerous other publications in verse and prose and was critic of the *Nouvelle Revue* from 1879 to 1887. His poems on *L'Isthme de Suez* (1861) and *La France dans l'extrême Orient* (1863), and his *Éloge de Châteaubriand* (1864), were crowned by the Academy. Among his novels are *La lieurdière* (1883) and *Le jeu des vertus, roman d'un auteur dramatique* (1885). In 1893 he was elected a member of the Academy.

BORNITE, or **PURPLE COPPER ORE**, PEACOCK ORE. A sulphide of copper and iron of variable proportions, the massive variety being probably a mechanical mixture with chalcocite (*qv*), the crystallized mineral carrying about 55 per cent copper. It occurs in isometric crystals, which, however, are comparatively rare. The common massive varieties have a granular to compact structure with a metallic lustre and are dark copper red, pinchbeck-brown or purple in color, tarnishing rapidly to iridescence. Bornite occurs in Cornwall, Chile, Peru, Bolivia, Mexico, Canada, at Bristol, Conn. and near Wilkesbarre, Pa. It is mined for copper.

BORNU, *būr nōw'* (from the tribe *Berauni*, *Bernūni*). Formerly a Sudanese native state, the greater portion of which (some 50,000 square miles) is now embraced in the northeastern end of Northern Nigeria, between lat 11° and 15° N and long 10° and 15° E, and bounded by Sokoto, the Sahara, Lake Chad, and the Shari River (Map Africa, F 3), while the remainder belongs to France and Germany. The surface is mostly level, with the exception of the southwestern part, where some of the mountains rise to an elevation of about 2000 feet. The climate during part of the year is excessively hot and unhealthful, the temperature not infrequently rising above 100° during the summer. The rainy season lasts from five to seven months, when malaria and other diseases are prevalent. The two principal rivers are the Shari and the Waube, both of which fall into Lake Chad. The soil is fertile, but the climatic tendency is to desiccation, and the desert is encroaching upon the northern border. Maize, millet, bailey, rice, various kinds of pulse, cotton, and indigo are grown. In former years slaves were very extensively dealt in, and exported to many countries, but slave raiding is now prohibited under severe penalties. At the head of the state was a sheik, who had absolute power and was assisted by a council. Bornu was divided into several provinces and had also a number of vassal states and dependencies. There was an army of about 5000 men. The native capital was transferred in 1908 from Kuka (*qv*), with a population of about 60,000, to Maidugari, where a native *sheik* is enthroned. A British resident administers the British territory. The population of Bornu is estimated at 5,000,000 and consists of a number of mixed negro races. The bulk of the population are known as the Bornuese, or Kanuri, a Mohammedan tribe of mixed negro and Berber blood. The territory of Bornu was invaded in the twelfth century by the Mohammedan ruler of Kanem. After 200 years of warfare the aborigines were either extirpated or completely subjected, and from 1533 a line of kings ruled over the country. Bornu was at the height of its power at the close of the sixteenth century, when its western frontier extended to the Niger River. After 1600 it underwent a rapid decline. In the beginning of the nineteenth century it was conquered by the Fellatahs, whose yoke, however, was soon shaken off, under the leadership of a fanatical fakir, named Mohammed el Kanemi, whose services were called in by the Sultan. Mohammed founded the town of Kuka and ruled there under the title of "Sheik," while the Sultan enjoyed only nominal power. Mohammed's son, Omar, became Sultan as well as Sheik. In 1882 Omar was succeeded by the Sultan Abu Bekr. Our knowledge of the country (though scant) is due to the travels of Barth, Nachtigal, and subsequent British, French, and German explorers.

BORO BUDDOR (Hind Great Buddha). The ruin of a Buddhist temple in Java, residency of Kadu, regency of Magelang, and district of Minoreh, near the junction of the Ello and Progo. It is the most elaborate monument of the Buddhist style of architecture anywhere existing. The building of Boro Buddor is assigned to the seventh century. It is a pyramid of a square form, each side of the base measuring 600 feet, and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running

round the building. The walls are richly ornamented with statuary. Outside are niches, each of which is occupied by a statue of Buddha, larger than life, with the legs crossed under the body. The number of these figures is about 400. Between each two of these are bas-reliefs representing Buddha in the same attitude, besides architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bas-relief encircling the whole building, representing scenes from the life of Buddha and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, seated figures, and architectural designs. The whole is a splendid artistic epitome of Buddhism just before its decline. The five lower concentric terraces are on a square plan and may represent a Buddhist *vihara* (q.v.), or monastery. The three uppermost terraces are circular and represent the *tops* (q.v.). They are surmounted each by a tier of small domes, 72 in all, each containing a statue of Buddha; while in the centre, rising high above everything else, is the large dome or pagoda (q.v.) for the relic of Buddha. Consult Playte, *Die Buddha-Legende in den Skulpturen des Tempels von Bôrd-Budur* (Amsterdam, 1901).

BORODIN, b'ô'rô-dîn', ALEXANDER PORFIRYEVICH (1834-87). A Russian composer and chemist. He was born in St. Petersburg, of a very ancient family. He studied medicine and chemistry at the Medico-Surgical Academy, practiced medicine for a while, and, being appointed to the chair of chemistry at his *Alma Mater*, went abroad to prepare for his duties. It is claimed that, during his studies in Paris, Heidelberg, and Italy, he had anticipated Wurtz in the discovery of aldol. In all, he wrote 21 articles and monographs of importance. During the Liberal movement of the sixties (see RUSSIAN LITERATURE) he espoused the cause of university education for women in Russia, and from 1872 till his death gave gratuitous instruction in chemistry at the Medical School for Women, opened by Professor Rudnyeff and Madame Farnoskaya. Amid his arduous professional duties he found time for composition as a recreation only. His musical studies had begun quite early. At nine he played on his piano the music performed by regimental bands, and at 13 wrote a concerto for the flute. With a friend he played over all the symphonies of Beethoven, Mozart, and Haydn in arrangements for four hands. Besides, for chamber music, Borodin learned to play the 'cello, and his friend the violin. Later he joined the circle of Balakireff (q.v.) and took up music seriously. While abroad he met Liszt, who later classed him as one of the greatest musicians of the age and made his works known in western Europe. He wrote his first symphony in 1862-67, and then in 1869 began the opera *Prince Igor*, on a libretto based on the epic *Prince Igor's Band* (q.v.), but soon left the work and utilized the composed parts for his second symphony (1869-70), the so-called "heroic." He then resumed work on the opera, which, however, was still unfinished at his death. It was orchestrated and finished by Rimsky-Korsakoff (q.v.) and Glazunoff (q.v.) and scored an enormous success at its first performance in November, 1890. He also wrote two string quartets besides a score of songs, of wonderful lyric depth. His *In Central Asia* (1880), a "musical picture," is one of the mainstays of the concert room. Two movements of his third sym-

phony were reconstructed by Glazunoff, partly from rough draughts and partly from memory. Though a member of the Balakireff circle, Borodin could not give up the rounded forms of the classical opera. His talent was essentially melodic, and his cantilenas are stamped with breadth and power. The epic might and the Oriental coloring of his orchestration in *In Central Asia* hold a place among the most notable musical achievements in the field of programme music. Consult Habets, *Life and Works of a Russian Composer*, Eng. trans. by Rosa Newmarch (London, 1897).

BORODINO, b'ô'rô-dyê-nô'. A village of Russia, in the government of Moscow, about 70 miles west of the city of that name (Map: Russia, E 3). It is situated on the Kaluga, an affluent of the Moskva, and gave its name to the great battle fought between the French army under Napoleon and the Russians under Kutusoff, Barclay de Tolly, and Bagration, Sept. 7, 1812. The battle of Borodino was one of the most obstinate in history, and the loss on both sides was almost equally great. The struggle consisted chiefly in the attempt of the French to capture three lines of redoubts barring the way to the city of Moscow. These were thrice won and lost during the day. Out of 257,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but in the most perfect order and without the enemy's venturing to attack them. The Russians, therefore, have always regarded this battle as a victory, and in 1839 raised a fine mausoleum on the battlefield. To the French, however, certainly belongs the honor, as they not only remained on the field of battle, but soon after pushed on to Moscow. The French call it the battle of the Moskva, from the river of that name, and it gave Marshal Ney his title of Prince of Moskva. A magnificent description of the weird splendor and the horrors of the battle may be found in Count Leo Tolstoi's novel, *War and Peace*.

BORON (from *borax*, of which it is a component). A non-metallic element, which was isolated in 1808 by Gay-Lussac and Thénard in France and in 1809 by Sir Humphry Davy in England. Some of the compounds of boron were known to the ancients. The element is not found native, but occurs in combination in the following minerals: *sassolite*, a boric acid; *borax*, a sodium borate; *boracite*, a magnesium borate with magnesium chloride; and *ulecite*, a sodium and calcium hydrous borate. Boron was originally obtained by heating boric oxide with metallic potassium, then boiling the fused mass with hydrochloric acid to remove the soluble salts; while the residue, consisting of amorphous boron, was washed with water and dried. It can also be obtained by the electrolysis of fused boric oxide. As thus prepared, boron (symbol, B; atomic weight, 11.0) is an odorless, grayish-brown amorphous powder. It is a non-conductor of electricity and fuses only at a very high heat. It may be melted by placing it between the poles of a battery of 600 Bunsen cells. The specific gravity of amorphous boron is 2.45. A crystalline variety of boron was prepared by Wohler and Deville in 1856. It may be obtained by heating the amorphous variety for two hours with metallic aluminum to a temperature of from 1500° to 1600° C. Small monoclinic crystals are pro-

duced by this process, which, however, contain a small amount of aluminum. These crystals have been called *boron diamonds*, owing to their lustre and hardness, as they scratch both ruby and corundum. They have a specific gravity of 2.68. Boron is the only non-metallic element that forms no compound with hydrogen. Its principal commercial compounds are boric acid, boric oxide, and certain borates, especially borax.

BORORÓ A rapidly decreasing native American tribe inhabiting the region between upper Paraguay and upper Paraná. They are tall (m 174) and athletic and live by the chase, using bows of great length with arrows of cane tipped with bone or tooth. Polygamy prevails among them, with occasional polyandry. The institution of the "men's house" is known to the Bororó. The Bororó are fond of feather decorations, and practice ear and lip piercing. In the first half of the eighteenth century these Indians roved about the region of the Xingú-Araguaya watershed in central Matto Grosso. Branches of the Bororó are the Bororó da Campanha (Plains Bororó), Bororó Cabações (Bororó of the river Cabaçal), "Coroados" (Bororó of the river S. Lourenço). The decrease in numbers is due largely to conflicts (1876-80 and since) with the whites. Up to the present the Bororó language has been regarded as an independent stock, but recent studies of Rivet, etc., seem to indicate that it is a dialect of the adjacent Otukuan (Otuke) family. Consult Frié and Radin, in the *Journal of the Royal Anthropological Institute* for 1906, Chamberlain, in the *American Anthropologist* for 1912, and De Créqui-Montfort and Rivet in the *Journal de la Société des Américanistes de Paris* for 1913, also *I Bororós-Coroados del Matto Grosso-Brasil* (Turino, 1906), published by the Salesian missionaries, and Cook, in Smithsonian Institution, *Miscellaneous Collections*, vol. v, p. 50 (Washington, 1907).

BOROSA See **BARRÓSA**.

BOROUGH, bū'ró (AS *burh*, *burg*, Ger *Burg*, a fort, from AS *beorgan*, to protect.) In Great Britain, an incorporated municipality, either village, town, or city, having the right of returning one or more members to Parliament. Boroughs existed in England from the earliest times. According to the Domesday Book, there were 82 boroughs. Each of these had a market or an annual fair, was ruled by an elective officer, usually called the "portreeve," and had the privilege of a special borough court, which was independent of the larger divisions, known as hundreds and shires. The Normans utilized these units of government, supplanted the portreeves with officers deriving their authority directly from the throne. By the time of Henry VI the boroughs had generally become municipalities, with the power of government vested in the members of the principal guilds. During the same period the boroughs obtained the right of sending burgesses to Parliament. In course of time many of these boroughs decreased in population and became little more than names, but without losing their parliamentary representation, others came entirely under the control of members of the nobility and acted in elections only under such restraint. These two classes of boroughs received the names respectively of "rotten boroughs" and "pocket boroughs." Many of these were swept out of existence as regarded their parliamentary rights

by the Reform agitation, which culminated in the Reform Bill (q.v.) of 1832. The borough system of Scotland (see **BURGH**) is of even greater antiquity than that of England. A confederation of boroughs for purposes of mutual defense and the protection of trades existed in the reign of David I and was called a "Hanse."

In Connecticut, New Jersey, Minnesota, and Pennsylvania the term "borough" is applied to incorporated towns or villages of a lower grade than a city. William Penn's charter to the territory west of the Delaware River authorized him in 1681 to erect the country, among other divisions, into boroughs similar to those of England. This system of boroughs continues in Pennsylvania to the present time. In 1619 Virginia had 11 boroughs, the delegates of which sat in the House of Burgesses, but boroughs, as in incorporated towns, never obtained a footing in that State. The charter granted to Lord Baltimore entitled him to create boroughs in Maryland, but they were never so created. In New Jersey boroughs date back to the early part of the eighteenth century, but they were erected by special acts and without uniformity of system until 1818, when a General Borough Act was passed.

Greater New York, by an Act passed by the Legislature of 1897, was made a city, composed of five boroughs—Manhattan, the Bronx, Brooklyn, Queens, and Richmond. See **BURGH**.

BOROUGH ENGLISH (from Anglo-French *tenue en burgh englois* *tenue* in an English borough.) A curious custom that prevails in some parts of England, according to which the youngest son inherits real property in preference to his elder brothers. The name is a misnomer, as the custom is not distinctly English and was seldom found in boroughs. In mediæval England it prevailed widely as a frequent incident of villein tenure (See **VILLEINAGE**). The reason assigned for the custom by Littleton is that the youngest son, on account of his tender age, is not so capable as his elder brothers of maintaining himself. Blackstone, however, suggests, what is doubtless nearer the truth, that the custom is a survival out of the conditions of primitive society—a view which is strengthened by the sporadic occurrence of the custom in widely separated parts of the continent of Europe. Nothing is known of the social conditions under which ultimogeniture, or inheritance by the youngest born, originated, but it must have prevailed extensively at some early period of human history. There are other survivals of it, besides Borough English, in England as well as in other European countries, such as the preference of the youngest daughter or the youngest among collateral relations, as brothers, over the older sisters or brothers. See **GAVELKIND**, **INHERITANCE**, **PRIMOGENITURE**. Consult Blackstone, *Commentaries on the Laws of England*, Elton, *Origins of English History* (London, 1882), Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899), Robinson, *Gavelkind*, which gives instances of the occurrence of the custom in recent times.

BOROUGH JUSTICES Local justices in certain boroughs with the jurisdiction of justices of the peace, first appointed in the time of Charles I. Under the Municipal Corporations Act (1882, 45 and 46 Vict. c. 50), these justices consist of the mayor during his year of office, and for one year after it determines, the recorder *ex officio*, and such persons as the crown

may appoint by commission. Their duties cannot be delegated, and, before taking office, they are, like other English judges, required to take the oath of allegiance and the judicial oath. See **BOROUGH**; **JUSTICE OF THE PEACE**.

BOROUGH LAWS. In Scottish legal history, a code of ancient laws which have long ceased to have any force, but which serve to throw light on the ancient manners and customs of the country. The authenticity of the compilation was for a long time doubted, but has been established beyond question. It is supposed to have been made in the reign of David I, in the twelfth century. See **BRETTS AND SCOTTS**; and consult Erskine, *Principles of the Law of Scotland* (18th ed., Edinburgh, 1890).

BOROVICH, bō-rō-vē'chē. A town in the government of Novgorod, Russia, on both sides of the Msta, near the famous rapids of Borovich (Map: Russia, D 3). The inhabitants are engaged in shipbuilding, the dyeing of cloth and cotton goods, and the production of earthenware. The natives are famous for their skill as pilots, for which the proximity of the rapids is mainly responsible. Peter the Great considered them of such importance to the commerce of the country that he freed the town of all state taxes in order to induce its inhabitants to continue their dangerous occupation. Borovich has a salubrious climate and, owing to its comparative proximity to St. Petersburg (200 miles), is a favorite summer resort of the residents of the capital. Pop., 1897, 9421.

BOROWSKI, bō-rōf'ski, FELIX (1872-). An American composer. He was born March 10, 1872, in Burton, England, of Polish parents. His father was his first teacher on the piano and violin. In 1886 he entered the Conservatory of Cologne. In 1890-94 he lived at Aberdeen, devoting his time chiefly to teaching the violin. The next three years he spent in London. In 1897 he came to America, settling permanently in Chicago. While he continued to compose, he held a position as professor of composition in the Chicago Musical College, and as critic of the Chicago *Evening Post*. In 1909 he became musical editor of the Chicago *Record-Herald*. After 1908 he also wrote the analytical programmes for the concerts of the Theodore Thomas Orchestra. His compositions are a symphonic poem (*Eugene Onegin*), *Marche Triomphale*, two orchestral suites; a concerto for piano and orchestra; works for violin, piano, and organ, and songs.

BORROME/AN ISLANDS (so named after the Borromeo family). Four small rocky islands in Lago Maggiore (q.v.), in north Italy (Map: Italy, C 2). These islands are famed for their beauty, due partly to their surroundings and partly to the degree of their artificial development from mere rocks to luxuriant gardens. The one best known to tourists is Isola Bella, on which Count Vitaliano Borromeo, in the latter part of the seventeenth century, built a castle, which contains some good paintings and other art treasures, but the north wing of which is still unfinished. The garden, which rises in 10 terraces on the southern slope, contains rare plants and numerous shell grottoes and is adorned with fountains and statues. On Isola Madre the terraced garden is less extensive. The population of the islands is about 300.

BORRAMEO, bō-rō-mā'ō, SAINT CARLO (1538-84). An Italian prelate and reformer. He was born Oct. 2, 1538, at the castle of Arona, on

the west bank of Lago Maggiore, the family seat of his ancestors. He studied law at Pavia, and took the degree of doctor in 1559. His uncle, Pope Pius IV (1559-65), soon after being raised to the pontificate, appointed him, notwithstanding his youth, to a number of high offices and made him a Cardinal and Archbishop of Milan. Borromeo displayed great faithfulness and ability in governing Ancona, Bologna, and other parts of the States of the Church as legate, and in discharging the duties of offices connected with ecclesiastical administration in Rome. Though surrounded with magnificence and luxury, he was always grave, pious, and rigid in his life, studious, and a patron of letters.

Pius IV made him his grand plenipotentiary and did nothing important without his coöperation. It was in a great measure through his influence that the reopening of the Council of Trent was accomplished and that its deliberations were brought to a conclusion so satisfactory to the papal wishes. He committed its decrees to memory, had the principal part in drawing up the *Catechismus Romanus* for exposition of them, and proceeded to give all possible effect to them in his archiepiscopal province. His efforts to secure religious instruction of children made him one of the forerunners of the modern Sunday school. Borromeo's exertions, not only for the improvement of ecclesiastical discipline, but also for the reformation of morals in the archbishopric of Milan, aroused the hostility of some local monastic orders, and also, to some extent, that of the Spanish authorities in Milan, who were jealous of the extension of his jurisdiction. An attempt was even made upon his life in 1569. He spent a great part of his income in beautifying the cathedral and other churches. With a view to providing well-qualified priests, he founded in 1570 the Helvetic College in Milan. He brought about an alliance of the seven Catholic cantons, known as the Golden Borromeo League, for the united defense of their faith. He exerted his energies successfully in extirpating Protestantism from Milan by means of the Inquisition. In the famine of 1570, and during the plague in Milan in 1578, he displayed great energy and benevolence, saving the lives of multitudes by the prompt arrangements which he made for necessary relief. Exhausted by his labors and his austerities, he died on Nov. 3, 1584. He was canonized in 1610, and his day is celebrated on November 4. His embalmed body, enshrined in a silver sarcophagus and visible through a lid of rock crystal, lies in Milan Cathedral in the Cappella San Carlo Borromeo beneath the dome, where it may be viewed by permission.

His theological works were published at Milan, in 1747, in five volumes folio. On the western bank of Lago Maggiore, in the neighborhood of his birthplace, a colossal brazen statue of him, 70 feet high, was erected in 1897. His brother's son, Count Federico Borromeo, born 1564, was also a Cardinal, and from 1595 to 1631 Archbishop of Milan, and was the founder of the Ambrosian Library (q.v.). He died in 1631. For biographies of Borromeo, consult Sylva (3 vols., Bruges, 1884); also Thompson (London, 1893); Stacpoole-Kenney (New York, 1911).

BORROMINI, bō-rō-mē'nē, FRANCESCO (1599-1667). An Italian sculptor and architect, born at Bissone (Lombardy). He studied sculpture in Milan, and architecture in Rome under Carlo Maderna, then architect of St. Peter's, whom he

assisted in some of his work. After Maderna's death he continued for some time under the direction of Bernini, but an unreasoning hatred for Bernini sadly disfigured both his character and his art. Bent upon surpassing his rival, he attempted the arbitrary and the bizarre and became one of the chief representatives of the extreme baroque style. He built the churches of San Carlo alle quattro Fontane and San Ivo alla Sapienza, the oratory and cloister of San Filippo Neri, the facade of the church of Sant' Agnese in the Piazza Navona, the Palazzo Falconieri, and the interior of San Giovanni in Latraneo. All these works are in Rome. Mortified at Bernini's success, he killed himself in an access of hypochondria.

BORROW, GEORGE HENRY (1803-81) An English author. He was born at East Dereham, Norfolk, July 5, 1803, the son of Capt. Thomas Borrow, of the West Norfolk Regiment. Moving with his father's regiment from one station to another, he saw much of England. He was also for a short time in Edinburgh, where he attended the high school, and then in Ireland. In 1816 the family settled at Norwich, and three years later George was articled to the law. He had already acquired some knowledge of seven languages, and now, instead of attending to the law, he proceeded to study seven more. He had also become interested in the gypsies and had read many tales of wild adventure. On the death of his father (1824) he went to London, where he was employed as compiler and hack, his longest production was *Celebrated Trials* (1825), giving the record of all sorts of criminals. To this period also belongs *Romantic Ballads* (1826), translations from the Danish. In 1838 Borrow was appointed agent for the British and Foreign Bible Society. Now began, in the service of this society, his extensive tours through Russia and afterward through Portugal and Spain. Later he traveled as far east as Constantinople. True to his youthful predilection, he made the gypsies scattered over every part of Europe one of the principal subjects of his study, and he was continually adding to his vast linguistic knowledge. In 1840 he married and settled on Oulton Broad, near Lowestoft. From here he made many excursions through Celtic Britain—Cornwall, Wales, Ireland, etc.—and for a time lived at Yarmouth. In 1860 he removed to London, and in 1874 returned to Oulton, where he died, July 26, 1881. Borrow was a man of splendid physique. His knowledge of languages was probably more extensive than profound. But in literature he has left a name. His first important work—*The Zingari*, an account of the gypsies in Spain—appeared in 1841. It was followed two years later by *The Bible in Spain*, the most widely read of all Borrow's works. In 1851 was published *Lavengro*, and in 1857 its sequel, *The Romany Rye*. These three fascinating books are largely autobiographical. Indeed, Borrow's personality, tinged with superstition and curiously whimsical traits, has interested more persons than his literary and linguistic attainments. Of almost equal interest is *Wild Wales* (1862). For an authoritative life of Borrow, consult Knapp (2 vols., London, 1890). Knapp has also carefully edited *Lavengro*, *The Romany Rye*, together with Borrow's correspondence (2 vols., New York, 1900). A large literature has lately sprung up regarding Borrow, from which may be selected for mention here, Rickett, *The Vagabond in Literature* (London, 1906), Walling, *George Borrow, the Man*

and his Work (London, 1908), Hubert, *Borrow in Russia* (London, 1909), Thompson, *Borrow's Gypsies* (Liverpool, 1910), Thomas, *George Borrow* (London, 1912), Rodfein, *Some Notes on Borrow* (Manchester, 1913), Shorter, *George Borrow in Scotland* (London, 1913), Shorter, *George Borrow and His Circle* (Boston, 1914).

BORROWING (AS *borgian*, Ger *borgen*, to borrow, literally, to give a pledge, AS *borg*, *boih*, Ger *Borg*, pledge, security). The taking or receiving from another with his consent a sum of money or an article of personal property, with the obligation of returning it or giving an equivalent for it. In the strictest sense of the term it implies that the borrower is under the obligation of returning the specific thing borrowed, as to borrow a book or any other thing to be returned again. In this case it is that form of the contract of bailment (q.v.) legally termed *commodatum*, or loan. Where the agreement is to return another article of the same kind and value, the contract is rather in the nature of a barter or sale of the article loaned, the borrower becoming a debtor of the lender to the value of the article. This is what happens when a sum of money is borrowed. It is not contemplated that the identical money loaned shall be returned, but that the borrower shall pay the amount of the loan to the lender.

Unless the agreement of lending specifies the time when the borrowed article shall be returned, it is returnable at the demand of the lender. Where the lending is gratuitous and without consideration, it imposes no obligation on the lender, and he may terminate the arrangement at his will. The borrower, on the other hand, as a gratuitous bailee, is held to a high degree of care in protecting the borrowed article from loss or injury. He is not, however, liable for its loss or destruction if wholly without his fault. See **BAILMENT**.

BORROWING DAYS The last three days of March in the old-style calendar, or April 11-14 in the present new style. These days were from most ancient times in Scotland called "borrowing days," because they are usually cold and snowy, so that it is said

"March borrows frae April
Three days, an' they are ill,
The first o' them is wun' an' weel,
The second it is snaw an' sheet,
The third o' them is a peck-a-bane,
And freezes the wee bird's neb tae stane."

The meteorologist, Buchan, says that he has examined the records of temperature for a number of years and has shown that there is a distinct cold period between the 11th and 14th of April, corresponding to this old popular saying, the origin of which is lost in the mist of antiquity. Consult Buchan, *Handy Book of Meteorology* (Edinburgh, 1868).

BORROWSTOUNNESS, bōi'ō-stō-nēs' ('the cape near Burward's dwelling,' from AS *Nasu*, in composition *naes*, headland, nose, Lat *nasus*, Ger *Nase*, nose), usually shortened to *Bō'nēs*, bō-nēs'. A seaport in Lunthgowshire, Scotland, in the Firth of Forth, 17 miles west by north of Edinburgh (Map Scotland, E 3). It has coal mines extending under the bed of the Forth, and manufactures of iron salt, soap, malt, vitriol, and earthenware. It has an export trade in coal, iron and steel manufactures, and manures, and imports maize, timber, iron ore, paper-making materials, etc. Limestone, limestone, and freestone exist in the parish. Graham's

Dike, a part of the Roman Wall of Antoninus, traverses the parish. Dugald Stewart (q.v.) lived near Borrowstounness. Pop., 1901, 9306; 1911, 10,802.

BORS. The name of the King of Gaul in the Arthurian story. He was brother of King Ban of Benwicke, and both were Arthur's faithful allies.

BORS, or BO'HORT, SIR. One of King Arthur's knights, and nephew of Lancelot. When Guinevere was accused by Sir Nador, Bors was appointed to fight for her; but on the day of the contest his place was taken by Sir Lancelot.

BORSIPPA, bôr-sîp'pâ. A town situated on the west bank of the Euphrates, opposite the city of Babylon, and forming, in the days of the last Chaldean monarchy, a suburb of Babylon itself. There are indications that the place was fully as old as Babylon. The chief deity worshiped at Borsippa was Nabu (or Nebo), to whom Tashmîtu is given as a consort. Nabu—originally, as would appear, a water deity—becomes the patron of letters and learning in Babylon. He is the god of writing and wisdom in general. His temple at Borsippa was known as E-zida the "true" (i.e., fixed and legitimate house), and a solemn pilgrimage was made to it on the Babylonian New Year's festival. The site of Borsippa is represented by Birs-Nimrud, where there are ruins of a *zikkurat*, or temple tower.

BORSTELL, bôr'stêl, KARL HEINRICH LUDWIG VON (1773-1844). A Prussian soldier, born at Tangermünde. He served as commander in chief in Pomerania in 1812, and in this capacity did much to check the excesses of the French. As major general he took a prominent part in the campaigns of 1813, and his bold though unauthorized move at Dennewitz decided that conflict. At the battle of Leipzig (Oct. 16-19, 1813) his brigade was the first to enter the gates of the city. Soon afterward appointed lieutenant general, he accompanied Bülow's corps to Holland (1814), and after the departure of that general remained behind with 10,000 men to complete the conquest of the country. While engaged in the organization of the Second Prussian Army Corps, which had been intrusted to him (1815), a revolt, engendered by political discontent, broke out among several Saxon battalions stationed at Liège; and although promptly suppressed, Blücher ordered seven of the leaders to be shot and the flags of the insubordinate battalions to be burned. By reason of his failure to comply with this request, Borstell was sentenced to four years' military confinement. Several months later, however, he was pardoned by the King, who appointed him commander of Magdeburg.

BORT. See DIAMOND.

BORTNYANSKI, bôrt-nyân'ské, DMITRI STEPANOVITCH (1761-1825). A Russian composer of church music. He was born in Glukhov, government of Chernigov, and at seven joined the court choir at the capital, where he studied under Galuppi. The Empress Elizabeth, struck by his musical gifts, sent him to Italy. Under Galuppi, who had left Russia, and other famous masters, he studied for 11 years in Venice, Rome, Bologna, and Naples. He won success with his operas *Creonte* (Venice, 1776) and *Quinto Fabio* (Modena, 1778), but did not mistake his true vocation and clung to the study of the great Italian church composers. His own compositions of this period are distinguished by the lofty nobility and serenity of his models, with hardly a

trace of the floritures and pyrotechnics then in vogue in Italian music and abundant in his operas. On returning to Russia (1779) he was appointed composer to the Court Choir. Paul I transformed it in 1796 into the *Imperial Capella*, of which Bortnyanski was director till his death. Finding the choir in a poor state, Bortnyanski sought out the best voices in Russia, and in a few years the capella became the most famous in Russia. In the service he also found many evils; ignorant choir masters had altered the antique melodies to make their task easier, or had set the texts to secular melodies, trivial and out of keeping with the church atmosphere. He obtained a decree of the Holy Synod to the effect that all part music was to conform strictly with printed texts. For this purpose the music was revised and edited by Bortnyanski.

Bortnyanski, often styled "the Russian Palestrina," made an epoch in Russian church music. His compositions, especially the "Cherubim Song" (which, according to O. Fouqué, is the only one deserving that name), are performed in Christian churches the world over. They combine the austerity of the Greek psalmody with the Italian polyphony. Their simple harmonies embody the deeply devotional spirit of the texts, without studied effects that only distract worshippers. Among his compositions, edited by Tschaikowsky in 10 volumes, are 35 sacred concertos, 8 church trios with choir, a liturgy for three voices, 7 cherubim songs, a collection of psalms, hymns of praise for four voices and two choirs, etc.

Berlioz thus characterizes Bortnyanski: "All his works are imbued with a genuine religious feeling, at times a sort of mysticism which raises the hearer to an exalted state of emotion. In addition, Bortnyanski has a rare skill in grouping vocal masses, an extraordinary knowledge of nuances, a sonorosity of harmony, and, what is most remarkable, an incredible freedom in the disposition of the vocal parts; a contempt for the rules honored both by his predecessors and his contemporaries, especially the Italian masters, among whose pupils he is usually counted."

BORY DE SAINT VINCENT, bô'rê de sâx' vîn'sân, JEAN BAPTISTE GEORGE MARIE (1780-1846). A French naturalist, born at Agen. In 1798 he started with Captain Baudin on a scientific mission to Australia, but was separated from his companion and explored the Île de France, Réunion, and St. Helena alone. On his return he wrote his *Essai sur les îles fortunées et l'antique Atlantide* (1802), and his *Voyage dans les quatre principales îles des mers d'Afrique* (1804). He served at Ulm and Austerlitz, on Soult's staff in Spain, and as a colonel at Waterloo. After this he had to retire to Belgium, and at Brussels he edited, along with Van Mons, the *Annales des sciences physiques* (8 vols.). He also published an admirable work on the subterranean quarries in the limestone hills near Maastricht (1821). He returned to France in 1820 and wrote for Liberal journals and for Courtin's *Encyclopédie*. In 1827 appeared his *L'Homme, essai écologique sur le genre humain*. He rendered an important service to science by editing the *Dictionnaire classique de l'histoire naturelle* (1836). When, in 1829, the French government sent a scientific expedition to the Morea and the Cyclades, the first place in it was assigned to him; and the results of his researches are given in his *Expédition scientifique de Morée* (1832) and in the

Nouvelle flore du Péloponnèse et des Cyclades (1838). In 1839 he undertook the principal charge of the scientific commission which the French government sent to Algeria.

BORYSTHENES, bô-ris'the-néz See DNI-
PER

BORZNA A town in the government of Tchernigov, Russia, a short distance north of the Desna and about 90 miles southeast of the town of Tchernigov (Map Russia, D 4). It has a number of tanneries and oil presses, and a population of (1897) 12,458.

BORZOI A Russian wolf hound. See GREY-
HOUND

BOS, bôs, COENRAAD (1875--). A Dutch pianist. He was born Dec. 7, 1875, at Leyden, and received his musical education at the Conservatory of Amsterdam, where J. Röntgen was his teacher. From the very beginning he showed decided preference for ensemble playing. While living in Berlin he organized with two countrymen, Van Lier (violin) and Van Veen ('cello), a trio which soon enjoyed an excellent reputation. As accompanist he traveled with Ludwig Wullner (q.v.), and attracted more than ordinary attention, so that he came to be in great demand, both in Europe and America. His art shows to special advantage in the works of Brahms, Richard Strauss, and Hugo Wolf, where the piano part demands not only technical skill, but also the mental and emotional qualities of a great interpreter. See ACCOMPANIMENT.

BOS, LAMBERT (1670-1717). A Dutch classical scholar. He was born at Workum, West Friesland, studied at the University of Franeker, and in 1704 was there appointed professor of Greek. All his works are characterized by thorough scholarship and remarkable acuteness. They include *Exercitationes Philologicae* (1700), *Vetus Testamentum ex Versione Septuaginta Interpretum* (1709, new ed., 1805), *Ellipses Graecae* (1702, last reedited in 1808), *Antiquitatum Graecarum, Praecipue Atticarum, Descriptio Brevis* (1714, Eng. trans., 1839), *Animadversiones ad Scriptores Quosdam Graecos* (1715).

BOSA, bô'zà. An episcopal city in the province of Cagliari, Sardinia, on the west coast, near the mouth of the Temoe (Map Italy, C 7). It is an unhealthy town, surrounded by decaying walls, has an old castle, a cathedral, coral fisheries, and tanneries, and is visited fortnightly by coasting steamers. The country produces wine and oil. Bosa is a Roman town and was founded in 1112 by Malaspina. Pop., 1881 (commune), 6096, 1901, 6846, 1911, 6875.

BOSANQUET, bô'sap/kâ', BERNARD (1848--). An English philosopher. He was born at Rock Hall, Alnwick, and was educated at Oxford. From 1871 to 1881 he lectured at University College, Oxford, and from 1903 to 1908 was professor of moral philosophy at St. Andrews University. Among his publications are the following: *Civilization of Christendom* (1893), *Essentials of Logic* (1895), *Aspects of the Social Problem* (1895), *Psychology of Moral Self*, *Philosophical Theory of the State*, *The Principle of Individuality and Value* (1912), *Logic, or the Morphology of Knowledge* (2d ed., 1911), *The Value and Destiny of the Individual* (1913). He also edited a translation of Lotze's *System of Philosophy* (London, 1887).

BOSANQUET, GEORGE STANLEY (1835-1914). A British admiral. He was educated at the Royal Naval Academy at Gosport, England, and

in 1854 was appointed mate of the *Rodney*. He served in the Crimean War and in China at the time of the Tai-ping rebellion. During the latter period of service he was twice severely wounded and was promoted to be commander for distinguished services. In the Egyptian War of 1882 he was captain of the *Northumberland*. He was aid-de-camp to Queen Victoria in 1884. He received several medals from the Turkish and Chinese governments.

BOSBOM-TOUSSAINT, bôs'bôm-tô'sân' See TOUSSAINT, ANNA LOUISA GEERTRUIDA.

BOSC, bôsk, LOUIS AUGUSTIN GUILLAUME (1759-1828). A French naturalist. He visited the United States in 1796 to study the natural history of America and afterward traveled in Italy and was a professor at the Versailles Zoological Garden. He was the author of *Histoire naturelle des vers et des crustacées*, *Nouveau dictionnaire d'histoire naturelle* (1803), and he edited *Dictionnaire raisonné et universel d'agriculture* (5 vols., 1801) and published the *Mémoires* (1880) of his adopted daughter. This was Madame Rolan, the Girondist, loyalty and friendship for whom nearly cost him his head at the time of the Revolution.

BOSCÁN-ALMOGAVÉR, bô-ákan' al'mô-ga-vâr', JUAN (?1490-1542). A Spanish poet, whose real name was Moses Juan Boscá Almugaver. He was born in Barcelona, of an old patrician Catalan family, served for a time in the army of Ferdinand the Catholic, and in 1519 went to Granada, the court of Charles V, becoming soon after tutor to the Duke of Alva. His later years were passed in Barcelona, and he died near Perpignan, in 1542, while visiting his former pupil. Boscán's earlier verse was all cast in the old Castilian measures. It was not until 1526 that the idea of experimenting with Italian metres was suggested to him by a certain Andrea Navagero, a learned Italian who was then Ambassador of Venice to the court of Charles V. He forthwith began to experiment with sonnets and canzones, blank verse, and the octave stanza, and has naively recorded his satisfaction with the result. The innovation was adopted and still more successfully popularized by his friend and disciple, Garcilaso de la Vega (q.v.), and thus he became the founder of a new school of Spanish poetry. He is also remembered as the translator of Castiglione's famous manual for courtiers, *Il Cortegiano*. Boscán's poems were published after his death by his widow, together with some of Garcilaso's, in 1543. The latest edition, including a biographical sketch, is that of W. I. Knapp (Madrid, 1875). Consult also F. Flaminio, *Studia di storia letteraria italiana e straniera* (Lavorio, 1895), and M. Menéndez y Pelayo, *Juan Boscán*, vol. xii in *Antología de poetas líricos castellanos* (Madrid, 1908).

BOSCAWEN, EDWARD (1711-61). An English admiral, popularly known as "Old Dreadnought." He was born Aug. 19, 1711, and was the second son of Viscount Falmouth. He entered the navy in his fifteenth year, passed his examination for lieutenant in 1732, and in 1738 received a command. He won distinction at the taking of Porto-Bello and at the siege of Cartagena in 1741. He had an important share in the victory off Cape Finisterre (May 3, 1747). As a reward he was promoted to the command of the sea and land forces in the East Indies and conducted a long but vain siege of Fort St.

David. In 1751 he became a lord of the admiralty. In 1755 as vice admiral he intercepted the French fleet off Newfoundland, capturing two ships and 1500 men, including the French commander, Hocquart, whom he had taken prisoner twice before. In 1758, as Admiral of the Blue, he was commander in chief of the fleet in the expedition against Cape Breton, capturing that island and St. John's after some hard fighting. On his return he was given a seat in the Privy Council. The crowning success of his career was the defeat he inflicted on the French Toulon fleet, in the Bay of Lagos, Aug. 18, 1759. For this he received the thanks of Parliament, a pension of £3000 a year, and the command of the marines. He died near Guildford, Jan. 10, 1761. Consult: Norway, "Admiral Boscawen, 'Old Dreadnought,'" in *Cornish Magazine*, vol. ii (Truro, 1899); Standing, "Sir Edward Boscawen, K.C.B., Admiral of the Blue," *United Service Magazine*, vol. cxiii (London, 1900).

BOSCH, bōs, HIERONYMUS (c.1450-1516). A painter of the early Netherlands school. His signature "Bosch" is derived from his birthplace Hertogenbosch (Bar le Duc); he is sometimes called Hieronymus van Aken from the provenance of his family. He seems to have passed his life in his birthplace; for there is no evidence of his supposed sojourn in Spain beyond the fact that his paintings were very popular there. His art presents most analogies with that of the early Dutch school of Haarlem. Its resemblance to that of Breugel (q.v.) is due solely to Bosch's influence on that master. He is especially known as the painter of visionary representations of the infernal regions, incantations, and other gruesome subjects, depicted with grotesque humor. In this he was a preacher of morals, but he was also "very much a painter." He alone of the early Netherlanders strives primarily after tonal effect, and he was the very first to paint mood landscapes in the modern sense. (See BARBIZON, PAINTERS OF.) His great influence is attested by the unusual number of imitations and copies of his paintings, and by the wide adoption of his caricature of the human countenance in art. His paintings are especially numerous in Spain. In the Escorial are five, including "The Seven Deadly Sins," "The Hay Wagon," and "The Garden of Pleasure"; in the Prado (Madrid) are three; in Vienna four, of which the most important, the "Last Judgment," is in the Academy; in Berlin are also four, and in the former royal palace, Ayuda, Lisbon, is his well-known "Temptation of St. Anthony," the most copied of all his pictures. The museum of Princeton University possesses his "Christ before Pilate." The most important researches on Bosch are those of Justi, *Jahrbücher der königlich preussischen Kunstsammlungen*, vol. x (1889), and Gluck, ib., xxv (1904). Consult also Schubert-Soldern, *Hieronymus Bosch und Pieter Breugel* (Vienna, 1903), and Von Jan van Eyck bis Hieronymus Bosch (Strassburg, 1903) for his landscape; also Gossart, *Jérôme Bosch* (Lille, 1907).

BOSCH, HIERONYMUS DE (1740-1811). A Dutch poet and philologist, born in Amsterdam. He was a philologist of varied acquirements and an accomplished Latin poet. His *Poemata* first appeared at Leyden in 1803 (2d ed., 1808). He rendered an important service to classical literature by his edition of the *Anthologia Græca*,

with a metrical translation by Hugo Grotius (q.v.), never before published (4 vols., 1795-1810, to which Van Lennep added a fifth volume, 1822). His discourses and treatises on subjects of literature, which are mostly composed in the Dutch language, display profound learning, excellent judgment, and refined taste.

BOSCHOK, bōsh'bōk. The Dutch form of "bush buck" (q.v.).

BOSCH'VARK (Dutch *bosch*, wood, bush + *vark*, hog). The South African river hog (*Potamocheirus africanus*). See SWINE.

BOS'COREL (Fairwood, from It. *bosco*, thicket, OE. *bosch*, *bosch*, Engl. *bush* + *belo*, beautiful). An English farmhouse near Shifnal, Shropshire, famed as the hiding place of Charles II after his defeat by Cromwell, at Worcester, Sept. 3, 1651. With Major Carlis or Careless, who had led the forlorn hope at Worcester, he climbed the "Royal Oak" in Boscorel Wood and was concealed in its thick foliage for 24 hours, while Puritans in quest of him passed to and fro, unaware of his presence. The farmhouse still stands, and the oak is represented by a tree grown from one of its acorns.—The title of BOSCOREL TRACKS has been given to certain contemporaneous writings, published in 1662, giving a graphic description of this passage of the monarch's life.

BOSCOREALE, bōs'kō-rā-ā'lā (It. *bosco*, forest, Eng. *bush* + *reale*, royal). A city in the province of Naples, south Italy, a mile and a half from Pompeii (Map: Italy, E 11). Its name was brought to the notice of the world in 1895, when Baron Edmond de Rothschild presented to the Louvre a mass of first-century silverware discovered in the excavation of a villa there. In the collection are 40 vases, jugs, bowls, etc., and 100 small pieces. The chief trade of the town is in wine and silk. In 1850 a stream of lava from Vesuvius, about a mile and a half broad and 12 feet deep, divided only just in time to leave Boscoreale unharmed, the fiery torrents destroying the woods on either side. Pop., 1881 (commune), 8756; 1901, 9340; 1911, 10,282. Consult: Hérón de Villefosse, "Le trésor de Boscoreale," in *Monuments et mémoires de l'Institut de France*, vol. v (Paris, 1899); *Boscoreale Collection* (New York, 1898); De Cou, *Antiquities from Boscoreale*, in Field Museum of Natural History (Chicago, 1912).

BOS'COVICH, RUGGERO GIUSEPPE (1711-87). A celebrated Italian mathematician and astronomer, born in Ragusa. At an early age he joined the Jesuits and spent his life in scientific pursuits and important public labors. Before the completion of his course of studies in Rome, he was appointed teacher of mathematics and philosophy in the Roman College there. In 1758 he published his famous work, *Theoria Philosophæ Naturalis Redacta ad Unicam Legem Virium in Natura Existentium*, in which he advanced a molecular theory of matter, maintaining that substances consist of a system of material points which attract or repel each other, according to the distance between them. In 1764 he was appointed to a professorship at Pavia. After the suppression of the Jesuit Order he went to Paris in 1774, and received a pension from the King. In 1783 he went to Bassano, to superintend an edition of his works, on the completion of which he returned to Milan, but fell into a depression of spirits which at last grew into complete insanity. His works, which were the first to advocate in Italy the

theories of Newton, include dissertations on a great variety of important questions in mathematical and physical science, and were published collectively under the title, *Opera Perivtentia ad Opticam et Astronomiam* (5 vols, 1785). Consult M. Oster, *Roger Joseph Bosovich als naturs philosoph* (Bonn, 1909).

BOSE, bó'ze, JULIUS, COUNT (1809-94). A Prussian general, born at Sangelhausen. In 1861 he entered the Ministry of War, where he was active in the reorganization of the army. During the War of 1866 he conducted the celebrated night attack on Podol, which resulted in the retreat of the Austrian brigade. He was commander of the Eleventh Army Corps in the Franco-Prussian War, but, in consequence of severe wounds received at the battle of Worth (Aug. 6, 1870), he was prevented from further participation in that campaign.

BO'SHER, KATE LANGLEY (1865-) An American author. She was born in Norfolk, Va., graduated at the Norfolk College for Young Ladies in 1882, and after her marriage in 1887 resided in Richmond. Her *May Cary* (1910), *Miss Gibbie Gault* (1911), and *The Man in Lonely Land* (1912), won great popularity for their cleverly commingled humor and sentiment. In 1913 she published *The House of Happiness*.

BOSIO, bó'zyó, FRANÇOIS JOSEPH, BARON (1769-1845). A French sculptor. He was born at Monaco, March 19, 1769, and brought as a boy to Paris, where he studied under Pajou. Then he spent 17 years in Italy, as an enthusiastic student of the antique. Returning to Paris in 1808, he found a patron in Napoleon, who was disposed to encourage sculpture rather than painting. Of him and of his family, Bosio made many busts, as well as a statue of the Emperor for the Boulogne column and one of the King of Rome. Court favor was continued to him after the Restoration; he became sculptor to the King, and Charles X made him a baron. His mythological works, such as the "Aristæus" (1812), "Hyacinthus" (1817), and "Salmaeus" (1831), all in the Louvre, are characterized by classic form and smoothness without much truth to nature. His portraits are usually more realistic. Among his larger works were the bronze equestrian statue of Louis XIV for the Place des Victoires (his masterpiece) and the bronze quadriga of the Arc du Carrousel. Consult L. de Lomenie (Paris, 1844), Gouze, *La sculpture française* (Paris, 1895).

BOSNA-SERAI, bó'sna-sá-rí' See SARAJEVO. **BOS'NIA**. The southernmost province of Austria-Hungary. The name is officially applied to both the mountainous region known by this appellation and the lowlands of the Herzegovina on the south. The region thus defined has been an integral portion of the Austro-Hungarian monarchy since 1908. It is divided into six circles or administrative districts. Its area (with the Herzegovina) is estimated at 19,768 square miles.

Bosnia is bounded on the north and northwest by Croatia and on the west and south by Dalmatia and the Adriatic. Its eastern boundary coincides with Serbia's and Montenegro's western frontiers. Owing to the mountainous character of the northern portion of the province the name of Oriental Switzerland has been applied to it.

The elevated area lies in the zone of prolongation of the Dinaric Alps, which intervene between the province and the Dalmatian coast

land. Here some peaks attain 8000 feet in height. The uplift starts from the northern and western boundaries and spreads towards the east and the south, where it is fringed in part by valleys which extend to Serbia and Montenegro. The climate of the province is fairly uniform and may be described as cold-temperate. Mediterranean conditions prevail, however, in the Herzegovinian lowlands.

Bosnia is rich in natural resources. The relief of the land has prevented their speedy development, owing to the difficulty of providing arteries of communication. This obstacle, however, is being gradually overcome. A wide forest belt covers its central area from northwest to southeast. The southeastern slopes of the Bosnian ranges contain ores of silver, lead, copper, and iron. The last mineral in particular occurs in abundance. The valleys occurring between the mountains are exceedingly fertile and are well known for the charm of their scenery. The region between Travnik and Sarajevo is particularly noted in this respect. Bosnia is principally an agricultural country, agriculture engaging nearly 88 per cent of the population. The methods employed are of a primitive character, and extensive areas of fruitful land remain uncultivated. The chief European cereals are raised, and much attention is paid to the cultivation of fruits, especially plums, of which great quantities are exported in a dry state. Tobacco is an important product, the annual crop amounting to over 3000 tons. Sugar beets are also grown, and silk culture has been introduced. The yield of leading crops in Bosnia and the Herzegovina in 1910 and 1911 was as follows, in metric tons: corn, 250,000 and 213,700; wheat, 80,000 and 80,050; oats, 65,000 and 78,400; barley, 75,000 and 64,600; rye, 10,000 and 9600; potatoes, 137,300 and 63,300. The live stock of Bosnia and the Herzegovina and that of the Herzegovina alone were as follows in 1910: horses, 221,996 and 33,045; cattle, 1,308,753 and 147,336; mules and asses, 6721 and 4845; goats, 1,392,565 and 619,355; sheep, 2,488,854 and 852,525; swine, 527,223 and 33,787. The mountains of Bosnia are rich in minerals, some of which were worked in the days of the Romans. The mineral industry is chiefly in the hands of the government. The chief mineral products are iron, manganese, coal, and salt. The output of coal in 1910 was 706,659 tons and of iron ore 133,332. The manufacturing industries are also in a backward state and are confined chiefly to the production of coarse metal articles and some textiles for the home market. There are several extensive state tobacco factories. The exports consist mainly of cereals, fruit, animals, and animal products. After the Austro-Hungarian occupation the transportation facilities were extended and improved. At the beginning of 1911 there were in Bosnia and the Herzegovina 1215 miles of railway (a law of December, 1912, authorized important extensions) and 2549 miles of telegraph line, with 7940 miles of wire. The social and economic condition of Bosnia presents strange contrasts in the intermingling of institutions and customs handed down from the past with the innovations that reflect the spirit of modern progress.

The Treaty of Berlin (1878) recognized Bosnia and the Herzegovina as Turkish territory, but gave their administration to Austria-Hungary, and the latter finally annexed the terri-

tory, Oct. 5, 1908. The province is administered by the Bosnian Bureau, under the Austro-Hungarian Minister of Finance. The constitution of February, 1910, provides for a diet of 72 elected and 20 appointed members. The budget of 1911 showed estimated revenue and expenditure of 79,129,475 and 79,535,715 kronen, respectively. Military service is compulsory for every able-bodied male for a period of three years. Education is free, but not compulsory, and, although the number of schools, as well as the standard of instruction, has been raised since the Austro-Hungarian occupation, education is still very backward, and a large proportion of the population is illiterate. The census of Oct. 10, 1910, showed a population of 1,898,044 (994,852 male, 903,192 female), exclusive of 33,758 military. By circles the area and the population in 1895 and 1910 are stated as follows:

	Sq. km.	Pop. 1895	Pop. 1910
Sarajevo	8,405	228,107	298,061
Banjaluka . . .	9,018	329,499	403,817
Bihac	5,803	191,897	229,071
Travnik	10,116	240,088	284,661
Tuzla	8,918	358,990	425,496
Mostar*	9,189	219,611	267,038
	51,199 †	1,568,092	1,898,044 ‡

* The Herzegovina

† Equal to 19,768 square miles

‡ Increase over 1895, 21.04 per cent.

According to religion, the population in 1910 was: Servian Orthodox, 825,338 (showing an increase over 1895 of 22.59 per cent); Mohammedan, 612,090 (11.57); Roman Catholic, 434,100 (29.94); Greek Catholic, 8136; Spanish Jews, 8202; other Jews, 3655; Protestants, 6337.

The inhabitants (Bosniaks and Herzegovinians), Christian and Mohammedan alike, belong to the Serbo-Croatian branch of the Slavic race. In the necropolis of Glasine, with its 20,000 tumuli, were found crania which show that the dolichocephalic Hallstatt race was once as pronounced here as is the opposite type to-day. The language, "Bosnisch," is almost identical with the Servian (by the Roman Catholics it is written in Roman instead of Cyrillic letters). The Mohammedans, who call themselves Turks, are descendants of Slavic Christians converted to Islam during the Mohammedan conquest and do not adhere so closely to Islam as the Osmanlis. The Turkish element of the population is insignificant. There is an Albanian element in the south. The capital is Sarajevo, with a population of 51,919 in 1910. Other towns are: Mostar, 16,392; Banjaluka, 14,800; Tuzla, 11,333.

Bosnia constituted a part of the Roman provinces of Dalmatia and Pannonia and was celebrated in ancient times for its rich mines of silver and gold. After the passing of the Goths the region was occupied by a Slav population about the beginning of the sixth century. For a long time the various parts of the country had their own petty princes. The Bosnian rulers begin to figure under the name of Ban in the twelfth century. About this time the heretical Christian sect of Patarienes rose to importance. In the course of the Middle Ages the country passed through periods of Servian, Croatian, and Hungarian overlordship. A succession of powerful chiefs extended the limits of the principality over Dalmatia and a part of

Servia, and in 1376 Ban Tvertko proclaimed himself King of Bosnia. In 1401 came the beginning of Turkish invasion, which burst upon the country in all its force in 1463. The Turks now made themselves rulers of nearly the whole of Bosnia, and the fragment which had become attached to Hungary fell into their hands after the battle of Mohacs in 1526. Bosnia became thoroughly Islamized and submitted quietly to the ruthless Ottoman rule. In 1850-51 the Mohammedan nobility, crushed by the heavy weight of taxation, rose in arms against the Porte, but the revolt was stamped out with sanguinary efficacy by Omer Pasha. An unsuccessful insurrection in Bosnia and the Herzegovina took place in 1875-76, and was followed by Servia's disastrous war with Turkey. The facts of Turkish misgovernment were recognized at the Congress of Berlin (1878), and Austria-Hungary was authorized to occupy and administer Bosnia and the Herzegovina, though the Sultan retained the nominal suzerainty over them. The Austro-Hungarian occupation was effected in 1878, but only after a desperate resistance on the part of the Mohammedan inhabitants. In 1881 compulsory military service was introduced. From 1878 until 1908 the affairs of Bosnia and the Herzegovina were administered by the Austro-Hungarian Minister of Finance. This state of affairs was ended in 1908, when the Emperor Francis Joseph, taking advantage of the revolution at Constantinople and the Bulgarian declaration of independence, proclaimed the extension of the sovereignty of Austria-Hungary over the two provinces on October 7. This was a violation of the Treaty of Berlin and called forth remonstrances from Turkey and the Powers. Servia in particular, seeing her dreams of a Servian union frustrated, even began preparations for war. A few weeks of diplomatic negotiation, however, resulted in the assent of the Powers on the condition that Austria render some financial compensation to Turkey. A commission was appointed to prepare a constitution for the two states providing for an autonomous government. This was finally promulgated Feb. 22, 1910. It provides for a diet of 72 elected and 20 ex-officio members, and a president and two vice presidents, appointed yearly by the Emperor. The three great religious sects are to be represented in the presidential office in rotation—a Serb one year, a Mohammedan the next, and a Croat the third year. In the diet the Servians are allowed 31 representatives, the Mohammedans 24, the Croats 16, and the Jews 1. This division is on the basis of population. The diet has no authority in questions pertaining to the army or to customs duties, but in internal affairs, such as the negotiations of loans, civil and commercial law, and industrial and land questions, it has full power. All measures are, of course, subject to the sanction of the crown.

Ogg, *The Governments of Europe* (New York, 1913); L. Geller, *Bosnisch-Herzegowinische Verfassungen*

und politische Grundgesetze (Vienna, 1910), F. Kumlossy, *Das Rechtsverhältniss Bosniens und des Herzegowina zu Ungarn* (Pressburg, 1911)

BOSPORUS, or **BOSPHORUS** (Gk Βόσπορος, *Bosporos*, literally *ox-ford*, from βόις, *bous*, ox, cow + πορος, *poros*, ford, crossing. Called also the Strait of Constantinople). The narrow channel which connects the Black Sea with the Sea of Marmora and separates the continents of Europe and Asia. (Map Turkey in Europe, G 4). It has a length of about 18 miles, and in width varies from about 1800 feet at its middle section to about 2 miles towards its northern end. Its depth is over 100 feet.

The surface currents are from the Black Sea to the Sea of Marmora, while underneath and along the shore the direction is opposite, which fact accounts for the undiminished salinity of the Black Sea, in spite of the great quantities of fresh water which it receives through its affluents. The swift currents and the occasional fogs which envelop the northern entrance make the channel very dangerous for navigation, and a number of lighthouses have been erected to insure greater safety. The shores are for the most part elevated and are lined with palaces, picturesque villages, gardens, and numerous ancient ruins. The bulk of medieval trade between Europe and Asia passed through the Bosphorus. The galleys of Genoa and Venice bringing western commodities to Black Sea caravan terminals where they would load products of the East passed over its waters. One of the world's most commodious natural harbors, the Golden Horn, lies at the northern end of the strait. At the middle, where it is about 2800 feet in breadth, Darius made his bridge of boats when he marched against the Scythians. The Bosphorus has been under Turkish control since the year 1461. Repeated European conferences, including that of Berlin in 1878, have confirmed the stipulation of a treaty made in 1841, providing that no ship of war belonging to any nation but Turkey shall pass through the Bosphorus without the consent of the Ottoman authorities. Consult Goryainov, *Le Bosphore et les Dardanelles étude historique sur la question des détroits* (1910).

BOSPORUS, KINGDOM OF An ancient Greek state on both sides of the Cimmerian Bosphorus (the Strait of Yenikale, connecting the Sea of Azov with the Black Sea). It was founded probably about the beginning of the fifth century B.C. in the Tauric Chersonesus (Crimea). In 393 the kingdom was extended along the Asiatic coast, and Theodosia was united with it. In 360 the kingdom became tributary to the Scythians. In 290. Towards the close of the second century B.C., Mithridates, King of Pontus, vanquished the Scythians and set his son, Machares, on the throne of Bosphorus. On the death of Machares, soon followed by that of Mithridates, the Romans gave the country in 63 B.C. to Pharnaces, the second son of Mithridates, and after his assassination to several princes who gave themselves out as descendants of Mithridates. When at last the family became entirely extinct, in 259 A.D., the Sarmatians made themselves masters of the kingdom. The capital of the kingdom was called Panticapæum. See KERTCH.

BOSQUET, bô's'kâ', PIERRE FRANÇOIS JOSEPH (1810-61). A marshal of France. He was born at Mont de Marsan, in the department of Landes, Nov. 8, 1810, entered in 1829 the Polytechnic School in Paris, and in 1838 joined the artillery

as sublieutenant. He became colonel in 1847, general of brigade in 1848, and general of division in 1854. In the earlier part of his career he displayed such skill and valor in several Algerian campaigns that he was intrusted with the Second Division of the French army in the Crimean War, 1854-55, in which he especially distinguished himself at the Alma, Inkerman, and at the storming of the Malakoff. Having been seriously wounded at Sebastopol, he was compelled to retire from active service, and France, in recognition of his services, made him senator and field marshal. The British Parliament voted its thanks to him in a special resolution.

BOSS, bôs (Fr *bosses*, probably OHG *bōzo*, tuft, bunch, *bōcan*, MHG, *bōzen*, to beat). In architecture, (1) a projecting stone serving as a keystone at the intersection of two or more vaulting ribs (as in English, German, and Spanish late Gothic vaults). Such stones are cross-shaped or circular and carved with foliage, a rosette, heraldic escutcheon, or even a human figure. By extension, any knob-like projecting carved ornament resembling a vault-rib keystone. (2) A projecting portion or block of uncut stone left to be later carved or cut away.—The boss of a bit is the ornament with which a bridle bit sometimes terminates each end of the mouth bar.

BOSS. A term derived from the Dutch *baas*, originally meaning a master, overseer, or superintendent of any kind. So a *boss* shoemaker or carpenter is the head of a gang of shoemakers or carpenters, who deals out work to them and fixes the amount of their pay. The term seems to have arisen from aversion to the word "master," regarded as savoring too much of the relations between master and slave, and it has come largely into use among the American negroes since their emancipation. In American politics, it denotes a professional politician who has secured control of certain appointive offices, and often of the machinery of nomination to elective offices, and hence is able to direct the course of legislation and administration to his own advantage. In the early period of American history the boss was commonly an officeholder who used his influence to reward his political friends and hence to perpetuate his hold upon his position. In the latter half of the nineteenth century the powers of the boss were vastly extended through the necessity of organizing politically the masses of immigrants in the great cities. Moreover, his opportunities for enrichment were much increased through the development of franchise values, the increase in magnitude of public contracts, etc., at the disposal of public administrations. From this time the boss ceased, as a rule, to be an officeholder.

While the boss has been for over a century a prominent figure in American political life, his malign influence and the conditions under which he establishes his power were not generally understood until after the exposure of the Tweed Ring in New York in 1872. Since that time the elimination of the boss has been the chief aim of political reformers, and many of the cruder methods employed by the earlier bosses have been outlawed. It cannot be said, however, that any plan of reform yet proposed would wholly destroy the political bosses. See TAMMANY HALL, TWEED RING.

BOSS. In geology, a nearly circular area of

intrusive rock within a different formation, usually sedimentary. The circular outline is the essential feature which distinguishes it from a batholith (q.v.), the latter being of very irregular shape. In diameter it may range from a few score feet to several miles. Bosses consist of the plutonic rocks like granite, syenite, diorite, and gabbro, which, originating in the unknown depths of the earth, have been forced towards the surface but have cooled and consolidated before actually coming to daylight, as do the volcanic rocks. Their present position at the surface is attributable to erosive agencies which have removed the original cover. Since they are made up of very hard rocks they very often project above the surrounding country in the form of hills that have a rounded contour. Bosses are of very common occurrence wherever the older crystalline rocks are developed, and are exemplified by many of the granite areas in New England, New York, and the States traversed by the Appalachian Range from New York to Alabama.

BOSS, LEWIS (1846-1912). An American astronomer. He was born in Providence, R. I., graduated in 1870 at Dartmouth College, and from 1872 to 1876 was astronomer of the United States northern boundary commission. In connection with the determination of the latitude of various specified points on the boundary line, he compiled a list of the *Declinations of Fixed Stars* (Washington, 1878), which forthwith made him favorably known. In 1876 he was appointed director of the Dudley Observatory at Albany, N. Y. He was chief of the expedition sent in 1882 by the United States government to Santiago, Chile, to observe the transit of Venus. He was State superintendent of weights and measures for New York from 1883 to 1906. In 1909 he became the editor of the *Astronomical Journal* and in 1911 was awarded the Lalande prize of the Academy of Sciences of Paris. His publications, besides many monographs, include a *Catalogue of 8241 Stars* (1890); *479 Southern Stars* (1898); *Solar Motion and Related Researches* (1901); *Positions and Motions of 627 Standard Stars* (1903); *Preliminary General Catalogue of 6188 Stars* (1910); *Catalogue of 1059 Standard Stars* (1910).

BOSSAGE (for derivation, see Boss). A term used in two senses: either (1) to denote the stones in a building left rough and projecting, afterward to be worked into a decoration, as in carved Gothic keystones (see Boss), or in memorial tablets; or (2) to designate stones left in the same rough manner as a permanent feature, as in the rustic masonry of Florentine palaces.

BOSSCHA, bōs'sā, JOHANNES (1831-1911). A Dutch physicist. He was born in Breda, and was educated in Deventer and Leyden. He became director of the Polytechnic School in Delft in 1878. He has made important investigations on galvanic polarization, the rapidity of sound waves, and the mechanical theory of electrolysis, and he was one of the first (1855) to suggest the possibility of sending two messages simultaneously over the same wire. His *Verspreide Geschriften* were published in 3 vols. (Leyden, 1902).

BOSSÉ, bōs, ABRAHAM (1602-76). A French engraver. He was born in Tours and formed his art chiefly under the influence of Jean de St. Ign and Claude Mellan. He is known as the best depicter of French life during the reign of

Louis XIII. He executed 1449 plates alone and 57 in conjunction with other masters. (Consult the catalogue of his works by Du Plessis, Paris, 1859.) Most of these are after his own designs, in a free and spirited style, etched and then finished with the graver. The last years of his life were devoted to teaching perspective, of which he became professor. Consult his biography by Valabreque (Paris, 1892).

BOSSÉ, bōs'sé, ROBERT (1832-1901). A German statesman. He was born at Quedlinburg, and studied law at the universities of Heidelberg, Halle, and Berlin. He became Under-secretary of State in the Ministry of the Interior in 1889, in which capacity he had the principal share in the preparation of the laws providing insurance for workmen. In 1891 he was appointed Secretary of State in the Imperial Ministry of Justice, and he was chairman of the commission intrusted with the preparation of the new Civil Code of Germany. He was appointed Prussian Minister of Education in 1892 and retired in 1899. In 1883 he became editor of the *Monatsschrift für deutsche Beamte* (Berlin). He published: *Grundzüge konservativer Politik in Briefen* (1868), *Kommentar zum Invaliditäts- und Altersversicherungsgesetz* (3d ed., 1891); *Eine Dienstreise nach dem Orient* (1900).

BOSSI, bōs'sā, ENRICO MARCO (1861-). An Italian composer, born at Salò. He studied at the Milan Conservatory, became organist in the cathedral of Como, and professor at the Conservatory of Naples. From 1895 to 1902 he was director of the Conservatory at Venice, and from 1902 to 1913 director of the Liceo Musicale at Bologna. As a composer he ranks among the foremost living masters of Italy. His works include three operas, a Symphonic Concerto for organ and orchestra, a Requiem, *Canticum Canticorum* (a biblical cantata), *Il Paradiso Perduto* (symphonic poem with chorus), and fine organ and chamber music.

BOSSI, GIUSEPPE (1777-1815). An Italian painter and author. He was born at Busto Arsizio, Aug. 11, 1777, and studied in the Academy of Milan with Apiani, and afterward at Rome. On his return to Milan he was appointed secretary of the Brera Gallery, the foundation and organization of which is his greatest achievement. He was also instrumental in founding the important Museo Archeologico of Milan. He possessed a valuable collection of the drawings of the old Italian masters, upon which subject he was the greatest authority of his day. He is still famous as the discoverer of the celebrated Venetian sketch-book, attributed to Raphael (q.v.). Bossi's cartoon of Leonardo da Vinci's "Last Supper" (1807), now in the Museo Archeologico, was used by Raffaelli as a model for his celebrated mosaic reproduction of the subject. At the same time he wrote an interesting treatise, *Del cenacolo di Leonardo da Vinci* (1810). His last work was a series of monochrome mural paintings representing the life of Leonardo in the Villa Melzi on Lake Como. Paintings and drawings by him are in the Brera, the Gallery of Parma, the Museo Archeologico, and elsewhere. After his death a marble statue by Canova was erected in his honor in front of the Ambrosian Library in Milan.

BOSSI, LUIGI, COUNT (1758-1835). An Italian antiquary and historian. He was born in Milan, studied in Pavia, and became a canon

of the cathedral of Milan, but when the French entered Italy he took the side of the invaders, and was appointed by Bonaparte agent of the French government in Turin, and afterward (1803) prefect of the archives of the Kingdom of Italy. He was an extremely prolific author and produced more than 80 works on antiquarian, historical, and art subjects. The best known of his antiquarian writings is *Observations sur le vase que l'on conservait à Gènes sous le nom de Sacro Catino* (1807). His most important historical works are a much-enriched translation of Roscoe's *Life of Leo X* (12 vols., 1816-17), *Vita di Cristoforo Colombo* (1818, Fr trans., 1824), *Storia d'Italia* (20 vols., 1816-23), and *Storia della Spagna* (8 vols., 1821-22).

BOSSUET, bô'swâ', JACQUES BÉNIGNE (1627-1704). A distinguished French preacher. He was born Sept 27, 1627, in Dijon, received his earlier education in the Jesuit College there, and then went to Paris to the College of Navarre, where he studied the Sacred Scriptures, the works of classical antiquity, and the Cartesian philosophy. In 1652 he was made a priest, and a doctor of theology, and canon in Metz. Here he was called by the bishop to reply to the catechism of the Protestant minister, Paul Ferri, and thus he did (1655) in a way that commanded the admiration even of Protestants. He soon attained great distinction as a pulpit orator, and in 1661 he was made preacher to the court. His discourse on the occasion of Marshal Turenne's conversion to the Catholic church obtained for him the bishopric of Condom (1669). Louis XIV having in 1670 intrusted to him the education of the Dauphin, he resigned his bishopric in 1671, because he believed that he would be unfaithful to his duty if he retained it during a continued absence from his diocese. He was now made a member of the Academy. The care with which he attended to the education of the Dauphin was rewarded, in 1680, by his nomination as first almoner of the Dauphin, and in 1681 by his appointment to the bishopric of Meaux. He was the author of the four articles which secured the freedom of the Gallican church, and the privileges claimed by the King against the prerogatives of the Pope, and his eloquence in the famous assembly of the French clergy in the year 1682 secured the adoption of these articles. In 1697 he became a member of the Council of State, and in the following year first almoner to the Duchess of Burgundy. He spent the last year of his life in his diocese, but died in Paris, April 12, 1704. He was alike strict in morals and in religious doctrine, his strictness in the latter he showed particularly in his controversy with Fenelon, whom he accused of heresy for his defense of the Quietists, although at least in early life he had dreamed of a reconciliation of Catholics and Protestants. Bossuet is considered the greatest ecclesiastical orator known in history. His orations at the funerals of the Duchess of Orleans and the great Condé are particularly famous as masterpieces of this kind of eloquence. All his writings attracted much attention. For the defense of those dogmas of the Catholic church which are rejected by the Protestants he wrote his *Exposition de la doctrine de l'église catholique sur les matières de controverse* (Paris, 1671).

His greatest controversial work is his celebrated *Histoire des variations des églises protestantes* (2 vols., 1688), in which he founds his

arguments chiefly upon the doctrinal diversities of the churches of the Reformation. To the defense of the four articles of the Gallican church he devoted his *Defensio Declarationis Celebrissime, quam de Potestate Ecclesie Sanctæ Cælius Gallæus a* [1682] (2 vols., 1730). With a view to the instruction of the Dauphin, he wrote his *Discours sur l'histoire universelle jusqu'à l'empire de Charlemagne* (1681), a work particularly deserving of notice, as the first attempt at a philosophical treatment of history. The continuation of it to the year 1661 (1805) is entirely derived from materials which he left behind him but to which the last touch of his own hand was wanting. Another fruit of his political and historical studies was the *Politique tirée de l'Écriture Sainte* (1709). There are modern English translations of the following: *Select Sermons and Funeral Orations* (3d ed., London, 1801), *A Conference on the Authority of the Church* [1679] (1841), *A Survey of Universal History* (1819), *Elevations to God* (1850), *An Exposition of the Catholic Faith* (new ed., 1841), *The History of the Variations of the Protestant Churches* (2d ed., 2 vols., Dublin, 1836), *Sermon on the Mount* (New York, 1900), *Meditations* (London, 1901). His works appeared in Paris (31 vols., 1862-66), appendix *Œuvres inédites* (2 vols., 1881-83). For his life, consult A Reaume (3 vols., Paris, 1869-70), G Lanson (Paris, 1891), *Rebellion, Bossuet, historien du protestantisme, Etude sur l'histoire des variations* (Paris, 1892, new ed., 1905), Ledieu (Bossuet's secretary), *Mémoires et journal sur la vie et les ouvrages de Bossuet* (4 vols., Paris, 1855-57), Mrs H L Sidney Leai (London, 1880), Currier, *Nine Great Preachers* (Boston, 1912).—His nephew, JACQUES BOSSUET, died Bishop of Troyes, July 12, 1743. His very extensive correspondence, chiefly devoted to the elucidation and investigation of the views of Fenelon, is included in the above-mentioned edition of the works of his uncle.

BOSSUT, bô'sû', CHARLES (1730-1814). A French mathematician and physicist, born at Tartaras, near Lyons. He studied with the Jesuits in Lyons and received his ordination. In 1752 he became professor of mathematics at Mezières and in 1768 was received into the Academy of Sciences. The Revolution deprived him of his situation and his income, and he lived in the greatest seclusion till under the Empire he was appointed a professor in the Polytechnic School. His works are very numerous. The following may be mentioned as particularly valuable: *Recherches sur la construction la plus avantageuse des digues* (1764), *Recherches sur les altérations que la résistance de l'éther peut produire dans le mouvement des planètes* (1776), *Nouvelle expérience sur la résistance des fluides par d'Humbert, Condorcet, et Bossut* (1777), *Traité élémentaire de mécanique et de dynamique* (1763), *Cours complet des mathématiques* (7 vols., 1795-1801), *Cours de mathématiques à l'usage des écoles militaires* (1782), *Essai sur l'histoire générale des mathématiques* (2d ed., 1810), and *Traité du calcul différentiel et intégral* (1798). He was a great admirer of Pascal, and edited his works (15 vols., Paris, 1779), to which he prefixed an introductory *Discours sur la vie et les ouvrages de Pascal*, in 5 vols. Bossut is especially entitled to fame for his researches in experimental hydrodynamics, which have formed contributions of great importance to that science. He is best known,

however, for his history of mathematics mentioned above—a work which, while open to serious criticism, awakened much interest in the subject.

BOSTAN'GI, bōs-tān'ji (from Turk. *bostan*, Pers. *bustān*, garden). A class of men in Turkey who, originally the Sultan's gardeners, now perform a variety of duties, such as mounting guard at the seraglio and rowing the Sultan's barge. Their chief, called Bostangi Bashi, holds the rank of pasha, is governor of the Sultan's residences, and chief of police of the capital. The bostangi at one time numbered 3000, and were united with the janissaries in military duty. In war time their strength was 12,000. Their present number is about 600.

BOSTON, bōs'ton or bōs' (-"St. Botolph's town"). An ancient English borough and seaport in Lincolnshire, on both sides of the Witham (4 miles from its mouth), 28 miles southeast of Lincoln (Map: England, F 4). Boston is supposed to be the ancient Icanhoe, the site of the abbey founded by St. Botolph in 654. After the Conquest it became an important trading town and the home of a Hanseatic guild until about 1470. Henry VIII granted it a charter of incorporation in 1546. The ancient Guildhall is interesting historically as the place of trial of Brewster and his companions. The parish church of St. Botolph (1309), 200 × 98 feet, is one of the largest without cross aisles in England, and has a fine tower 290 feet high, surmounted by a lantern visible 40 miles out at sea. Its decorated chapel was restored in 1857 by citizens of Boston, Mass., in memory of John Cotton, who was a vicar in the English town before he came to America. Boston returns one member to Parliament. The town owns extensive docks, which are very profitable. The clearing of the river of silt and the closing of the adjacent fens have greatly promoted the trade of Boston. Pop., 1891, 14,570; 1901, 15,700; 1911, 16,873.

BOSTON. The capital of Massachusetts, and the county seat of Suffolk County, the commercial metropolis of New England, and the fifth city of the United States in population (Map: Massachusetts, E 3). It is in lat. 42° 21' 27" N., long. 71° 3' 30" W., 232 miles by rail northeast of New York City, on Boston harbor, an arm of Massachusetts Bay, at the mouths of the Mystic and Charles rivers.

Description. The original site of Boston was a peninsula marked by three hills, of less than 800 acres in extent, cut into by inlets of ocean and river, coves, and creeks, the deeply indented shore surrounded by tidal marshes, and connected with the mainland by an exceedingly narrow neck, one mile in length and so low that it was not infrequently submerged. One of the three hills, named by the settlers Beacon, Copp's, and Fort respectively, has been leveled, and the other two, Beacon and Copp's, have been considerably cut down, though the former still rises to a height of 110 feet. The inlets, coves, and tidal marshes have been from time to time filled in and reclaimed at great expense until the original area of 783 acres has been expanded to 1801 acres, a part of which, covering what was the basin of the Charles River, is now the location of the well-known Back Bay district of the modern city. The limits of the original town have been extended at various periods to include Noddie's Island in the harbor, "laid to Boston" in early Colonial times (1636) and afterward

named East Boston; Dorchester Neck, annexed in 1804, and becoming South Boston; Washington Village, set off from Dorchester, 1855, Roxbury, annexed in 1868; Dorchester, in 1870; Charlestown, West Roxbury, and Brighton, in 1874; and Hyde Park in 1912—the modern Boston occupying a total area of 30,295 acres, or about 47.30 square miles.

The appearance of the old town is still slightly retained in the narrow and irregular streets of the North End, now one of the foreign quarters of the city, mainly an Italian centre. As historical relics remain four old burying grounds—King's Chapel Burying Ground, the oldest cemetery in Boston, dating from 1630, in which are the graves of the Winthrops and numerous other Colonial worthies; the Granary Burying Ground, 1660, containing the graves of Samuel Adams, James Otis, Peter Faneuil, Paul Revere, and other persons noted in history; Copp's Hill Burying Ground, the earliest also dating from 1660, where are the tombs of the Mathers, Increase, Cotton, and Samuel; and the Central Burying Ground, on Boston Common, 1756, a notable grave in which is that of Gilbert Stuart, the portrait painter. A few old buildings are still standing—Christ Church (Old North Church, so called) (1723), from the spire of which, as it is marked—though this has been violently disputed—were hung the lanterns for Paul Revere; Faneuil Hall (q.v.); the Old State House (1748), restored in 1882 and 1908–09 as nearly as possible to its provincial appearance, one of the most noteworthy historic buildings in the United States and the repository of an interesting collection of relics and paintings; King's Chapel (1754), occupying the site of the first Episcopal church, of 1688; and the Old South Meeting House (1729), with which are connected many notable events in the history of the city, and which now contains historic relics and in winter is used as the hall for lectures on American history. The interior of Christ Church and the exterior of the Old South have also been restored to their original aspect.

The modern city has about 570 miles of accepted streets, of which all are paved—the greater part with macadam, granite block, gravel, and asphalt. In the newer sections they are handsomely laid out. Beacon Street and Commonwealth Avenue, the latter 240 feet wide and one of the finest boulevards in America, with other streets of the Back Bay region, are representative of the beauty of Boston's residential avenues. Washington, Tremont, and Boylston streets are the headquarters of the retail trade, and State Street is the financial centre, the Wall Street of Boston. Intercommunication between the various districts is afforded by an efficient street-railway system which operates upward of 400 miles of track, elevated and surface railways, subways, and tunnels, and a number of bridges; East Boston being connected by ferry and by a tunnel under the harbor.

Buildings. Boston is replete with objects of architectural interest. The State House, on Beacon Hill, the front built in 1795 after designs by Charles Bulfinch, and subsequently enlarged and extended at various times, is a prominent structure, some 400 feet long, the "Bulfinch Front" crowned by a gilded dome. The Shaw Monument, by Saint-Gaudens; the reproduction of the First Independence Monument, by Bulfinch, which was erected in 1790;

and statues of Daniel Webster, Horace Mann, Gen Joseph Hooker (equestrian, the figure by Daniel C French), Charles Devens (Olin L Warner), and Nathaniel P Banks (H H Kitson), are of interest in this locality. The City Hall, an Italian Renaissance structure, on School Street, is fronted by statues of Benjamin Franklin and Josiah Quincy. In the rear, and facing Court Street, is the City Hall Annex, with lofty pillared front, erected in 1912-14. The granite County Courthouse near by, on Pemberton Square, a type of German Renaissance, is 450 feet long, erected at a cost of \$2,500,000. On State Street stands the Customhouse, the original building, dating from 1847—a massive pillared structure of granite, in form a huge Greek cross—reconstructed, the dominating feature being a broad lofty tower rising from the domed roof of the original. Not far distant, facing Post Office Square, is the United States Government building, which covers an entire block and accommodates the post office, sub-treasury, and United States courts. The total cost of this edifice, including construction and land, was nearly \$6,000,000.

Copley Square, Back Bay, is perhaps the city's chief architectural centre. Here are the Public Library, facing the square, the Copley-Plaza Hotel and Trinity Church on the south side, the New Old South Church, and the Wesleyan Building, north side. The library (McKim, Mead, and White) is built of Milford granite, in Italian Renaissance style, and is nearly square, inclosing an open court which contains a fountain and is surrounded by a fine arcade. Over the main entrance are reliefs by Saint-Gaudens, and on the entrance platform, statuary groups representing, respectively, Science and Art, by Bela L. Pratt, while the interior is richly decorated with colored marbles and mural paintings by well-known artists, among them Puvis de Chavannes, Abbey, and Sargent. The entrance hall leads to a magnificent marble staircase flanked with lions. A statue of Sir Harry Vane adds to the interior decoration. The Boston Public Library is the second largest free circulating and reference library in the country. It has accommodation for 2,500,000 books and contains upward of 1,000,000 volumes, among which are included several valuable special collections, that of Shakespeariana being one of the finest in the world. The general reading room (Bates Hall) is 42 feet wide by 217 feet long and extends across the Copley Square front. The churches on this square are worthy examples of ecclesiastical architecture, and, with the Roman Catholic Cathedral of the Holy Cross in Washington Street, the Arlington Street Church, the First Baptist (originally Brattle Square Church, Unitarian, by Richardson) on Commonwealth Avenue, and the First Church of Christ (Scientist), are perhaps the most striking church edifices in the city. The New Old South Church is in Italian Gothic with a fine campanile and an interior noticeable for its rich marble. Trinity Church, by Richardson, said to be the finest church in New England, is of French Romanesque. It has the form of a Latin cross and is particularly notable for its beautiful interior decorations and stained-glass windows. Other structures of interest are the Stock Exchange Chamber, the Chamber of Commerce, the Boston Athenæum, the New England Historic Genealogical Society's buildings, the Unitarian and

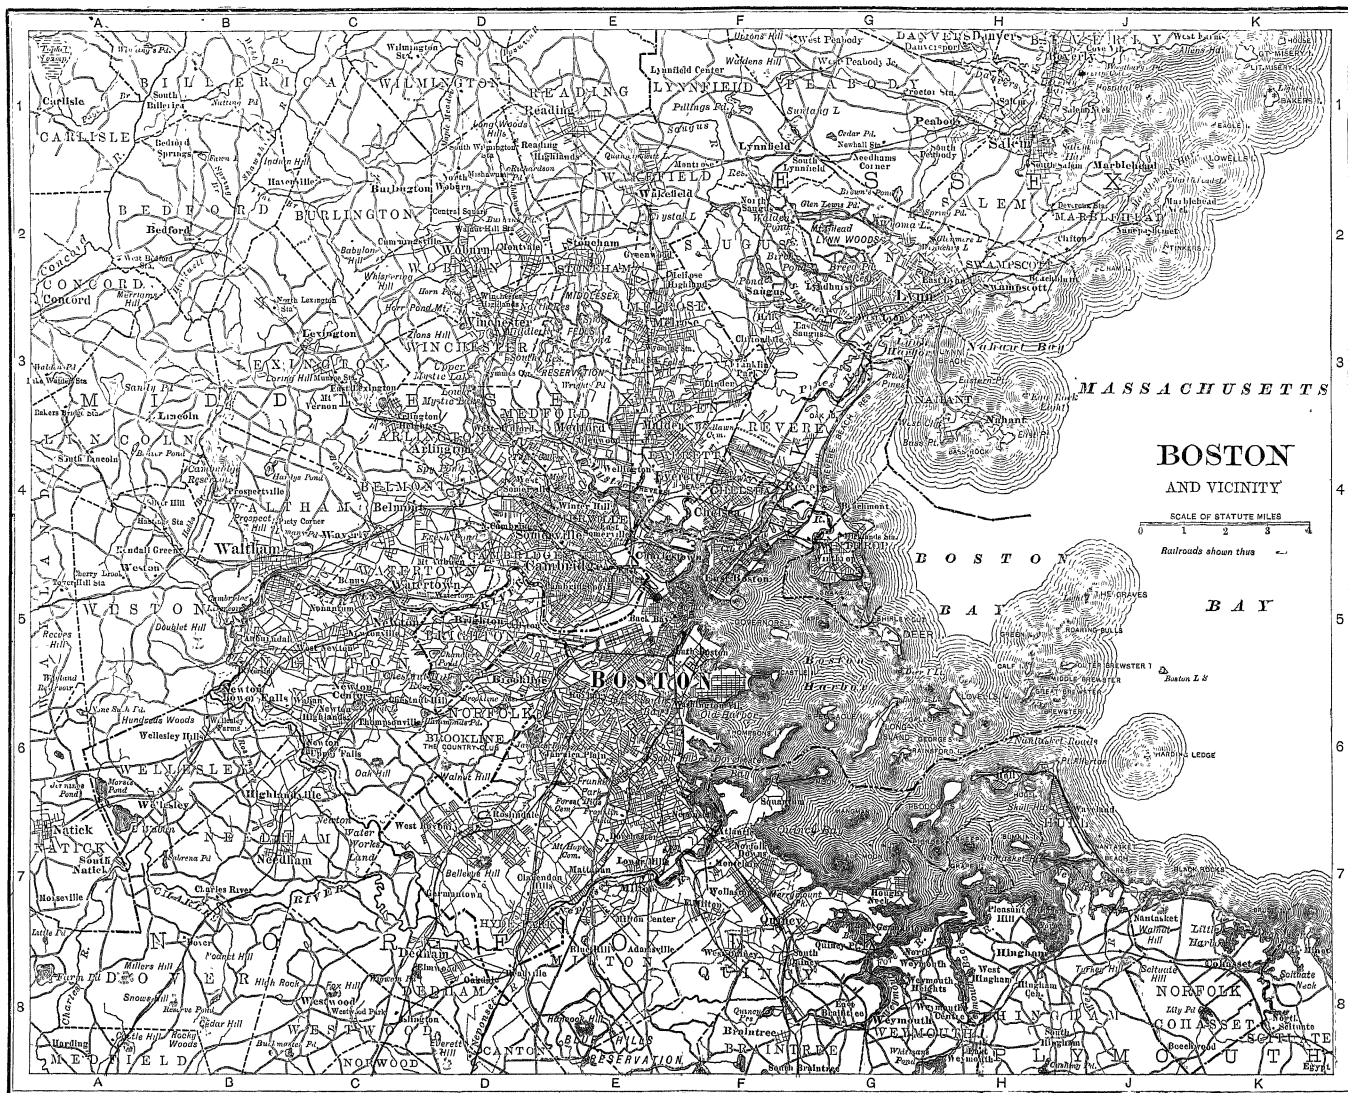

Congregational buildings, Ford Hall, Tremont Temple, and the Masonic Temple in the older and business parts, the Armory of the Independent Corps of Cadets, the Youth's Companion Building, and the Franklin Union (established from the fund created by a bequest of Benjamin Franklin to Boston), in the South End, and in the Back Bay district, the Natural History Museum, with a library and valuable collections, the buildings of the Massachusetts Institute of Technology, of the Massachusetts Historical Society, the New England Conservatory of Music, the Young Men's Christian Association, the Museum of Fine Arts (Guy Lowell, architect)—the repository of works of inestimable value, the collection of Japanese art being the largest and that of antique casts among the best in the world—the Wentworth Institute, Simmons College, and the Harvard Medical and Dental schools, the former comprising a noble group of five white marble structures, and constituting the centre of a collection of hospitals also largely of marble.

In Charlestown are the famous Breed's Hill and Bunker Hill. In this section of the greater city the principal points of interest are the Bunker Hill Monument, a granite obelisk 220 feet high, which affords from the top an extensive view, and the Navy Yard, occupying nearly 90 acres, and containing machine shops, ship houses, etc., and a large granite dry dock. Charlestown has also statues of Col William Prescott and Gen Joseph Warren, a soldiers' monument, and a monument to John Harvard. A large statue of Warren (by Paul W Bartlett) is in Roxbury, near the site of his birthplace there.

Parks. The Common, a most characteristic feature of Boston, esteemed by the people as few other public parks are because of its intimate connection with the history of the city, was set off in 1634 as a training field and common ground and has since been carefully preserved for public use. Its 48 acres are crossed by paths shaded by old elms and maples. Towards the centre, near where an historic Great Elm stood until blown down in 1876, is the Army and Navy Monument (by Martin Milmore), erected in memory of the men of Boston who fell in the Civil War. Near the Tremont Street (Lafayette) Mall stands the Crispus Attucks Monument (by Robert Kraus) commemorating the "Boston Massacre of 1770." A bronze figure represents Revolution breaking the chains, and the scene of the massacre is portrayed in bas-relief on the base, the names of the victims are on the shaft. Adjacent to the Common is the Public Garden, of 24 acres, the entrance to the Back Bay district, tastefully laid out and in season a mass of brilliant flowers. It contains an artificial lake, spanned by a bridge, an equestrian statue of Washington by Ball, statues of Charles Sumner (by Ball), William Ellery Channing (Herbert Adams), and Edward Everett Hale (Bela L. Pratt), a representation of "Venus Rising from the Sea," and the Ether Monument, a group by J. Q. A. Ward, commemorating the discovery of ether, first successfully used in 1846 by Dr. Morton, in an operation at the Massachusetts General Hospital.

Other noteworthy statues in various parts of the city include figures of Samuel Adams (by Anne Whitney) in Adams Square, of Governors Andrew (Ball) and Wolcott (French) in the State House, of Alexander Hamilton (Rimmer),

John Glover (Milmore), William Lloyd Garrison (Warner), and Leif Ericson (Anne Whitney), in Commonwealth Avenue; Governor Winthrop (Greenough), at the side of the First Church, Marlborough Street; Phillips Brooks (Saint-Gaudens), beside Trinity Church; Beethoven (Crawford), in the New England Conservatory of Music; Columbus (Buyens), in front of the Roman Catholic Cathedral; Admiral Farragut (Kitson), in Marine Park; Edward Everett (Story), Edward Everett Square, Dorchester district; and memorials to John Boyle O'Reilly (French), and Patrick A. Collins (Mr. and Mrs. Kitson), Back Bay Fens.

Owing to the natural beauty and accessibility of its suburbs, and the existence of the Common and the Public Garden in the heart of the city proper, Boston was late in initiating a system of public parks. There are now two phases of park development—the municipal, dating from 1875, and the metropolitan, of later inauguration and of vast extent. The municipal system of over 2400 acres includes, besides numerous playgrounds, open-air gymnasias, and independent parks in various parts of the city, a chain of parks connected by fine parkways, and almost encircling the city from the Charles River Esplanade to the Marine Park in South Boston. From its terminus at the Charles River, the system extends through a narrow section, Charlesgate, to the Back Bay Fens, thence by the Riverway to Olmsted Park and parkways to Jamaica Pond; through the Arnold Arboretum, where may be found every tree and shrub that will grow in Boston's climate; thence to Franklin Park, of 627 acres, between Roxbury, West Roxbury, and Dorchester districts, the central feature of the system, with a Zoological Garden; and ending at the Marine Park and Aquarium, at City Point, South Boston. The Marine Park is connected by a bridge with Castle Island, a part of the park system, as is also Governor's Island. This locality is a popular headquarters for yachts and affords facilities for boating and bathing (municipal bath houses). The Metropolitan Parks district, in which are included, with Boston, 38 municipalities, is administered by a commission of five members, appointed by the Governor. The scheme comprises such reservations as the Blue Hills (4900 acres), Middlesex Fells (1900 acres), Stony Brook Woods (460 acres), connecting the first named with the Boston municipal system at the Arnold Arboretum, Lynn Woods (2000 acres), Beaver Brook and Waverley Oaks Reservation (58 acres), of greater interest than its small extent presupposes, Revere Beach (67 acres), which is open to public use for several miles, Nantasket Beach (25 acres), and improvements along the Charles, Mystic, and Neponset rivers: a total of reservations and parkways of 10,214.86 acres.

Education, Libraries, etc. Boston is noted as one of the greatest educational and literary centres of the country. Its public-school system comprises, besides kindergarten, primary, and grammar schools, a liberal number of high schools; special high schools of the mechanics' arts, the practical arts, and of commerce; girls' trade and boys' industrial schools; and also normal and Latin schools. The Boston Latin School, founded in 1635, and the English High School occupy the largest school building in the United States. Among the higher institutions of learning are Boston University (Methodist Episcopal), Boston College (Roman Catholic),

Massachusetts Institute of Technology, the Medical and Dental schools of Harvard University, Tufts College Medical School, College of Physicians and Surgeons, St. John's Ecclesiastical Seminary (Roman Catholic), and the Massachusetts College of Pharmacy. The New England Conservatory of Music has an enviable reputation, and the Lowell School of Design, the Massachusetts Normal Art School, and the school connected with the Museum of Fine Arts are representative of Boston as a centre of art education. Besides these regular institutions, the great system of free lectures on a wide variety of subjects practically constitutes a great university. The work of the Lowell Institute (founded in 1839, by the will of John Lowell, Jr.), which is specially endowed for this purpose, is particularly worthy of note. The lectures in the Old South Meeting House have been mentioned.

The Boston Public Library maintains 250 agencies, including 13 branch stations with large permanent collections, besides numerous reading rooms and delivery and deposit stations. Within a radius of 15 miles from the State House more than 5,000,000 volumes in free or institutional libraries are publicly available. Among other noted collections in the city are those of the American Academy of Arts and Sciences (founded in 1780), the Boston Athenaeum (founded 1807) with over 240,000 volumes, Boston Library Society, Congregational Library, Massachusetts Historical Society (founded 1791), Massachusetts Horticultural Society (founded 1829), New England Historic Genealogical Society (founded 1844), State Library, Social Law Library, General Theological Library, and Natural History Society, besides those of the leading educational institutions.

Charitable Institutions. In the number and efficiency of institutions of this class, both public and private, Boston holds high rank. Among these mention may be made of the Massachusetts General Hospital (founded 1799), one of the best equipped in the world; Boston City Hospital, comprising 26 buildings; Massachusetts Homeopathic Hospital, Carney Hospital (in South Boston), Women's Charity Club Hospital (in Roxbury), Massachusetts Charitable Eye and Ear Infirmary, New England Hospital for Women and Children, Boston Insane Hospital (separate establishments for men and women), Children's and Infants' Hospitals, the Horace Mann School for Deaf-Mutes, and the Perkins Institution for the Blind (removed from South Boston to Watertown in 1913), the latter having a large library of raised-character books. On islands in the harbor are the principal almshouse, House of Correction, and House of Refuge for Boys.

Theatres, Clubs, Societies, Hotels. The Boston Theatre, seating 3000, is the largest in New England, and the Colonial, Tremont, Hollis Street, Shubert, Park, Castle Square, Keith's, Majestic, Plymouth, Cort, and Wilbur theatres have seating capacities ranging from 1000 to 2000. The Boston Museum, torn down in 1903, was noteworthy for the first appearance of famous actors and for the excellence of its stock companies; also as the oldest in the city. The earlier Tremont Theatre, which occupied the site of the present Tremont Temple, was notable in its day for the eminent players who appeared on its stage. The celebrated Boston Symphony Concerts are given in Symphony Hall, one of the

finest music halls in the country, while permanent opera is established in the Boston Opera House. See BOSTON SYMPHONY ORCHESTRA.

Boston is the home of a large number of historical, scientific, literary, and musical societies. In the last-mentioned class are such distinguished organizations as the Apollo, Cecilia, Harvard Musical, Handel and Haydn, and Orpheus. The social and literary clubs include, among numerous others, the Somerset, Union, St. Botolph, University, Puritan, Boston Art, Algonquin, Harvard of Boston, Athletic, Exchange, City, Engineers, Architectural, Tavern, Appalachian Mountain, and the Chilton, Mayflower, College, and Women's City (the last four women's clubs).

The principal hotels include the Copley-Plaza, Adams House, Parker House, Young's Hotel, Hotel Touraine, Somerset, Vendome, Westminster, Copley Square, Lenox, Thorndike, Brunswick, Belvedere, and Essex.

Commerce and Industry. Boston is the terminus of the Boston and Maine, and the New York, New Haven, and Hartford Railroad systems; the Boston and Albany, and the Boston, Revere Beach, and Lynn (narrow-gauge) railroads. There are two large union stations on the water fronts and on opposite sides of the business district—the North Station, used by the Boston and Maine system, and the South Station, one of the largest stations in the world, over 800 feet long by 700 feet wide, used by the Boston and Albany and the New York, New Haven, and Hartford system. There are several regular steamship lines to Europe. The harbor is spacious and safe. It is about 8 miles wide and more than twice as long, with a minimum depth in the main channel of 23 feet at low tide. There are several lights and beacons and numerous islands, upon certain of which are situated the old Fort Independence and Forts Warren and Winthrop, and the modern forts Standish and Strong, besides the charitable and reformatory institutions already mentioned.

Boston's interests, once chiefly commercial, have become now mainly industrial, though the factories owned by Boston capital are mostly out of town, the manufactures are extensive and varied. According to the census of 1910 a total of over \$211,000,000 was invested in the various manufacturing industries, which had a production valued at nearly \$237,500,000. The city is the second wool market in the world, and the second fish market, ranking next to London in both, and is second to New York only among American ports in the value of its foreign trade, which amounted in 1912 to \$216,310,809. The exports comprised chiefly provisions (including animals), breadstuffs, meat and dairy products, cotton and its manufactures, leather and its manufactures, iron and steel manufactures, wool and its manufactures, printing paper and paper manufactures, distilled spirits, manufactures of rubber, and agricultural implements. The principal imports were wool and woollen manufactures, fibres, sugar, hides and skins, cotton and cotton manufactures, chemicals, drugs and dyes, manufactures of iron and steel, india-rubber and substitutes, tea, tin, wood and wooden products, fruits, fish, wood pulp, paper stock, hemp, flax, jute earthenware and china ware. The facilities for handling this great traffic are excellent, a system of freight terminals brings together the railroads and

ships, deep-water piers making accessible docking facilities for the largest vessels. The fishing industry, which formerly was one of the chief sources of Boston's prosperity, is still of importance, the city remaining the largest fish market in the country. Boston is the centre of immense mining, railroad, and insurance interests, which are operated all over the country.

Administration, Municipal Activities. On Nov. 2, 1909, as the result of a report made by a Finance Commission, the city adopted an amended charter which provided a quasi commission form of government. Under this charter the term of the mayor is four years, with the privilege of recall at the end of two years by not less than a majority of all the registered voters. There is a city council with one chamber of nine members elected at large for three-year terms, three elected each year, nominated, as is the mayor, by petition of not less than 5000 voters. The school committee, consisting of five members for three-year terms, two elected each year, is also nominated by petitions of not less than 5000 names. Appointment of all heads of departments and municipal boards (except those officially by law appointed by the governor of the State) are made by the mayor without confirmation by the city council, but subject to approval or certification of the appointee's qualification by the State civil service commission. A finance commission, of five members—residents and qualified voters of the city, but appointed by the governor of the State for five-year terms, one member appointed annually—is provided, whose duties are to investigate any matters relating to appropriations, loans, expenditures, accounts, and methods of administration affecting the city, or any department of it, that may appear to the commission to require investigation, and to report thereon to the mayor, the city council, the governor, or the legislature. Under this charter it was made a criminal offense for a member of the city government to participate in the profits of any city contract.

There has been of recent years a great increase in the activities undertaken by the municipality. These now extend to a municipal printing plant, work in the repair and construction of city buildings, watering of the streets, municipal bath houses, lectures, and concerts, free excursions for children, a camp for boys, etc. Besides these, and the greatest of municipal enterprises—the subways and tunnels—there are the combined municipal works comprised in the metropolitan systems of parks, of sewerage, and of water supply. The metropolitan districts are not, however, coextensive with the parks district comprising, with Boston, 38 cities and towns, the sewerage, 24, and the water district, 17. The sewerage system comprises a network of common and intercepting sewers (820 miles in Boston), discharging into Boston harbor. The water supply is obtained from the Naubna River, and the plan is arranged to include other sources in case the demand exceeds the present supply. The first water works of the system were completed in 1848. The entire system, including 828 miles of supply and distributing mains, has cost above \$23,000,000.

The original subway, constructed in 1895-98 at a cost of \$4,250,000, was the finest example in the United States of municipal enterprise in this field—a notable work of engineering undertaken for the relief of the congested traffic in

BOSTON
TRINITY CHURCH (UPPER)
THE NEW STATE HOUSE (LOWER)

the business district. It was opened for traffic in September, 1897, when it was leased for operation to a private company for a term of 20 years at an annual rental of 4½ per cent of the net cost of the work. This Tremont Street Subway is substantially constructed, is well lighted and ventilated, and is attractively finished at the stations with glazed white brick. On Dec. 30, 1904, the East Boston Tunnel, passing beneath Boston harbor to East Boston and affording eastern suburban street cars direct access to the city, was put in use. On this tunnel the operating company pays the city 4½ per cent per annum on the net cost of construction. On Nov. 30, 1908, the Washington Street Tunnel was opened to the public and put into service exclusively for elevated trains, which before had been run together with surface cars in the Tremont Street Subway. It is leased to the operating company, for 25 years from the date of beginning of use, at 4½ per cent of the net cost. The elevated system, which is in connection with the surface systems south and north, was opened in 1901, when it extended from the Roxbury district through the city northward and through the Charlestown district, connecting with both the North and South terminal railway stations. In 1911 it was extended through Roxbury southward to Forest Hills, West Roxbury district. The structure is of steel, and the trains are operated by electricity, on the third-rail system. On March 23, 1912, the Cambridge connection, comprising a tunnel through Beacon Hill to an open way over Cambridge Bridge into the Cambridge Main Street Tunnel (built by the operating company), was opened, leased at an annual rental for 20 years at 4½ per cent upon the net cost, and thereafter at 4½ per cent. In 1912 began the construction of the Boylston Street Subway, starting from about the junction of Commonwealth Avenue and Beacon Street, Back Bay, and making connection with the Tremont Street Subway; the Dorchester Tunnel, from the Tremont Street Subway to the Dorchester district; and the East Boston Tunnel Extension, on the Boston side. These three works when completed are also to be leased to the operating company for 20 years at a yearly rental of 4½ per cent on the net cost. The elevated and surface lines of the city are all operated by the Boston Elevated Railway Company, and the various subways and tunnels accommodate its elevated and surface cars and a portion of the cars from the Boston and Northern Company.

The annual expenditures of the city for maintenance and operation amount to about \$40,000,000 (including \$1,700,000 by the county), the main items of expense being about \$4,740,000 for schools, \$3,400,000 for interest on debt, \$2,300,000 for the police, \$4,500,000 for public works, which comprise streets, sewers, water, bridges, ferries, and municipal lighting (consolidated in a single department in 1910), \$1,003,000 for water service, \$1,720,000 for the fire department, \$1,200,000 for charitable institutions, \$450,000 for parks and playgrounds. The assessed valuation of property, real and personal (the basis of assessment being 100 per cent), in 1912 was about \$1,480,000; the funded debt (1913) was, approximately, \$72,500,000, including \$2,370,000 county debt. The legal borrowing limit is fixed at 2½ per cent of the average assessed valuation for three years.

Population. From a very early date Boston has ranked among the largest American cities.

The growth of its population has been gradual and steady, as seen from the following figures: 1790, 18,320; 1800, 24,937; 1850, 136,881; 1870, 250,526; 1890, 448,477; 1900, 560,892; 1910, 670,585; 1914 (est., based on the observed increase from 1900 to 1910), 724,243.

The first sections to be settled in Boston were the harbor front and the north end of the peninsula. Until towards the middle of the nineteenth century the population was still largely confined to the peninsula. After that period the population began to spread out into Charlestown, East Boston, South Boston, and in later years turned to Roxbury, West Roxbury, Dorchester, and Brighton. Boston proper (by which the city exclusive of the annexed parts is designated) contains now less than a third of the total population, business buildings crowding out dwellings. What was the earliest genteel quarter, the North End, has become a part of the commercial section of the city and is largely taken up with the dwellings of immigrant people. Similarly the South End, a fashionable quarter of the mid-nineteenth century, gradually changed its character with the crowding in of business interests, and the "court end" shifted therefrom to the Back Bay section.

While it is claimed for Boston that it still retains its old American spirit and character, the city has a larger foreign element than many other large American cities. The percentage of people of foreign birth in 1890 was 35.27, and those of foreign parentage constituted 60.9; while in 1900 the former constituted 34.8 per cent, and in 1910 35.9 per cent, of the total population. Of the foreign nationalities, the Irish are most strongly represented. The largest immigration of Irish took place in the decade 1845-55, the immigrants settling in the once fashionable section of the North End. The Scotch, English, and Germans are represented in much smaller numbers, while in later years the immigration has been made up largely of Italians and Russian Jews, the latter having taken the place of the Irish in the North End of the city. The colored population is very small, having been less than 12,000 in 1900 and under 14,000 in 1910. The geographical conditions, unlike those of New York, have allowed of an easy expansion of the city limits, thus preventing excessive overcrowding. However, the North and South Ends have a congested population.

History. The peninsula on which old Boston was built was known as Shawmut, or Living Waters, or Near the Neck, to the Indians, and was named Trimontaine by the early Colonists at Charlestown, from the three-peaked top of its highest hill, which became Beacon Hill. It was first visited by an exploring party from Plymouth in 1621. In July, 1630, the Colonists brought by John Winthrop to Salem established themselves at Charlestown; but on the invitation of William Blackstone, or Blaxton, a "bookish recluse," who had lived on the peninsula since 1625, Winthrop and the greater part of his company moved to Trimontaine on or before Sept. 17, 1630, on which date the place was renamed Boston, after the Lincolnshire town whence the chief men of the company had come. The old "Trimontaine," changed to Tremont, is preserved in Tremont Street and in a theatre and other buildings. On Oct. 19, 1630, the first General Court met at Boston "for the establish-

inge of Gov^t," and on Oct 3, 1632, the court adopted the vote. "It is thought by generall consent that Boston is the fittest place for publique business of any place in the Bay," thus establishing it as the capital of the Massachusetts Bay Colony. Early in 1632 the first meetinghouse was erected, near the head of the present State Street, and three years later the first free schoolhouse was built on the present School Street. In 1635 the first grand jury of the country met in Boston. Boston soon became the chief town of the Massachusetts Bay Colony and the centre of Puritan religious life and learning. In 1636 the Antinomian controversy (see HUTCHINSON, ANNE) broke out and, with the disturbances caused by Roger Williams (q.v.), led to the emigration of many prominent citizens. Between 1648 and 1688 four women—Margaret Jones of Charlestown, Mary Parsons of Springfield, Ann Hibbins, and Goody Glover—were executed for witchcraft, and between 1659 and 1661, during the excitement caused by the Quaker immigration, four Quakers were hanged on the Neck for returning after banishment on pain of death. A post office was opened in 1639. In 1652 a mint was established, at which the "pine-tree" shillings were coined for a number of years. In 1686 the first bank, and the first in the Colonies, was chartered. A printing office was opened in 1674, and in 1704 the *Boston News Letter*, the first regular newspaper to be printed in America, began publication. At the beginning of the eighteenth century Boston was the largest and most important town in America, and its citizens took a leading part in the expression of public opinion in the conflict of the Colonies with Great Britain. The impressment of seamen by the home government in 1747 caused several riots, and the spirit of independence increased till the Stamp Act in 1765, and later the revenue acts, incited outbreaks, which led to the quartering of two British regiments in Boston. On March 5, 1770, the "Boston Massacre" (q.v.) occurred. On Dec 16, 1773, occurred the famous Boston "Tea Party" which caused Parliament to pass the Boston Port Bill (q.v.)—in effect June 1, 1774—virtually closing Boston harbor to commerce. At the outbreak of the Revolution Boston was occupied by British troops, but was besieged by the American army after the skirmishes at Lexington and Concord, and attempts to fortify Charlestown were followed by the battle of Bunker Hill (q.v.), June 17, 1775. By fortifying Dorchester Heights Washington forced the British to evacuate the town, March 17, 1776.

Since the Revolution Boston's prosperity has been almost continuous, the most important interruption having been caused by the Embargo of 1807. The city received its charter in 1822, and had then a population of 47,000. In 1840 the *Brannania*, the first of the Cunard liners, entered Boston harbor and began the present system of transatlantic passenger traffic. In 1849 there was an epidemic of cholera, 5080 dying out of a population of 130,000. Slaves were owned in Boston as early as 1638 and continued to be held till after the Revolution. In 1831 William Lloyd Garrison began the publication of *The Liberator*, and organized (1832) the New England Antislavery Society, the first society to advocate immediate emancipation. Boston thus became the centre of the radical Abolitionist movement, though in 1835 there was an anti-Abolitionist riot. Intense excite-

ment was caused throughout the country by the rescue here of Shadrach, in February, 1851, and the return to slavery from here, under the provisions of the Fugitive Slave Law of 1850, of Thomas M. Sims (q.v.), in April, 1851, and of Anthony Burns (q.v.), in May, 1854. During the Civil War Boston strongly supported the measures of the Federal government and sent more than 26,000 men to join the army and navy. The city has suffered severely from fires, the most destructive occurring in 1676, 1679, 1711, 1760, 1872, 1889, and 1893. That of 1872 was especially disastrous, 60 acres in the business portion of the city having been thoroughly devastated, and property valued at over \$60,000,000 destroyed. On Sept 17, 1880, the two hundred and fiftieth anniversary of the settlement of Boston was celebrated with great enthusiasm.

Consult Justin Winsor's (editor) exhaustive and scholarly *Memorial History of Boston, Including Suffolk County* (4 vols, Boston, 1880-81), also Quincy, *A Municipal History of the Town and City of Boston, from 1630 to 1830* (Boston, 1852), Hale, *Historic Boston and its Neighborhood* (New York, 1898), Drake (Samuel G.), *History and Antiquities of Boston, from 1630 to 1670* (Boston, 1854), Drake (Samuel A.), *Old Landmarks and Historic Personages of Boston* (Boston, 1900), Lodge, "Boston," in the *Historic Towns Series* (London, 1891), Howe, *Boston, the Place and the People* (New York, 1903), Sprague, *Government of Boston, Its Rise and Development* (Boston, 1890), *Directory of the Charitable and Beneficent Organizations of Boston* (Boston, 1899), "The Completion of the Boston Subway and New Arrangements of Street Cars," in *Railroad Gazette*, No 30 (New York, 1898), Benton, *Story of the Old Boston Town House* (Boston, 1908), Howe, *Boston Common Scenes from Four Centuries* (Boston, 1910), Sullivan, *Boston, New and Old* (Boston, 1912).

BOSTON, THOMAS (1677-1732). A Scottish divine and author, born at Dunse (Berwickshire). He was educated at the University of Edinburgh (M.A., 1694), and in 1699 was ordained to the Presbyterian ministry and appointed to the parish of Simprin. In 1701 he was clerk of synod, and in 1707 became pastor of Ettrick (Selkirkshire). It was through his reading and recommendation to friends of the treatise *The Marrow of Modern Divinity*, by Edwin Fisher, that the well-known Marrow controversy (q.v.) was instituted. He wrote *Human Nature in its Fourfold State* (1720), a strongly Calvinistic work, frequently reprinted, and a popular sermon styled *The Crook in the Lot* (1863). Consult his *Memoirs* (1776) and the *Whole Works* (ed by S. McMillan, London, 1854).

BOSTON ART SCHOOL. An institution connected with the Boston Museum of Fine Arts. Shortly after the opening of the Museum in 1876 a few rooms were set apart for technical instruction in drawing, modeling, and painting, and later a department of decorative design was added. In 1909 the school was moved into a building of its own adjoining the new Museum. The number of students, who come from all parts of the United States and even from foreign countries, is limited to about 250. The teaching is of a high order, and the school has trained many artists who have since risen to prominence. Among the scholarships offered the most

BOSTON
THE OLD STATE HOUSE (UPPER)
FANEUIL HALL (LOWER)

important is the Paige Traveling Scholarship, paying \$800 a year. There are also several annual prizes.

BOSTON COLLEGE. An institution for higher education under the auspices of the Roman Catholic church. It was chartered in 1863 and opened in Boston, Mass., in September, 1864. There are 45 founded scholarships. In September, 1913, the collegiate department was removed to Chestnut Hill, Mass., where a new site and a new building had been secured, while the old building in Boston has been devoted to the preparatory school. The value of all the buildings and grounds is somewhat over \$1,000,000; and the income from tuition fees about \$30,000. The faculty for college departments in 1913 numbered 18 and the students 400; the number of instructors in the preparatory school was 30 and the number of students 900. The library contains 50,000 volumes. The college course is four years, leading to the degree of A.B. The president in 1914 was the Rev. Charles W. Lyons, S. J.

BOSTONIANS, THE. A novel by Henry James (1886).

BOSTONITE. A fine-grained igneous rock related in composition to trachyte (q.v.), but containing no basic feldspar and very little or none of the dark silicates. The main ingredient is feldspar of the alkali variety, such as microcline, micropertite, or anorthoclase, so that the rock usually has a very light color. The texture may be even-grained or porphyritic. Bostonites occur in dikes and are rather common, though nowhere extensive as to area. They are found in the New England States—but not in the immediate vicinity of Boston, as might be inferred from their name—in the Champlain valley, the adjoining section of Canada, and in the British Isles.

BOSTON MASSACRE, THE. After the quartering of British troops in Boston (1768), there was continual friction between the soldiery and the people. Several minor riots occurred early in 1770, and the trouble culminated on March 5, when seven soldiers under Captain Preston, who were being pelted with snowballs and stones by fifty or sixty of the populace, headed by one Crispus Attucks (q.v.), fired into the crowd, killing three and wounding seven more, of whom two died. This act infuriated the Boston people, who met in mass meeting and compelled the withdrawal to Castle Island (March 12) of the two regiments of troops. The seven soldiers, with Captain Preston, were tried for murder in October and November, were defended by John Adams and Josiah Quincy, and were finally acquitted, though two of them were declared guilty of manslaughter and received light punishments. There is much difference of opinion with respect to the "Massacre," some writers regarding it as a lawless affair discreditable to the people and the soldiers alike and without any great historical significance; others, as the "first act in the drama of the Revolution." In 1816 John Adams wrote: "Not the Battle of Lexington or Bunker Hill, not the surrender of Burgoyne or Cornwallis, were more important events in American history than the battle of King Street on the 5th of March, 1770." The day was annually commemorated in Boston until 1783, and in 1888 a monument was erected to the memory of the 10 victims. Consult Kidder, *History of the Boston Massacre* (Albany, 1870)

and Winsor, *Memorial History of Boston*, vol. iii (Boston, 1880-81).

BOSTON PORT BILL. A bill passed by the British Parliament, and signed by the King in March, 1774, to punish the people of Boston for their destruction of tea in Boston harbor, Dec. 16, 1773. (See BOSTON.) It was to go into effect on June 1 and provided for the virtual closure of Boston harbor to commerce, for the removal of the seat of government to Salem, and for the supplanting of Boston by Marblehead as a port of entry, until the people of Boston should indemnify the owners of the property destroyed and fulfill other specified conditions. This, the greatest encroachment yet made by Parliament upon the liberties of the Colonists, aroused an instant and widespread feeling of indignation and alarm. Assurances of sympathy and support were immediately sent to the people of Boston by the legislatures and committees of correspondence of other Colonies, and June 1 was widely observed as a day of fasting and prayer, bells being tolled, flags placed at half-mast, and houses draped in mourning. Material aid was also given from all quarters, food supplies being sent from as far as South Carolina. Nonimportation agreements were everywhere urged, pamphlets and broadsides were issued, and finally a general congress—the first Continental Congress—was called to discuss this and other obnoxious acts passed in the same year and to devise measures for relief. Consult: Frothingham, *Rise of the Republic* (Boston, 1872); Pickering, *Statutes at Large*, vol. xxx (London, 1842); Halsey, *Boston Port Bill* (New York, 1904).

BOSTON SYMPHONY ORCHESTRA. One of the finest orchestras in the United States. Ever since the beginning of the nineteenth century the works of the great instrumental masters had been performed by amateur orchestras. In 1881 Mr. Henry L. Higginson established a permanent orchestra, which was to give a series of 24 subscription concerts on Saturday nights throughout the season. Each concert is preceded by a public rehearsal on Friday afternoon. Originally the orchestra consisted of 67 pieces. The first conductor was Georg Henschel. He was succeeded by Wilhelm Gericke, who soon made his orchestra the equal of any body of performers in Europe. Arthur Nikisch kept the orchestra at its high degree of technical excellence and infused his interesting personality into interpretation of the works of the great classical masters. His successor, Emil Paur, was a conductor of wonderful temperament, with strong leaning towards the Neo-German school, whose works figured extensively on his programmes. He, in turn, was again succeeded by Wilhelm Gericke, who at the end of his five years' contract retired in 1906, and was succeeded by Dr. Karl Muck. From 1907 to 1912 Max Fiedler was the conductor. During his incumbency the orchestra was increased to 96 performers, and the number of concerts given in various cities averaged 100 per season. He also introduced the custom of giving concerts without soloists. In 1912 Dr. Muck returned as conductor. After 1890 the Boston Symphony Orchestra regularly visited New York, where they gave five concerts on Thursday nights. A new feature was the establishment, in 1900, of afternoon concerts on Wednesdays in New York. These were not public rehearsals, inasmuch as different programmes

with different soloists were performed on Wednesdays and Thursdays. In 1904 these Wednesday concerts were changed to Saturday Rehearsals are held daily during the season. This, and the fact that the members play only at concert performances, are the principal reasons for the high perfection that marks the playing of this orchestra. The conductor is now always appointed for five years. Franz Kneisel, the former concert master, organized from among the members of this orchestra his famous quartet, which is not surpassed by any kindred organization in the world. In 1904 Kneisel was succeeded by Prof. Willy Hess, who organized the new Boston Symphony Quartet, and he, in 1906, by Karl Witek. In 1905 Colonel Higginson invited Vincent d'Indy to conduct the orchestra in a few concerts presenting works of the modern French school. The twenty-fifth anniversary of the founding of the orchestra was celebrated by a special Wagner concert towards establishing a pension fund. The success of this concert was such that a Wagner concert is given annually for this purpose.

BOSTON TEA PARTY, THE A popular designation of the summary action of a party of Bostonians, on Dec. 16, 1773. After an unavailing protest against the importation of tea as part of the policy of taxing the Colonies without representation in Parliament, a number of citizens, in Indian disguise, proceeded to three ships carrying cargoes of tea and threw about 350 chests of tea into the harbor. In retaliation for this action the port was declared closed.

BOSTON UNIVERSITY. A system of allied schools and colleges. The university is situated in Boston, Mass., and was chartered by the Massachusetts Legislature in 1869, the original incorporators being Isaac Rich, Lee Claflin, and Jacob Sleeper. The university is divided educationally into (1) a College of Liberal Arts (1873), (2) a School of Theology (1871), a School of Law (1872), a School of Medicine (1873), a College of Business Administration (1913), and (3) a general post-graduate department, known as the School of Arts and Sciences. The administration of the university is vested in a university council, consisting of the president of the university and the deans of the constituent schools, a university senate, consisting of the council and the professors of the several faculties, and a corporation, composed of trustees, not less than 10 in number nor more than 50, elected for a term of five years each. The chief benefactor of the university was Isaac Rich, in whose honor the institution founded 64 free scholarships, since then the university has founded over 200 other scholarships as well as two fellowships. The property held by the institution is valued at \$2,500,000. The number of instructors in 1913 was 141, and the number of students 1508. President, Lemuel H. Munlin, LL.D.

BOS/TRA See **BOZRAH**

BOSTROM, bös'trēm, CHRISTOFFER JACOB (1797-1866). A Swedish philosopher. He was born at Pitea and studied at the University at Upsala. In 1838 he was appointed an adjunct professor of philosophy at the university and from 1840 to 1863 held the chair of practical philosophy. He wrote little, but his system has been very influential in Sweden, where it is still the most prominent in centres of

higher education. He has been termed by Falckenberg (*History of Modern Philosophy*, Armstrong's trans.) "the most important systematic thinker of his country." His teaching, defined by himself as "rational idealism," presents reality as spiritual only, and God as an absolute, self-conscious unity, in which all living beings, according to degree, are forever immutably contained. Each living being is a thought of God, and as such potentially emancipated from space and time. Yet man belongs also to a sensible world, which exists for him until he rises beyond the limited to the real and becomes for himself that which he is in God. Bostromian ethics, recalling that of Krause, makes society, as well as the individual, a thought of God, holds constitutional monarchy to be the sole reasonable form of state and regards an all-comprehensive system of states as the ultimate ideal of political development. Bostrom's writings have been edited by Edfelt (Upsala, 1883). Consult Hoffding, "Die Philosophie in Schweden," in the *Philosophische Monatshefte*, vol. xv (Berlin, 1879).

BOSTWICK, ARTHUR ELMORE (1860-) An American librarian and author, born in Litchfield, Conn. He graduated from Yale in 1881, and two years later received the degree of Ph.D. After a short period of teaching he went into literary work, first on Appleton's *Cyclopaedia of American Biography* and Appleton's *Annual Cyclopaedia*, then on the *Standard Dictionary*. In 1895 he became chief librarian of the New York Free Circulating Library, in 1899 of the Brooklyn Public Library, in 1901 of the circulation department of the reorganized New York Public Library, and in 1909 (when he became president of the American Library Institute) of the St. Louis Public Library. He was interested in university extension work. With J. D. Champlin he edited an excellent *Young Folks' Cyclopaedia of Games and Sports* (1890). He wrote *The American Public Library* (1910), a standard work, *The Different West, as Seen by a Transplanted Easterner* (1913), and *Earmarks of Literature* (1914).

BOSWELL, bōz'wēl, JAMES (1740-95). A Scottish lawyer and writer celebrated as the biographer of Dr. Samuel Johnson. He was born Oct. 29, 1740, in Edinburgh, where his father, who had the title of Lord Auchinleck, from the name of his property in Ayrshire, was one of the judges of the Court of Session. He was intended by his father for the law. He studied first in Edinburgh and Glasgow and afterward at the University of Utrecht, where he went in 1763. When in London in that year, May 16, he made the acquaintance of Johnson, an event of decisive importance for his whole subsequent life. The acquaintance was earnestly sought by himself and originated in his ardent admiration of Johnson's writings. He spent one winter in Utrecht, and then proceeded on a tour through Germany, Switzerland, and Italy, and visited Corsica with a letter of introduction from Rousseau to Paoli, with whom he contracted a warm and lasting friendship. He enthusiastically adopted the cause of Corsican independence and after his return to Scotland published his *Account of Corsica* (1768), which was speedily translated into several languages. Boswell became a member of the Faculty of Advocates in 1766, but never devoted himself with earnestness to the law. In 1773 he was admitted into the Literary Club, instituted by

Johnson, of which Burke, Goldsmith, Reynolds, and Garrick were members. From this time he made it his principal business to note down his sayings and doings of Johnson, with whom he associated on most intimate terms, and whom he accompanied on his tour to Scotland and the Hebrides in 1773. It has been estimated that, taken all together, Boswell met Johnson on 276 days. Boswell was married in 1769 to his cousin, Margaret Montgomerie, by whom he had several children. After Johnson's death, in 1784, he employed himself in arranging the materials which he had collected for his long-contemplated biography. His *Journal of a Tour to the Hebrides* appeared in 1785; his *Life of Samuel Johnson*, 2 vols., in 1791. Both have gone through many editions. Boswell has been emphatically styled by Macaulay "the first of biographers." His work is indeed full of details, and these are such as exhibit character and are arranged in the most interesting manner. He conceals neither his own faults nor those of Johnson, but presents a picture of which the truthfulness is too vivid to be questioned: and Johnson is, unquestionably, better known by the pages of Boswell than by any of his own writings. Boswell died in London, May 19, 1795. Besides the works already mentioned, he was the author of several productions of great interest to the curious. In 1857 appeared a posthumous volume of *Letters of James Boswell, addressed to the Rev. W. J. Temple, from the Original MSS.*, in which the gay, insouciant character of the man very strongly appears. The sketches of Boswell by Macaulay and Carlyle are famous. Consult Rogers, *Boswelliana* (London, 1874), and Fitzgerald, *Life* (London, 1891). For the best edition of *The Life of Johnson*, consult Hill (Oxford, 1887), in 6 vols., with the standard edition of the text and minutely curious annotations; Bissell, *Boswell as a Biographer* (New York, 1905); and Brown, *The Youth and Early Manhood of James Boswell* (Glasgow, 1910).

BOSWELLIA, bôz-wel'li-a (named after Dr. John Boswell). A genus of trees of the family Burseraceae. About 15 species are known, natives of tropical Africa and the East India region. The most interesting species is *Boswellia serrata*, the tree which yields olibanum (q.v.), now very generally believed to have been the frankincense (q.v.) of the ancients. It is a large timber tree, with pinnate leaves, which have about 10 pairs of hairy serrated oblong leaflets, and an odd one, each leaflet about 1 to 1½ inches in length. The flowers are small and numerous, in axillary racemes, and of a pale-pink color. When the bark is wounded, the olibanum, of a delightful fragrance, flows out and hardens by exposure to the atmosphere. The tree is found in the mountainous parts of Coromandel and is supposed to be also a native of other parts of India, and of Persia, Arabia, and perhaps Abyssinia. A very similar species, a native of India, also yields a resin, comparatively coarse, which is used as a substitute for pitch. *Boswellia papyrifera* is indigenous in parts of Africa, extensive forests of this species being reported in the mountains of Morocco. *Boswellia carterii* is also common in Africa and yields large quantities of olibanum.

BOSWORTH, bôz-wôrth, or MARKET BOSWORTH (AS. *Bosan*, Bosa's + *worthe*, farm). A small market town of Leicestershire, England, famous for the moor, 2 miles to the south, where

the battle of Bosworth Field was fought (Aug. 22, 1485). In this battle, which terminated the Wars of the Roses, Richard III was slain, and on a near elevation called Crownhill Lord Stanley placed the crown on the head of the Earl of Richmond as Henry VII.

BOSWORTH, FRANCIS HUNTINGTON (1843-). An American physician, born at Marietta, Ohio. He studied at Yale and at the Bellevue Hospital Medical College, where, in 1898, he became professor of diseases of the throat. He was also appointed consulting physician to the Presbyterian and St. Vincent's hospitals, New York. He retired in 1906. His publications include a *Treatise on Diseases of the Nose and Throat* (2 vols., 1893); *Text-Book of Diseases of the Nose and Throat* (1896); *The Doctor in Old New York* (1898).

BOSWORTH, JOSEPH (1780-1876). An English philologist. He was born in Derbyshire. He graduated at Aberdeen and also took degrees from Oxford and Cambridge. In 1817 he obtained the vicarage of Horwood Parva, Buckinghamshire. He devoted such time as an active discharge of his parochial duties left at his disposal to literature and especially to researches in Anglo-Saxon. The result of his labors appeared in 1823 in *Elements of Anglo-Saxon Grammar*, republished in 1826 with additional material under the title *Compendious Grammar of the Anglo-Saxon Language*. In 1838 he published the work by which his name is best known, *A Dictionary of the Anglo-Saxon Language* (new ed., very much enlarged and improved by T. N. Toller, 1882-98; *Supplement*, Oxford, 1908). Bosworth lived in Holland from 1829 to 1840 as British chaplain, first at Amsterdam and later at Rotterdam, and during this period he translated the Book of Common Prayer into Dutch. On his return to England he was presented to the vicarage of Waith in Lincolnshire. In 1857 he became rector of Water Shelford in Buckinghamshire, and in the following year Rawlinson professor of Anglo-Saxon at Oxford. In 1865 he published the Gospels in Gothic of 360 and in Anglo-Saxon of 995 in parallel columns with Wycliff's version of 1389 and Tyndale's of 1526. In 1867 he founded a professorship of Anglo-Saxon at the University of Cambridge. He died May 27, 1876.

BÖSZÖRMÉNY, bö'ser-mä-y' (cf. Russ. *basurman*, Mussulman, Hung. *hajdu*, Turk. *haiduk*, a light-armed Turkish or Hungarian guard), HAJDÚ-BÖSZÖRMÉNY. A town of the Kingdom of Hungary, about 8 miles north-northwest of Debreczin (Map: Hungary, G 3). It is situated in the midst of a fertile district, growing vegetables and fruit, particularly melons, in large quantities. Pop., 1900, 25,065.—BÉREK-BÖSZÖRMÉNY, a town in the county of Bihar, 18 miles northwest of Grosswardein, had in 1900 a population of 3340.

BOT, or **BOTFLY** (cf. Gael. *bottus*, belly worm). Names common to several dipterous insects of the family *Cestridae*, which are parasitic in their early stages upon or within certain domestic and wild animals.

The HORSE BOT, or botfly of the horse (*Gastrophilus equi*), is a creature well known to stockmen and veterinary surgeons. The adult fly is about three-quarters of an inch in length; the body is very hairy and brown in color. The female has an extensible abdomen. She poises herself in flight near a horse, then darts suddenly towards the animal, gluing an egg to a

hair almost instantly, then retreating for a yard or two until another egg is ready to be deposited. In this way hundreds of eggs may be deposited upon a horse in a short time. The larvæ, or maggots, soon form within the eggs, but these do not hatch unless the horse licks itself, in which case the eggs are carried to the alimentary canal, hatch almost immediately, and the larvæ enter the stomach, where they attach themselves to its wall and remain until fully grown. The inner stomach wall of a horse is frequently covered with large patches of these larvæ densely crowded together. This attachment to the walls of the stomach probably causes an irritation which interferes with the normal action of the glands, or reduces the glandular surface, the grubs also probably extract some nutriment from the walls of the stomach. There can be little doubt that the presence of these grubs is injurious to the horse, although some stock raisers consider this injury insignificant. When fully grown, the larvæ loose their hold and pass through the pyloric orifice of the stomach and down through the intestines, occasionally attaching themselves to the intestinal wall or to the wall of the rectum, causing irritation which is sometimes severe. They are finally voided with the excrement, transformed to pupæ near the surface of the ground, and eventually the adult flies appear. There seems to be but one generation annually. Horses kept in stables are little troubled if they are well groomed. In pastures or on ranges, however, unless the stock is washed every two or three weeks, bots are apt to be present. Turpentine, used with care, is considered a remedy for those which succeed in establishing themselves in the stomach.

The Ox Bot, ox warble, ox worm, or heel fly, as it is termed in the West (sometimes simply "the grub"), belongs to a different genus of *Cestridae* and has quite different habits. The American species is *Hypoderma lineata*, Villers, and the European species is *Hypoderma bovis*, L. The "grubs" of this species are found in lumps or pockets in the skin of cattle, and it was formerly supposed that the fly laid its eggs upon the hairs and that the larvæ worked their way through the skin, forming cysts in which they remained through the entire larval life, but it has recently been discovered that the life of the species is more complicated. The flies appear early in the spring and attach their eggs to the hairs, particularly of the legs, of cattle, and especially the part just above the hoof, whence comes the name "heel fly." The eggs, or the quickly hatching larvæ, are carried into the mouth of the animal when it licks its legs, and the larvæ penetrates the walls of the oesophagus by means of its strong spines. After penetrating the oesophagus it casts its skin and becomes nearly smooth, and for several months works through the connective tissue between the skin and the flesh, penetrating gradually down the neck and ultimately reaching a point beneath the skin in the region of the back. In the meantime all traces of inflammation have disappeared from the oesophagus. When the final position is reached, the grub molts again, becomes more spiny, and bores a hole through the skin through which it gets air for breathing. Its presence causes much irritation, and it feeds upon the pus and bloody serum which collect. Several individuals usually join together in one of these punctures or sores. When fully

grown, it forces its way through the skin, drops to the ground, where it transforms to a pupa, and the following spring the adult fly emerges. The adult looks much like the common honey-bee. It is about half an inch long, black in color, and is clothed with reddish-brown hairs. An oily application to the wound will kill the grubs, and some simple antiseptic, like carbolic acid, causes a rapid healing. When the insects are common, however, cattle become emaciated and their skins are spoiled for commercial purposes by the perforations. The money loss in the United States through the work of this insect is very great.

The SHEEP Bot (*Oestrus ovis*, L.) belongs to still another genus of *Cestridae* and differs again radically in habits. The adult flies are smaller than those of the other species mentioned and resemble large house flies. The color of the head and thorax is dull yellow, but so spotted with brown as to appear brownish. The abdomen is velvety and variegated with dark brown and straw color. The female fly lays her eggs in the noses of sheep. They hatch almost immediately, and the larvæ at once commence to work their way up the nostrils and the nasal passages, causing great irritation, until they reach the frontal sinuses, which are cavities located between the two plates of the skull, and lying one on each side of the central line of the head and between and a little above the eyes. Here they attach themselves to the membranes which line the sinuses, and feed upon the mucus. The damage caused by this insect has probably been underestimated. Stiles has found that in Colorado, in some large flocks, at least 25 per cent of the animals are affected, and after conducting a number of post-mortems he is convinced that in many cases the bots cause the death of the animal. It is the custom in some places to prepare "salt logs" for the sheep to visit. The salt is placed in cavities in the log, and the edges of the cavity are smeared with tar, so that the sheep in eating the salt gets a certain amount of tar upon its nose. This is supposed to deter the flies from laying their eggs. A recent remedy proposed by Stiles consists in puncturing the frontal sinuses with a trochar and syringing in a small quantity of gasolene.

Other bot flies affect domestic animals and in tropical regions even man himself. The *Oestrus hominus* of Linnaeus and the *Dermatobia noxalis* of Goudot, in Guana, Mexico, and other tropical regions, lay their eggs upon the skin of monkeys and of human beings, and the larvæ form cysts under the skin, much like those of the ox bot. The emaculating bot fly (*Cuterebra emasculator*, Fitch) lives in the larval state in the inguinal and axillary regions (testicles) of squirrels and gophers. The rabbit bot fly (*Cuterebra cuniculi*, Clark) in the larval stage forms a large tumor in the skin of the common rabbit. Other species affect reindeer in Europe, and deer, elk, and antelopes in America. The history of many American species, with illustrations, may be found in Osborn's *Insects Affecting Domestic Animals* (Bulletin No 5, N. S., Div of Entomology, U. S. Dept. Agri., Washington, 1896), which also contains an extensive bibliography of the *Cestridae*.

BOTANIC GARDEN (Gk *botanikos*, *botanikos*, pertaining to herbs, plants, see BOTANY). An area upon which is grown a collection of plants primarily for scientific purposes. In

such a collection the idea may be to include as many forms of vegetation as can grow in the conditions of the garden; it may be to illustrate some special phase of botany, as natural relationships, ecology, economic botany, etc.; or it may be to furnish material for instruction and research. The Benedictine monks of Italy are said to have established the first botanic gardens in the ninth century, but they were designed entirely for growing the various medicinal plants. It was not until the latter part of the sixteenth century that plants began to be collected into gardens for scientific purposes. Since that time the botanical garden has been a growing factor in connection with research work, until now a college or university does not seem properly equipped without the facilities of such a garden.

The "Jardin des Plantes" of Paris, established in 1633, probably contains the largest collection of living plants, the catalogue enumerating 15,000 species. One of the most famous gardens is the Royal Garden at Kew, near London, which has its branches in every English colony. It lays stress primarily upon the economic value of plants, the stations in the numerous colonies being almost entirely engaged in testing the economic qualities of plants. In addition to serving this purpose, the garden is a great pleasure park; and its herbarium and library make it one of the great centres of work in systematic botany. The botanic garden which is most favorably situated and best equipped for scientific research is that of Buitenzorg, Java, established by the government of Holland in 1817. Its original purpose was to test the economic value of plants for the East Indian colonies, but its contact with tropical vegetation and the scientific spirit of its management have made it a great centre of research. Notable and very old European gardens are those of Bologna, Leyden, Montpellier, Giessen, Strassburg, Jena, and Upsala. In Germany the botanic garden is an essential adjunct of the botanical institutes, and in such conditions the most notable advances in botanical knowledge have been made. Conspicuous among those gardens, with their botanical institutes, which are prominently identified with botanical progress, are those of Munich, Wurzburg, Tübingen, Göttingen, and Leipzig.

In the United States a few botanic gardens are in the process of development, but their importance has never been appreciated by those who are able to establish them. That they are necessary adjuncts to any university which professes to do research work is an idea which has never taken any hold upon boards of management. The few gardens which have been started in the United States, and which bid fair to get beyond the initial stage of elementary instruction, are as follows: the Missouri Botanical Garden (the old "Shaw Gardens") at St. Louis, in connection with Washington University; the Botanical Garden at Cambridge, in connection with Harvard University, where, upon an area of seven acres, there are about 5000 growing plants; the Arnold Arboretum at Jamaica Plain, a public park of Boston, also in connection with Harvard University, and devoted entirely to hardy trees and shrubs; and the New York Botanical Garden, the most recent and one of the most promising garden establishments, occupying an area of 250 acres in Bronx Park, New York City.

BOTANIC SOCIETY, ROYAL. This society, incorporated in London in 1839, organized the Botanical Gardens in London, and has established a school of practical gardening, which annually distributes thousands of cut specimens among the various schools and colleges. The society holds exhibitions in the spring and fall. The Duke of Teck is president, and the library and office are at Inner Circle, Regent's Park, N. W. The society has issued a *Quarterly Record* since 1880. For other English botanical societies, see **HORTICULTURAL SOCIETIES**.

BOTANICAL GEOGRAPHY. See **DISTRIBUTION OF PLANTS**.

BOTANICAL SOCIETY OF AMERICA. A national scientific association organized in 1893 as an outgrowth of the Botanical Club of the American Association for the Advancement of Science. The membership includes many of the best-known botanists of the country.

BOT'ANY (Gk. *botanē*, *botania*, or *botany*, *botanē*, grass, plant). The science which treats of plants. Botany has become a very diversified subject, in fact, a group of sciences. The common bond is that plants furnish the material for study, but the methods of study are numerous. The scientific study of plants began in connection with their use in medicine, so that the earliest botanists were physicians. Gradually the subject differentiated, until now there are many divisions of botany. The principal divisions of the subject are defined in the following account.

Taxonomy. The classification of plants preceded all other aspects of botany by many centuries. The earliest records of plant descriptions are found in the writings of Hippocrates (460-357 B.C.), who has been called "the father of medicine." Notable later authors of the ancient period were Aristotle (384-322 B.C.), Dioscorides (first or second century of the Christian Era), and Pliny (23-79 A.D.). It was in the sixteenth century that the history of taxonomy really begins, with the publication of "herbals." These works are simply descriptive lists of wild and cultivated plants, often accompanied by rough woodcuts. The first herbal of importance is that of Brunfels (1488-1554); followed notably by those of Bock (1498-1554), in which the plants were grouped as herbs, shrubs, and trees; of Fuchs (1501-1566), in which botanical terminology began; and of Dodoens (1517-1585). Gradually the idea of natural affinities developed, which probably reached its first decided expression in the *Icones Stirpium* (1591) of De l'Obel (Lobelius). The first real attempt at classification was made by the Italian Cesalpino (1519-1603) in his *De plantis libris*. The idea of classification was further developed by Bauhin (1560-1642) and Robert Morison (1620-83), who is to be regarded as the first great British botanist.

In the opening of the eighteenth century the notable botanical figure was that of Tournefort (1656-1708), who in his *Institutiones* (1709) established genera and hence is called "the founder of genera." The most distinguished botanist of the eighteenth century, however, was Linnaeus (1707-78), who brought to a climax all the work of his predecessors and put the study of classification upon its modern basis. His notable contribution was the establishment of "binomial nomenclature," according to which every kind of plant bears two names, that of the genus and that of the species. While realiz-

ing that a natural system of classification was inevitable, he felt that not enough knowledge of affinities had been acquired to justify the attempt in his time. In lieu of this, he devised the most elaborate and satisfactory artificial system of classification that had been proposed, a system that remained in use for at least a century.

Following the establishment of genera by Tournefort, and of binomial nomenclature by Linnaeus, the study of taxonomy developed in outline as follows: Antoine de Jussieu (1748-1836) published the first attempt at a natural system of classification, and in so doing grouped genera into families. A. P. de Candolle (1778-1841) grouped families into orders, and the De Candollean sequence of families was in use in all manuals until very recently. Robert Brown (1773-1858) was one of the greatest of English botanists and made most important contributions to a natural classification of plants. Further progress was made by John Lindley (1799-1865), Endlicher (1805-49), Alexander Braun (1805-77), Eichler (1839-87), Bentham and Hooker (1802-83), and A. Engler (1892-).

Engler's classification, most in use among botanists at present, though doubtless to be modified very soon, is as follows: The plant kingdom is divided into four great fundamental groups: (1) Thallophytes (Alga and Fungi), (2) Bryophytes (Liverworts and Mosses), (3) Pteridophytes (Ferns, Horsetails, and Club Mosses), and (4) Spermatophytes (Gymnosperms and Angiosperms). The Thallophytes, as at present constituted, doubtless represent several groups coordinate with the other great groups and probably the gymnosperms and angiosperms are each to be regarded as worthy of first rank. In any event, the general categories have become fairly well established. The subordinate classification of angiosperms is of most general interest, as the group comprises the most conspicuous and best-known forms, the true flowering plants. The two great subdivisions are Monocotyledons (grasses, palms, lilies, orchids, etc.) and Dicotyledons (the ordinary trees, buttercups, roses, peas, heaths, mints, sunflowers, etc.). The overwhelmingly large assemblage is the Dicotyledons, which are now grouped under two heads: (1) Archichlamydeae, with calyx or corolla lacking or of distinct parts, and (2) Sympetalae, with corolla present and its petals more or less united.

All subordinate classification is constantly shifting, in order that it may keep step with the very rapidly accumulating body of morphological data, for Taxonomy must include the last expression of our knowledge of plants.

Morphology While from the historic standpoint taxonomy (classification) deserves first mention, probably the most fundamental subdivision of botany is Morphology, which treats of the structures of plants and their development, and upon whose data taxonomy must build. There was an older morphology which dealt merely with the forms of mature plants and their organs, and whose conception of organs was that everything about a plant could be referred to a very few categories, the favorite ones being root, stem, and leaf. Under this belief every structure which was not evidently root, stem, or leaf was disguised, and the business of morphology was to strip off these disguises and reveal the real nature of the struc-

ture. This phase of morphology was dominated by Goethe's doctrine of metamorphosis—a doctrine which has been a serious impediment to botanical progress.

The present morphology, however, concerns itself more with the development of structures than with the mature forms, a point of view which dates at least from Hofmeister's classic researches of 1851. It is essentially an embryological subject, therefore, whose purpose is to discover from developing structures every possible suggestion as to the relationships and origin of great groups. In such study the life history of a plant is traced from the single cell with which it starts to its mature form, and this life history at more than one point may give suggestions of relationships. To develop a plant through all of its individual history, or to obtain all the stages in the history of some kind of plant, is a long and difficult piece of work. When this is done for the hundreds of thousands of species of plants recorded, morphology will be in a position to supply the data for a real and relatively permanent classification.

At the present stage of morphological progress, however, large problems, such as the origin of the great groups, still confront us. In a general way morphologists may be said to agree to the following statement: The algae represent the most primitive known forms from which the higher plants may be said to have been derived. The fungi are largely regarded as degenerate algae, which have made a certain amount of progress, but have developed no higher groups. The algae, therefore, represent the great ancestral group, and directly from them the liverworts seem to have arisen. The liverworts have certainly given rise to the mosses, and many claim that they have also given rise to the ferns. It certainly seems true that the ferns have come either through the liverworts or directly from the algae. Whatever may be the origin of the ferns, they have undoubtedly given rise to the seed plants (flowering plants). The study of fossil plants has assured us that the fern plants very early gave rise to Gymnosperms (pines and their allies). Whether the Angiosperms (true flowering plants) arose from the Gymnosperms or directly from fern plants is a matter of conjecture, but the former alternative is generally accepted. For a fuller statement of the modern development of morphology, see ALTERNATION OF GENERATIONS, HETEROSPORY.

Anatomy It was early observed that the bodies of the more complex plants consisted of layers of different constitution, but the real nature of the various structures was not determined until the great improvements were made in the microscope in the latter half of the seventeenth century. The first observers of the anatomy of plants (qv) with the microscope were Robert Hooke, Malpighi, Grew, and Leeuwenhoek, and their descriptions of the constitution of plant bodies remained authoritative for over 100 years. Although the discovery was made that plant bodies are made up of cells of various forms, the real study of cells and their development dates from 1840, following the researches of Schleiden and Nägeli. From that time the science of Plant Anatomy (Phytotomy, Plant Histology) has developed enormously, until now the recognized plant tissues are very numerous, and their origin and relation to one another in position and function are fairly well understood. Anatomy is associated on the

one hand with morphology, since the tissues enter into the structure of organs; and on the other hand with physiology, since the nature of the tissues has to do directly with the various functions of the plant.

Cytology. In recent years another definite field of botanical research has been developed, which deals exclusively with the problems of the cell, and is called "Cytology" (q.v.). It is related to anatomy in that it deals with cells, which in their aggregation form the tissues that are the subject of anatomy. At the same time it studies cells from the standpoint of morphology, since it is concerned with cell organs, their origin and mutual relationships; while it also has its distinct association with physiology, inasmuch as the functions of its organs furnish the ultimate problem of the cell. It is through cytological investigation that the technique of research with the microscope has been developed so greatly. The discoveries in methods of killing material, imbedding, sectioning, and staining, have brought to view structures which were invisible to the observers of a few years ago. The principal problems of cytology at present are the structure and activities of protoplasm, the life history of plastids (protoplasmic organs of the cell, of which chloroplasts, the green color bodies of leaves, are examples), the structure and function of the nucleus (an essential and permanent organ of the living cell), the reduction of chromosomes (bodies which enter into the structure of the nucleus), the origin and development of the achromatic figure (a peculiar spindle-shaped body which appears in connection with a dividing nucleus), the centrosome (a cell organ supposed to be prominently concerned in the division of the nucleus), the cell wall, the development of the sex cells, fertilization, the embryo, and the problem of heredity.

Physiology. Nothing was known of the life of plants in the early part of the seventeenth century except what had been learned through agricultural and horticultural operations. It was in the latter half of the seventeenth century that the science of Plant Physiology was founded, long after the physiological significance of the different organs of the human body and of most animals was generally known. The history of the gradual discovery of the various functions of plant organs is long and full of interest. The foundation of all physiology is the direct observation of vital phenomena, and these must be evoked or altered by experiment. It is by means of this experimentation that a definite knowledge of physiological processes has developed, until now the student of plant physiology is in possession of a vast body of facts. Vital phenomena in plants are essentially the same as in animals, but are often simpler; and hence plants frequently furnish the clues for the interpretation of the more complex activities of animals.

The important general functions of plants, which furnish the subject-matter for physiological research, are as follows: Absorption of material and of energy from the outside world; transfer of water through the plant body, by which materials are properly distributed; transpiration, by means of which water is lost from the plant's surface; nutrition, including photosynthesis (the manufacture of carbohydrates), digestion (the conversion of foods into soluble form for transfer), and assimilation (the organ-

ization of protoplasm from food material); secretion; respiration, by means of which energy is liberated for the activities of the body; growth; and movement, which includes irritable responses to many stimuli.

For example, in the higher plants the root is an absorbing organ for water and soluble soil substances; in the root, stem, and leaves there are certain sets of vessels along which water and food materials travel readily; the leaves and the young stem surface are organs for the absorption and evolution of the carbon dioxide and oxygen, they also give off water by evaporation (transpiration), and are most important organs for the manufacture of carbohydrate foods. Although these various processes are distributed among the organs of a complex plant, they may all go on in a single cell of the simplest plant.

Ecology. A phase of plant physiology which has recently come into prominence as an independent subject is Ecology (q.v.) or Ecology, which deals with the mutual relations between plants and their environment. Certain phases of ecology, such as pollination, seed dispersal, protection, symbiosis, have long been studied, and have been called "plant biology." Ecology as at present organized was first presented by Professor Warming, of Copenhagen, in 1895, and a fuller later statement was that of Professor Schimper, in 1898. Three rather distinct lines of ecological investigation have been developed. One deals with the reactions of plants, tissues, and organs to their environment, and may be called physiologic ecology. A second line has to do with the origin, development, and life relations of the plant communities known as plant societies, and may be called physiographic ecology. The third line is a study of the great forest, grass, desert, and other formations of the globe in relation to climate, and may be called geographic ecology.

Various special subjects connected with plants are also organized into distinct fields of work. *Paleobotany* (q.v.) is a study of fossil plants, a subject which has been developing with remarkable rapidity. *Bacteriology* is the science which treats of that very peculiar group of plants known as bacteria, whose relationships to the interests of man are often of great importance, and whose life processes are so peculiar that this study demands special manipulation. *Pathology* is that division of the subject which deals with plant diseases, chiefly those inflicted by other plants. *Economic botany*, closely allied to agriculture and horticulture, is a growing subject, which deals with plants from the standpoint of their usefulness to man. *Forestry* is a special division of economic botany which studies the proper handling of forests. The subject of *Plant breeding* has developed very rapidly since 1900. In its scientific aspect (Genetics) it deals with heredity, while in its practical aspect it is revolutionizing the cultivation of plants.

Below are given only some of the more important works of a general nature on botany. Under the articles ANATOMY OF PLANTS, DISTRIBUTION OF PLANTS, ECOLOGY, MORPHOLOGY, PHYSIOLOGY, PLANT BREEDING, and TAXONOMY a selected list of elementary and advanced books treating those subjects is given. Also, in connection with the treatment of the larger groups of plants, the most important available literature is cited.

Bibliography. Atkinson, *Elementary Botany*

BOTANY, FOSSIL See PALEOBOTANY.

BOTANY BAY An indentation on the eastern coast of Australia, in 34° S lat., about 9 miles south of Sydney, the capital of New South Wales. It was entered by Captain Cook on the 28th of April, 1770. Here Cook took possession of New South Wales in the name of the British King. The north and south heads are named, respectively, Cape Banks and Cape Solander, after the botanists who accompanied the expedition. The inner south head is named Point Sutherland, after a seaman. In 1787 Captain Arthur Phillip was sent out by the British government to found a penal settlement on the shores of this inlet. Phillip deemed the place unsuited to settlement and founded his colony on the present site of Sydney. The bay, which owes its name to Dr Hawkesworth, the editor of Cook's *Voyages*, is a shallow sheet of water some 20 miles in extent. The district has been formed into two municipalities, Botany and Botany North, with a combined population of about 7200 inhabitants (Map New South Wales, F 4).

BOTANY BAY KINO, ke'nó See EUCALYPTUS.

BOTERO, bô-tê'rô, GIUSEPPE (1815-85) An Italian poet. He was born in Novara, studied at the University of Turin, fought in the campaign of 1848, was appointed professor of Ital-

ian literature in the College of Cortemilia in 1849, and was subsequently director of various lycees. His published works include *Ricciarda* (1854), *Raffaele* (1858), *Il Galeotto* (1859), *Didimo Frate* (1865), *Speranza* (1870), *Amore e natura* (1873).

BOTETOURT, bôt'e-tûrt, NORDBORNE BERKELEY, BARON (c1717-70) A Colonial Governor of Virginia, appointed in 1768. Though he dissolved the Colonial Legislature in 1769 for passing resolutions condemnatory of several recent acts of Parliament, he nevertheless consistently opposed the arbitrary measures of the British Ministry for Colonial taxation, and, finding his protests unheeded, resigned in 1770.

BOTHE, bôt The name of two Dutch painters, ANDRIES (c1608-49) and JAN (c1618-52). They were born in Utrecht, the sons of the glass painter Dirk Both, and studied with him and under Abraham Bloemaert. Together they went to Italy, where Andries is said to have been drowned in a canal at Venice, but, though they were closely associated by their work, they took independent lines. Andries may be said to belong to the school of Pieter de Laer, painting genre pictures of peasant life with skill and good coloring. He did not, as is commonly supposed, paint the figures in his brother's landscapes, the uniform character of which usually precludes external assistance. Jan felt the spell of Italian scenery more deeply and devoted himself almost wholly to reproducing it in the manner of Claude Lorrain and with a somewhat monotonous uniformity. Truth to nature, good drawing, and a certain mastery of light effects mark his landscapes, of which good examples, on both a large and a small scale, are to be seen in Amsterdam, The Hague, the public galleries of London, Dresden, and New York, and in many private collections. Several etchings of both brothers are also preserved, those of Jan being better executed.

BOTHA, bô'ta, LOUIS (1862-). A Boer general and statesman, born in Greytown, Natal. Botha early distinguished himself as an officer in the Boer army in the War of 1899-1902. From field cornet under General Meyer, Botha rose rapidly to high rank. He commanded the army besieging Ladysmith, defeated the English at Colenso, and became, after the death of General Joubert, in 1900, commander in chief of the Boer army. Botha now continued the struggle with signal determination, and though his capital, Pretoria, was captured, it was not till 1902 that he surrendered. Botha carried on for his defeated people the peace negotiations with Great Britain, and when the latter country finally bestowed autonomous government upon the conquered territory, became the first Prime Minister of the Union of South Africa (qv). In 1907 he represented his country at the famous colonial conference held in London, in 1911 received honorary degrees from Oxford, Cambridge, and Glasgow, and in 1912 was made an honorary general in the British army. In 1913 Botha was confronted by two crises the first, a labor dispute of grave proportions, he succeeded in settling, temporarily at any rate, the other, a disruption within his own political party, the Boer, or South African, ended in what appears a permanent succession to power of General Hertzog and the more irreconcilable of the Boers, who long have chafed at the moderate British sympathies of Botha.

BOTH'NIA. The name formerly given to

the territory on both sides of the Gulf of Bothnia. The eastern portion has been included in Finland since 1809. The western belongs to Sweden.

BOTHNIA, GULF OF (ML, for Scand. *botten*, lake, sea). The most northerly part of the Baltic Sea, having on its eastern shore Finland, on the western, Sweden. The submarine ridge on which the Åland Islands stand cuts off the Baltic proper from the Gulf of Bothnia. Its length is 415 miles, and its breadth from 93 to 149 miles. Its depth varies from 164 to 330 feet, but both along its shores and in the middle are many small islands, sand banks, rocks, and cliffs, called *skaers*, which render the navigation difficult, though on the whole it is less dangerous than other parts of the Baltic, and has many good harbors. The rivers which fall into this gulf, both from Sweden and Finland, are numerous, and the waters of the gulf itself are but slightly salt. In winter it is usually frozen so hard that the journey from Sweden to Finland can be made on sledges. The shores of the gulf are gradually rising, as has been observed since the middle of the eighteenth century, causing increasing shallowness of its ports. The rise of the bottom is estimated at nearly 5 feet per century. (Map: Russia, B 2).

BOTHWELL, bōth'wēl. A village in Lanarkshire, Scotland, on the right bank of the Clyde, 9 miles east-southeast of Glasgow (Map: Scotland, D 4). The river is here crossed by the celebrated *Bothwell Brig*, near which occurred the bloody encounter between the Covenanters and the Royalists under Monmouth on June 22, 1679, when the former were defeated. Near the village are the fine Norman ruins of Bothwell Castle, to which the Earl of Bothwell carried Mary, Queen of Scots. Pop. of the parish in 1911, 6200. Consult Duncan, "Bothwell Castle," in *Archæological Journal*, vol. xlv (London, 1889).

BOTHWELL, JAMES HEPBURN, fourth EARL OF (?1536-78). A Scottish nobleman, husband of Mary, Queen of Scots. He was born probably in 1536 or 1537, and was brought up and educated by his granduncle, Patrick Hepburn, Bishop of Moray, at Spynie Castle. His character was vicious and unruly. On his father's death in 1556, as Earl of Bothwell and one of the most powerful nobles in Scotland, he proved himself an irreconcilable enemy of the English. At first he opposed the Reformation party, but on their accession to power changed his politics, and in 1561 formed one of the deputation of lords sent to convey the youthful Queen of Scotland to her kingdom. He was shortly after made a Privy Councillor; but his violence and misconduct became intolerable, and he was ordered to quit Edinburgh. In March, 1562, he and the Earl of Arran were committed to the castle for conspiracy to seize the Queen's person. Bothwell made his escape, was recaptured at Holy Island, again got free, and sailed to France. He speedily returned, but, finding Moray close on his trail, embarked for the Continent. Not appearing at his trial, he was outlawed. In 1565, after the Queen's marriage with Darnley, he reappeared, and, having strongly espoused her cause against Moray and his party, was restored to favor and high influence. In October, 1566, while performing a judicial tour in Liddesdale, he was attacked by an outlaw and wounded. The Queen rode 20 miles and back to see him, a journey which brought on a dangerous fever. At Craigmillar,

some time after, Bothwell attempted, unsuccessfully, to overrule her objections to a divorce from Darnley. On the night of Feb. 9, 1567, Darnley was blown up at the Kirk of Field. Public opinion charged Bothwell with the murder, and he was formally indicted, March 28. He came to the trial attended by 4000 followers and received an easy acquittal. Two days after he carried the sword of state before the Queen at the opening of Parliament, and at its close all his lands and offices were confirmed to him. The leading nobles signed a bond approving of Bothwell's acquittal, and, commending him as a fit husband to the Queen, pledged themselves to stand by him. On April 24 Bothwell, accompanied by a strong force, carried off the Queen to Dunbar Castle, on May 6 he was divorced from his wife, and on the 15th his marriage with Mary was solemnized at Holyrood. He had previously been created Duke of Orkney. His triumph was short; the wrath of the nation was roused; at the end of one month Mary was a prisoner in Edinburgh, and Bothwell, pursued in his voyage to the Orkneys, where he had collected a small navy and turned pirate, fled to Norway, whence he was sent under arrest to Denmark, and there imprisoned for the rest of his life. The confinement drove him insane, and he died at Dragsholm Castle in 1578, leaving no heirs. His titles and estates were forfeited to the crown. Consult: Schiern, *Life of Bothwell* (Edinburgh, 1880); Ellis, *Later Years of James Hepburn* (1861); Burton, *History of Scotland* (Edinburgh, 1873).

BOTOCUDO, bō'tō-kōō'dō (Portug. *botoque*, plug; see below), or AIMORÉ. A Tapuyan tribe living in the Sierra dos Aimorés and on the Rio Doce and Rio Pardo, in Minas Geraes, in southeastern Brazil. They are undersized, their features are repulsive, and their grade of intellect is very low. Until brought under subjection by the government, they were naked cannibals. The name *Botocondo*, 'barrel bung,' was given them by the Portuguese in allusion to large wooden labrets and ear blocks. The *Botocondos* have a sort of flute or pipe made of cane. Some anthropologists think the *Botocondos* are a relic of "paleo-American man," represented also by the "fossil man" of the caves of Lagoa Santa, the *sambagus* (shell heaps), etc., and possibly likewise by some of the *Fuegians*. Consult: Ehrenreich, *Ueber die Botocondos* (Berlin, 1887); Gensch, *Die Erziehung eines Indianerkindes* (Wien, 1908); Rey, *Etude anthropologique sur les Botocondos* (Paris, 1880); Rudolph, *Wörterbuch der Botocondensprache* (Hamburg, 1909). See TAPUYA.

BOTONE, or BOT'TONY (OF. *botonné*, from *loton*, Fr. *bouton*, button). In heraldry, a cross botoné is a cross of which the ends are in the form of buds or buttons.

BOTOSHANI, bō'tō-shān'y'. A town of Rumania, in Moldavia, situated 60 miles northwest of Jassy, on a branch line of the Lemberg-Czerowitz-Jassy Railway, and on a small branch of the Jijia River (Map: Turkey in Europe, F 1). It is irregularly built and contains a lyceum and a theatre. The town has manufactories of glass, sugar, corn, and flour. It carries on a large trade in cattle, grain, petroleum, and wood. Pop., 1900, 32,183, of whom one-half were Jews; 1905, 33,320; 1911 (est.), 34,000.

BO TREE. The name given to the sacred fig tree, *Ficus religiosa*, or pipal (see PEERUL), under which the Buddha, Prince Siddhārtha, sat

during the night in which he received supreme enlightenment and attained to the Buddhahood. As *bo* tree literally means 'Tree of Wisdom,' from Sinhalese *bo* = Skt Pali *bodhi*, wisdom, enlightenment, the name is applicable to any tree under which a Buddha receives the great spiritual enlightenment. The particular *bo* tree, or pipal, under which the Śākya sage, Gotama, was seated when he became Buddha, was situated at Uruvelā, the modern Gayā, in Behar, 150 miles southeast of Benares. The scene is described in the Pali writings of the Buddhists, and is familiar to English readers in Sir Edwin Arnold's *Light of Asia*. The spot is marked by an ancient temple, nine stories high, which is now undergoing restoration. The present *bo* tree at Gayā can hardly itself be very old, but it is one of the two most venerated trees in the world. The second sacred *bo* tree is situated at Anurādhapura, in northwestern Ceylon. This is said to be the oldest historically authenticated tree in existence. It is stated that when Buddhism was established in Ceylon the Buddhist abbess Sanghamittā, a sister of the royal missionary Mahinda, brought a branch from the original *bo* tree at Gayā, and planted it at Anurādhapura, 245 B.C. From this branch the present tree grew up, and its history is traced in the native chronicles. Its leaves are most sacred relics for the thousands of Buddhist pilgrims that visit it.

BOTRYCHIUM, *bo-trik'-tūm* (Gk *βότρυχος*, a curl or lock of hair, *βότρυς*, *botrys*, grape cluster, refers to its fruit clusters). A genus of ferns of the family Ophioglossaceae, having a short, erect rootstock, with clustered fleshy roots, bearing a leaf, one part of which is sterile and fernlike, the other fertile and carrying the clusters of sporangia or spore cases. The only British species is the *Botrychium lunaria* ('moonwort'), a little plant pretty frequent in dry mountain pastures. About a dozen species occur in the United States, the most wide-ranging one being *B. virginicum*. It abounds in many parts of the United States, in the mountains of Mexico, in Australia, in some parts of Asia, as the Himalaya Mountains, and is found also in Norway, although in no other part of Europe. It is large and succulent, and is boiled and eaten in the Himalaya, in New Zealand, etc. It is called rattlesnake fern in some parts of America, from its growing in places where rattlesnakes are found. *Botrychium lunaria* ranges from Colorado to New England, Lake Superior, and sparingly northward. *Botrychium simplex*, a rare species, with small fronds, is found from California and Yellowstone Park to Lake Superior and eastward. *Botrychium lanceolatum* ranges from Colorado to Lake Superior, Ohio, New Jersey, and New England. *Botrychium lunarioides* is found from Massachusetts to Florida in dry, rich woods and shady pastures. *Botrychium ternatum* occurs throughout North America.

BOTRYTIS, *bō-trī'tis* (Gk *βότρυς*, *botrys*, a cluster of grapes). A genus of mold, fungi belonging to the Mucedineae. The plant consists of a mycelium (see FUNGI) of more or less entangled threads, with shoots of the same nature rising up from them and bearing the fructification at their extremity. Most of the species live upon dead leaves, decaying wood, and other vegetable material. Some are found on living animal tissues, whether always previously diseased or not is a question still unsettled. A

remarkable species of this genus is the *Vusicainae* (qv). Many of the species of *Botrytis* belong to fungi whose life history is not fully known, the *Botrytis*, or conical stage, being the only form discovered. A number of *Botrytis* forms are known to produce disease in plants by attacking them through their young tissues, but most of the fungi causing diseases, formerly referred to species of *Botrytis*, are now referred to other genera. *Botrytis douglasii* is the cause of a destructive disease of the Douglas fir and other conifers. *Botrytis cinerea*, which causes the ripe rot of grapes, is now referred to *Sclerotinia fuckeliana*, and a number of other species of *Botrytis* are considered as belonging to *Sclerotinia libertiana*. The potato-rot fungus once referred to *Botrytis* is now called *Phytophthora infestans*.

BOTT, JEAN JOSEPH (1826-95). A German violinist. He was born in Cassel, Germany, where he received his first musical instruction from his father, the court musician. After further studies with M. Hauptmann and L. Spohr, he won the Mozart scholarship (1841), and successively became solo violinist in the Electoral orchestra (1846) and court kapellmeister at Meiningen (1857) and Hanover (1865). In 1885 he came to New York, where he died. His works comprise two operas—*Der Unbekannte* (1854) and *Altea, das Mädchen von Korinth* (1862)—and symphonies, overtures, violin concertos, pianoforte music, solos for violin, and songs.

BOT'TA, ANNE CHARLOTTE LYNCH (1820-01). An American author, born in Bennington, Vt. In 1885 she married Vincenzo Botta. She published a book of poems (1848), besides many essays and reviews, promoted the establishment of Barnard College, and founded the prize awarded every five years by the French Academy for the best essay on "The Condition of Women." Her *Handbook of Universal Literature* (1860, new ed., 1902) has been widely used as a textbook.

BOTTA, CARLO GIUSEPPE GUGLIELMO (1766-1837). An Italian historian, born in Piedmont. As a young physician he entered vigorously into the spirit of the French Revolution, was imprisoned in Piedmont (1792), and later served with Napoleon, who rewarded him with various appointments in Piedmont. He was a consistent supporter of Italian independence. He brought new standards of accuracy and elegance into historical writing in his *History of the American War of Independence* (1809), which has remained a classic in the subject, and in his *History of Italy*, which was crowned by the Academy of the Crusca. Consult E. Regis, *Studio intorno alla vita di C. B.* (Turin, 1903), Pavesio, *C. B. e le sue opere storiche* (Florence, 1874), trans. of American War (Philadelphia, 1820).

BOTTA, PAUL EMILE (1802-70). A French archaeologist and traveler. He was born in Turin, the son of Carlo Giuseppe Guglielmo Botta. While still young he undertook a voyage round the world and remained some time on the west coasts of America, where he zealously collected treasures of natural history. In the year 1830 he went to Egypt, where he entered the service of Mohammed Ali (qv) as physician, and in this capacity accompanied the Egyptian expedition to Sennar. Here he formed a very considerable zoological collection, with which he returned to Cairo in 1833. The French

government now appointed him consul in Alexandria, from whence he undertook a journey to Arabia, the results of which he published in a work entitled *Relation d'un voyage dans l'Yémen, entrepris 1837, pour le musée d'histoire naturelle de Paris* (1841). At the suggestion of the Orientalist Julius Mohl, of Paris, he was by the government sent as consular agent to Mosul, and at this place he commenced a series of discoveries which form an epoch in archaeological science. Early in the spring of 1843 he began his diggings in the heaps of ruins at Khorsabad (q.v.), near the Tigris, for monuments of Assyrian antiquity. These excavations revealed much valuable archaeological material, including the ruins of the palace of Sargon II, King of Assyria (722-705 B.C.). The *Journal Asiatique* soon contained accounts of the success with which his enterprise and perseverance were rewarded, and also disquisitions on the extremely difficult subject of the cuneiform writings of the Assyrians, which afterward appeared as a separate publication under the title *Mémoires de l'écriture cunéiforme assyrienne* (1848). The French government took up the matter warmly; Flaminio, a practiced draughtsman, was sent out for the purpose of making sketches on the spot of the sculptures on alabaster, so apt to fall to pieces; and a commission of learned men was appointed for the purpose of conducting the publication of a magnificent archaeological work, which shortly afterward appeared under the special superintendence of Botta himself, with the title *Monuments de Ninive découverts et décrits par Botta, mesurés et dessinés par Flaminio* (1847-50). In 1848 he published the *Inscriptions découvertes à Khorsabad*. In 1846 Botta was appointed consul at Jerusalem, and in 1857 at Tripoli. He returned to France in 1868 and died at Achères, near Poissy. See ASSYRIA.

BOTTA, VINCENZO (1818-94). An Italian-American educator. He was born in Piedmont, Italy, was educated at the University of Turin, became a professor there, was elected to the Sardinian Parliament in 1849, and was appointed commissioner to examine the German educational system in 1850. He came to the United States for the same purpose in 1853 and soon afterward was naturalized and appointed professor of Italian language and literature in the University of New York. He remained in this position till his death. In 1855 he married Anne Charlotte Lynch, a well-known author. His best-known works are: *Account of the System of Education in Piedmont; Character and Policy of Cavour* (1862); *Dante as a Philosopher, Patriot, and Poet* (1865); *Introduction to the Study of Dante* (1886); and "An Historical Sketch of Modern Philosophy in Italy," in Ueberweg's *History of Philosophy from Thales to the Present Time* (1872).

BOTTALLA, bôt-tâl'la, PAOLO (1823-). An Italian historian. He was born in Palermo, Sicily, and was educated at the Jesuit colleges in his native city and in Rome. He subsequently held successive professorships in Church history and theology in Palermo, in Rome, at the College of St. Bruno, Wales, and in Poitiers. He wrote in the Italian, French, and English languages, among his works being the following: *Corso di storia e di geografia universale* (1860); *L'Autorità infallibile del Papa nella Chiesa e le sue relazioni collo stato* (1880); *The Papacy and Schism* (1869); *The Pope and*

the Church Considered in their Mutual Relations (2 vols., 1868-70); *Pope Honorius before the Tribunal of Reason and History* (1868); *La composition des corps d'après les deux principaux systèmes qui divisent les écoles catholiques* (1878).

BOTTARI, bôt-tr'èrè, GIOVANNI GAETANO (1689-1775). A learned Italian prelate and librarian of the Vatican, born in Florence. Author of numerous works on mathematics, philosophy, theology, and archaeology. He labored with the Academy of the Crusca on the revision of the Italian dictionary and as a purist wrote emendations to Varchi's *Ercolano*, and criticisms of Dante and Boccaccio. His reputation rests largely on his criticism on painting (Fr. trans. by Jay, Paris, 1817), his edition of Vergil from the Vatican manuscript, and his treatises on the catacombs of Rome.

BOTTESINI, bôt-te-zè'nè, GIOVANNI (1821-89). An Italian musician and composer, born at Crema, Lombardy, Dec. 24, 1821. He was one of the greatest performers on the double bass that ever lived, and practically the only one known to fame as a concert soloist. He entered the Milan Conservatory and studied double bass under Rossi and Basili and theory under Vaccai, Piantanida, and Ray. From 1840 to 1845 he was a concert virtuoso throughout Italy. In 1846 he went to Havana, Cuba, where, during his régime as conductor, his opera *Cristoforo Colombo* was produced. During his residence in Cuba he made occasional visits to the United States. In 1848 he made a tour through England; for two years following was conductor at the Théâtre des Italiens, Paris; afterward resuming his concert tours. In 1861 he was appointed conductor at the Bellini Theatre, Palermo, and in 1863 held a similar post in Barcelona. He established in Florence a society for the cultivation of German classical music, conducted the opera at Cairo, Egypt, and at the Lyceum, London, in 1871. Ultimately he settled in Parma and became director of the conservatory there. His oratorio, *The Garden of Olivet*, was given under the composer's direction at the Norwich (England) Musical Festival in 1887. His published works include operas, symphonies, overtures, quartets, etc., but although he wrote many compositions for the double bass, none of these appear to have been published. He died in Parma, July 7, 1889.

BÖTTGER, bêt'kër, ADOLF (1815-70). A German translator and poet, born in Leipzig. He studied at the University of Leipzig and won high praise as a translator of the English poets, especially of the complete works of Byron (1840, and in frequent and variously arranged editions). He also translated the poems of Pope (1842, in collaboration with Olckers), of Goldsmith (1843) and of Milton (1846). He also made renderings of Ossian (1847) and of Longfellow's *Havatha* (1856). His own works, displaying often the influence of English prototypes, especially Byron, include: *Die Pilgerfahrt der Blumengeister* (1851); *Gedichte* (1846; 7th ed., 1851); *Das Buch der Sachsen* (1858); *Neue Lieder und Dichtungen* (1868). His *Gesammelten Dichtungen* appeared in 6 vols. (2d ed., 1880).

BÖTTGER, BÖTTCHER, or BÖTTIGER, JOHANN FRIEDRICH (1628-1719). The inventor of Saxon porcelain. He was born at Schleiz, in the principality of Reuss-Schleiz. He was apprenticed to an apothecary in Berlin, but

became an enthusiast in the search for the philosopher's stone, and carried on extensive researches under the patronage of Prince Egon von Fürstenberg in Dresden. As he did not succeed in making gold, he was induced to use the chemical knowledge he had acquired in experiments upon clays, with a view to the manufacture of porcelain, and factories for this purpose were erected under royal patronage, and the celebrated Meissen porcelain was the result. As a security against the revelation of the art of making it, Bottger and his assistants were treated as prisoners, and when Saxony was invaded by Charles XII of Sweden in 1706, they were secretly removed from Dresden to Königsberg. His success was not without its reward. He was appointed to supervise the porcelain manufacture in 1708, and shortly afterward the Meissen porcelain was brought out. In 1716 he entered into negotiations to reveal the secrets of the process, but was discovered and imprisoned.

BOTTICELLI, bōt'ti-chē'lli, SANDRO, properly **ALESSANDRO FILIPEPI** (c 1444-1510). One of the most important and representative Florentine painters of the Early Renaissance. The generally accepted account of Sandro's early life, based for the most part on Vasari, has been disproved by recently discovered documentary evidence. From a sworn statement made by his father, Mariano Filipepi, in a tax roll of 1457, it appears that the date of his birth at Florence was within the year beginning March 1, 1444. He is there mentioned as a lad of 13, sickly and (probably) at school. As the fortunes of his father, formerly a well-to-do tanner, had seriously declined, the lad was cared for by his eldest brother, Giovanni, a prosperous broker. From the latter's nickname "Bottaccio" ('small cask'), Sandro's name is derived, and not because he had been apprenticed to a goldsmith of that name. He was, however, apprenticed to his second brother, Antonio, a beater of gold leaf, and not long afterward to Fra Filippo Lippi, then at the height of his career. Filippo's influence appears in his earliest panels, such as the oblong "Adoration of the Kings," in the National Gallery, London, and the diptych illustrating the story of Judith and Holofernes, in the Uffizi. When Filippo left Florence for Spoleto in 1467, the young artist, following a more independent development, was subject to other influences. He was influenced by the realistic school of the Pollaiuoli, especially by Antonio, from whom he learned bodily structure and movement. This appears in the panel "Fortitude," painted to complete a series of seven, ordered from the Pollaiuoli for the Mercanzia ('Court of Merchants') in Florence, now in the Uffizi, and even more so in the nude San Sebastian of the Berlin Gallery. He is also supposed by some authorities to have studied with Verrocchio, but the pictures upon which this assumption is based have been shown by Benson to be the work of another artist, influenced by both Sandro and Verrocchio, to whom the name of Amico di Sandro has been assigned by Benson (See SANDRO, AMICO DI). A good example of his early period is the circular "Adoration of the Magi," with more than 70 figures subtly arranged. Of greater importance is the panel of the same subject painted for Santa Maria Novella, now in the Uffizi—the masterpiece of his early period, which established his reputa-

tion. Simple and original in composition, strong and direct in execution, it shows only in the draperies and the color the lingering influence of Filippo Lippi. It reveals him also as a master of portraiture, for in the three kings and their followers we recognize Cosimo de' Medici, other members of his family, various Florentine notables, and on the extreme right of the painting, Botticelli himself. From this time the Medici and other great Florentine families were his patrons. When in 1478 the Pazzi conspiracy, which well-nigh overthrew the Medicean rule, was foiled, he was commissioned to paint on the walls of the Palazzo del Podesta the effigies of the conspirators hanging by their necks. In 1480 he was commissioned by the Vespucci family to paint on the choir screen of Ognissanti the imposing fresco of St. Augustine. This was the beginning of his rivalry with Domenico Ghirlandajo (qv), whose St. Jerome in the same church he has plainly excelled.

In 1481 Botticelli was summoned to Rome by Sixtus IV, to assist in decorating his newly erected chapel in the Vatican. According to Vasari, whose statement there seems no valid reason to doubt, he was made chief superintendent of the work. His coworkers were Ghirlandajo, Cosimo Rosselli, Pinturicchio, Perugino, and Luca Signorelli. Botticelli himself painted a number of the 24 portraits of popes in the upper niches of the chapel, and three of the twelve frescoes, viz., "The Life of Moses," "The Temptation of Christ," and the "Punishment of Korah, Dathan, and Abiram." These compositions illustrate both the vigor of his imagination and the limitations of his genius, for, while many of the separate groups are strikingly beautiful and exhibit an extraordinary amount of life and motion, there is a want of harmony in the whole, and in several cases the figures are crowded together in confused groups.

Towards the end of 1482 Botticelli returned to Florence. He was now at the zenith of his popularity and received most important commissions from the Medici and other great Florentine families. For Lorenzo the Magnificent he painted extensive mythological frescoes in his villa near Volterra, none of which have survived. In 1490, at Lorenzo's behest, he was appointed one of a commission for the completion of the façade of Florence Cathedral, and to design mosaics for the chapel of St. Zenobius in Florence. His principal patron, however, was a cousin of "Il Magnifico," Lorenzo di Pierfrancesco de' Medici, for whom he painted his greatest mythological pictures, and now drew his remarkable illustrations of Dante. In 1493 Sandro's third brother, Simone, returning from Naples, shared his home. A devout disciple of Savonarola, whose manuscript account of the friar's remarkable career still survives, he no doubt influenced his brother, but the latter was not an early convert. He was probably associated with the Medici until Di Pierfrancesco, the leader of the faction opposed to Savonarola, left Florence in 1497. It is therefore wrong to ascribe the deep religious sentiment of Sandro's later paintings to the friar's influence rather than to his own innate religious temperament. This could only be true of those painted in the last few years of the fifteenth century. In the most famous of his last paintings, the "Nativity" (1500, National Gallery), Savonarola and the two friars who were burned with him are represented as received by angels in Para-

BOTTICELLI (ALESSANDRO FILIPEPI)
"PRIMAVERA" (SPRING) FROM THE PAINTING IN THE ACADEMY
OF THE FINE ARTS, FLORENCE

dise, and the painter, in a Greek inscription, affirms his faithfulness to the cause. This and later works, some of them pagan, sufficiently refute Vasari's statement that in his religious frenzy Sandro entirely abandoned painting and was reduced to misery and want. Besides, Botticelli's income tax for 1498 shows that he was then keeping house with his nephew in Florence, and at the same time possessed "a gentleman's villa" and vineyards outside the gates of San Frediano. His father, too, seems to have been in comfortable circumstances, since in 1510 he purchased the family vault in the Church of the Ognissanti, where Sandro was buried, May 17, 1510.

Probably no artist in the entire range of the Italian Renaissance has evoked such contrary opinions of his merits as has Botticelli. As has been seen, his reputation among his contemporaries was the highest; but later, when the merely technical excellences of the art of painting had assumed an exaggerated importance, he went out of favor, and for 300 years his work was not considered as a factor in the development of art. To-day, however, with the realization of the great importance of the Early Renaissance, Botticelli has fully regained favor. One reason for his present popularity is that in the breadth and richness of his culture, in the varied character of the subjects he chose, and in the greatness of his aim, he represents the most striking features of the memorable period in which he lived. For the range of his subjects extended from the great scriptural compositions, "through the most touching scenes in the life of the Virgin," to events in classic history, and thus in his works the brilliancy of the Medici's court, the force of Christian traditions, and those classic myths that were the delight of Renaissance scholars, are all present in varying degrees.

But though he is thus a reflex of his time, Botticelli's works are yet pronounced and individual. Living in a generation of naturalists, he might have been a mere naturalist among them. There are traces enough in his work that he was deeply impressed by nature, by man, and by things considered as plastic objects. The sea, rocky mountain scenery, soft woodland landscapes, and gardens of every variety of rose, appear again and again in his paintings. But Botticelli was essentially a visionary painter, and to represent merely the outward image was not enough for him. Instead, he clothed all he saw with the color of his own moods and ideas, and thus made each of his works an outgrowth of his own personality. In color, too, he showed independence, for while in his youth he used the gay colors common in his age, in his later works his color scheme was more subservient to the central idea and sentiment of his work. He was also one of the first to accept art as an instrument of general culture, and as such at the service of the world as of the Church. But while Botticelli painted religious works, he painted them with an originality of feeling which appeals to the spectator as the real matter of the work through the veil of its ostensible subject. On the other hand, his Venuses have so much feeling and such tender grace that they seem "Madonnas masquerading in mythology."

Nowhere does he give greater proof of his personal feeling and creative energy than in depicting Mary and her Child. The earliest of his Madonnas is the one formerly in the Chigi col-

lection, Rome, but now in that of Mrs. J. L. Gardner, Boston. After his return from Rome he painted his two most important Madonnas—"The Magnificat" (c.1482-83) and its pendant, "The Madonna of the Pomegranate" (1487)—both in the Uffizi. The former, which is named from the text which the Blessed Virgin writes in a book, reveals her dreamy yet passionate, and surrounded by angels with wistful, eager faces; the other, in which six angels are wonderfully grouped about her, is better preserved and of even deeper religious pathos. These two pictures, both circular in form, are the prototypes of many similar Madonnas, like those of the National Gallery (London) and the Berlin Museum, long attributed to Sandro, but really by his school. Other important examples are: "The Madonna with St. John the Baptist and St. John the Evangelist" (1485, Berlin Museum); the great altarpiece of St. Barnabà (now in the Academy), "The Madonna Enthroned with Angels and Six Saints," whose lives are represented in the predella; and the Virgin and Child and three Angels, in the Ambrosiana, Milan. Other important religious paintings are the imposing "Coronation of the Virgin," formerly the altarpiece of San Marco, now in the Academy; the "Last Communion of St. Jerome" (Marchese Farinola, Florence); "St. Augustine in his Cell" (Academy); and the three panels with scenes from the life of St. Zenobius, of which one is in the Dresden Gallery, another in the Metropolitan Museum, New York.

Of his mythological pictures, the earliest, painted prior to the Roman journey, and the most famous, is the one usually known as "La primavera" ("Spring")—a charming composition of classical figures, over life-size, in a beautiful spring landscape, redolent with flowers. The researches of Dr. Warburg have shown that the real subject is "The Realm of Venus," and that it was painted to describe a poem by Poliziano. So was also its companion piece, the "Birth of Venus," which represents the goddess perfectly nude, except for the covering of her wind-blown hair, and wafted ashore by the breath of the wind gods. It is the most chaste and refined treatment of the nude, except perhaps Giorgione's "Sleeping Venus," in modern painting. Both these pictures were painted for Lorenzo di Pierfrancesco's Villa di Castello; the former is in the Uffizi, the latter in the Florence Academy. To the same period as the "Venus" (c.1485-88) belongs "Mars and Venus" of the National Gallery, and "Pallas and the Centaur," an allegory typifying the pacification of the factions by Lorenzo the Magnificent. About 1485, also, he painted the beautiful frescoes of the Villa Tornabuoni, which in a damaged condition now survive in the Louvre: one representing Lorenzo Tornabuoni and the Liberal Arts, the other Giovanna Tornabuoni with Venus and the Graces. To his last period belongs the "Allegory of Calumny" (Uffizi), after Lucian's description of a painting by Apelles, considered by some his masterpiece. Even later in date are the decorative panels representing the "Story of Virginia" (Morelli collection, Bergamo) and that of Lucretia (Gardner collection, Boston), both belonging to his latest period.

Although too mannered to be counted among the world's greatest portraitists, Botticelli has left a few portraits of subtle charm. The authenticity of most of those formerly ascribed to him is disputed. The well-known "Simonetta"

(Uffizi) is no longer considered his work but authorities are generally agreed that the "Young Man with the Medal" in the same gallery and the portrait of a young man in the National Gallery (London) are his handwork. So also is "Giuliano dei Medici," the original being in the Gallery of Bergamo, not in Berlin, as Morelli has shown, and to these should be added, in our opinion, the two beautiful young women in the Berlin and Frankfurt galleries—the latter one of the most beautiful pieces of linear decoration in art.

A picture of Botticelli's art is not complete without mention of his drawings, particularly those intended as designs for engravings. His beautiful print of "Bacchus and Ariadne" (1480) survives in only one example in the British Museum. He also designed 19 small woodcuts for the edition of Dante with commentary by Landino, published in Florence (1481) by Lorenzo della Magna. Finest of all are the remarkable illustrations of the *Divina Commedia*, which he drew for Lorenzo di Pierfrancesco about 1492-95. Eighty-five of these survive in the Berlin Cabinet of Engravings, 11 in the Vatican. Sketched in silver point, they were finished with the pen and a few were completed in color. They are interesting, not so much as illustrations as because they reveal Sandro as the greatest master of the single line, not only of the Renaissance but perhaps of the Western world. In this quality he approaches the Japanese.

Botticelli was at the head of a numerous and important school, to which many of the beautiful paintings attributed to him in European collections are due. The most important of his pupils was Filippo Lippi the Younger (q.v.), less widely known is Bartolommeo di Giovanni, who busied himself with graceful decorations of cassoni (chests) and similar objects. For another important pupil see the article SANDRO, AMICO DI.

Bibliography. The principal sources of information on the life of Botticelli are the original documents published by Hoon and others, and his life in Vasari's *Life* (vol. III, ed. Milanesi, Florence, 1878-83). A convenient English translation is that of Blashfield and Hopkins (New York, 1896). Botticelli's popularity with the English-speaking public was greatly enhanced by the essay of Walter Pater, in his *Studies in the History of the Renaissance* (London, 1873)—an admirable literary effort, but superseded as regards criticism and historic facts. Berenson in his *Florentine Painters of the Renaissance* (New York, 1898), and other publications, was the first to distinguish Sandro's works from those of his school. Herbert P. Horn's admirable folio monograph, *Alessandro Filipepp, Commonly Called Sandro Botticelli* (London, 1908), is in all respects authoritative, and will be followed by a similar volume on his school. Other biographies are those of Umann (Munich, 1893), Philimore (New York, 1894), Steinmann (Bielefeld, 1897, Eng. trans., New York, 1901), Supino (Florence, 1900), Streeter (London, 1903), Cartwright (ib., 1904), Rusconi (Bergamo, 1907), Proffil (Bologna, 1909), Schaeffer (London, 1910), Schneider (Paris, 1911), and Oppé (London, 1912). Consult also Warburg, *Sandro Botticelli's Geburt der Venus und Frühling* (Leipzig, 1893), Lippmann, *Sandro Botticelli's Zeichnungen zu Danies göttlicher Comodie* (Berlin, 1887, Eng. trans., London,

1896). Kroeber, *Die Einzelportraits des Sandro Botticelli* (Leipzig, 1911).

BOTTICHER, bō'ti-kēr, KARL (1806-89). A German archeologist, born in Nordhausen. He studied at the Academy of Architecture in Berlin, and was afterward appointed an instructor in the School of Design of the Industrial Institute there. In 1844 he was appointed a professor in the Academy of Architecture. His chief work is the *Tektonik der Hellenen* (1844-52), a splendid contribution to the study of Greek architecture. Others of his works are *Beicht über die Untersuchungen auf der Akropolis in Athen* (1863), *Der Zophoros am Parthenon* (1875), and *Die Thymele der Athena Nike auf der Akropolis von Athen* (1880).

BOTTICHER, KARL HEINRICH VON (1833-1907). A German statesman. He was born in Stettin, and was educated at the universities of Würzburg and Berlin. He was Governor of Schleswig-Holstein in 1876, Lord Lieutenant of Schleswig-Holstein in 1879, Secretary of the Interior in 1881. In 1888 he became Vice President of the Prussian Ministry of State, and as the representative of the Chancellor introduced numerous social reforms, and the enactment of the invalid and old-age insurance laws, in 1889, was due principally to his splendid energy and executive ability. From 1898 to 1906 he was Lord Lieutenant of Saxony, and in 1901 became a member of the Upper House of the Prussian Diet.

BOTTICHER, PAUL. See LAGARDE, PAUL ANTON DE.

BOTTICINI, bō'ti-chē'ne, FRANCESCO (1446-97). A Florentine painter. He was a pupil of Neri di Bicci, but, according to Berenson, was influenced by Castagno, formed under Cosimo Roselli and Verrocchio, and later a follower of Amico di Sandro. Little is known concerning his life. His works were formerly attributed to other masters, especially to Botticelli, but thanks to modern research and criticism, especially that of Berenson, he has emerged as a distinct artistic personality. Heterogeneous influences can be traced in all his pictures. Thus "St. Jerome" in the National Gallery (London) recalls Castagno's apostles, his Madonnas recall Filippo Lippi, his angels Botticelli, his draperies Verrocchio, and his landscapes Baldovinetti and the Pollaiuoli. The artistic quality of his pictures is as different as their style, but the best of them rank with the highest achievements of the fifteenth century. Such are "The Assumption of the Virgin" (National Gallery, London), the "Portrait of a Young Man" (Royal Palace, Stockholm), the "Madonna and Child with St. John and Angels" (Pitti Palace, Florence), formerly attributed to Filippo Lippi, "The Annunciation" (Empoli), and finally the much disputed picture of the Florence Academy, "Tobias and the Three Angels." The Metropolitan Museum, New York, possesses two examples of his work.

BOTTIGER, bō'ti-gēr, CARL VILHELM (1807-78). A Swedish scholar and poet. He was born in Westeras, and studied at the University of Upsala, where, after extensive travel, he was appointed professor of modern literature in 1845, professor of aesthetics in 1856, and in 1858 professor of modern languages and literatures, from which post he retired in 1867. He was exceedingly active as translator, poet, dramatist, and literary critic. Most of his publications in the latter capacity appeared among the *Translations*

of the Swedish Academy. It is perhaps by his graceful verse that he is known to best advantage. His publications include: *Lyriska stycken* ('Lyrical Pieces,' 1837-39); *Religiösa sånger* ('Religious Songs,' 1841); and translations of Tasso's *Gerusalemme Liberata* (1842-51), and Dante's *Divina Commedia* (1845-51). His collected works appeared at Stockholm (6 vols., 1855-51).

BÖTTIGER, KARL AUGUST (1760-1835). A German archaeologist. He was born at Reichenbach, in Saxony, and studied in Leipzig. In 1791, chiefly through the influence of Herder, he was appointed director of the gymnasium and consistorial councillor at Weimar. Here he enjoyed the stimulating society of Herder, Wieland, Goethe, and others. His literary activity at this period was prodigious. He edited several journals and wrote multitudes of reviews, biographical notices, etc., for the *Allgemeine Zeitung*. In 1804 he was called to Dresden, where he began to deliver lectures on special branches of classical antiquities and art. In 1832 he was elected a member of the French Institute. Among his important works are *Sabina oder Morgenscenen im Putzzimmer einer reichen Römerin* (Leipzig, 1803; 3d ed., Munich, 1878), a study of the household life of the Roman women; *Die Aldobrandinische Hochzeit* (Leipzig, 1810); *Kunstmythologie* (Dresden, 1811); *Vorlesungen und Aufsätze zur Alterthumskunde* (Leipzig, 1817); *Amalthea oder Museum der Kunstmythologie* (3 vols., Leipzig, 1821-25); *Ideen zur Kunstmythologie* (2 vols., Dresden and Leipzig, 1826-36). His minor writings in Latin and German were collected by Sillig and published in 1837-38. Consult Carl Vilhelm Böttiger, *Karl August Böttiger. Eine biographische Skizze* (Leipzig, 1837), and his *Litterarische Zustände und Zeitgenossen* (Leipzig, 1838), which he published from his father's papers.

BOT'TLE (Fr. *bouteille*, dim. of *botte*, *boute*; from LL. *buticula*, dim. of *but[t]is*, *butta*, flask, Eng. *butt*). A vessel, generally of a round shape, with a narrow neck, for holding liquids. Bottles are now usually made of glass or earthenware; but the first bottles were made of the skins of animals, mostly goats. Of this kind were the bottles spoken of in Scripture. Skin bottles are still used in southern Europe for the transport of wine and water, and by tribes of Africa and Asia for carrying water. The ancient Egyptians made bottles of most elegant form and exquisite workmanship, of alabaster, stone, gold, ivory, and other substances. The Italian peasants carry, slung round their necks, bottles made of the rind of the gourd, which, when dry, is as hard as wood. Bottles made of glass will be treated under GLASS.

BOTTLE CHART, BOTTLE PAPERS. A chart which purports to show the track of sealed bottles thrown from ships into the sea. It is a well-known practice, on long voyages, to throw sealed bottles containing some intelligence into the sea, in the hope that these messengers may be picked up, and the information inclosed may reach its proper destination. The frequency of these instances at length led to the inference that by such means the determination of currents might be illustrated. Lieutenant Beecher, an English naval officer, has the merit of having constructed, in 1843, a chart of bottle voyages in the Atlantic, his facts being drawn from the numerous cases that had occurred. The time

which elapses between the launching of the bottle from the ship and the finding it on shore, or picking up by some other ship, has varied from a few days to 16 years; while the straight-line distance between the two points has varied from a few miles to 5000 miles. Of the actual length of the curved line followed by the bottle, little or nothing is known; but some are believed to have exceeded 8000 miles. The bottle chart has been reedited and reengraved from time to time, and published in the *Nautical Magazine*; it is marked by several hundred straight lines, each drawn from the latitude and longitude of immersion to the latitude and longitude of the finding. Charts of this sort are now prepared at the United States Hydrographic Office, not for general circulation, but for information of the office; and from the records thus established current charts are prepared and corrected. Papers printed in several languages are furnished by the hydrographer to masters of ships for the purpose of putting in bottles; the paper contains a request for their return when found to the nearest United States consul, who will forward them to Washington, with a statement in regard to the circumstances of their discovery.

BOTTLE FISH, BOXFISH. See SWELLFISH.

BOTTLE GLASS. See GLASS.

BOTTLE GOURD (gourd used for making bottles; see below), *Lagenaria*. A genus of plants of the family Cucurbitaceae, nearly allied to the gourds (*Cucurbita*). One of the most marked distinctions between *Lagenaria* and *Cucurbita* is the very swollen border of the seeds of the bottle gourds, which have also all the anthers separate and have white flowers, while those of the gourds proper are yellow. The single species of bottle gourd (*Lagenaria vulgaris*) is a native of Central Asia and tropical Africa, but is now common almost everywhere in warm climates. It is a climbing, musky-scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to even 6 feet in length, which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind and when the pulp is removed and the rind dried, it is used in many countries for holding water, and is generally called a calabash. The bottle gourd in its wild state is very bitter, and is said to be poisonous, and even in cultivation some of its varieties exhibit not a little of the bitterness and purgative properties of colocynth. The bottle gourd appears to have been introduced into Europe about the close of the sixteenth century; but it requires for its advantageous cultivation a warmer climate than that of any part of Great Britain, where, although it succeeds well enough in a hotbed, it is chiefly known as an object of curiosity. It is, however, much cultivated in warmer countries as an esculent, and is an important article of food to the poorer Arabs, who boil it with vinegar, or make a pudding of it in its own rind with rice and meat. It is also used when young as we employ summer squash. This plant is often grown in the United States, where it is known as Hercules' club, sugar trough, snake, dipper gourd, etc. For illustration, see CUCUMBER.

BOTTLEHEAD, or BOT'TLENOSE (so named from the shape of the snout, or head). A whale (*Hyperodon rostratum*) closely allied to the sperm whale, frequenting the Arctic and North Atlantic. It reaches a length of 30 feet and has the snout produced into a beak, as in the dolphins; the forehead rises suddenly from

the beak, and is remarkably elevated, owing to large bony crests rising over the bones of the upper jaw. The teeth are only two in number and are situated in the fore part of the lower jaw, pointed, but sometimes completely hidden. There is a dorsal fin, rather small in proportion to the size of the animal, and placed farther back than in the common dolphin. The blowhole is crescent-shaped, the points of the crescent directed backward. The skin is smooth and glossy, of a blackish lead color on the back, gradually becoming lighter on the sides, and whitish on the belly, turning yellowish brown in old age.

These small whales travel in bands or "gangs," as they are technically called, of 4 to 10 or even 15, and keep just south of the limits of the Arctic ice, moving northward in summer and southward in winter. They are active, leaping out of the water and when in mid-air can turn their heads from side to side. These whales can also remain under water for long periods, two hours appearing to be the limit, observed in the case of a harpooned whale. The voice is said to be more like a sob than a bellow. They are curious rather than alarmed by the presence of boats. They feed mainly on squids, for which they are believed to dive to a very great depth. They are pursued and harpooned for the sake of their oil, resembling and equal to sperm, of which a large one will yield two tons, besides 200 pounds of spermaceti.

The same name is often applied to several other of the smaller cetaceans, such as dolphins and blackfish, with protruding snouts.

BOTTLENOSE In Great Britain, a puffin (qv).

BOTTLE TREE (so named from the shape of the trunk and the water it contains, see below), *Sterculia rupestris*. A native of Australia, noted for a great globular expansion between the ground and the branches, or, where the soil is without rocks, for a trunk in the shape of an ordinary bottle, the limbs appearing to grow from the mouth. It belongs to the family Sterculiaceae and is of middling stature. The wood is soft and brittle, the leaves are from 2 to 4 inches long, entire, stalked, and lance-shaped, the flowers inconspicuous, on short panicles, arising from the axils of the leaves, calyx in the staminate flower, five-cleft, the stamens numerous, the fruit, of five-stalked, leathery folioles, containing six seeds. According to Von Muller, the stems of this tree hold considerable quantities of water, a fact often taken advantage of by travelers and the aborigines, who cut holes into the soft wood to get the supply of water. There are a number of other species to which the name "bottle tree" is applied. Some of them are important food plants of the natives of Australia, who eat their roots, which are filled with a gum similar to gum tragacanth. For illustration, see **BREADFRUIT TREE**.

BOTTLING Bottling is a very general term for a process practiced wherever liquids and some kinds of merchandise are placed in bottles for preservation or sale. In this article only the bottling of beverages, alcoholic and nonalcoholic, will be described. The subject can be best treated if it is divided into four classes, viz., wines and liquors, beer and malt liquors, carbonated beverages, mineral waters.

Wines and Liquors Wines, including champagne, and liquors generally are bottled in every civilized country the world over. In France, where the wine production is on an enormous

scale, and where most of the champagne is produced and bottled, the bottling industry naturally is large and important. It is also quite extensive in Germany, while in Spain and Portugal there is less actual bottling done, as the celebrated wines from those two latter countries are shipped for the most part in hogsheads, and the contents bottled in the country of their destination. In Italy most of the wines for export are bottled. In England wine bottling is on a much smaller scale, while alcoholic liquors, chiefly whisky, gins, etc., are bottled extensively. In the United States the wine industry is really in its infancy, the production being mainly in California, Missouri, Ohio, and New York, and most of the bottling is done at the wine centres, while alcoholic liquors, such as whisky, etc., are bottled in various States, mostly under the supervision of the United States government.

Beer and Malt Liquors Beer and malt liquors are bottled to a very large extent in England, but very little on the continent of Europe, excepting in Germany, but even there most of the beer for export is shipped in barrels to be bottled in the country of its destination. In the United States the production of bottled beer is on an enormous scale, and probably nearly every brewery has its own bottling plant. Accordingly brewery bottling has become highly developed and has come to be known as the best of its kind, for the beer is taken from the vats in the brewery, and allowed to run through pipes in tunnels under the street, according to United States Internal Revenue regulations, and bottled in the bottling shop, which must be located across the street from the brewery. It is therefore prepared under the best of circumstances, the measurements being taken by United States inspectors for the purpose of the stamp tax. Furthermore the air contact is minimized from the time it leaves the vat until it is stoppered within the bottle. It is then steamed or pasteurized, the name being in honor of Pasteur (qv), who first discovered the germ theory in connection with bottled liquids. The steaming or pasteurizing process is done by placing the bottles either in a covered steaming tank or a revolving pasteurizing machine, and the temperature of the liquid contents raised to 140° F. It is then allowed to cool naturally, and after about an hour the bottles are labeled and ready for shipment.

Carbonated Beverages In the United States this particular designation covers all that class of bottled nonalcoholic beverages or "soft" drinks which first have been siruped in the bottle, after which the bottle is filled with water previously surcharged with carbon dioxide (CO₂), or, more popularly "carbonic gas." Such beverages are variously and popularly known as ginger ale, sarsaparilla, lemon soda, lemon sour, cream soda, a number of other specially flavored beverages of this character and kind being known under a variety of names. There are probably about 10,000 bottling establishments in the United States, Canada, Mexico, and the West India Islands engaged in the manufacture of carbonated beverages. A great many of these establishments also prepare or bottle what are called siphon waters, or, more properly speaking, artificial mineral waters, such as Vichy, Selters, Kissingen, etc. In England the trade is known more popularly as the aerated-water trade, although the class of goods is of pretty much the same nature as in the United States.

1. CARBONATING APPARATUS.

2. BEER BOTTLE FILLER.

3. FOUR-COMPARTMENT SOAKER WITH BRUSH DEVICE ATTACHED.

4. BOTTLE WASHER.

5. AUTOMATIC CROWN SODA WATER BOTTLING MACHINE.

In England, in addition there is a beverage known as ginger beer, which is a fermented product, put up in stoneware bottles. The siphon water trade in England, carried on on a large scale, is probably the most up-to-date in the world. In Germany nonalcoholic carbonated beverages are mostly known by the popular title of *limonades*, although various flavors are used to designate the different drinks. In France, Italy, Portugal, and Spain the trade in this class of goods is not very extensive.

Mineral Waters. The bottling of natural mineral waters is done wherever such springs abound, and in the bottling and export of natural mineral waters Germany and France probably take higher rank than any other countries in the world. Spain has several popular mineral-water springs, the product of which is bottled mostly for export. In the United States there are about 1000 flowing natural mineral-water springs, many of them, however, supplying merely local demands. There are, however, a number of natural mineral water springs, in New York, Wisconsin, Maine, Missouri, Massachusetts, California, Virginia, Pennsylvania, Texas, and Indiana, where the mineral waters are bottled, both still and carbonated, on a very large scale, and shipped to all parts of the United States. It should be said, though, that some of these so-called natural mineral waters are really not waters that are mineralized, and the industry has come to class them as mineral and nonmineral; i. e., any water that contains say about 8 to 10 grains of different minerals in solution to a United States gallon would be classed as a mineral water, while all the waters having less would be classed as nonmineral waters or table waters. There was produced and sold in the United States in the year 1912 a total of 62,281,201 gallons of mineral water, which was said to have an average value of 10½ cents a gallon. It might be said further that upward of 5,000,000 gallons of mineral, or rather nonmineral waters from such springs were used in the bottling of various nonalcoholic beverages during the same year.

Bottling Machinery, Appliances, and Accessories. Some or all of the following proc-

ing, tinfoiling, or capsuling the bottles. Clean bottles are strictly essential for all classes of bottled beverages, especially if intended for long-distance shipment or foreign countries.

RUBBER BRUSH FOR RINSING BOTTLES.

New bottles are put through the same course of cleansing as the old bottles; for in many industries the bottles are used repeatedly and must be cleansed as often as they are returned to the bottling establishment. To wash bottles properly they should be soaked in tanks containing hot water in which is dissolved some kind of an alkali or other cleansing solution, such as caustic soda. Soaking machines are now in use in all first-class establishments. These machines contain pockets or spindles in which the bottles are placed bottom downward at an angle of about 45°. The weight of the bottles helps to operate the machine, although it is power driven and regulated, and the wheel carrying the bottles revolves slowly through the hot water containing the cleansing solution in the tank. After the bottles have been thus soaked, interior and exterior, they are again immersed in hot water, and as the layers of bottles come out of this clear hot water the angle of suspension is reversed and the bottles are drained of all contents. They are then washed or scrubbed by means of brushes revolving at high speeds. Such machines are operated in connection with the soaker, automatic or otherwise. When operated automatically, the bottles are carried by a conveyor from the soaker to the washer, where they are scrubbed, inside and outside, placed upside down on a rinser, and again automatically conveyed to the filling machines. The brushes are made both of bristle and rubber, the latter having two, three, and four prongs which are spread by centrifugal action. The bottle-soaking machines are made in different sizes, with a capacity of from 5000 to 50,000 bottles per day.

The filling process in the case of wines, whiskies, etc., still partakes of the old methods, and often, especially in European countries, the bottles are corked by mallet-driven corks or some old-style machine that has been in use for many years. In the Champagne district of France a peculiar machine is employed which spreads the cork and gives it that peculiar formation on the part of the cork which is not driven into the bottle. Whisky and wine corks, however, are driven even with the neck of the bottle. In the bottling of beer the method now used is a counterpressure system, the beer from the barrel being emptied into a reservoir in the machine proper. A rotary automatically operated spindle machine of varying capacities will fill, in the case of a hand machine, about 1500 pint bottles per hour, while the power-driven, large rotary machine will bottle about 5100 pints per hour. The bottles, when filled, are removed or transferred, sometimes by hand, but in large plants by automatic conveying machinery, to what is known as a crown-capping machine. These machines, which make use of the single-service cap or stopper, have almost revolutionized the bottling industry in the United States. The so-called crown cap they employ is made from

BRISTLE BRUSH FOR CLEANSING BOTTLES.

esses, for the different classes of goods, usually are involved: (1) cleansing the bottles; (2) cleansing the corks where the natural cork is used; (3) filling, corking, crown capping, label-

tinned iron, cut out and stamped with a corrugated edge, in one operation. Next to the metal in the shell are placed a prepared paraffin paper and a thin sheet cork. This sheet of paraffin paper answers a double service, viz, to prevent the liquid from reaching the metal and also assisting in an adhesive way to retain the cork in its proper place while the cap is being handled.

This crown cap has all but driven other stoppering devices out of the market, and it is safe to say that in the United States alone at least 150,000 gross of such caps are used daily, as they have been found clean, sanitary, and attractive. The capping machines are ingenious, the caps being fed through the throat of the power machine to the top of the bottle, where they are crimped over the top and around the edge or mouth of the bottle, the cork acting as the seat or seal, which must be gas-tight. A foot-power beer machine with a single operator will cap about 900 pint bottles per hour while the large power-driven capper will cap about 5500 pint bottles per hour.

In the manufacture and bottling of carbonated beverages the system, as well as the machinery or apparatus, is entirely different. In France the method is known as a continuous system, where use is made of a fill machine with a copper cylinder in which the water and gas are driven together. In England the system is also called continuous, but the machinery is heavier, made of cast iron, lined with block tin, and of larger size, but not of larger capacity. It is the old system in both countries, handed down for several generations back. In the United States the early pioneers in the industry used what was known as the intermittent system, a generator on one end connected or piped to two or more cylinders in which the water was charged or carbonated. In the generator was placed the marble dust with a vitriol chamber on top, and these two ingredients were mixed with a certain amount of water which liberates the carbon dioxide (carbonic gas) in the marble dust or carbonate of soda, which gas being under pressure rose from the mass and was forced through pipes over into the water cylinders, where with the necessary agitation it became mixed with the water. Later days have seen the introduction, however, of a continuous (column) system. The column may be filled with particles of glass or marbles or other obstructions, in order to break the continuity of the stream of water, which is pumped in at the top of the dome. The gas is admitted at the bottom of the dome, and as it rises meets the downcoming water through the various interstices, and thus the water and the gas are mingled together. From the reservoir below the charged or carbonated water is led through pipes to the filling or bottling machine. The system generally employed, aside from a refrigerator plant, consists of taking water directly from the filter or water-distilling apparatus and then forcing it by a pump through coils of block tin pipe, imbedded in ice. The water thus cooled to a temperature of about 35° F is then passed through the carbonator as described, where it takes the gas. The theory is that the water and carbonic gas, having an affinity for each other, when cool, are mixed and mingled successfully at about the temperature stated, the gas being at a pressure of about 55 pounds to the square inch. Waters thus highly charged with carbon dioxide (CO_2) are naturally under

great pressure and present problems in filling. Such waters supply their own pressure entirely and flow continuously from the carbonator to the sipping, filling, and capping machine.

The present system of manufacturing carbon dioxide, contradistinguished from the generator plan, is that the gas is taken from various sources like marble dust and raw magnesite by heat or the burning of coal or coke, with the detention or catching of the gas in the flues or chimneys after the complete combustion. This gas is then taken and put through a series of pumps and cooled down to a very low temperature and liquified and forced into steel tubes, at a pressure of about 900 pounds to the square inch. This is a separate industry, the manufacturers selling the compressed gas to the bottlers.

MACHINE FOR FILLING SIPHONS

The present system of sipping, filling, bottling, and capping the bottle of carbonated beverage is what is known as the crown cap or single-service cork, the same as described for bottled beer, and is generally used throughout the United States. The foot-power soda-bottling machine, with a single operator, will siphon, fill, and cap about 350 half-pint bottles per hour, while the power-driven automatic machine will siphon, fill, and cap about 2000 half pints, or 1500 pints, or 1000 quart bottles per hour respectively. The system of bottling siphon waters, or artificial mineral waters, is to bottle the product in the regular siphon bottle, which is extra strong, and tested in advance of use. The ingredients or salts to make the different artificial mineral waters are first dissolved in the still water before the gas is added for saturation. Then, after the solution of the mineral

salts, to make them correspond to some natural mineral waters, the gas is added, and the system of drawing off and bottling is much like that above described for soda-water bottling or carbonated beverages.

In both soda-water bottling and siphon bottling the workmen usually, or should, wear masks, gloves, sleeves, and aprons of horsehide leather as a protection against flying glass from bursting bottles. In addition, the bottles are placed in strong iron cages or traps while being filled. Siphon bottles are filled upside down through the nozzle or head of the siphon. Mineral-water bottling is carried on in much the same way as soda-water bottling. Where it is bottled still, it is taken directly from the spring in pipes in a very simple manner and capped immediately; when it is charged with carbon dioxide, it is forced through a carbonator, where it takes the gas, and the bottling is done with the same kind of machine as is used for soda-water bottling, but the siruping part is omitted. Bottle-labeling machines, to affix labels to the bottle, body or neck, or both, are in general use. Power-driven labeling machines, operated with one attendant only, will label from about 2000 to 3000 bottles per hour.

Bibliography. Consult: Sulz, *Treatise on Beverages* (New York, 1888); Dreesbach, *Beer Bottler's Handy Book* (Chicago, 1906); Goosmann, *The Carbonic Acid Industry* (Chicago, 1906).

BOTTOM (AS. *botm*, Ger. *Boden*, Lat. *fundus*, ground, bottom). A term used to designate either the whole ship itself, or that part of it which is under water when laden. Commodities are often said to be imported "in foreign bottoms," or in "American bottoms," in which cases the phrase is applied to the whole ship. A "full ship," or a "full bottom," denotes such a form given to the lower half of the hull as to allow the stowage of a large amount of merchandise. A "sharp ship," or a "sharp bottom," implies a capacity for speed.

BOTTOM, Nick. In Shakespeare's *Midsummer Night's Dream*, an ignorant and conceited weaver. In the play of *Pyramus and Thisbe*, he takes the rôle of Pyramus. Puck gives him an ass's head, and Titania is compelled by the fairy king to be enamored of him.

BOTTOM HEAT. The heat communicated to certain soils from below, either by the fermentation of fresh stable manure, tan bark, leaves, etc., buried for the purpose, or by steam-pipes, flues, or other like arrangements. It is one of the most important agents used in forcing houses and hotbeds in the artificial cultivation of vegetables, flowers, or fruits.

BOTTOMRY BOND or CONTRACT (for derivation, see Bottom). An agreement for a definite period of time or for a voyage by the owner or master of a ship, pledging the ship or the ship and its cargo as security for the repayment of money loaned for the building, repair, or fitting of the ship or for the purposes of the voyage. When the cargo of a ship alone is pledged, the agreement is strictly called a *respondentia bond*. In either case the loan is made upon a maritime risk, i.e., upon the condition that the loan or debt, together with the stipulated interest, shall be repayable only on the safe termination of the voyage; otherwise the lender loses his debt. In consideration of the hazard, he may exact any rate of interest, not grossly extortionate, which the nature of

the adventure may justify. The agreement is usually in the form of a bond and must set forth all the necessary terms, especially the maritime risk. The owner may hypothecate the vessel or its freight and execute a bottomry bond at any time and for any purpose; but the master can do so only under stress of necessity in a foreign port, destitute of funds and unable to communicate with, or to receive instruction from, the owners.

Contrary to the rule governing ordinary mortgage securities, preference among bottomry bonds is not according to order of date, but inversely, the latest having priority, on the theory that the last loan saved the ship. The United States statute which provides for the recording in the office of the collector of the port, of bills of sale, mortgages, hypothecations, and conveyance of vessels, under penalty of their being otherwise invalid as against subsequent purchasers, mortgagees, or lien holders, expressly excepts the lien of a bottomry bond from its operation where such lien has been created by a loan of money or materials necessary to repair the vessel or to enable her to prosecute the voyage, so that the lien of that description does not lose its priority. A bottomry bond is, however, subordinated to the lien of the seamen for wages, even though in some cases given after the wages were earned, and to liens for repairs or supplies indispensable for the safety of the ship. Where the holder of a bottomry bond is compelled to satisfy a lien for wages, it seems that he is entitled to compensation from the owners and has a lien upon the proceeds of the ship for reimbursement. See ADMIRALTY LAW; MARITIME LAW, and the authorities there referred to.

BOTTOMRY. See Bottomry.

BOTTS, JOHN MINOR (1802-69). An American lawyer and politician, born in Virginia. He served several terms in the Virginia Legislature after 1833 and in 1839 was chosen to Congress, where he served three terms (1839-43 and 1847-49) and where he was conspicuous as an advocate of a protective tariff, of a national bank, and of the repeal of the gag rules (q.v.). When President Tyler left the party that elected him, Botts separated from and antagonized him, although a warm personal friend. He opposed secession and was faithful to the Union through the Civil War. He published *The Great Rebellion: Its Secret History, Rise, Progress, and Disastrous Failure* (1866).

BOTULISM. A term originally used to embrace all forms of sausage poisoning. It is really due to a specific saprophytic bacillus, *B. botulinus*. This organism is mostly found in incompletely cooked or cured ham and produces a soluble and very active toxin. The symptoms of botulism are those of severe gastroenteritis, followed by visual disturbances, extreme prostration and, in fatal cases, delirium or coma, and collapse. Other organisms occurring in diseased or decomposed meat, and giving rise to similar symptoms, are *B. enteritis*, *B. coli*, and *Proteus vulgaris*. The eating of putrid meat and fish is common in many countries and does not of itself cause poisoning. It is only when a specific bacillus happens to be present that toxic symptoms arise. See FROMAINES; SAUSAGE POISON.

BOTURINI BENADUCI, bo'too-ré'né bá'ná-doo-ché, LORENZO (c.1702-?). An Italian historian, and one of the first great collectors of American antiquities. He went to Mexico in

1736 and gathered a very large collection of aboriginal writings and other records, which eventually passed into the archives of the Mexican government, where most of them were lost or destroyed. Botuini returned to Spain and was appointed historiographer for the Indies in 1745. He included a valuable catalogue of his collections in his only published work, *Idea de una nueva historia de America* (1746).

BO TZARIS, bô-tsa'rês, MARCO See Boz-zaris, MARCO

BO TZEN See Bozen

BOUAYANAN, or **BUAYANAN**, bwi-ya'-nan A dialect group of the Batak of northern Palawan. They have intermarried to a considerable extent with neighboring Malay people. See PHILIPPINES

BOUCHAIN, bô'shân' (anciently, Lat *Lucinum*, the first part of the name was probably taken from Baudouin, or Baldwin IV, who fortified the town). A fortified town in the department of Nord, France, 12 miles southeast of Douai, situated on an eminence about 300 feet above the sea level (Map France, N, J 2). By means of two sluices the adjacent land may be laid under water in time of war. There are beet-root sugar refineries, dye works, and tanneries at Bouchain, which has also a considerable trade in cattle. Pop., 1896, 1527, 1901, 1760, 1911, 2214.

BOUCHARD, bô'shar', CHARLES JACQUES (1837-) A French physician, born in Montier-en-Der (Haute-Marne). He was educated in Lyons and subsequently went to Paris, where he was appointed professor of pathology in 1879. He was one of the physicians sent to the International Congress of the Medical Sciences, held in Berlin in August, 1890, and took a prominent part in the deliberations of that body. Among his principal works may be mentioned *Des dégénération secondaires de la moelle épinière* (1866), *Sur quelques points de la pathologie des hémorrhagies cérébrales* (1887), *De la pathologie des hémorrhagies* (1889), *Leçons sur les auto-intoxications* (1887, Eng. trans., 1906), *Antisepsie* (1889), *Traité de radiologie médicale* (1904).

BOUCHARDON, bô'shar'dôn', EDMOND (1698-1762) A French sculptor, born in Chaumont (Haute-Marne). He was a pupil of his father, Jean Baptiste Bouchardon, sculptor and architect, and afterward of the younger Coustou in Paris. Winning the *Prix de Rome* in 1722, he studied nine years in the Eternal City, where he executed a number of portrait busts, including that of Pope Clement XII. On his return to Paris he received quarters in the Louvre, in 1736 was named official designer of medals and memorial coins of the reign of Louis XV, and in 1746 professor in the Royal Academy. Among his principal works are "Christ Bearing the Cross" and "Cupid Cutting a Bow from Hercules' Club," in the Louvre, and several statues and a tomb in St Sulpice, Paris. His principal works for the city of Paris were the decorative fountain in the Rue du Grenville-St Germain and the bronze equestrian statue of Louis XV, destroyed during the Revolution—His brother, JACQUES PHILIPPE BOUCHARDON, was court painter to the King of Sweden and modeled a great number of figures for the Royal Palace at Stockholm.

BOUCHER, bô'shâ', ALFRED (1850-) A French sculptor, born in Bouy-sur-Orvin. He was a pupil of Dumont and Paul Dubois, and

in 1876 received the second *Prix de Rome*. In 1886 he received a gold medal for "Au But," a youth at the end of a race, now in the Luxembourg garden, in 1891, the medal of honor for "A la Terre," a youth spading the ground, now in the Musée Galliera, and in 1900 the *Grand Prix* of the Paris Exposition. Other important works by him are "Repose," a woman sleeping, in the Luxembourg Museum, and "Diana Surprised," in the Musée Galliera.

BOUCHER, FRANÇOIS (1703-70) One of the most important painters and decorators of the Rococo period in France. He was born in Paris, Sept. 29, 1703, studied painting with Lemonne, and was then apprenticed to the engraver François Jean Cars, but formed his style after Watteau (qv). In 1623 he won the *Grand Prix de Rome* and went to Italy in 1827. After a period of study in Rome and Venice, in which he was chiefly influenced by Tiepolo, he returned to Paris, where he speedily won a great reputation. He became a member of the Academy in 1734, professor in 1739, rector in 1761, and director in 1766, when he was also appointed first painter to the King. He was an artist of prodigious facility and indefatigable industry, was endowed with a brilliant imagination, and painted everything, from religious subjects and mythological and pastoral scenes to still life, from portraits, landscapes, and animals to decorations for the opera. His works are the true mirror of his time, when voluptuousness was the keynote of the court and aristocratic society. Pastoral scenes were his favorite subjects, painted with a spirited touch and a freshness and transparency of color resembling that of Rubens, but sensual in character. To the end of his days he was celebrated as the "Painter of the Graces," and was also styled the "Anacreon of Painting." He was in high favor with Madame de Pompadour, whose portrait he painted, and who engraved some of his works. An interesting phase of his art is found in his designs for the tapestry factory of Beauvais (1734-55), in which he changed the customary allegorical and hunting subjects to spirited pastoral scenes and fêtes galantes. This activity was continued as inspector of the Paris Gobelins from 1755 to 1765. Among his most celebrated paintings are "Rinaldo and Armida," "Diana Leaving the Bath," "Venus Demanding of Vulcan Arms for Æneas," "Jupiter and Callisto," "Rape of Europa"—all in the Louvre, "Leda and the Swan," "Triumph of Galatea," "Toilet of Venus," in the Stockholm Museum. He is represented in other large European and in most of the French provincial museums. Consult Mantz, *Boucher, Lemoyne and Natoire* (1880), the monographs of Goncourt (Paris, 1861, new ed., 1881), Watier (ib., 1885), Michel (ib., 1886, new ed., 1907), and Kahn (ib., 1905), also the extra number of the *Connoisseur* (London, 1908).

BOUCHER, bou'chër, JONATHAN (1738-1804) A British-American clergyman, prominent as a Loyalist at the time of the Revolutionary War. He was born in Blencogo, England, emigrated to America in 1764, conducted a boarding school in Virginia, was ordained a priest in 1762, and was a rector in Virginia and Maryland until 1775. He was then driven from his pulpit on account of his opposition to the principles of the Revolution, and returned to England, where from 1785 until his death he was vicar of Epsom. He wrote many essays and papers on political and theological subjects,

but is chiefly remembered for his *View of the Causes and Consequences of the American Revolution* (1797)—a collection of 15 discourses delivered in Virginia and Maryland between the years 1763 and 1775. Of this book Professor Tyler has said: "Nowhere else, probably, can be found so comprehensive, so able, and so authentic a presentation of the deeper principles and motives of the American Loyalists, particularly from the standpoint of a High-Church clergyman of great purity and steadfastness of character, of great moral courage, of great learning, finally of great love for the country thus torn and distracted by fratricidal disagreements." The book was dedicated to Washington, between whom and Boucher there existed for many years an intimate friendship. A *Glossary of Archaic and Provincial Words*, an unfinished work, was used as a supplement to *Webster's Dictionary* in 1832-33. Extracts from Boucher's *Autobiography* were published in *Notes and Queries*, 5th series, vol. vi (1850), and the "Letters of Jonathan Boucher to George Washington," in the *New England Historical and Genealogical Register*, vol. lii (Boston, 1898). Consult Tyler, *Literary History of the American Revolution* (New York, 1897).

BOUCHER, bō'shā', PIERRE, SIEUR DE BUCHERVILLE (1622-1717). A French pioneer, who came to America in 1635 and was engaged in the wars with the Iroquois. He was sent by the Colony of New France as deputy to France in 1661, about which time he published his *Histoire véritable et naturelle des mœurs et des productions de la Nouvelle France* (1663). He was ennobled and appointed Governor of Three Rivers. Shortly before his death he addressed to his children *Les adieux du grandpère Boucher*.

BOUCHER DE CRÈVECŒUR DE PERTHES, de krēv'kēr' de pārt', JACQUES (1788-1868). A French archaeologist, born at Rethel. He was employed by Napoleon in several diplomatic missions to Italy, Germany, and Austria, and after the Restoration was most active as president of the Society of Emulation at Abbeville. He collected Roman and Celtic antiquities, which he presented to the government, and gained much celebrity by archaeological discoveries and by his work *De la création* (1839-41). Even more noteworthy are *Antiquités celtiques et antédiluviennes* (1847-65) and *De l'homme antédiluvien et de ses œuvres* (1860); in the former of these he first proved that man had existed in the Pleistocene Period. His views on this point were not accepted till they were approved by Prestwich (q.v.). Consult "Recollections of M. Boucher de Perthes," in Lady Prestwich's *Essays Descriptive and Biographical* (London, 1901).

BOUCHER-DESNOYERS, bō'shā'dā'nwā'yā', AUGUSTE GASPARD LOUIS, BARON. See DESNOYERS, AUGUSTE GASPARD LOUIS BOUCHER, BARON.

BOUCHES-DU-RHÔNE, bō'sh' dū-rōn' (Fr. Mouths of the Rhône). A department in the southeast of France, bordering on the Mediterranean, formerly a part of Provence (Map: France, S., K 5). Area, 2026 square miles. Pop., 1806, 679,646; 1901, 734,347; 1911, 805,532. About one-half of the department is under cultivation; heaths, woods, wastes, and water occupy the other half. The Rhône—which between Arles and the sea separates into several branches, forming a delta called *île de la Ca-*

margue—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance. The agricultural products are cereals, olives, grapes, vegetables, and in some parts sheep; while the cultivation of figs, capers, mulberry trees, and silkworms receives the most attention. The most important mineral product is lignite, but iron, bauxite, lime, building stone, cement, and marble are also obtained. More salt is produced than in any other department in France, and metal founding, distilling of oil, shipbuilding, and soap making are quite general throughout the territory. Capital, Marseilles.

BOUCHETTE, JOSEPH, bō'shet' (1774-1841). A French-Canadian engineer, topographer, sailor, soldier, and scout. He received his professional training in the office of his uncle, then surveyor-general of British North America. In 1794 he raised the sunken gunboat *Anondaga* in Toronto harbor and sailed her to Niagara. For some time he was employed in making surveys of the harbors of Lake Ontario, and in 1803 he succeeded his uncle, Major Holland, in the surveyor-generalship of Lower Canada. He did valuable scouting on the Canadian side in the War of 1812-15. Appointed on behalf of Great Britain to take part in the survey of the boundary between British America and the United States, he did his share of the work between New Brunswick and Maine in 1817, but was prevented by illness from continuing it along the forty-fifth parallel in the following year. With extraordinary industry and intelligence he persisted in collecting a mass of topographical information which he published in England in 1830. His great work was dedicated to William IV, but he served also as a public official under George III, George IV, and Queen Victoria. His death took place in Montreal.

BOUCICAULT, bō's'ak-ō, DION (1822-90). An Irish-American playwright and actor, born in Dublin, of an Irish mother and a French father, Dec. 26, 1822. He was brought up under the guardianship of Dr. Dionysius Lardner, after whom he was named, and was educated at University College, London. His first dramatic work, produced before he was 19 years old, was *London Assurance*, Covent Garden, in March, 1841. Its signal success determined his career. It has ever since remained a favorite with British and American playgoers. The plot was slight, but ingenious; it abounded in comic situations; the dialogue was brisk and sprightly; there was no lack of wit, and there were perhaps more than enough of those flippancies and pleasant impertinences which average theatregoers prefer to wit. Boucicault next produced, in rapid succession, *Old Heads and Young Hearts*, *Love in a Maze*, *Used Up*, *Louis XI*, and *The Corsican Brothers*. When he went upon the stage, in 1852, he added the vogue of an actor to the reputation he had previously gained as an author. From 1853 till 1860 he was in America, where his popularity was scarcely less than it had been in England. On his return to London in 1860, he produced at the Adelphi Theatre a play, *The Colleen Bawn*, which proved among the most successful of modern times, and which, if not the first of a new school, has at least supplied a new descriptive name to our dramatic literature. The author made a fortune by it. It has been performed in almost every theatre in the United Kingdom; it had a great run in

America, it was even translated into French, and brought out at the Ambigu Theatre in Paris. Boucicault subsequently produced at the Adelphi — of which he was for some time joint manager — another "sensational" drama, *The Octoroon*, the popularity of which was only a little less than that of *The Colleen Bawn*. In 1862 he opened a new theatre in London, the Westminster, but this speculation turned out unfortunately. He afterward reestablished his fortunes by new plays, in some of which he and his wife — formerly Miss Robertson, a very popular actress — took the leading parts. *The Streets of London*, *Flying Scud*, *After Dark*, and *The Shaughraun* were among the most popular of his later works, all of which are of the type with which he had familiarized the public. His character of Con in *The Shaughraun* was perhaps his most effective and amusing creation. In collaboration with Charles Reade he wrote the novel *Foul Play*, which was afterward dramatized. In all he wrote more than 300 dramatic pieces, and in illustration of the facility with which he composed works which — all deductions made — are of considerable merit, it may be said that he once even wrote to a royal commission that he would undertake to write plays for all the theatres in London. As an actor, Boucicault was always very popular, without attaining high excellence in his vocation. His lack of marked histrionic talent was, in part at least, made up by his keen sense of humor, and whatever his artistic ability may have been, it is certain that he was immensely popular with his audiences. In 1876 he took up his residence in New York, where he died, Sept. 18, 1890. He was twice married. Three of his six children Dion (1861), Nina (1867), and Aubrey (1869), also became distinguished in the profession. Consult Clement Scott, *The Drama of Yesterday and To-day* (London, 1899); Montrose J. Moses, *Famous Actor-Families in America* (New York, 1906); Winter, *Other Days* (New York, 1908).

BOUCICAULT, Mrs. DION (1833–) An English actress, the adopted daughter of Charles Kean. As Agnes Robertson she had already made a reputation in Taylor's *Our Clerks* and other comedies at the Princess's Theatre, London, when, in 1853, she became the wife of Dion Boucicault (q.v.) and accompanied him to America. Returning in 1860 to London, she played successively at the Adelphi, Drury Lane, and other theatres, taking leading parts in several of her husband's dramas, notably as Eily O'Connor in *The Colleen Bawn* (1860), Zoe in *The Octoroon* (1861), and Jane Learoyd in *The Long Strike* (1886). For a time she again lived in America, but in her later life was separated from her husband.

BOUDICCA. See **BOADICEA**.

BOUDINOT, bōō'din-ōt, ELIAS (1740–1821). An American philanthropist, born in Philadelphia, Pa. He studied law, was admitted to the New Jersey bar, and was in 1777 appointed by Congress commissary general of prisoners. In 1777–78 and again in 1781–84, he was delegate from New Jersey to the Continental Congress, of which he was in 1782 elected President. In the latter capacity he signed the ratification of the definitive Treaty of Peace with Great Britain. In 1789–95 he was a member of the First, Second, and Third Congresses of the United States, and from 1795 to 1805 was Director of the Mint at Philadelphia. He assisted in 1816 in founding the American Bible Society, whose

first president he became. He aided also in the education of Indians and deaf-mutes, in the relief of the condition of the poor, and in the preparation of youth for the ministry. His publications include *The Age of Revelation* (1790), a reply to Thomas Paine's *Age of Reason*, and *Stas in the West*. or, *An Attempt to Discover the Long Lost Tribes of Israel* (1816), in which, with an extensive array of evidence, he supports the theory of James Adair, that the North American Indians are the lost tribes in question. Consult Boudinot, *Life of Elias Boudinot* (1896).

BOUDINOT, ELIAS (?–1839). The name taken, with Dr. Boudinot's permission, by a Cherokee Indian in the missionary school at Cornwall, Conn., where he married a white lady of the village. *An Address to the Whites* on behalf of his nation, delivered May 25, 1825, in Philadelphia, was published in 1826. He edited the *Cherokee Phoenix* (1828–34), and was a man of talent and influence in his nation. Being, with others, persuaded to make a treaty with the United States in December, 1835, for the expatriation of the Cherokees, he was accused of having sold his country, and was killed by the John Ross party, June 10, west of the Mississippi. — His son, ELIAS CORNELIUS BOUDINOT (1835–90), was educated in New England and became a well-known lawyer, a lieutenant colonel in the Confederate army, and a delegate from his nation to the Second and Third Confederate Congresses.

BOUFFARIK, bōō'fa-rēk' (the 'Hanging Well'). A town in the department of Algiers, Algeria, 21 miles by rail southwest of the town of Algiers. Originally it was called Medina Clausel, after Marshal Clausel, who planted the town on the site of an entrenched camp in 1835. It is the centre of a rich agricultural district on the plain of Mitidja, growing oranges, grapes, and grain. Pop. 1901, 9284, 1911, 10,968.

BOUFFIERS, bōō'fiar', LOUIS FRANÇOIS, Duc DE (1644–1711). A marshal of France. He was descended from one of the oldest noble families of Picardy. He began his military career as a lieutenant and rose very rapidly in rank. Under the great Conde, Turenne, Crequi, Luxembourg, and Catinaut, he fought with distinction in Germany, the Netherlands, and on the Spanish frontiers. His defenses of Namur in 1695 and of Lille in 1708 are famous. The siege of the former place, conducted by William III, cost the Allies more than 20,000 men, and although Louis XIV sent to Bouffiers an order written by his own hand for the surrender of the place, he did not surrender it until all the means of defense were exhausted. After the defeat of Malplaquet (Sept. 11, 1709), he led the French army so admirably that the retreat seemed rather a triumph than the result of a lost battle. He was a man of highly honorable and upright character. Consult La Rue, *Oraison funèbre* (Paris, 1712).

BOUFFIERS, STANISLAS, MARQUIS DE (1738–1815). A French wit and author, commonly styled the Chevalier de Bouffiers. He was born in Nancy and trained for the Church, but, dissatisfied with the clerical profession, the young abbe entered the military service of France and was made Governor of Senegal in 1765. He was a member of the Constituent Assembly in 1789. He emigrated in 1792 and was well received at the court of Frederick William II of Prussia. Returning to France in 1800, he resumed his old place of academician, and continued a devoted

adherent of light literature till his death, in January, 1815. His poems are typical of the age, charming, meaningless, but full of passion. He was a brilliant conversationalist and a fine wit; a friend of Voltaire's, a romancer, and a *débauché* after a gentlemanly fashion. His best-known work is the story *Aline, reine de Golconde*. A collection of his works was published after his death (8 vols., Paris, 1815). Consult Uzanne, *Notice sur la vie de Boufflers* (Paris, 1880), and his *Lettres de Boufflers*, published in Paris in 1875.

BOUGAINVILLE, boo'gān'vel' (after the navigator Bougainville). The largest of the Solomon Islands (qv) under German control in the Pacific, situated in about lat. 6° S. and long. 155° E. (Map: Australasia, H 3). Area, 3860 square miles. It is well wooded, densely populated, and contains two active volcanoes, one of which, Mount Balbi, rises to a height of over 10,000 feet. Bougainville Strait separates it from Choiseul Island on the southeast. The name "Bougainville" is also applied to a strait in the New Hebrides group between the island of Marina and Mallicolo, a cape on the northwest coast of Australia, and a cape on the south coast of New Ireland. Pop., about 60,000.

BOUGAINVILLE, Louis Antoine de (1729-1811). A French soldier and navigator, born in Paris. He studied law, was admitted as an advocate before the Parlement, and published a *Traité du calcul intégral* (2 vols., 1754-56). Having subsequently entered the army, he was in 1756 appointed aid-de-camp to the Marquis de Montcalm in Canada. He presented the terms of capitulation at the fall of Oswego (1756), was dispatched to Montreal with news of the victory at Fort William Henry (1758), and was slightly wounded at the capture of Ticonderoga (1758). In the autumn of 1758 he went with Doreil to France to request supplies and reinforcements. During the siege of Quebec (1759) he was stationed with 1500 troops at Cap Rouge, there to watch the movements of the English squadron under Admiral Holmes. With the rank of colonel he left the army in 1763, entered the navy, and was authorized by the government to establish a French colony in the Falkland Islands (Îles Malouines). In 1766-69 he circumnavigated the globe. Through the scientific and geographical discoveries of this voyage he won for the nation a glory not unlike that obtained by Cook for England in a similar expedition. When, in 1778, France came to the assistance of the United States in the Revolutionary War, he was appointed to the command of a ship of the line, took a distinguished part in the battle between De Grasse and Admiral Rodney, and rose to the rank of *chef d'escadre*. He subsequently reentered the army as a brigadier general, but retired in 1790, and later became a Senator and Count of the Empire. The *Journal* kept by him during his service in Canada is highly praised by the historian Parkman; he also wrote *Voyage autour du monde* (2 vols., 1771-72). Consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

BOUGAINVILLEA, (named for De Bougainville, a French navigator). A genus of plants belonging to the family Nyctaginaceæ. There are seven or eight species, all of them South American. They are shrubs, sometimes trailing, with small inconspicuous tubular flowers surrounded by large colored bracts. Some of the species have been widely introduced in the

tropics and warmer parts of temperate zones and are often conspicuous about dwellings. *Bougainvillea spectabilis* is probably the best-known species. It is a tall growing shrub, often used to cover trellises, and is very handsome on account of its large clusters of flowers with their deep rose-colored bracts, varying to purple or greenish. *Bougainvillea glabra* is a smaller plant, with rosy-red bracts. A variety, *sanderiana*, is often grown in pots. It blooms profusely, is of brighter color, and is considered a valuable plant for greenhouse culture, as it begins blooming very soon after starting growth and continues in flower for a long time.

BOUGHT AND SOLD NOTES. The written memorandum of a transaction of purchase and sale of personal property which is delivered to the buyer and seller, respectively, by the broker who conducted the sale. The copy delivered to the seller is the sold note; that delivered to the buyer is called the bought note. The object of the notes is to inform the buyer and seller of the fact and of the terms of the contract, and also, where necessary, to satisfy the requirements of the Statute of Frauds (qv.). No particular form of words is necessary to a valid bought or sold note. The usual form of a sold note is the following: "Sold for A B to C D 1000 bushels of Early Rose potatoes, now in A B's cellar, for \$300 cash, to be paid on delivery at C D's warehouse, within one week from date." Dated, and signed by the broker. The bought note would begin, "Bought from A B for C D," but otherwise it would contain the same language as the sold note. Bought and sold notes have been the subject of considerable litigation in England. For the legal rules deducible from the English decisions relating to them, see Benjamin, *Treatise on the Law of Sale of Personal Property* (7th Amer. ed., by Bennett, Jersey City, 1889), and Campbell, *Law Relating to the Sale of Goods and Commercial Agency* (2d ed., London, 1891).

BOUGHTON, bo'ton, GEORGE HENRY (1833-1905). A genre and landscape painter who may be classed in both the American and British schools. He was born near Norwich, Dec. 4, 1833. His family came to America when he was a child and settled at Albany, where he received his first instruction in art. His earliest paintings proved so successful that in 1856 he was able to make a sketching tour through England, Scotland, and Wales. He had a studio in New York from 1858 to 1860, when he went to Paris. For two years he studied there, visiting no regular school but receiving much assistance from Edouard Frère. After 1862 he resided in London. He continued, however, to exhibit in the United States and always found patrons here. His subjects also were for the most part from the life of the early American colonists and that of Holland. He was elected to the National Academy of Design in 1871 and to the Royal Academy in 1896. His work is marked by grace and refinement, by a fine sense of color, and by much sympathy with nature. Among his principal paintings are "Winter Twilight" (1858); "Puritans Going to Church" (Public Library, New York, 1867); "The Heir-Presumptive" (1873); "The Edict of William the Testy" (1877, Corcoran Gallery, Washington); "Snow in Spring" (1877); "Hester Prynne," from *The Scarlet Letter* (1881); "Weeding the Garden" (1882, National Gallery, London); "Golden Afternoon" (1888, Metropolitan Museum, New

York), "The Road to Camelot" (1898), "Strome Valley" (1904). He also wrote for the magazines and illustrated his stories with taste and skill. Consult A. L. Baldry, *G. H. Boughton: His Life and Work* (London, 1904).

BOUGIE, bō'zhē', or **BOUGIAH**, bōo-jā (from the tribe *Bujayah* or *Bojana*). A fortified Mediterranean seaport on the Bay of Bougie, in the department of Constantine, Algeria, 112 miles east of Algiers. It has a deep and well-sheltered roadstead, and an inner basin with quayage (Map Africa, E 1). It has a trade in grain, wine, oranges, oil, minerals, and wax, the latter being famous, due to the fact that wax candles are said to have been first made here, thus giving the derivation to the French name "bougie," of that article. The town is built on the slope of Mount Guraya, which rises to a height of 2310 feet. The chief buildings are the Abd el-Kader fort, used as a prison, and the French church. Founded by the Carthaginians, it was the Roman *Saldae*, and Genseric, King of the Vandals, who for a time made it his capital, built walls around it. In the tenth century it was the greatest commercial city of the north African coast, with a population of 100,000, and in the twelfth and thirteenth centuries Italian merchants had their own warehouses and churches there. After the successive occupation by Spain and Turkey, in the sixteenth century, it dwindled into insignificance. Its modern rise dates from the French occupation in 1833. Pop., 1901, 14,552, 1911, 19,012.

BOUGIE, bōo-zhē' (Fr. wax candle, a bougie, from the Algerian town Bougie, whence these candles were first imported). A solid rod of whalebone, gutta-percha, woven thread covered with gum elastic or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra. (See *STRUTURES*.) Similar instruments made of silver, steel, or other metals are called "sounds." Bougies vary from a filiform to a half inch in diameter. They are cylindrical, tapering to a blunt point, or tipped with olive-pointed or conical extremities. The name is also given to rods of gelatin or cocoa butter, impregnated with drugs, which are placed in the urethra to be dissolved by degrees, as the heat of the body melts them, thus causing a continuous application of the medicine. Special medicated bougies are also made for the nasal cavities.

BOUGIVAL, bōo-zhé'val'. A favorite pleasure resort of Parisians in the department of Seine-et-Oise, France, on the left bank of the Seine, 8 miles northwest of Paris (Map Paris and vicinity). Its Romanesque church dates from the twelfth century. Pop., 1901, 2189, 1911, 2671.

BOUGUER, bōo-gā', **Pierre** (1698-1758). A French mathematician and physicist, the founder of photometry. He was born at Croisic, in Bretagne, and studied in the Jesuit College at Vannes. In 1713 he succeeded his father as professor of hydrography in Croisic, whence he removed to a similar office in Havre in 1730. In 1729 he published his *Essai d'optique sur la graduation de la lumière*. In 1731 he was made associate geometer of the Academy of Sciences and was promoted to the office of pensioned astronomer in 1735. He was chosen to proceed, along with Godin, La Condamine, and Jussieu, to South America, for the purpose of measuring a degree of the meridian at the equator. They had to contend with many difficulties, and were

more than seven years away from home, during which time Bouguer made valuable observations on the length of the seconds pendulum at great elevations, the deviation of the plumb line from a vertical position through the attraction of neighboring mountains, the line of perpetual snow, etc. He published an account of his labors and those of his colleagues in a magnificent work, entitled *Théorie de la figure de la terre* (1749). Bouguer's investigations concerning the intensity of light laid the foundation of photometry, and their results, which had been partly exhibited in the optical work already noticed, were more fully embodied in his *Traité d'optique sur la graduation de la lumière*, which was edited after his death by Lacaille (1760). He is the inventor of the heliometer (qv). He published an excellent *Nouveau traité de navigation et de pilotage* (1753), and numerous works in the *Mémoires de l'Académie des Sciences* (1726 to 1757).

BOUGUEREAU, bōo-grā', **ADOLPHE WILLIAM** (1825-1905). A French figure painter. He studied under Picot, took the *Prix de Rome* in 1850, received medals of honor in 1873 and 1885, became a member of the Institute in 1876 and grand officer of the Legion of Honor in 1903. A classicist in line and contour, he was also influenced by modern realism, especially in rendering flesh. Although his work is very popular with the general public, it is less so with artists and critics, who consider it lacking in sincerity and untrue to nature. The figures are idealized models, and his execution is very smooth and labored. Of his paintings, which are numerous in the provincial and metropolitan museums of France, the most celebrated are "The Body of St. Cecilia Borne to the Catacombs" (1898), "The Birth of Venus" (1879), and "La Vieille Consolatrice" (1877)—all in the Luxembourg. He was formerly very popular in the United States, where he is well represented in public and private collections. He also painted mural decorations in Ste. Clotilde and St. Augustin, Paris, in the Opéra at Bordeaux, and elsewhere. Consult the catalogue of his works by Vendryes (Paris, 1885), and Ménard in *The Portfolio* (London, 1875), also the monographs by Ménard (Paris, 1885) and Vachon (ib., 1900).

BOUILLÉ, bōo-yā', **FRANÇOIS CLAUDE AMOUR, MARQUIS DE** (1739-1800). A French general. He was born at the castle of Chuzel, in Auvergne, entered the army at the age of 14, and served with distinction in Germany during the Seven Years' War. He was Governor of Guadeloupe in 1761, and soon after became Governor-General of Martinique and St. Lucia, and commander in chief of the French forces in the West Indies. In the war against England which broke out in 1778 he added several small islands to the West Indian possessions of France. For this he was rewarded with the rank of lieutenant general. In 1784 he visited England and was received with extraordinary respect on account of his kindly behavior to his enemies during the war just concluded. Louis XVI. nominated him a member of the Assembly of Notables in 1787-88, in 1790 he was made commander in chief of the Army of the Meuse, the Saar, and the Moselle. His decision of character prevented the dissolution of the army and the outbreak of civil war. He quelled the insurrection of the garrison of Metz and of the three regiments at Nancy. For this

he received the thanks of the National Assembly and of the King. From 1789 to 1791 Bouillé was regarded with suspicion by the Revolutionists, and rumors were often spread of his joining with the Austrians to march on Paris. After Louis XVI's flight to Varennes, of which he declared himself the instigator, he repaired to Coblenz to the King's brothers and in 1791 attended the conference at Pilnitz. In the same year he entered the service of Gustavus III of Sweden and after the assassination of that monarch served in the corps of the Prince of Condé. He rejected an offer, which the French princes made to him in 1793, of the chief command in La Vendée, and went to England, where his advice in West Indian affairs was useful to the government; here he wrote his *Mémoires sur la révolution française*, a useful work throwing much light on the transactions of that time. He died in London. Consult Gabriel, *Louis XVI, le marquis de Bouillé et Varennes* (Paris, 1874).

BOUILLIER, בּוּיִ'יָא', FRANCISQUE (1813-99). A French philosopher, born in Lyons. He studied at the Normal School, Paris, and in 1839 was appointed professor of philosophy at the University of Lyons. From 1849 to 1864 he was dean of the faculty of Lyons and from 1867 to 1870 director of the Normal School. His works, the best of which display both a finished style and high scholarship, include *Histoire et critique de la révolution cartésienne* (1842); *Théorie de la raison impersonnelle* (1844); *Le principe vital et l'âme pensante* (2d ed., 1873); *La vraie conscience* (1882); *Du plaisir et de la douleur* (4th ed., 1891); *Souvenirs d'un vieil universitaire* (1897); Latreille, *Francisque Bouillier, le dernier des Cartésiens* (Paris, 1907).

BOUILLON, בּוּיִ'לֹן' (ML. *Bullonium*). An old duchy, included in the Belgian province of Luxembourg, consisting of a woody and hilly district in the Ardennes, about 157 square miles in extent, with a population of 22,000. This duchy was the possession of the famous Crusader Godfrey de Bouillon (q.v.), who, in order to raise money for his Crusade, pledged it in 1095 to the Bishop of Liège, from whom it passed to the Lords of Sedan. In the seventeenth century it became the possession, under French suzerainty, of the family of La Tour d'Auvergne. In 1793 it became a part of France. After the Napoleonic wars it belonged for a time to the King of the Netherlands, and in 1830 it was united with Belgium. The little town of Bouillon, above which towers the mediæval castle of the dukes of Bouillon, is situated about 10 miles northeast of Sedan. Consult Ozeray, *Histoire de Bouillon* (Luxembourg, 1827).

BOUILLON, FRÉDÉRIC MAURICE DE LA TOUR D'AUVERGNE, DUC DE (1605-52). A French general, son of Henri. He first served in Holland under Maurice of Nassau, his uncle, and entered the French service in 1635. Joining the rebellion of the Comte de Soissons against Richelieu in 1641, he defeated the royal forces at La Marfée, but, abandoned by the Spaniards, retreated to Sedan and managed to make his peace with Richelieu, whereupon he received command of the French army in Italy. Implicated in the plot of Cinq-Mars only a year afterward, he was arrested and was in danger of execution, but his wife had possession of Sedan and threatened to surrender the place to the Spaniards

unless he should be saved. After the death of Louis XIII he went to Rome, where he had command of the papal forces. Returning to France in 1649, he took an active part in the war of the Fronde against Cardinal Mazarin. His *Mémoires* were published in 1731.

BOUILLON, GODFREY DE. See GODFREY DE BOUILLON.

BOUILLON, HENRI DE LA TOUR D'AUVERGNE, DUC DE (1555-1623). A French general, at first known as Vicomte de Turenne. He became a Calvinist and partisan of Henry of Navarre, who, when King, gave him the hand and estate of Charlotte de La Marek, the heiress of the Duchy of Bouillon. On the night in which he was to be married he suddenly left his prospective bride and stormed the fortress of Stenay, then held by the army of Lorraine. Soon afterward he was made marshal of France, and intrusted with two diplomatic missions to England, Holland, and Germany. Compromised in the Biron conspiracy, he was obliged to take refuge in Geneva in 1603, but became reconciled to the King in 1606. After the assassination of Henry IV he was one of the Council of the Regency and was alternately for and against the Queen. The Assembly of La Rochelle appointed him general in chief of the Reformed forces, but he refused the appointment and retired to Sedan, where he established a college and valuable library. His second wife, a daughter of William, Prince of Orange, left him two sons, the younger of whom was the celebrated Marshal Turenne. Consult his life by Marsollier (3 vols., Paris, 1720), and his *Mémoires* (Paris, 1666; new ed., 1901).

BOUILLY, בּוּיִ'יָא', JEAN NICOLAS (1763-1842). A French dramatist. During the Revolutionary period he was first a judge, then a public prosecutor in Tours, and later he was called to Paris to aid in the establishment of primary schools throughout France. He retired from public life in 1799. The sentimental character of most of his works earned for him the name of "poète lacrymal." The most noteworthy among them are: *Pierre le Grand* (1790), a comic opera, for which Grétry wrote the music; *L'abbé de l'épée* (1800); *Les deux journées*, set to music by Cherubini; *Fanchon*; and *Madame de Sévigné*. Of his writings for the young, the *Conseils à ma fille* (1809); *Contes offerts aux enfants de France* (1824); *Les adieux du vieux conteur* (1835), and *Contes à ma fille*, have passed through several editions and have been translated into several languages.

BOULAINVILLIERS, בּוּלֵ'אן'בֵּי'יָא', HENRI, COMTE DE (1658-1722). A French historian, born at Saint-Saire, Normandy. He studied for a time and entered the military profession. The difficulties of succession after the death of his father compelled him to study the titles of his family, and in the end he devoted himself exclusively to the investigation of the genealogy of the ancient families of France. He regarded the feudal system as the most perfect form of human government, and he succeeded so far as concerned himself in establishing absolute proof that all powers of government should be vested in certain families and particularly in his own. His writings, published after his death, include: *Histoire de l'ancien gouvernement de France* (1727); *L'état de la France* (1727); *Histoire de la pairie de France et du parlement de Paris* (1753); *Histoire des Arabes* (1731); and his *Abrégé*

chronologique de l'histoire de France (3 vols., 1733)

BOULANGER, bō'lan'zhā', GEORGES ERNEST JEAN MARIE (1837-91) A French general. He was born at Rennes, and educated at Saint-Cyr. He served in Italy and China, was with Bazaine at Metz, but escaped to Paris, and held a lieutenant colonelcy under the Government of National Defense. In 1881 he headed the deputation of French officers at the celebration of the centenary of the battle of Yorktown, he became brigadier general through the influence of the Duc d'Aumale, and in 1884-85 commanded the army of occupation in Tunis, but was recalled shortly after, owing to differences with the civil authorities. He was Minister of War from January, 1886, to May, 1887, and through the introduction of some desirable army reforms, and the appearance of a popular music-hall song in his praise, was adopted as the embodiment of the "revenge" policy by the Parisians. In 1887, while commanding an army corps, he was arrested for remarks on the acting War Minister, and in March, 1888, for disobedience to orders, was deprived of his command and placed on the retired list. Supported by a combination of malcontents of all parties, chief among them the Orleansists, he aroused for a time that reckless popular enthusiasm which is so easily stirred in France by a little bravado. For a brief period the "man on horseback" fixed the attention of all observers and aroused some fear as to the safety of the Republic. In 1888 and 1889 he was elected deputy from a number of departments. A coup d'état was momentarily expected, but Boulanger's courage was not equal to his ambition. When the danger of prosecution by the Tirard ministry for conspiracy seemed imminent, he fled to Brussels. He was convicted of malfeasance by the Senate. Politically discredited, he finally took up his residence in the island of Jersey. In 1890 one of his former adherents, M. Meunier, published in the Paris *Figaro* a series of revelations concerning the inner history of the Boulangist movement, under the title *Les coulisses de Boulangerisme*, furnishing conclusive evidence that Boulanger was a tool in the hands of the Royalists. The funds, amounting to 3,000,000 francs, for his propaganda were furnished by a Royalist noblewoman, the Duchesse d'Uzès. Boulanger committed suicide at Brussels, Sept. 30, 1891, on the grave of Madame Bonnemain, his mistress. Consult pamphlets and broadsides of the time, articles in the periodical press, and the following Chincholle, *Le Général Boulanger* (Paris, 1889), Guyot, *Le Boulangerisme* (Paris, 1889), Turner, *General Boulanger A Biography* (London, 1889), Verly, *Le Général Boulanger et la conspiration monarchique* (Paris, 1893), De Vermont, *Les coulisses de Boulangerisme revues et augmentées de plusieurs chapitres inédits* (Paris, 1890).

BOULANGER, GUSTAVE CLARENCE RODOLPHE (1824-88) A French figure painter. He was born at Paris, studied with Delaroche and Jollivet, and in 1849 took the *Prix de Rome*. Like Gérôme, whose art he resembles, he belonged to the Neo-Greek group of classicists and also painted Oriental subjects. Although his many classical paintings show deep archaeological study, his Oriental work is the better. All his paintings show a refined taste and imagination, but are cold and academic in execution. They include a "Moorish Café" (1848), "Cæsar at

the Rubicon" (1865), the "Promenade in the Street of Tombs, Pompeii" (1869), the "Slave-Market" (1883), and the decorative panels of the *foyer de la danse* of the New Opéra, Paris, with 20 portraits of dancers. The recipient of many medals, he became a member of the Institute in 1882.

BOULANGER, LOUIS (1806-67) A French painter, born at Vercelli (Piedmont). He was a pupil of Guillon-Lethière and Déveria, and from 1860 was director of the School of Fine Arts at Dijon. He first attracted attention in 1827 with his "Mazeppa" (Rouen Museum). His other works include "Spanish Mule-Drivers" (1833), many excellent water colors, chiefly in series depicting scenes from *Notre Dame de Paris*, *Othello*, *King Lear*, "The Triumph of Petarch" (1836), "Macbeth" (1859), "Concert in Picardy" (1866). He illustrated many of Hugo's works.

BOULAY DE LA MEURTHE, bō'lay' də la mērt', ANTOINE JACQUES CLAUDE JOSEPH, COUNT (1761-1840) A French statesman, born at Chaumousey in the Vosges, the son of a peasant. He espoused the cause of the Revolution, but held moderate views, and in the Council of Five Hundred opposed both Jacobinism and the despotism of the Directory. Under the Empire he took an important part in the preparation of the *Code Civil* and afterward labored with zeal in the administration of the national domains. Napoleon created him Count in 1813. After the Second Restoration he was banished to Nancy, whence the Russians carried him off into Germany. He was kept under surveillance at Halberstadt, and then at Frankfort until 1819, when he returned to France and lived in retirement at Paris. His *Essai sur les causes qui en 1649 amenèrent en Angleterre l'établissement de la république* (1799) had a wide circulation and considerably influenced the French mind in favor of the coup d'état of the 18th Brumaire. Of his other numerous political writings the most important is *Tableau politique les régnes de Charles II et de Jacques II* (2 vols., 1818). In conjunction with others he wrote *Bourienne et ses erreurs volontaires et involontaires* (1830), valuable regarding the history of Napoleon.

BOULAY DE LA MEURTHE, HENRI (1797-1858) A French statesman, son of Antoine (see above), born in Paris. He took an active part in the Revolution of 1830, but became an opponent of the government of Louis Philippe. He devoted great attention to questions of social economy, contributing much to promote the establishment of houses of refuge (*salles d'asile*), the extension of elementary education, and many improvements in the condition of the laboring classes. In the National Assembly of 1848 he associated himself with the moderate Republicans, and in January, 1849, was elected Vice President of the Republic. Nevertheless he tacitly acquiesced in the coup d'état of December, 1851, and became a member of the new Senate.

BOULDER, bō'ldər. A city and the county seat of Boulder Co., Col., 29 miles northwest of Denver, on the Union Pacific, the Colorado and Southern, and the Denver, Boulder, and Western railroads (Map Colorado, D 1). It is the seat of the State University, established in 1877, of Mt St Gertrude's Academy, and of the Colorado Chautauqua, and has a Carnegie library and one business college. There is a public

park of 2250 acres, and near by are the famous Boulder Cañon, and the gold, silver, and telluride mines of Sunshine, Salina, Gold Hill, Magnolia, Rowena, Springdale, Eldora, Ward, Sunset, Crisman, and Jamestown. Boulder is noted as a summer and health resort, medicinal springs being near, and a sanitarium in the city. It is in an agricultural, stock-raising, and mining region, and has flour mills, sampling works, lumber mills, cutlery and food-product factories, and manufactories of clay and kaolin products. A large number of oil wells have been drilled within a radius of two miles of the city. Chartered as a city in 1871, Boulder is now governed under a charter of 1882, which provides for a mayor, elected biennially, and a city council. The water works are owned and operated by the municipality. Pop., 1910, 9539.
